Alternative, No Change to 2008 Decision, Oil Shale", so that approximately 2,000,000 acres of public land remain available for potential development of oil shale and 430,000 acres of public land remain available for potential development of tar sands. The basis for this recommendation is that the first PEIS has already adequately and thoroughly addressed this issue. #2])>

<([#3 [9.8] The Energy Policy Act of 2005 (EPA'05) declared oil shale and heavy oil "strategically

important resources that should be developed to reduce the growing dependence of the United States on politically and economically unstable sources of foreign imports". Events since 2005 have only served to reinforce the need for domestic oil shale development as part of an "all of the above" solution.

In September 2008, the BLM issued what was thought to be the Final PEIS; a comprehensive work consisting of 1,828 pages in three volumes. This document was published after a 120-day comment period in which more than 100,000 comment letters were submitted. The comments and the BLM responses are contained in a fourth volume containing over 7,000 pages. Shell provided 226 comments covering nearly 80 pages.

BLM has stated that the bases for reopening the PEIS are: (1) because there are presently "no economically viable ways yet known to extract and process" oil shale and tar sands, (2)

because new information has come out (including revisions to the resource assessment and to the list of threatened/ endangered species) and (3) “to reassess the appropriate mix of allowable uses with respect to oil shale and tar sands leasing and potential development” that were apparently not sufficiently covered in the original PEIS.

Regarding the first reason, the work that went into the PEIS was based on the assumption that a commercial development of oil shale would successfully emerge from the RD&D work. That is the objective of the RD&D program. If the RD&D work does not lead to a commercial development, there will be no demand for leases (and thus no need to withdraw lands from leasing consideration).

The second reason for reopening the original PEIS is not valid given that new information and studies are being produced all the time. The existing, fully vetted, comprehensive, 1,800 page PEIS is less than three years old and in the intervening time no substantive new information has emerged that merits revisiting the PEIS in such a short time. Additionally, the entire issue fails to recognize the comprehensive framework of regulatory checks and balances already in place in the form of environmental (and other) laws, including site specific NEPA review that will apply to every oil shale project under federal jurisdiction in the future. These laws and regulations are further elaborated on in Section 2.2.1 (Existing Relevant Statutory Requirements).

The third reason for reopening the PEIS is also without warrant. Remarkably, all five areas proposed for removal from development as identified in the Notice (i.e. those with wilderness characteristics, “very rare or uncommon” designation, sage grouse habitat, “areas of critical environmental concern”) may be precluded under the existing leasing authority assigned to BLM land managers.

Given the fact that there are already adequate checks and balances provided in existing regulatory programs to accomplish the stated bases for this PEIS, Shell views the new Draft PEIS as an inefficient and unnecessary use of taxpayer money and a significant deterrent to capital investment by Shell and others in the energy industry. The ramification of such a downsizing of the areas of potential development coupled with the increase in regulatory uncertainty could be (1) lower capital investment, (2) lower domestic oil production, (3) higher oil imports, (4) higher unemployment, (5) lower tax revenues from royalties, federal and state corporate and individual incomes taxes, severance tax, and property and sales taxes, and (6) lower overall economic growth.

#3]>> Shell’s Long Standing Commitment to Oil Shale Research

2

<([#4 [6.3.3] Shell has been investing in the technical and commercial development of the In situ Conversion Process (ICP) for oil shale since the early 1980s as a means to economically develop oil shale- in an environmentally responsible and socially sustainable manner. This effort has required considerable dedicated scientific effort and significant investment. To date, through persistence and much effort, a logical progression of work has been completed from desk top studies, to laboratory scale testing, to prototype scale testing, and finally to field pilot testing in Colorado.

Shell’s seven previous Colorado pilot projects have tested broad technology themes, including (1) demonstrating that the technology works, (2) measuring energy balance and recovery efficiency necessary to estimate commercial project economics, (3) producing and measuring the properties of ICP oil and gas, (4) proving that the groundwater can be protected, and (5) testing the effectiveness of a variety of heat delivery methods. In the

process, Shell has carried out extensive pre-operational environmental assessments. Shell has given careful attention to archaeologically sensitive areas by completely assessing and avoiding such areas, and has cooperated fully with agencies such as the State Historical Preservation Office and BLM to identify and avoid areas of critical environmental concern, including establishing conservation easements to provide permanent protection of certain areas. Shell has also funded research into environmental restoration, and has shown that disturbed lands can be returned to beneficial uses that are equivalent to the pre-disturbance conditions. And last, Shell has always stated our commitment to supporting a transparent and regulated NEPA process for a potential commercial project.

#4) **<([#5 [10.6] The Pressing Need for Energy Solutions in the United States**

While questions and challenges remain regarding the future implementation of oil shale technology, Shell believes it is now time for increased commitment by the Federal Government to create a regulatory environment that encourages the investment in oil shale RD&D, including ICP technology. While perfect regulatory certainty can never be attained, the lack of policy consistency from one administration to another makes investment risky and potentially untenable.

Shell firmly believes that if the ICP technology (or technologies being tested by other energy companies) can be proven through RD&D testing, a meaningful domestic source of energy can be successfully unlocked. The energy challenges facing this nation and this planet are real and require working together to maximize the chance of finding cost effective, environmentally acceptable, and timely solutions.

Shell intends to develop oil shale in a manner that is economically viable, environmentally responsible and socially sustainable. An environmentally based “no development” policy is unsustainable when considering socioeconomics, national energy needs, and the facts and realities of future U.S. energy requirements. As NEPA requires, the environmental and social impacts and benefits of any proposed action need to be considered. Our country needs energy in every form. There is clearly a path forward where our energy needs can be supplemented with oil shale, while also managing and mitigating the impacts of development.

#5) **<([#6 [2.1.1] As previously stated, Shell supports “Alternative 1, No Action Alternative, No Change to 2008 Decision, Oil Shale”, so that approximately 2,000,000 acres of public land remain**

available for potential development of oil shale and 430,000 acres of public land remain available for potential development of tar sands.

#6) Additional, and more specific comments can found in the following attachment to this letter.

last, **<([#7 [1.1.1] Shell reserves the right to submit additional comments to this PEIS in the event that the public comment is extended, as was requested by our letter of April 10, 2012. Because BLM**

intends to issue the Notice of Proposed Rulemaking (NPR) for the commercial leasing regulations on or around May 15th, which is after the planned May 4th end of this initial comment period, there will be additional context in the NPR that will reflect directly on this PEIS.

#7) Thank you for the opportunity to comment on this important matter.

Dan Whitney

Heavy Oil Development

<([#8 [9.2.1] PEIS Citation: Vol 1, Pg 2-76, Sec 2.4.4, line 12 Preferred Alternative
 Topic: Compliance with Section 369(e) of the Energy Policy Act of 2005 requiring
 COMMENCEMENT OF COMMERCIAL LEASING OF OIL SHALE AND TAR SANDS
 Comment: The DOI and BLM are attempting to alter federal law through a federal policy
 decision.

Section 369(c) of the Energy Policy Act of 2005 requires establishment of a LEASING
 PROGRAM FOR RESEARCH AND DEVELOPMENT OF OIL SHALE AND TAR SANDS.
 Then, Section 369(d) requires development of a separate commercial leasing program for
 oil shale and tar sands by requiring a PROGRAMMATIC ENVIRONMENTAL IMPACT
 STATEMENT for that program in Section 369(d) and COMMENCEMENT OF
 COMMERCIAL LEASING OF OIL SHALE AND TAR SANDS in Section 369(e).
 By recommending Alternative 2(b) as BLM's chosen Preferred Alternative, BLM and DOI
 are essentially vacating the federal law by policy decision by making the RD&D program
 the only possible future avenue to commercial oil shale development. #8]>

<([#9 [1.3] [2.2] PEIS Citation: Vol 1, Pg 2-76, Sec 2.4.4, line 12 Preferred Alternative
 Topic: Compliance with 40CFR1501.6(a)(2)
 Comment: For multiple reasons, BLM should re-evaluate its decision to select Alternative 2(b)
 as the Preferred Alternative. In doing so, BLM and the DOI have demonstrated that the most
 stringent reductions of
 "operating space" for the oil shale industry are a matter of policy from the administration
 rather than taking into consideration the needs and desires of entities within the region of
 potential oil shale development. Not a single entity among the 14 Cooperating
 Agencies prefers Alternative 2(b) as the Preferred Alternative, and more than half of
 them {8} preferred Alternative 1, the No Action Alternative. Choosing a Preferred
 Alternative that is inconsistent with the consensus of all 14 of the Cooperating Agencies,
 and diametrically opposed to the preference of the majority (8 of 14) of the Cooperating
 Agencies appears to be in conflict with the requirements of 40 CFR 150 1.6(a)(2) which
 states that the lead agency (BLM) shall "Use the environmental analysis and proposals of
 cooperating agencies with jurisdiction by law or special expertise, to the maximum extent
 possible consistent with its responsibility as lead agency". Putting forth a Recommended
 Alternative that has zero support among the Cooperating Agencies does not constitute
 using the proposals of the Cooperating Agencies to the maximum extent possible. #9]>

<([#10 [10.6.3] PEIS Citation: Vol 1, Pg 2-76, Sec 2.4.4, line 12 Preferred Alternative
 Topic: National Energy Security
 Comment: Another reason BLM should re-evaluate its decision to select Alternative 2(b) as the
 Preferred Alternative has to do with National Energy Security. BLM is charged to be the
 steward of much of our nation's Federal property, and those properties are to be
 managed for multiple uses. Yet, in the case of oil shale-containing lands, developing the
 mineral and energy resources of the single most concentrated hydrocarbon resource on
 the planet is taking the lowest priority among an idealistic Focus on environmental
 protection at a time when the economy is struggling, and our nation depends on external
 sources to supply more than half of our oil demand. In the mean time, we export

approximately a half a trillion tax payer dollars a year to purchase oil that could be otherwise invested here in the United States. There is an extensive array of existing environmental regulatory programs in the US that are more than adequate to effectively manage, mitigate and restore the impacts of oil shale production activities. The selection of Alternative 2(b) does not appear to reflect the DECLARATION OF POLICY stated in the Energy Policy Act of 2005 that states that the “United States oil shale, tar sands, and other unconventional Fuels are strategically important domestic resources that should be developed to reduce the growing dependence of the United States on politically and economically unstable sources of foreign imports”.

#10])>

<([#11 [2.2] PEIS Citation: Vol 1, Pg 2-76, Sec 2.4.4, line 12 Preferred Alternative Topic: Regulatory Uncertainty

Comment: Another reason BLM should re-evaluate its decision to select Alternative 2(b) as the Preferred Alternative has to do with regulatory uncertainty. Alternative 2(b) has reduced the acreage potentially available for oil shale and tar sands development by nearly 77%, and in Colorado, where the richest and most abundant oil shale exists, the acreage potentially available for oil shale development has been reduced by nearly 90%. Additionally, the acreage in Colorado now deemed suitable for oil shale development is so significantly dispersed and discontinuous, especially outside the area of the existing RD&D leases, that the opportunity for a company to put together a viable operation is nearly non-existent. To have such wide variability in national oil shale policy is a significant disincentive to companies that have invested many millions of dollars into oil shale research and development, as well as other companies that are considering such investment. **#11])>**

<([#12 [10.5] PEIS Citation: Vol 1, Pg 2-82, Sec 2.5.12, line 7 Topic: Establishment of Trust Funds

Comment: In saying that socioeconomic impact mitigation through establishment of a trust fund should be left to site specific NEPA analyses of specific projects, BLM is failing to recognize and address the most significant socioeconomic impact associated with oil shale development. The issue is not site- or project-specific because it is so tied to the cumulative impacts of the developing industry. The issue is the disparity between when socioeconomic impacts will occur (primarily during project construction and start-up phases) versus when the revenue stream of royalty payments begins many years later. A legal/legislative mechanism needs to be devised to facilitate a flow of money on the front end to mitigate the impacts when they occur, tied to a credit against future royalty payments for the amount paid early on for impact mitigation. **#12])>**

<([#13 [10.5] PEIS Citation: Vol2, Pg 4-165, Sec 4.12, Line 10 Topic: Socioeconomics

Comment: In general, the PEIS fails to provide an assessment of both the potential negative and positive potential socioeconomic impacts of oil shale development. It should be better recognized that the opportunity for revenue distribution grows proportionally with the scale of the industry. For example, a 12.5% royalty on production of 1,000,000 barrels

per day of oil at \$100 per barrel would nominally generate \$12,500,000 dollars in royalties {subject to standard deductions) each and every day, or \$4.56 billion per year. In addition to that would be state severance taxes, property tax, federal and state income tax, and sales tax and other fees that would all go toward making an enormous amount of revenue distribution that contribute to the positive impacts that such a level of development would provide. Other positive impacts and benefits resulting from oil shale development include economic expansion and diversification, long-term, well-paying employment opportunities, educational/ academic growth and skill development opportunities, and the positive effects that revenue distribution will have on public sector infrastructure enhancement. #13]>

<([#14 [6.2.1] PEIS Citation: Vol 2, Pg 4-165, Sec 4. 12, Footnote 13

Topic: Presumption of supplemental energy sources

Comment: A scenario where the primacy: energy supply comes from new gas-fired power, and not coal-fired power, should be built into the PEIS as a likely option. Footnote 13 on page 4-165, and elsewhere, presumes that coal-fired power plants will be used to provide electrical power to oil shale developers. The PEIS fails to consider the likelihood that 1) natural gas fired power will almost certainly be preferential to coal because of the abundance of natural gas in the region, 2) CO2 emissions of gas fired power are nearly half that of coal, and 3) that gas-fired power plants are faster and less expensive to build. There is also the high likelihood that the natural gas produced by some oil shale operators will be directly used to generate electricity and thus reduce demand off the grid. The PEIS also fails to consider that local power supplies might also be supplemented by wind power that is abundantly available in the region north of the Piceance Basin.

The comments set forth below are intended to supplement, augment and correct the oral comments which Raymond L. Ridge provided during the Scoping Meeting of April 26, 2011 (1st session) at the Little America Hotel in Salt Lake City, UT and our comments dated May 12, 2011, a copy of which, together with Exhibit Volumes I-V, is attached hereto and incorporated herein by this reference as though newly submitted herewith. The undersigned demands that such materials be addressed as fully as any other comments now being submitted in response to the Draft Programmatic EIS bearing a date of January 2012 ("Draft PEIS").

Introduction

<([#1 [1.5] Bureau of Land Management ("BLM") Land Use Policy has historically permitted multiple uses, provided those uses were not mutually incompatible. This policy is enshrined in the Federal Land Policy and Management Act of 1976 ("FLPMA").

The Draft PEIS is fundamentally flawed as it seeks not to protect the environment, but rather to kill the nascent oil shale industry by withdrawing lands requisite to attracting the capital needed to develop the

industry. It was “born” from a contrived settlement agreement between Secretary Salazar and plaintiff environmental organizations, including The Wilderness Society, dated February 15, 2011, Civil Action No. 09-cv-0009-JLK. It was contrived, because both Secretary Salazar and The Wilderness Society were aware of the technology subject of U.S. Patent 7,807,049, issued to the undersigned, dated October 5, 2010, described as “Method and Apparatus For Recovering Oil From Oil Shale *Without Environmental Impacts.*” Secretary Salazar was informed by letter dated December 14, 2010 from the undersigned. It is a fraud on the Federal Court dependent on the contrived Draft PEIS for its full implementation! This fraudulent intent is corroborated by the decision of Secretary Salazar to persist in extending the withdrawal of the Naval Oil Shale Reserves Nos. 1 & 3 (56,238 acres) as detailed in the Draft PEIS on Page 2-31, lines 29-32. Secretary Salazar’s position contravenes the clear intent of Congress when it authorized the transfer of those Naval Reserves from the Department of Energy’s Office of Naval Petroleum and Oil Shale Reserves to the Department of the Interior! If acting in “good faith” Secretary Salazar should have sought clarification from Congress to the extent any question regarding “Congressional intent” really exists.

It would appear that the environmentalist plaintiffs felt their chances for a favorable resolution lay with Secretary Ken Salazar and his sympathies towards environmentalists who had funded his election campaigns as a Senator, and the perception that he is “ beholden ” to them for delivering the “Colorado Vote” for President Obama in 2008, rather than risk a Federal court likely to honor the most recent evidence of Congressional Intent set forth in Section 369 of the Energy Policy Act of 2005, also known as the “Oil Shale, Tar Sands, and Other Strategic Unconventional Fuels Act of 2005” (the “Act”). It would be more difficult for a Court to set aside a voluminous rework of a Programmatic Environmental Impact Statement than that embodied in the 2008 PEIS. The Draft PEIS of 2012 is a continuing perpetration of that fraud, and involves the complicity of every employee of the BLM advancing the withdrawal of oil shale lands on the pretext of environmental protection.

The Settlement and the Draft PEIS are an affront to Procedural Due Process protected by the U.S.

Constitution, as it is intended to achieve by the appearance of propriety that which would not have been

sanctioned by the Federal Court. As such it smacks of denying the nascent industry a full hearing on the

merits, especially as it abuses the Power of Definition. It ignores traditional principles of “fair play and

substantial justice”, and seeks to control the outcome of court decisions under the guise of an open and

fair review of the 2008 PEIS. And, it borders on being “treasonous”, as it intends to deprive our Nation

of a 1.5 Trillion barrel resource of hydrocarbons in oil shale capable of providing energy independence and

strategic national security. America does not have just 2% of the world’s oil reserves, as the 1.5 Trillion

barrels represents a reserve equal to or in excess of all the oil the world has produced to date.

Indeed, the

link between our food chain and fossil fuels that provide transportation fuels would break without the

transportation fuels needed to maintain high farm productivity. Peak Oil is a reality, and famine could result

from diminished access to transportation fuels.

#1])>

Abuse of the “Power of Definition”

<([#2 [9.1] The Draft PEIS abuses the “power of definition” in the following particulars:

1. “Need” for a New PEIS. The only attempt to define the “need” for a new PEIS is contained in the last sentence of the second paragraph of the introductory letter signed by Michael D. Nedd which states, “*The purpose and need for the proposed planning action is to reassess the appropriate mix of allowable uses with respect to oil shale ... leasing and potential development.*” The “need” is neither explained nor defined; nor does it reference the Settlement Agreement! As such, it abuses the power of definition by failing to explain the attempt to reexamine land use policy without any intervening expression of Congressional Intent, environmental studies, nor technological improvements or degradations that would otherwise prompt a reexamination.

#2])>

<([#3 [9.2.2] 2. Assumption that Oil Shale Technology is “Experimental”. “*In the present experimental stage of the oil shale . . . industr[y] ... , the BLM believes that the stages of NEPA compliance will be different from those used in oil and gas.*” [Page ES-5, second full paragraph]. This statement is made in derogation of the express intention of Congress quoted on page 1-3 of the Introduction citing paragraphs (d) and (e) of the Act to the effect that the Secretary shall:

“ ... Complete a programmatic environmental impact statement for a commercial leasing program for oil shale ... on public lands ... “

“ ... Not later than 6 months after completion of the programmatic environmental impact statement . . . the Secretary shall publish a final regulation establishing such [commercial/easing] program.”

Secretary Salazar is illegally conducting this review of the 2008 PEIS in violation Congressional intent that commercial leasing should have commenced six months after the completion of the 2008 PEIS!

The only thing industry has been exploring as “experimental” are approaches to solve the environmental conundrum, e.g. “in-situ”, i.e. “Out-of-Sight/Out-of-Mind”. Oil shale processing has been proven to be “commercial” in Brazil, Estonia and China. In Brazil, for example, Petrobras has been producing continuously since 1972 using a Paraho retort from 7% grade vs. the 13% grade generally available in Colorado and Utah. The only thing which has prevented those processes from being implemented in the U.S. has been the challenges they present to do no harm to the environment.

6.3.1] 3. Improper Assumptions About Technologies. *“Underground mines with surface retorts*

are assumed to be commercial implementations of the OSEC RD&D technology (see Appendix A, Section A.5.3.4) “. Section A.5.3.4 of the Draft PEIS is outdated using information from 2007!! Since 2007, OSEC abandoned the ATP Taciuk rotary kiln (which is that cited in the Draft PEIS) in favor of Petrobras’ Petrosix vertical kiln; and then even later sold out the RD&D Lease to Enefit American Oil, a subsidiary of Enefit, an Estonian company, that has processed oil shale for decades using vertical retorts designed by Russian engineers. Enefit has not identified the method it proposes to use in the U.S., but has stated only that it is experimenting with U.S. oil shale.

The thing which makes this approach so egregious is that the ATP Taciuk rotary kiln was never proven in Australia (as asserted by the BLM); in fact it was so damaging to the environment in Australia that it threatened the very existence of the Great Barrier Reef and was shut down at the insistence of GreenPeace. Subsequently, in 2008, Australia imposed a 20-year moratorium on oil shale development precisely because of the perceived environmental problems caused by the ATP Taciuk rotary kiln technology.

In brief, the BLM has assumed the use of a technology already proven to be an environmental nightmare. In doing so, it has intentionally selected the most environmentally challenged method of oil shale production as the “model” for use in the Draft PEIS. Further, no rotary kiln technology will ever work in oil shale production and still be environmentally clean. The undersigned has been advised by Reaction Engineering International, experts in rotary kilns, that rotary kilns are at least 45% less efficient in transferring heat from “gas-to-particle” than a vertical kiln. Thus, every rotary kiln configuration using recycling gases must produce 45% more heat and carbon dioxide to heat the same amount of oil shale feed stock as a vertical retort. No rotary kiln can ever

be environmentally preferred!

#4])>

<([#5 [6.3.1] 4. Exclusion from the Draft PEIS of Consideration of Clean Technologies. How can one

assess the need to withdraw BLM lands from leasing if one excludes by definition technologies proven to be commercial, and which have been improved to not impact BLM lands adversely? [See the last paragraph on page 1-13 of the Draft PEIS which definitionally excludes consideration of “*renewable energy resources, clean technologies and conventional oil and gas activities.*] And, more importantly perhaps, **there is no provision for opening or re-opening BLM lands to environmentally clean technologies!** The BLM has excluded my environmentally clean technology from consideration even though it would not impact BLM lands adversely! Moreover, absent Congressional action, Secretary Salazar is imposing a predicate requirement to Commercial Leases in the form of RD&D Leases, which violates the Congressional Intent to proceed to commercial leasing as soon as possible.

The only impact on BLM lands using my technology and concepts would be the use of underground mining and transport of resource material via elevated conveyor belts (across BLM lands) and rail (in already existing transportation corridors) to an environmentally expendable site for processing, i.e. a site where nothing grows and no Sage Grouse live.

Underground mining would employ continuous mining machines, which have been developed in conjunction with the Colorado School of Mines for oil shale mining, and are readily available from Joy Mining Machinery and Caterpillar. Such machines have been available since at least 2004, as they were demonstrated at the Mining Convention in Las Vegas. See Appendix I attached hereto and incorporated herein by this reference. Such machines are capable of extracting 10,000 tons/day in two eight hour shifts, with the third shift allocated to maintenance and repair. Thus, BLM assertions that underground mining must be conducted using blasting and mucking procedures is ill informed and erroneous.

Above-ground conveyors are used extensively in the mining industry, as depicted on Appendix II attached hereto and incorporated herein by this reference. Such conveyors are no more intrusive on wilderness lands and wildlife than ski lifts, electrical transmission lines, and pipelines (both underground and above ground), all of which are currently accessing BLM lands overlying oil shale deposits to support other kinds of energy production, e.g. shale gas and shale oil drilling.

#5])>

<([#6 [6.3] 5. Exclusion from Draft PEIS of Impacts from Other Energy Activities. The BLM is

allowing access to the same lands it seeks to exclude from oil shale activity for the purpose of shale gas and shale oil drilling. Those activities are far more destructive of the surface than would be underground mining and conveyor belt transport. See Appendix III attached hereto and incorporated herein by this reference, which portrays the surface destruction of shale gas drilling at Anvil Points, CO, the same site where the Bureau of Mines first demonstrated oil shale processing and extraction in 1948. If the Draft PEIS subject of this current inquiry were merely a re-evaluation of the 2008 PEIS, it would be appropriate to

compare contemplated oil shale activity and its potential impacts against the damage already being imposed on the same lands by shale gas drilling and related activities.

#6])>

<([#7 [6.3] 6. **Assumption that Processing Must Occur on BLM Lands.** There is an underlying assumption that all oil shale processing will be performed on BLM lands, rather than on distant environmentally expendable lands. This imposes unnecessary requirements on remediating spent shale and water. Spent shale can be processed into ancillary products, and water can be purified using Plasma Whirl plasma gasification. See Appendix IV attached. #7])>

<([#8 [9.6] 7. **Ignoring Congressional Mandate for “Commercial Leasing”.** The BLM has effectively asserted in the Draft PEIS that the Congressional mandate to permit “commercial leases” **must** be frustrated by first requiring an applicant to obtain an “RD&D Lease”, i.e. Preferred Alternative 2. It makes no sense for an applicant seeking to use a proven technology employed in Brazil, for example, to waste funds on an RD&D Lease and pilot plant; especially when it proposes processing the oil shale and spent shale on environmentally expendable lands using technology which solves the environmental conundrum. #8])>

<([#9 [9.3] 8. Alternative 2 (the Preferred Alternative): Changing the Fundamental Purpose and Use of the 2008 PEIS. Alternative 2 of the Draft PEIS deviates from Congressional intent in that it interposes and imposes on industry a requirement that a lease applicant spend monies to demonstrate its technology on an RD& D Lease, and reduces the acreage available as determined in the 2008 PEIS.

The 2008 PEIS was intended to provide a “benchmark” for industry against which cleanliness would be measured and compared in the future, so that industry would not have to be burdened with extensive, costly and time-consuming environmental studies on each project. The BLM asserts in this Draft PEIS of 2012 that the NEPA process will be mandated for each future project, thus starting anew, for each project, an EPA assessment under the National Environmental Policy Act of 1969. This violates Congress’ intent as expressed in the Act. #9])>

<([#10 [1.5] The BLM fails to explain in ES.7 on page ES-9 the reason and authority for its deviation from Congress’ intent! #10])>

Conclusion

<([#11 [2.1.1] The BLM should not deprive the Nation of this \$150 Trillion asset and the jobs and revenues it can generate for the Nation and the U.S. Treasury, especially when it can be achieved without damage to the environment!

The BLM can avoid further litigation by adopting Alternative 1, as the environmentalist plaintiffs have no continuing right to pursue litigation, having agreed to terminate the Case in

return
for the BLM conducting a review of the 2008 PEIS.

If the final PEIS adopts any alternative other than Alternative 1, these issues will yet be finally adjudicated in a Federal Court, and will include individual defendants, both in government and from the environmental community; especially if no provision is made for environmentally clean technologies to access those lands.

The lands themselves need not be withdrawn to protect the environment! The lands can still be protected using stringent environmental standards!

Re: Comments on Draft Oil Shale and Tar Sands Resources Programmatic EIS

Dear Reviewers:

Thank you for the opportunity to review and provide comment on the Draft Programmatic Environmental Impact Statement and Possible Land Use Plan Amendments for Allocation of Oil

Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah, and Wyoming (DPEIS). This analysis and clear statements about the limitations of existing technologies mark an important and fundamental shift from the oil shale and tar sands PEIS that the Bureau of Land Management (BLM) adopted in 2008.

<([#1 [2.3.1] Our interest in this DPEIS stems from the fact that we represent individuals who live in close

proximity to the areas identified for oil shale and tar sands leasing, many who recreate on these lands, and many others who are concerned about the fate of their public lands. Based on the BLM's analysis in the DPEIS, commercial development of oil shale or tar sands would irreparably harm local lives and livelihoods. Development would also compromise a wide range of environmental values, including clean air, clean water, climate, recreation, water supply, and wildlife habitat.

Our organizations continue to strongly oppose opening any federal lands for oil shale and tar sands development. As we have stated numerous times over the past four years, research must precede any consideration of commercial leasing, and any commercial leasing, should technologies be developed, must protect our land, air, water, wildlife, communities and economies.

We are encouraged that the BLM, through this review, is taking clear and measured steps to restore order to the federal oil shale and tar sands policy. While Alternative 2(b) is a step in the right direction, we continue to believe that no lands should be allocated for commercial development until completion of research, including but not limited to federal research, design and demonstration (RD&D) leases, and an analysis of the impacts. For that reason, we urge the BLM to adopt Alternative 3 in the Final PEIS. If, following completion of research activities the BLM concludes that lands should be open to application for commercial development, the BLM can then amend resource management plans and make land available.

By placing off-limits areas containing important environmental and ecological values, and by requiring companies to first prove their technologies and evaluate the impacts to communities, human health and the environment, Alternative 3 helps ensure that any commercial development is initiated following a full understanding and evaluation of the impacts. The 2008 PEIS not only excluded such guarantees, but it facilitated research and commercial development as concurrent paths.

#1)> <([#2 [9.3] Additionally, as a matter of law, we concur with the BLM's many statements that the agency

does not have enough information to conduct a thorough National Environmental Policy Act (NEPA) 1 analysis, including a cumulative impacts analysis. As stated in the document "The current experimental state of the oil shale and tar sands industries does not allow this PEIS to include sufficient specific information or cumulative impact analyses to support future leasing decision within these allocated lands."² A cumulative impacts analysis is a cornerstone of NEPA analyses. ³ By identifying the limitations in this DPEIS and stating that additional NEPA analyses must address this deficiency, including the identification and enforcement of mitigation measures, the BLM is helping to ensure that future analyses take the broad look mandated by NEPA.

1 40 C.F.R. § 1500.1(b), §§ 1508.25, 1508.7, 1508.8.

2 Draft Programmatic Environmental Impact Statement and Possible Land Use Plan Amendments for Allocation of

Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah, and Wyoming, (hereafter DPEIS), at 1-2.

340 C.F.R. § 1500.1 (b), §§ 1508.25, 1508.7, 1508.8.

#2) **<([#3** [9.3] Finally, as the preferred alternative, Alternative 2(b) rests on the proposition that the BLM, in the

Final PEIS, can define the protocols and parameters the agency will use in determining whether technologies are appropriate for commercial development. Should the BLM adopt Alternative 2(b) in the Final PEIS, those protections would then take on greater importance in ensuring any development protects these lands, airsheds, water systems, wildlife, economies, and a host of other interests.

In our comments below, we outline those parameters and tie the information needs to protection strategies. As we note in our recommendations, we are seeking to align federal policy across different energy sources. First, consistent with the terms specified in the second round oil shale RD&D lease terms, the final oil shale and tar sands PEIS and subsequent NEPA analyses must include, in addition to standard environmental analyses, a quantifiable analysis of the water and energy demands, water quality impacts, air impacts, greenhouse gas emissions, and greater sagegrouse

protections. **#3)** **<([#4** [9] In addition, we believe the requirements described in the Supplement to the

draft Solar PEIS for variance applications provides a template for moving forward those applications with the least direct impacts, and a similar process should be considered for other energy sources.

#4) **<([#5** [6.3] As the BLM reviews these and other comments and make final decisions, it is imperative to

remember that we have time. As Jeremy Boak, director of the industry-funded Center for Oil Shale Technology and Research at the Colorado School of Mines, stated in November 2011, “It isn’t obvious to me yet that we need to be putting a bunch of commercial leases out there because

no one has a commercial process yet. .. I don’t see anybody eager to go out and lease land now when they’re still running experiments.”⁴

⁴ E&E News, November 18, 2011.

#5) **<([#6** [10.6.1] We also have time to ensure that any oil shale and tar sands leasing does not undermine or

otherwise detract from the Secretary’s commitment to use public lands to support renewable energy projects. Building a new energy economy is central to the long-term economic, social and environmental health of our nation. We need to focus our resources on supporting energy efficiency and renewable energy sources that are known to protect the environment against the impact from climate change, and are economically sound. Those twin goals must remain our priority, and any consideration of oil shale and tar sands must be secondary to those goals.

#6) Respectfully submitted,

Erik Molvar

<([#7 [9.7] I. Overview - Restoring order to a failed oil shale policy

The current federal oil shale policy is deeply flawed. While the issuance of federal research leases is part of the federal policy, the policy does not require that any research be completed prior to companies securing access to more than 2 million acres of public land. Nevertheless, as the 2008 PEIS and commercial leasing regulations acknowledge, the picture is not so rosy and there remain important questions about the ability of industry to create oil from oil shale and to do so in an environmentally-protective manner. Tar sands development raises similar questions and concerns.

This DPEIS takes those concerns one step further by linking them with a more reasoned policy, one that ensures research be completed prior to any consideration of commercial leasing. #7])>

<([#8 [2.3.1] The

cleanest means to accomplish that goal is by adopting Alternative 3. Under that alternative, the first and second rounds of research, design and demonstration (RD&D) leases would be completed, and then if it made sense to open lands to oil shale leasing, the BLM could then make available lands for commercial leasing on a Resource Management Plan basis.

This alternative, we believe, addresses the concerns Secretary Salazar stated in February 2011 in announcing that the BLM would take a fresh look at the 2008 PEIS,

For more than a century, and through many busts, we in the West have been trying to unlock oil shale resources to help power our country If we are to succeed this time, we must continue to encourage RD&D, determine whether the technologies would be viable on a commercial scale, and find a way to develop the resources in a way that protects water supplies in the arid West. With commercial oil shale technologies still years away, now is the time to ensure that our rules and plans reflect the latest information and will deliver a fair return to the American taxpayer.

Towards this end, we are encouraged by the following statements in the DPEIS:

The current experimental state of the oil shale and tar sands industries does not allow this PEIS to include sufficient specific information or cumulative impact analyses to support future leasing decisions within these allocated lands. 5

In contrast, the present experimental state of the oil shale and tar sands industries does not allow this PEIS for land use plan amendments to include sufficient site-specific information or cumulative impact analysis to support issuance of a lease. 6

The BLM's approach is designed to ensure that oil shale technologies can operate at

economic and environmentally acceptable levels before the agency authorizes full-scale commercial leasing on public lands. 7

These and other similar statements in the DPEIS are important as they establish, as both a matter of law and policy, that due to the nascent state of the technology, the BLM will not at this time make available lands for commercial leasing. The 2008 PEIS likewise recognized the BLM's limitations in analyzing the technologies and related impacts, but nevertheless opened lands to application for both oil shale and tar sands development. This change in policy is warranted and, we believe, is required under both the National Environmental Policy Act and Federal Land Policy Management Act.

5 DPEIS, at 1-2.

6 DPEIS, at 1-6.

7 DPEIS, at 2-1. #8)>

<([#9 [9.7] II. The Legal Framework for the PEIS

In 2008 the BLM understood that due to the nascent state of both oil shale and tar sands technologies, the agency lacked the necessary information to meet Congress' directive in the Energy Policy Act of 2005 to develop a PEIS that could support commercial leasing. As the agency acknowledged,

The BLM originally intended the PEIS to support the amendment of land use plans to allocate areas open to commercial leasing and development of oil shale and tar sands, as well as to support the issuance of such leases. However, in consultation with the cooperating agencies, it was determined that the analysis to support immediate leasing decisions would require making speculative assumptions regarding potential, unproven technologies, and, consequently, the decision to offer specific parcels for lease was dropped from consideration in the PEIS.

Nevertheless, the BLM amended 12 land use plans and made available for leasing more than 2 million acres of oil shale and tar sands lands.

In 2012, the BLM faces the same challenge. The technologies are no more advanced than they were in 2008. Land use decisions and supporting NEPA analyses made without the benefit of research will continue to suffer from the same fundamental flaws the BLM encountered when it issued the FPEIS. This time, though, the BLM is taking a far different tack in the proposed alternative - requiring companies to complete their research and evaluate its impacts prior to securing a commercial lease. In doing so, the BLM will, at least theoretically, secure good, current, independently-verifiable data to support land use decisions before large tracts of public land are committed to development.

8 FPEIS, at ES-3 (emphasis added).

#9)>

<([#10 [9.3] Nevertheless, due to these challenges, this NEPA analysis is deficient. For that reason, it

remains imperative that the Final PEIS maintain the many provisions that provide the BLM cannot meet its NEPA responsibilities, and identify the timing and scope of subsequent analyses. As discussed below, due to the nascent state of the technology and the corresponding limitations of this DPEIS, subsequent NEPA analyses should include either another PEIS or require lessees to conduct environmental impact statements. Environmental assessments at the leasing stage would not sufficiently address the legal and other deficiencies contained in this DPEIS.

#10)> <([#11 [4.1] A. The National Environmental Policy Act- Cumulative Impacts Analysis

One critical change from the 2008 PEIS is the agency's admission that it does not have sufficient information to conduct a cumulative impacts analysis, one of the cornerstones of the National Environmental Policy Act⁹ (NEPA). We applaud the frankness regarding the way the DPEIS addresses this requirement.

As stated early in the DPEIS, "The current experimental state of the oil shale and tar sands industries does not allow this PEIS to include sufficient specific information or cumulative impact analyses to support future leasing decisions within these allocated lands."¹⁰ Additionally, as expressed in Chapter 6,

analysis of the cumulative effects in this PEIS will be qualitative to reflect the limited and highly speculative character of the information available, and the limited nature of the decision to be made on the basis of this PEIS. At the leasing decision and at the decision to approve a plan of development, more specific cumulative effects analyses would be appropriate, and such analysis would be able to be completed, because specific technical and environmental information for those analyses should be available. ¹¹

Finally,

This section describes, in a preliminary way, the possible cumulative impacts of potential commercial oil shale development that could occur over the next 20 years. More specific information regarding impacts, including cumulative impacts, would be provided by the analysis conducted at any future leasing stage and at the review of any project-specific plan of development. ¹²

As the BLM is aware, NEP A requires federal agencies to prepare a detailed statement on the environmental impacts of a proposed "major federal action" and all of the reasonable alternatives thereto before authorizing any such action. ¹³ An agency proposal for major federal action exists for NEP A purposes "at that the stage ... when an agency subject to [NEP A] has a goal and is actively preparing to make a decision on one or more alternative means of accomplishing that goal and the effects can be meaningfully evaluated." ¹⁴ NEPA's purpose is to promote efforts "which will prevent or eliminate damage to the environment", ¹⁵ to inform the public of environmental consequence ¹⁶ and to "help public officials ... take actions that protect, restore, and enhance the environment." ¹⁷

Under NEPA, the PEIS must analyze "connected", "cumulative", and "similar" actions and three types of impacts. ¹⁸ Cumulative and connected impacts assessments help assure that FLPMA's requirements regarding no degradation to the environment are met. Courts have held that there are situations where an agency must consider several related actions in a single NEP A document.

The U.S. Court of Appeals for the Fifth Circuit held that in a cumulative impact analysis, an agency should consider "(1) past and present actions without regard to whether they themselves triggered NEPA responsibilities and (2) future actions that are 'reasonably foreseeable,' even if they are not yet proposals and may never trigger NEPA-review requirements."¹⁹ The court noted that the applicable law "does not limit the inquiry to the cumulative impacts that can be expected from proposed projects; rather, the inquiry also extends to the effects that can be anticipated from "reasonably foreseeable future actions."²⁰

Similarly, the U.S. Court of Appeals for the Ninth Circuit has specifically required analysis of activities on both public and private land, since both may impact federal resources; the court also found cumulative impacts analysis insufficient where it did not include foreseeable projects in the same geographical region. ²¹ Identifying these impacts is vital to the decision-making process

s

as the “primary purpose” of the PEIS is to “insure that the policies and goals defined in [NEP A] are infused into the ongoing programs and actions of the Federal Government. “22 Given that the BLM must delay until the leasing stage a full and complete cumulative impacts analysis, the Final PEIS must include two important provisions, both of which are discussed below:

1. Define the scope of the subsequent NEP A analysis, including the scope of the cumulative impacts analysis.
2. Define mitigation actions.

#11)> <([#12 [9.3] B. Define the scope of subsequent NEPA

A landscape level analysis of proposed commercial oil shale and tar sands development must evaluate the distribution of resources and supporting facilities across the affected states. This analysis is a critical component of any NEP A analysis, and the BLM must use the Final PEIS to define the scope of subsequent analyses.

Comments: 2012 Draft Oil Shale and Tar Sands PEIS

Western Resource Advocates, *et al.*

Some items that the agency should require lessees to evaluate include in subsequent NEP A include:

1. Energy infrastructure and refining projects that would be developed. The increased infrastructure and the clustering of projects to access and service the oil shale and tar sands leasing areas is likely to have a cumulatively significant effect on the resources in the area. Support facilities such as coal-fired electric power plants or other electricity sources must be analyzed for their impacts upon the lands, communities, and resources.
2. Mainline and branch power lines that would be needed to run oil shale facilities.
3. Emissions of greenhouse gases from these power plants or their contributions to global warming.
4. Oil shale and tar sands development would require substantial new construction of regional and feeder pipelines and expansion of existing refineries to transport and process the kerogen and bitumen. These connected systems and their impacts must be analyzed. Other impacts and actions that should be addressed in a cumulative fashion include, but are not

limited to:

1. Road construction,
2. Activities leading to soil and vegetation disturbance,
3. Activities leading to changed habitat structure,
4. Activities leading to habitat fragmentation, and
5. Activities causing air or water pollution.

Similarly, given that cumulative actions are actions that, incrementally, have significant impacts, even if the individual impacts are minor, the Final PEIS should state that subsequent cumulative impacts must include projects already approved under each resource management plan. First among many are oil and gas development.

#12])> <([#13 [5] C. Define mitigation actions

At the most fundamental level, NEP A is intended to help public officials make decisions that are based on an understanding of environmental consequences, and to take actions that protect, restore, and enhance the environment. 23 Federal agencies are required, to the fullest extent possible, to use all practicable means consistent with the requirements of NEP A to ‘restore and enhance the quality of the human environment and avoid or minimize any possible adverse effects of their actions upon the quality of the human environment.’²⁴ A key element in meeting this mandate is developing and implementing mitigation measures.

As the BLM acknowledges in the DPEIS, “NEPA analysis and other appropriate review would also be required before approval of a lease and subsequent plan of development on a lease, which would include analysis of particular activities at the specific location where development would occur. Appropriate stipulations and mitigation measures would be identified as part of both of these subsequent NEPA analyses.”²⁵

Council on Environmental Quality (CEQ) regulations define mitigation as:

1. A voiding the impact altogether by not taking a certain action or parts of an action.
2. Minimizing impacts by limiting the degree or magnitude of the action and its implementation.
3. Rectifying the impact by repairing, rehabilitating, or restoring the affected environment.
4. Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action.
5. Compensating for the impact by replacing or providing substitute resources or environments. ²⁶

[n addition to these long-standing regulations, in January 2011, CEQ issued new mitigation guidance. ²⁷ The guidance stresses the importance of mitigation in the alternatives analysis, in project design, and in other contexts. This guidance clearly provides that mitigation measures be “explicitly described as ongoing commitments and should specify measurable performance standards and adequate mechanisms for implementation, monitoring, and reporting.”²⁸ A key element of determining mitigation effectiveness is establishing baseline resource conditions. In general, the guidance directs agencies to:

1. commit to mitigation in decision documents when they have based environmental analysis upon such mitigation;
2. monitor the implementation and effectiveness of mitigation commitments;
3. make information on mitigation monitoring available to the public; and
4. remedy ineffective mitigation when the Federal action is not yet complete.

The DPEIS attempts to define mitigation measures. However, due to nascent state of the

technology, subsequent NEP A must define mitigation measures a lessee would take. Those measures must be tied to the technology developed, and other contemporary land use activities.

28 Id. **#13]**>

<([#14 [2.3.1] III. Defining Stipulations and Reporting Requirements in Alternative 2(b)

As discussed throughout these comments, we strongly encourage the BLM to adopt Alternative 3 in the Final PEIS. We continue to believe that no lands should be allocated for commercial development until completion of research, including but not limited to federal research, design and demonstration (RD&D) leases, and an analysis of the impacts. For that reason, we urge the BLM to adopt Alternative 3 in the Final PEIS. If, following completion of research activities the BLM concludes that lands should be open to application for commercial development, the BLM can then amend resource management plans and make land available.

By placing off-limits areas containing important environmental and ecological values, and by requiring companies to first prove their technologies and evaluate the impacts to communities, human health and the environment, Alternative 3 helps ensure that any commercial development is initiated following a full understanding and evaluation of the impacts. The 2008 PEIS not only excluded such guarantees, but it facilitated research and commercial development as concurrent paths.

#14)]> **<([#15 [9.7] We do not support the fact that Alternative 2 would open more than 462,000 acres to research**

and development. Nonetheless, should the lands be open for this purpose, we agree with the premise of 2(b) to limit activities to research pending proof of viable technologies and a clear understanding of the impacts is both logical and necessary. As the BLM makes clear, this approach would require companies to secure answers to key questions prior to any consideration of commercial leasing, while avoiding what the BLM terms a few companies tying “up large areas with speculative commercial leases.”²⁹

As provided in the DPEIS “as the Draft PEIS was being developed, the idea for this alternative emerged. It is presented here in brief. This alternative is not noted elsewhere in the document but will be developed further in preparation of the Final PEIS.”³⁰ The following helps define those terms and conditions that give rise to Alternative 2(b) or any Alternative that the BLM adopt that first requires companies to complete research before accessing any land for commercial development.

The issues and ideas offered below recognize that in the nearly four years since the BLM issued the 2008 PEIS and Record of Decision (ROD), technology development has produced little new data. Companies have not yet developed any commercially-viable technologies, have not reported on their air and water emissions, have not provided data regarding their water demands, plus a host of other issues and concerns. They not even shown what products they will produce or where any manufacturing, including upgrading, might occur.

Yet since the PEIS was issued in 2008, there is now good data regarding water challenges Colorado and Utah will face over the next 40 years, and important (and troubling) data regarding air quality impacts resulting from fossil fuel development. (These issues are discussed below.)

In that period the BLM has also taken steps to increase renewable energy and oil/gas development on some of the same areas proposed for oil shale and tar sands development. Taken together, it is imperative that the Final PEIS state in clear and unambiguous terms what companies will need to provide and what protections they will need to ensure before any consideration of commercial leasing. As noted in the cover letter, a good model the BLM should look to in defining Alternative 2(b), or any chosen Alternative that allows applicants to move forward with commercial-scale leases, is the October 2011 Supplement to the Draft Programmatic Environmental Impact Statement for Solar Development in Six Southwestern States (Solar SDPEIS), and how the BLM addresses variance applications.

Consistent with the terms specified in the second round oil shale RD&D lease terms, the oil shale and tar sands Final PEIS and subsequent NEP A analyses should require that in addition to standard environmental analyses, there be a quantifiable analysis of the water and energy demands, water quality impacts, air impacts, greenhouse emissions, and greater sage-grouse protections. Additionally, by requiring companies to report on this data, not only will the BLM secure the necessary data, but it will place federal oil shale RD&D lessees and non-RD&D lessees on equal footing.

One of the inconsistencies in federal oil shale policy is that RD&D lessees have a greater burden of proof than companies not holding an RD&D lease (“non-lessees”) that their technology is viable on a commercial scale. RD&D lessees must prove they can produce commercial quantities, but non-lessees do not. The Final PEIS should also require all potential lessees to provide quantifiable data showing they are technically and financially capable of producing commercial quantities, as well as data regarding the full suite of environmental impacts. Only then would all potential lessees be able to provide with any accuracy and detail the impacts identified below.

29 DPEIS, at 2-35.

30 /d.

#15])> <([#16 [9.2.6] [3.4.1] [3.7.1.2] More specifically, in defining Alternative 2(b), or any chosen Alternative, the BLM should

include in the Final PEIS language that addresses the following. Under these terms, approval of any commercial leases would only be granted upon an adequate and acceptable analysis of those impacts, and clear and detailed plans for mitigating such impacts.

Water demands - impacts to other water interests: Mandate that following completion of research activities lessees provide:

- a. An analysis of the impacts of utilizing water for oil shale on efforts to meet municipal & industrial, agricultural, and other water demands.
- b. An analysis of the economic and socio-cultural impacts of utilizing water for oil shale on communities, agricultural, recreation, and other water demands.
- c. An accounting of water demands and water rights, including:
 - i. Specifying how much water all facets of an operation would require
 - ii. Identifying the sources of all water
 - iii. Identifying the impacts of surface diversions on existing users, including junior users
- d. An analysis of the impact on USFWS’ efforts to protect four endangered species - the Colorado pikeminnow, the humpback chub, the bonytail, and the razorback sucker including

on the 15 Mile Reach in Colorado and the Green River below its confluence with the White River.

#16])> <([#17 [9.2.6] [6.2] More specifically, in defining Alternative 2(b), or any chosen Alternative, the BLM should

include in the Final PEIS language that addresses the following. Under these terms, approval of any commercial leases would only be granted upon an adequate and acceptable analysis of those impacts, and clear and detailed plans for mitigating such impacts.

Energy demands: Mandate that, following completion of research activities, lessees provide the following information as a condition of further development:

- a. Identify all sources of energy needed to support and power development.
- b. Evaluate the impact of such energy development and use on water availability, water quality, air quality, endangered species, wildlife, and other resources.

#17])> <([#18 [9.2.6] [3.4.1] More specifically, in defining Alternative 2(b), or any chosen Alternative, the BLM should

Air quality: Mandate that, following completion of research activities, lessees provide the following information as a condition of further development:

- a. Document that the proposed project will not result in further exceedances of NAAQS.
- b. Provide a full analysis of the direct, indirect, and cumulative impacts of energy development on ambient PM_{2.5}, PM₁₀, NO_x, SO₂, ozone, and HAP concentrations, including necessary mitigation measures.
- c. Provide a full analysis of the impacts to air quality from the cumulative impacts of oil shale and tar sands development with oil and gas development.

#19])> <([#20 [9.2.6] [3.10.2] [3.10.4] More specifically, in defining Alternative 2(b), or any chosen Alternative, the BLM should

include in the Final PEIS language that addresses the following. Under these terms, approval of any commercial leases would only be granted upon an adequate and acceptable analysis of those impacts, and clear and detailed plans for mitigating such impacts.

Socio-economic impacts: Mandate that, following completion of research activities lessees provide the following information as a condition of further development:

- a. Estimate the true costs associated with oil shale and tar sands development to private landowners, recreation, agriculture, and other viable industries at the time of the lease sale.

b. Identify the increased public service and infrastructure costs associated with oil shale and tar sands development, and specify in detail how negative impacts would be mitigated.

#20)> <(**#21** [3.5.1.3] [9.2.6] More specifically, in defining Alternative 2(b), or any chosen Alternative, the BLM should

include in the Final PEIS language that addresses the following. Under these terms, approval of any commercial leases would only be granted upon an adequate and acceptable analysis of those impacts, and clear and detailed plans for mitigating such impacts.

Greenhouse gas emissions: Mandate that, following completion of research activities, lessees provide the following information as a condition of further development:

a. Document the greenhouse gas emissions from all phases of the project, including energy demands, construction of lease sites, production of fuel, and combustion of fuel ultimately produced. This analysis must include incremental contributions from individual projects.

b. Show compliance with applicable federal and state policies and standards.

More specifically, in defining Alternative 2(b), or any chosen Alternative, the BLM should include in the Final PEIS language that addresses the following. Under these terms, approval of any commercial leases would only be granted upon an adequate and acceptable analysis of those impacts, and clear and detailed plans for mitigating such impacts.

#21)> <(**#22** [9.2.4] [9.2.6] [3.7.4.8] Greater Sage Grouse: Mandate that, following completion of research activities, lessees

provide the following information as a condition of further development:

a. Document that development would protect core and priority sage-grouse areas, as defined at the point of a lease sale.

b. Document there would be no net decline in habitat or species viability, while furthering DOI's goal of maintaining or enhancing the health of sage-grouse populations.

c. Establish that proposed activities would comply with all applicable federal agency sage grouse policies, as well as state policies or standards.

d. Analyze the cumulative impacts to grouse conservation of the proposed project, and other current and reasonably foreseeable projects or activities that could adversely affect populations.

#22)> <(**#23** [9] In addition to the requirements stated above, in defining Alternative 2(b), or the Alternative

selected, the Final PEIS must:

1. Include language providing that the BLM can, in appropriate circumstances, rely on the broad discretion it has under FLPMA to deny commercial oil shale lease and tar sands nominations without completing the NEPA process.

#23)> <(**#24** [9] [3.1.1] In addition to the requirements stated above, in defining Alternative 2(b), or the Alternative

selected, the Final PEIS must: 2. Include language requiring the BLM to coordinate with the National Park Service to

ensure that development will not negatively impact the resources and values of units of the National Park System and other special status areas under NPS and/or BLM administration. This analysis would include potential air quality degradation of class 1 air sheds. See Attachment 11 for impacts to Park Service units from commercial development.

#24)> <(**#25** [9.2.4] [1.4] [3.7.4.8] In addition to the requirements stated above, in defining

Alternative 2(b), or the Alternative selected, the Final PEIS must: 3. Include a provision requiring the BLM to coordinate with the USFWS to evaluate the impacts of development on sage grouse areas of concern. #25)>

<([#26 [3.4.1] IV. Water Availability

Water resources in the West are scarce and are under increasing pressure from development. In Colorado and Utah, water will be largely, if not completely, spoken for by 2050, the time line the BLM projects industry could develop large-scale oil shale or tar sands operations. Any discussion and evaluation of water availability and water consumption projections for oil shale and tar sands- no matter how great or little- must be viewed in the context of states' water availability projections, including both current and future demand.

The State of Utah and Government Accountability Office (GAO) have spoken to the challenge. Utah, the nation's second driest state, concluded in its 2011 10-year energy study:

Limited quantities of water may be available for new energy development. Most areas of the state are closed to new surface- and ground-water appropriations (especially new consumptive appropriations) and those that are still open are primarily for ground water in relatively small quantities. What little may be currently available will undoubtedly decline over the next decade. Water currently used at other facilities or by other water users may be purchased for use in energy development in the future Given Utah's population growth and projected economic growth over the next decade, the possibility of increased drought, and with limited new water resources available, water consumption of energy resources should be given careful consideration As an arid state, an energy portfolio that encourages low water-use technologies should be considered. 31

Like the State of Utah, the GAO has also raised concern. The GAO's October 2010 report on oil shale and water, "Energy-Water Nexus: A Better and Coordinated Understanding of Water Resources Could Help Mitigate the Impacts of Potential Oil Shale Development," 32 concluded

that oil shale would likely require 4-to-5 barrels of water for every barrel of oil produced from shale, higher than the BLM's projections in the DPEIS.33

Moreover the GAO offered this important cautionary note:

Water is likely to be available for the initial development of an oil shale industry, but the size of an industry in Colorado or Utah may eventually be limited by water availability. Water limitations may arise from increases in water demand from municipal and industrial users, the potential of reduced water supplies from a warming climate, fulfilling obligations under interstate water compacts, and the need to provide additional water to protect threatened and endangered fishes. 34

The GAO also offered the following:

The unproven nature of oil shale technologies and choices in how to generate the power necessary to develop this resource cast a shadow of uncertainty over how much water is needed to sustain a commercially viable oil shale industry These nascent efforts do not adequately define current baseline conditions for water resources in the Piceance and Uintah Basins, nor have they begun to model the important interaction of groundwater and surface water in the region. 35

Utah and Colorado understand the challenge industry would face and the impacts development would bring. The State of Utah projects that due to an increasing population statewide municipal and industrial (M&I) water demand would increase from 904,000 AF/yr in 1995, to 1,951,000

AF/yr in 2050, a 115% increase. 36 With conservation, the state hopes to reduce the 2050 demand, but none of these plans account for potential oil shale or tar sands development. 37 In Colorado, the December 2010 Statewide Water Supply Initiative (SWSI) study projected that by 2050, after taking into account conservation, statewide M&I demand will increase by somewhere between 538,000 AF/yr and 812,000 AF/yr (55-83%) over 2008 baseline demand. 38 M&I does not include water for oil shale or thermoelectric power production, or any water for oil shale, including water for electricity/energy production, will come in addition to statewide M&I demands. To meet these growing M&I demands- demands that are principally driven by an increasing population - large quantities of water currently used for agriculture would likely be diverted to M&I uses.

As the State of Utah and the State of Colorado's projections make clear, even without water for oil shale or tar sands, by 2050 the states will face enormous challenges in meeting demand for this increasingly scarce resource. Any water for oil shale or tar sands must therefore be analyzed in the context of competing water needs, as oil shale and tar sands development would have broad impacts on water availability.

Climate change increases the challenges states will face. As the DPEIS makes clear, by 2050, water in the Colorado River Basin could be reduced by 6-20%. 39 Such reductions would further stress existing resources, compounding the problems posed by large development projects such as oil shale and tar sands.

The DPEIS recognizes the importance of water, and makes clear that water requirements for commercial development could be substantial. It also projects how much water might be available for oil shale or tar sands development, and the impacts of using large quantities of water on existing demand and future uses. Based on those projections, the DPEIS cautions in Tables 3.4.1-2 and 3.4.1-3 and the corresponding text that demand in the Upper Basin could exceed what is legally available to the states. This conclusion is striking. It is reason alone why research must be completed and the impacts analyzed prior to any consideration of commercial leasing.

Knowing that water could be a limiting factor, companies are working hard to reduce their water demand. Since the release of the PEIS in 2008, companies pursuing oil shale and tar sands development have claimed that they are reducing the amount of water that would be needed to produce oil. None of these claims appear to be supported by independently-verifiable data, and claims made to the media, on websites, and in power point presentations have consistently been devoid of facts or data.

39 DPEIS, at 4-36 through 4-37.

#26) > <(**#27** [3.4.5] A. Opportunities to improve the PEIS

In Utah, water availability in the DPETS is projected through 2050. The data needs to be cross referenced against the state's data included in "Utah's M&I Conservation Plan." 40 That report, which was published in July 2003, provides more recent information than the BLM used in the DPEIS.

#27) > <(**#28** [3.4.1] Similarly, the Colorado data (section 3.4.1.4, "Water Use" relies on old data, the 2004 SWSI

study. That report was replaced by the 2010 SWSI study. 1 One of the primary differences between the two reports is that the 2004 report includes projections through 2035, while the 2010 report includes projections through 2050. Importantly, the 2010 report also uses updated population projections and per capita water use rates, both vital data points when projecting water availability.

<http://www.water.utah.gov/M&I/Plan7-14-03.pdf>

41 State of Colorado 2050 Municipal & Industrial Water Use Projections, July 2010, report prepared by Camp

Dresser & Mckee, Inc. and Harvey Economics for Colorado Water Conservation Board, [b.tto://cwcbweblink.state.co.us/webtink/0/doc/144800/Electronic.aspx?searchid=c1469548-e589-49df-a54f-6b03612a38e3](http://cwcbweblink.state.co.us/webtink/0/doc/144800/Electronic.aspx?searchid=c1469548-e589-49df-a54f-6b03612a38e3)

#28) > <(**#29** [3.4.1] Another area where the PEIS can be improved is expanding the analysis of the impacts of using

water for oil shale and tar sands on allocations and obligations under the Colorado River Compact. One of the great uncertainties and thus risks water managers face concerns water availability under the Colorado River Compact. The great unknown is how much water remains available for development, and the risk states face that large scale oil shale and tar sands development would result in a call under the Compact.

To help answer these and other related questions, the Bureau of Reclamation initiated an evaluation to "define current and future imbalances in water supply and demand in the Colorado River Basin and the adjacent areas of the Basin States that receive Colorado River water for approximately the next 50 years, and will develop and analyze adaptation and mitigation strategies to resolve those imbalances. 42 That study will likely show that even without largescale oil shale and tar sands production, demands outstrip supply by millions of acre-feet. The Colorado Water Conservation Board is also in the early stages of a study focused on

identifying how much water the state of Colorado may have left to develop under the Colorado River Compact- their “compact compliance study.” Information from these analyses and any subsequent analyses must be examined in all subsequent NEP A reviews that the BLM requires or undertakes as part of the oil shale and tar sands research and leasing program.

42 <http://www.usbr.gov/lc/region/programs/crbstudy.html> #29]>

<([#30 [3.7.1.2] Further compounding the challenge companies would face in developing oil shale and tar sands

is ensuring development does not undermine protections provided under the Upper Colorado River Endangered Fishes Recovery Implementation Program. However, as the DPEIS makes clear, those protections could be weakened:

The Upper Colorado River Endangered Fishes Recovery Implementation Program considers any water depletions from the upper Colorado River Basin, which includes the watersheds of the Green River and the White River, an adverse effect on endangered Colorado River fishes that requires consultation and mitigation. Water depletions for individual projects could be quite large and represent a significant adverse impact on these riverine fish. 43

43 DPEIS, at 4-122.

#30]> <([#31 [3.10.4] Additionally, in Colorado alone, water-related activities inject into the economy between \$7

billion and \$8 billion, and employ 85,000 people.44 Non-consumptive uses are fundamental to these industries. It is thus imperative that subsequent NEP A analyses evaluate the impact diverting water for oil shale and tar sands development would have on these industries.

#31]> <([#32 [3.4.1] [3.7.1.2] Finally, one other issue that should be included in any subsequent NEP A analysis is the impact

of storing water for oil shale and tar sands development. Much if not most of the water required by development would need to be stored in reservoirs. Big :flows only happen in the Spring, yet industry would need water all year round. The impacts of storage projects, required to sustain oil shale and tar sands operations on endangered fish species, healthy river flows, plus a host of other concerns must be evaluates as part of any proposed project.

44 <http://cwcb.state.co.us/environment/oon-consumptive-needs/Pages/main.aspx>

#32]> <([#33 [3.4.1] [9.2.6] B. Alternative 2(b) Data Needs -- Impacts on other uses

The Final PEIS must require potential lessees to provide quantifiable data on the impact development would have on water demands and uses. This data is vital in ensuring oil shale and tar sands’ impacts are understood and fully analyzed prior to the issuance of any commercial leases. As noted in Section III of these comments, in defining Alternative 2(b), or any Alternative selected for the Final PEIS, the BLM has an opportunity to require all potential lessees to detail the amount of water a given development project would require and the impacts on other users.

There are a number of unanswered questions that must be addressed before considering commercial development. For these reasons, it is imperative that the Alternative selected in the Final PEIS mandate that following completion of research activities lessees provide the following information:

A. An analysis of the impacts of utilizing water for oil shale on efforts to meet municipal & industrial, agricultural, and other water demands.

B. An analysis of the economic and socio-cultural impacts of utilizing water for oil shale on communities, agricultural, recreation, and other water demands.

C. An accounting of water demands and water rights, including:

i. Specifying how much water all facets of an operation would require

ii. Identifying the sources of all water

iii. Identifying the impacts of surface diversions on existing users, including junior users

D. An analysis of the impact on USFWS' efforts to protect four endangered species- the Colorado pikeminnow, the humpback chub, the bonytail, and the razorback sucker including on the 15 Mile Reach in Colorado and the Green River below its confluence with the White River.

#33])> <([#34 [3.5.4] V. Air Quality

The PEIS does not fully analyze air quality impacts, but the analysis contained therein raises serious concern. The quality of air resources in western Colorado, eastern Utah and outwestern Wyoming is quickly degrading due to ongoing oil and gas development. Oil shale and tar sands development would further impact regional air quality. With that, human health and environmental health would be further compromised. Economies that depend on clear air would also suffer. Protecting air quality alone is cause for the BLM to adopt Alternative 3 as the preferred alternative.

Accordingly, before considering any development of these deposits, the BLM must be up front with the public and fully disclose the potential impacts to human health and the environment from this significant source of SO₂, NO_x, PM, CO and CO₂ emissions. Prior to any further leasing activity, the BLM must complete an assessment of the impact of the emissions from the power generation for development and determine adequate mitigation measures that demonstrate compliance with all of the NAAQS (including SO₂, PM, NO₂ and ozone) and the PSD increments and that prevent visibility degradation and acidification of lakes in affected areas.

#34])> <([#35 [9.3] The following comments rely on those submitted by Megan Williams and incorporated herein

(see Attachment 1).

A. The BLM must conduct a comprehensive air quality analysis and consider the impact of development on existing air quality concerns in the study areas

The DPEIS does not contain an air quality impact analysis, but instead, as discussed above, defers the analysis to address emerging technologies and site-specific conditions. Deferring this analysis undermines NEPA requirements. As Williams notes in Attachment 1,

Under NEPA, the BLM has obligations to assess and report the near-field, far-field and cumulative impacts of expected emissions in the various development areas on the National Ambient Air Quality Standards (NAAQS), prevention of significant deterioration (PSD) increments, and air quality related values (AQRVs) and to identify alternatives or other mitigation measures sufficient to prevent expected violations of NAAQS, PSD increments and adverse impacts on AQRVs (e.g., visibility impairment). (40 C.F.R. §§ 1502.14(a), (f), 40 C.F.R. § 1502.16(h) and 40 C.F.R. § 1508.27(b)(10)).

As Williams also discusses, "The Federal Land Policy and Management Act (FLPMA) mandates that, "[i]n the development and revision of land use plans, the Secretary shall ... (8) provide for compliance with applicable pollution control laws, including State and Federal air, water, noise, or other pollution standards or implementation plans ... " (43 U.S.C. § 1712(c)(8))."

Compliance with these requirements is central to preventing unnecessary or undue degradation

of public lands and the environment. That analysis cannot be done in a vacuum. Given existing air quality concerns on oil shale and tar sands lands, the BLM's analysis in this PEIS and in future NEPA analyses must bring together air impacts from oil shale and tar sands development with oil and gas development and other uses that degrade air quality. An analysis that fails to do so is a violation of NEPA.

#35])> <([#36 [3.5.4] 1. Ozone concentrations are high and final particulates are also a concern. Wintertime ozone pollution resulting from oil and gas development is an increasing problem, and would overlap with oil shale and tar sands areas. Essentially, there is no room for growth in emissions that contribute to these harmful levels of ozone pollution in the region—namely, NO_x and VOC. Yet, the BLM is proposing with both research and commercial development to allow increased NO_x emissions and VOC emissions.

Oil shale and tar sands development produce both NO_x and VOC emissions (e.g., from coal-fired

power plants that supply electricity for in-situ processes, from drilling engines, compressor engines, diesel generators, heaters, boilers, mining equipment and from solvent extraction plants as well as from flares, storage tanks and retort processes, etc.). Without completing a dispersion modeling analysis, it is difficult to gauge the resultant impacts research and development would bring on regional air quality. As Williams makes clear any increase in emissions of ozone precursors will exacerbate the negative health effects of ozone in the region and is almost certain to cause significant health-based impacts.” To protect human health and comply with ozone standards, the BLM must ensure that ozone concentrations in the region do not increase further. A NEPA analysis must rigorously analyze increased pollution and its impacts on regional air quality and the health of nearby residents.

Moreover, as Williams notes,

In addition to ozone, ambient concentrations of particulate matter—both fine particles (PM_{2.5}) and coarse particles (PM₁₀)—in the potential lease areas in Colorado, Utah and Wyoming indicate high concentrations and cannot be characterized as having relatively low concentrations compared with the NAAQS, as suggested. In these areas, background concentrations of PM_{2.5}, PM₁₀ and ozone are already at or exceed the NAAQS and leave virtually no room for additional growth in emissions.

The areas that would be opened for research and then development under Alternative 2(b) already experience ambient concentrations that exceed, or are close to exceeding, the level of the short-term PM₂₅ NAAQS. The BLM cannot therefore promote development without demonstrating quantitatively that development would not cause or contribute to violations of the NAAQS. As Williams notes, major sources of fine particles from oil shale and tar sands development would include but are not limited to:

../ products of combustion (e.g., coal-fired power plants used to generate electricity for in-situ oil shale development, on-site drilling engines, boilers, diesel generators, heaters and compressors used during oil shale extraction and retort)

../ fugitive dust from travel on unpaved roads and from construction activities

../ fugitive dust emissions from in-situ oil shale development.

../ spent tar sands from solvent extraction plants, and

../ fugitive dust from mining operations (e.g., the mine pit, storage piles, crushing operations, etc.). **#36])>**

<([#37 [3.5.4] 2. Visibility in several Class I and Class II areas is already impacted

As Williams makes clear, “Several recent modeling analyses performed by the BLM for

projectspecific

EISs, Environmental Assessments (EA) and RMPs in the study areas indicate that visibility in several Class I areas and sensitive Class II areas is threatened by ongoing development.” Further, as the 2007 RD&D EAs make clear, the combined effect of the five RD&D sites in Colorado with Exxon Mobil’s Piceance Development Project will result in significant adverse effects on visibility at the Flat Tops Wilderness Area Class I area. 45 Thus, the potential air quality impacts of the oil shale RD&D sites are already quite significant.

Additional development would further impact air quality. In Colorado, Utah and Wyoming, the BLM has concluded that oil and gas development would further impact Class I air-sheds.⁴⁶ The near-field modeling performed for the draft EGL (now AMSO) oil shale RD&D EA showed that the project alone would directly cause violations of the 24-hour average Class II PM_w and SO₂ increments.⁴⁷ For the final EA, the BLM revised the emissions inventory and modeling such that there are no longer predicted violations of these PSD increments. However, the modeling done for the final RD&D BAs still shows that the EGL project consumes nearly all of the 24-hour Class II PM₁₀ and SO₂ increment and that the Chevron RD&D site also consumes nearly all of the available Class II 24-hour PM₁₀ increment. 48

Similarly, the recent Gasco DEIS did not include a comprehensive increment consumption analysis, however, even without such an analysis the BLM’s modeling shows that Gasco project sources alone consume almost 287% of the available Class II 24-hour PM₁₀ increment. 49 The Class II 24-hour PM₁₀ increment will, therefore, also likely be exceeded when considering all other increment affecting sources in the area that impact the same area impacted by the Gasco development area.

As Williams explains, in Wyoming, the maximum modeled in-field pollutant concentrations for the Supplemental EIS for the Pinedale Anticline Oil and Gas Exploration and Development Project indicate that Pinedale Anticline project sources will result in pollutant impacts greater than the PSD Class II increment for NO₂ of 25 ~g/m³ (annual average), greater than the PSD Class II increment for PM₁₀ of 30 ~g/m³ (24-hour) and greater than (be PSD Class II increments for PM_{2.5} of 9 ~g/m³ (24-hour) and 4 f.lg/m³ (annual). 50 Similarly, the Jonah Infill Development

Project EIS showed that project sources will result in pollutant impacts greater than the PSD Class II increment for PM₁₀ (24-hour) and greater than the PSD Class II increments for PM_{2.5} (24-hour and annual). 51

#37] > **[#38** [3.5.3] [6.2.] B. The BLM must address the impacts associated with electricity requirements to

power production activities

As the BLM concluded in 2008, this DPEIS assumes that the electricity for in-situ oil shale development would come from coal-fired power plants. As the BLM noted in the DPEIS, ‘Other types of electrical generation might be used, including natural gas, synthetic natural gas, nuclear, and renewable energy, but for the purposes of this PEIS, coal is assumed to be the fuel to avoid underestimating the impacts.’ 52

As provided in the DPEIS, based on conversations with industry representatives and others, the BLM reduced the in-situ oil shale production level estimates from 200,000 barrels/day (as provided in the 2008 PEIS) to 50,000 barrels/day. 53 The electricity requirements were also reduced by a factor of four to 600 MW of additional electrical generating capacity. The electricity needs to support this level of development are equivalent to 15% of the generation from the electric power industry (from coal) in 2010 in Colorado and Utah and 12% in 2010 in Wyoming. 54

In Table 6.1.6-3, the BLM presents assumed emission rates for coal-fired power plants and states that “power plants are assumed to operate at a 60% efficiency.” As Williams explains, The BLM does not indicate what type of efficiency this represents (i.e., gross thermal efficiency, net thermal efficiency or something else entirely) but it cannot possibly represent either gross or net thermal efficiency of the assumed plant- modern IGCC (Integrated Gasification Combined Cycle) and supercritical pulverized coal units can only achieve net thermal efficiencies in the high 30s to low 40 percent range. 55

Even assuming the 600 MW of additional power will come from plants with not-yet-seen-today efficiencies of 60% the emissions from these plants, based on the BLM's assumed emission rates in Table 6.1.6-3, will be significant.

The BLM must acknowledge the full suite of emissions that would result from the increased need for electrical power generation to support in-situ oil shale production, even at the RD&D level. It is quite possible that the region simply cannot withstand, without adverse effects, the significant increases in emissions that would result from increased power needs.

#38]> <(**#39** [3.5.4] C. Alternative 2(b)- Data Needs

As discussed above and throughout these comments, the BLM's analysis falls short of meeting its NEPA and FLPMA requirements. The agency, for instance, has not analyzed whether the proposed oil shale and tar sands RD&D activity allowed under the RMP revisions will comply with the NAAQS and will prevent significant deterioration (PSD) of air quality, as required by the Clean Air Act (CAA). The BLM must complete an analysis to determine compliance with the NAAQS and also to determine how much of the incremental amount of air pollution allowed in clean air areas (i.e. , PSD increment) has already been consumed in the affected areas and how much additional increment consumption will occur due to the proposed RD&D program.

Without this analysis, the BLM cannot ensure that the air quality in the study areas will not deteriorate more than allowed under the CAA. Finally, the BLM should complete an analysis of impacts to air quality related values, including visibility, in impacted Class I and sensitive Class II areas.

#39]> <(**#40** [9.2.6] The Final PEIS must address these deficiencies. As noted above, the BLM should require

potential lessees to provide quantifiable data on the impact development would have on air quality. As noted in Section. III of these comments, in defining Alternative 2(b) or any Alternative selected for the Final PEIS, the BLM has an opportunity to require all potential lessees to detail the air quality emissions and associated impacts. This data is vital to ensuring oil shale and tar sands' impacts are understood and fully analyzed prior to the issuance of any commercial leases.

There are a number of unanswered questions that must be addressed before considering commercial development. For these reasons, it is imperative that Alternative 2(b) or the Alternative selected in the Final PEIS mandate that following completion of research activities lessees provide the following information:

- A. Documentation that the proposed project will not result in further exceedances of NAAQS.
- B. Full assessment if the direct, indirect, and cumulative impacts of energy development on ambient PM_{2.5}, PM₁₀, NO_x, SO₂, ozone, and HAP concentrations, including necessary mitigation measures.
- C. Quantification of the impacts to air quality from the cumulative impacts of oil shale and tar sands development with oil and gas development.

#40) > <([#41 [3.5.1.1] VI. Climate Change

We are encouraged by the BLM's inclusion of climate change as a serious issue that needs to be thoroughly evaluated prior to an initiation of commercial leasing. BLM's discussion in section 3.5.1.2 is a significant improvement on the agency's analysis in the 2008 PEIS where the BLM was reticent to link climatic change to human activity.

As the BLM discusses in the DPEIS, climate change has been intensely studied by the world's scientists, and broad consensus exists around its causes, magnitude, and effects. In February 2007, the IPCC declared, "[w]arming of the climate system is unequivocal," and it is "very likely ' that most of the warming since the middle of the 20th century is the result of human pollutants. Climate change is a global phenomenon with well-documented and serious local impacts. Those impacts affect both the ecosystems and the welfare of citizens not only around the world but in the United States and the nation's Western states in particular.

However, we strongly question the BLM's assertion that the impact from development might not be that great. Specifically, the DPEIS states:

GHG emissions and changes to carbon sinks would be small relative to state, regional, and global GHG emission inventories. Consequently, global or regional scale modeling may be unlikely to yield meaningful predictions of climate change impacts in relation to GHG emissions attributable to oil shale and tar sands activities alone. 6

Independent analyses have concluded that barrel-to-barrel, oil shale would produce more GHG than conventional oil. According to a report by Dr. Adam Brandt, Dr. Jeremy Boak, and Dr. Alan Burnham, 57 "without mitigation or technology improvements, full-fuel-cycle carbon dioxide (CO₂) emissions from oil shale derived liquid fuels are likely to be 25-75% higher than those from conventional liquid fuels." Dr. Brandt is a professor at Stanford University. Dr. Boak runs the Center for Oil Shale Technology and Research, an industry funded research center at the Colorado School of Mines. Dr. Burnham is the Chief Technology Officer with AMSO, one of the RD&D lessees.

As these three scientists note, emissions of CO₂ from oil shale derived fuels come from three stages: retorting of shale, upgrading and refining of raw shale oil, and combustion of the finished transportation fuels. 58 As they make clear, "emissions from these stages represent approximately

25-40%, 5-15%, and 50-65% of total fuel-cycle emissions, respectively, the most uncertain source of emissions is the retorting stage, due to variation in emissions with shale quality and retorting technology used.' Brandt, Boak, and Burnham conclude that "the primary opportunity for reducing CO₂ emissions from oil shale retorting lies in the substitution of low- or zero-carbon energy sources for high carbon sources." That means, "given the potential scale of emissions, it is clear that mitigation of CO₂ emissions from oil shale development will be needed to comply with any future CO₂ regulation." Thus oil shale upgrading and refining will unquestionably lead to significant increases in GHG emissions that BLM must account for in the Final PEIS.

<([#42 [1.5] A. Legal and policy basis for the BLM evaluating climate change

As the BLM makes clear in the DPEIS the agency is required to evaluate the impacts of its land use decisions on climate change and to take action is clear. In 2007, the Supreme Court’s decision in *Massachusetts v. EPA* 59 recognized the severity of the climate change crisis, and the EPA’s obligation to confront the problem. The Supreme Court noted “the enormity of the potential consequences associated with man-made climate change,”⁶⁰ and the contribution of carbon dioxide emissions to global warming. ⁶¹ The Supreme Court concluded, “[t]he harms associated with climate change are serious and well recognized,” ⁶² and that the federal government has a responsibility to take action to reduce it, even if such action may not completely reverse global warming or if the emission are small in comparison to global emissions. ⁶³

In connecting climate change with an agency’s NEPA responsibilities, the U.S. Court of Appeals for the Ninth Circuit has stated that, a with any relevant information, an agency must take a “hard look” at the effects of climate change in its EIS. ⁶⁴ This requirement flows in part out of the cumulative effects analysis requirements of NEPA ⁶⁵ Accordingly, the analysis is one of considering “the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions,” including the impacts of climate change. ⁶⁶ BLM is not exempt from this responsibility.

Indeed, Interior Secretary Salazar understands the great importance of Interior agencies analyzing the impacts of agency decisions on our climate. As noted in the DPEIS, Secretarial Order (S.O.) No. 3289 unequivocally mandates that all Department of the Interior agencies “analyze potential climate change impacts when undertaking long-range planning exercises, setting priorities for scientific research and investigations, developing multi-year management plans and making major decisions regarding potential use of resources under the Department’s purvi ew.”⁶⁷ The DPEIS falls squarely under this guidance and BLM must assess impacts from the proposed actions that may directly, indirectly, or cumulatively result in exacerbating climate change within this document.

Further, NEPA regulations require that NEPA documents address not only the direct effects of federal proposals, but also “reasonably foreseeable” indirect effects. These are defined as: Indirect effects, which are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable. Indirect effects may include growth inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems, including ecosystems.”⁶⁸

BLM is required to take a hard look at direct, indirect, and cumulative impacts to and from climate change in the planning area in the RMP.

#43])>

<([**#44** [3.5.1.1] The Council on Environmental Quality’s (CEQ) 2010 draft guidance on how NEPA should consider and evaluate greenhouse gas emissions and climate change is instructive. Under this draft guidance, the agency should quantify and disclose its estimate of the expected, annual direct and indirect greenhouse gas emissions. Specifically, where a proposed action is anticipated to cause direct, annual emissions of 25,000 metric tons or more of CO₂-equivalent greenhouse gas emissions, a quantitative and qualitative assessment is required together with the consideration of mitigation measures and reasonable alternatives to reduce greenhouse gas emissions.

#44])> <([**#45** [3.5.1.4] EPA has commented, in recent NEPA reviews, that an analysis of reasonable alternatives be

performed that includes an assessment of potential means to mitigate project-related greenhouse gas emissions. 72 Specifically, EPA suggested assessing carbon capture and sequestration technologies as well as measures from BLM’s Supplemental Information Report for the eight EAs in Montana, North Dakota and South Dakota. 73 These measures should be considered by BLM in alternatives developed pursuant to NEPA prior to any further development of oil shale and tar sands resources.

In addressing climate impacts, BLM must craft long-term management prescriptions without permanent impairment and unnecessary or undue degradation to the resources in the face of

climate change. S.O. 3289 states that “[t]he realities of climate change require us to change how we manage the land, water, fish and wildlife, and cultural heritage and tribal lands and resources we oversee.” Without this critical analysis BLM cannot meet its NEP A obligations or other legal and policy mandates discussed above.

[www.blm.gov/mt/st/en/prog/energy/oil and gas!leasing/leasingEA .html](http://www.blm.gov/mt/st/en/prog/energy/oil%20and%20gas/leasing/leasingEA.html)

#45])>

<([#46 [3.5.1.1] B. Defining Alternative 2(b)

As the DPEIS makes clear, the numerous uncertainties regarding development affect the BLM’s ability to catalogue and quantify with any reasonable certainty. Some of those uncertainties include, but are not limited to:

- ./ Nature of the technologies
- ./ Sources and amount of electricity to power production
- ./ Transportation needs, including types of vehicles
- ./ Carbon sequestration
- ./ Emission capturing technology
- ./ Rate of development

Despite these uncertainties, the DPEIS provides, “The maximum potential increase in cumulative GHG emissions from all potential oil shale and tar sands activities cannot be predicted with accuracy.”⁷⁴ Given these significant uncertainties, BLM cannot simply state that cumulative GHG emissions cannot be predicted and proceed with permitting development activity. BLM does not have the analytical basis to claim that future oil shale and tar sands development is unlikely to cause significant impacts to climate. Until enough information is known to be able to reasonably quantify the potential environmental impacts from further oil shale and tar sands resource development, BLM must not open up any lands for development activity. If at any point in the future, technology development progresses to the point that commercial development is viable, the BLM must conduct a comprehensive analysis of impacts prior to the issuance of any lease.

Towards this end, BLM must commit to inventory GHG emissions from future oil shale and tar sands development and to seriously investigate the alternatives available to avoid or minimize these impacts as required by 40 C.F.R. § 1502.1, 40 C.F.R. § 1502.14 and 40 C.F.R. § 1502.16. That inventory should include impacts from other phases of extraction and production-energy demands, vehicles/transportation, construction site development, refineries, and combustion of fuel-and incremental impacts from individual projects.

⁷⁴ DPEIS, at 4-59.

#46])> <([#47 [3.5.1.3] [9.2.6] Additionally, in defining Alternative 2(b), or the selected Alternative, the Final PEIS must

mandate that following completion of research activities lessees:

A. Document the greenhouse gas emissions from all phases of the project, including

energy demands, construction of lease sites, production of fuel, and combustion of fuel ultimately produced. This analysis must include incremental contributions from individual projects.

B. Show compliance with applicable federal and state policies and standards #47)> .

<([#48 [3.10.3] VII. Socio-Economic Impacts

Over the past 30 years, western economies have shifted from largely extractive industries to more diversified economies based on recreation, tourism, knowledge-based industries, and the professional and service sector. A 2004 study examining the impact of public lands on economic well-being in eleven western states found that only 3% of western counties could be classified as resource-extraction dependent. 75 There is a vast and growing body of research that indicates that

the environmental amenities provided by public lands are an important economic driver in the rural West. Given the changing nature of these economies, prioritizing oil shale and tar sands development at the expense of non-extractive economic drivers may harm the economy of the region in the long run by depleting the natural amenities currently responsible for the economic growth of western communities.

It is especially important to consider these demographic and economic shifts given the region where oil shale and tar sands development is being proposed. Since the 1982 oil shale bust, northwest Colorado has successfully transitioned from an economy dependent on extraction of natural resources to one that relies more heavily on the protection of the natural amenities. This area has developed a thriving retirement community, and has begun to market itself as a destination for outdoor recreation. In fact, many rural communities in the Rocky Mountain region are benefiting from the increase in demand for outdoor recreation, especially activities on federal public lands. The President's America Great Outdoors Initiative recognizes the social, economic and spiritual values of our public lands for recreation, 76 so in analyzing the socioeconomic

impacts of oil shale and tar sands development, the Final PEIS and subsequent NEPA must account for these benefits.

Oil shale and tar sands development threaten these economic drivers. It is imperative that the relationship between protected public lands in the area and the local economy be given a more thorough comprehensive examination across the tri-state region. A rural communities diversify their economies, the framework for making public land management decisions must also evolve. Management plans for public land need to account for all aspects of the economic and social systems of these communities, including investment and retirement income, recreation, tourism, and entrepreneurial businesses attracted to scenic locations, when evaluating alternatives.

Management plans must also consider the increasing importance of industries and economic sectors that rely on these public lands, but not necessarily on the extraction of natural resources.

As the population of the entire country grows, the presence of undeveloped lands becomes increasingly important because these lands strengthen western rural economies by meeting growing needs for clean air and water, wildlife habitat, and recreation opportunities.

76 <http://a.mericagreatoutdoors.gov/> #48])>

<([#49 [3.10.2] A. Challenges facing western communities

A 2008 report by BBC Consulting evaluating the economic impacts of oil shale development in western Colorado highlights the challenge and needs communities could face. 77 The report, which was prepared for the Associated Governments of Northwest Colorado, offers a number of startling conclusions. Two in particular bear attention.

First, concurrent oil/gas and large-scale oil shale development would cause existing towns to reach capacity. New towns would have to be built. The report also notes baseline population projections already strain most municipalities. Second, even with payments made to the cities and counties, growth-related capital costs are projected to exceed energy revenues by \$1.4 billion. The report suggests some of the revenue loss could be made up from state grants, but given the state's budget challenges and budget projections, that assumption is highly questionable. Communities in eastern Utah and southwestern Wyoming would face similar challenges.

BBC detailed the most significant challenges currently facing this region:

1. Providing roads, increased wear and tear, and congestion
2. Providing workforce housing
3. The demand for industry workers creates inflation for labor and supplies
4. Timing mismatch between upfront costs associated with developmental impacts and when local government revenues arrive
5. Geographical mismatch between costs created and the revenues generated
6. Lack of strategic partnership with the industry to address upfront industry impacts

The dichotomy of when the costs are created and the revenues are generated cannot be overstated. In their comments on the on the 2008 draft PEIS, Club 20, a group representing the 22 counties in western Colorado, noted that based on these economic considerations, "the federal government must encourage industry to make appropriate up-front investments in the infrastructure of locally-impacted communities." 8 Club 20 further noted, "We are concerned about the socio-economic impacts to the local communities. As the PEIS anticipates, rapid increases in population and immigration in parts of each region of influence could impact quality of life, in particular requiring a transition from traditional rural, to more urban lifestyles, and potentially cause large social disruption impacts."

Specifically, as Club 20 noted, "With the increasing natural gas development activity in northwestern Colorado, we are already experiencing:

1. housing shortages,
2. dramatic increases in retail and housing prices,
3. overwhelming demands on the community's social and physical infrastructure (schools, police and fire services, social services, water and sewer), and
4. a lack of available workforce to sustain each community's traditional Main Street economy."

BBC ascribes these challenges to the fact that the "four counties included in the study are located in rural Colorado and have minimal infrastructure, topographic barriers, lack housing, major road networks, and service capacity, and over 68 percent of the land in the region is public lands."

Like these four counties in western Colorado, infrastructure presents an enormous challenge for local municipalities in Utah and Wyoming. While the energy industry is creating new jobs, as BBC notes, "due to tight labor markets, they are competing with traditional industries like tourism/recreation, agriculture, and the public sector for workers and materials."

It is especially important to consider demographic and economic shifts given the location where this large-scale oil shale development is being proposed. As rural communities diversify their economies, the framework for making public land management decisions must also evolve. Management plans for public lands need to account for all aspects of the economic and social systems of these communities, including investment and retirement income, recreation, tourism, and entrepreneurial businesses attracted to scenic locations, when evaluating alternatives. Management plans must also consider the increasing importance of industries and economic sectors that rely on these public lands, but not necessarily on the extraction of natural resources. As the population of the entire country grows, the presence of undeveloped lands becomes increasingly important because these lands strengthen western rural economies by meeting growing needs for clean air and water, wildlife habitat, and recreation opportunities.

78 Club 20, Comments on 2008 Oil Shale and Tar Sands DPEIS, March 2008, at 4. (on file with the BLM)

#49) > <(**#50** [3.10.4] [3.10.2] B. Assets at stake

While oil shale and tar sands proponents extoll the potential economic value resulting from large-scale development, they often downplay or ignore the economic value development, were it feasible, would undermine.

Environmental quality, including the quality of the social and natural environments, is a critical economic asset in this region. Oil shale and tar sands development would overlap with increasing tourism, agriculture, and recreational opportunities. Older workers and retirees are drawn to the West and bring with them investment, retirement, and other non-employment income. Younger people are likewise drawn to the area because of the quality of life they find here. The recovery of Colorado's West Slope from the oil shale and energy collapse of the early 1980s, for example, rests strongly on outdoor recreation opportunities, scenic beauty, open space, small towns, and an influx of retirees.

Consider the following:

./ Substantial conversion of water rights currently used for agriculture "could have large impacts on the economy of each ROI."

./ A September 2008 report prepared for the Colorado Division of Wildlife concluded that the 2007 direct annual expenditures in Colorado from hunting and fishing alone were approximately \$1.1 billion. 79 Secondary impacts of the dollars re-spent within the economy in 2007 are estimated to be \$767 million, for a total economic impact of more than \$1.8 billion. The same study found wildlife-watching yields an additional total economic impact of \$1.2 billion annually. Wildlife plays a similarly important role in Utah and Wyoming .

./ The DPEIS identified "172,339 acres of mule deer winter habitat, 11,470 acres of mule deer summer habitat, 159,205 acres of elk winter habitat, and 11,465 acres of elk summer habitat overlap lands that would be available for oil shale leasing." 80

./ In Utah, for tar sands alone, "57,708 acres of mule deer winter habitat, 17,110 acres of mule deer summer habitat, 52,361 acres of elk winter habitat, and 17,170 acres of elk summer habitat overlap lands that would be available for tar sands leasing." 81

./ Oil shale tar sands and ancillary facility development "may fragment or destroy wildlife

habitat and affect the behavior of migratory big game species such as elk and mule deer, which form an important basis for recreational activities in many parts of each ROI.”⁸²

./ As the DPEIS provides, recreation would decline. Specifically,

- o In Colorado, oil shale would result in a loss of up to 2,830 jobs and \$36.5 million in income annually in the ROI. Additional economic impacts would be felt elsewhere.

- o In Utah, 1,552 jobs and \$12.6 million in income would be lost from oil shale and tar sands in the ROI. Additional economic impacts would be felt elsewhere.

- o In Wyoming 2,719 jobs and \$14.4 million in income would be lost. Additional economic impacts would be felt elsewhere.

Impacts from the development scenarios considered in Alternatives 1 and 4 would be significantly greater.

#50) > <(**#51** [3.10.2] [9.2.6] C. Alternative 2(b)- Data Needs

The economic impacts on communities, jobs, and existing business remain highly unclear.

Following completion of research activities, potential lessees should be required to:

A. Estimate the true costs associated with oil shale and tar sands development to private landowners, recreation, agriculture, and other viable industries at the time of the lease sale.

B. Identify the increased public service and infrastructure costs associated with oil shale and tar sands development, and specify in detail how negative impacts would be mitigated.

#51) >

<(**#52** [3.7.5.1] [9.2.4] [3.7.4.3] [3.7.4.9] [3.7.5.2] [3.7.5.3] VIII. Greater Sage-Grouse

As the BLM is acutely aware, listing the greater sage-grouse under the Endangered Species Act (ESA) is not hypothetical. The disappearance of greater sage-grouse habitat and the decline of populations indicate the need to implement effective conservation immediately. While federal land management agencies and state wildlife agencies are taking steps to conserve greater sagegrouse

populations and habitat, the species is still in decline, demonstrating that past efforts have been inadequate.

Since the 2008 PEIS was issued, the United States Fish and Wildlife Service (USFWS) determined that listing the sage-grouse as threatened or endangered rangewide is “warranted but precluded by higher priority listing actions.” As the agency cautions, “Evidence suggests that habitat fragmentation and destruction across much of the species’ range has contributed to significant population declines over the past century. If current trends persist, many local

populations may disappear in the next several decades, with the remaining fragmented population vulnerable to extinction.”⁸³ The USFWS determined that southwestern and central Wyoming and northwestern Colorado are strongholds for sage-grouse, with some of the highest estimated densities of males anywhere in the remaining range of the species. The USFWS also identified this “high-density sagebrush area as one of the highest priorities for conservation consideration as it comprises one of two remaining areas of contiguous range essential for the long-term persistence of the species.”⁸⁴

The BLM recognizes the challenge it faces in meeting energy demand and protecting the greater sage-grouse. That’s one of the reasons why the agency issued Instruction Memorandum 2012-043 “Greater Sage-Grouse Interim Management Policies and Procedures.”⁸⁵ Oil shale and tar sands development would further exacerbate the challenge, as development could occupy as much as 100% of the leasehold surface, thereby eliminating all grouse habitat on the lease, and effectively rendering adjacent habitat unsuitable and causing abandonment by sage-grouse populations due to industrial activity on the lease. Mention of this memorandum is missing from the DPEIS. This oversight should be corrected in the Final PEIS.

In addition, an excellent compilation of greater sage-grouse conservation is contained in “A Report on National Greater Sage-Grouse Conservation Measures.” This December 2011 report by the BLM’s sage-grouse National Technical Team (NTT) establishes the BLM’s objective is “to develop new or revised regulatory mechanisms, through Resource Management Plans (RMPs), to conserve and restore the greater sage-grouse and its habitat on BLM administered lands on a range-wide basis over the long term.”⁸⁶ With the NTT and the sage-grouse plan amendments, the BLM is taking steps to achieve its goal to “maintain and/or increase sagegrouse abundance and distribution by conserving, enhancing or restoring the sagebrush ecosystem upon which populations depend in cooperation with other conservation partners.”⁸⁷ The NTT further provides “Until such time as more specific conservation objectives relative to sage-grouse distribution or abundance by sage-grouse management zone, state, or population are developed, BLM will strive to maintain or increase current distribution and abundance of sagegrouse

on BLM administered lands in support of the range-wide goals.”⁸⁸

The NTT provides fairly detailed suggestions on how the BLM should identify priority sagegrouse

habitats, and recommended to achieve conservation goals, including limiting disturbance to 3% surface per square mile of the land where activities such as oil shale and tar sands would take place. Overall, effective conservation will require that the BLM designate large, contiguous tracts of prime sage-grouse habitat that are set-aside from development or protected via stringent management protections. Otherwise, the agency cannot meet its goal of maintaining and enhancing populations and habitats.

As BLM finalizes a new policy based on the NTT’s recommendations to achieve the long-term viability of the species, and the USFWS moves toward reconsideration of its warranted but precluded finding, all priority sage-grouse habitat should be placed off limits to oil shale and tar sand research and development, including adequate buffers to protect priority and core habitat on adjoining lands. (See Molvar Comment, Attachment 3.) Additionally, the BLM needs to address the extent to which adjacent lands may warrant protection because they are likely to provide important habitat in the future, as climate change results in shifting habitat types and ecosystem conditions. Adaptation is recognized as a key strategy for addressing the impacts of climate change.

Under NEP A, the BLM is required to:

1. take a hard look at sage-grouse conservation, including new information and science regarding the current biological status of the species, and
2. thoroughly analyze all direct, indirect, cumulative, and reasonably foreseeable impacts to sage-grouse habitat and populations that could also be impacted by future oil shale or tar sands development.

Additionally, consistent with the court ruling in *Western Watersheds Project v. Salazar*, 89 oil shale or tar sands proposals must fully consider cumulative impacts to sage-grouse populations and habitat, in addition to proposed leasing and development for oil shale and tar sands. Existing and reasonably foreseeable oil and gas leases, wind generation projects, and associated roads, transmission and other infrastructure from both fossil fuel and renewable energy development must be considered in a rigorous cumulative impacts analysis analyzing the total impact on sagegrouse from projects on both public and private lands in the bird's range.

#52] > <([#53 [3.7.5.1] [3.15] [3.7.4.3] [3.7.4.9] [3.7.5.3] A. Problem with Figure 6.1.2-5

We believe there is a problem with the overlay used to develop Figure 6.1.2-5. As provided in the DPEIS,

Areas including greater sage-grouse habitat and lek sites are shown in Figure 6.1.2-5.

Although greater sage-grouse core and priority habitats are excluded from oil shale development under this alternative, core and priority habitats may occur in close proximity (<1 mi [1.6 km]) to proposed lease areas. In addition, three current and historic sage-grouse leks have been identified in Wyoming in areas overlapped by the Alternative 2 lease areas in that state (Figure 6.1.2-5). Those areas for which lease stipulations have been established in existing RMPs to protect federally listed and candidate species, BLM-designated sensitive species, and other special status species would not be available for lease application under Alternative 2. 90

While it is hard to discern the specific cause of the problem, based on what the Utah organizations signing these comment have been told by the Utah State BLM Office, it appears that in the DPEIS the BLM is using the wrong layer for what they are calling priority habitat in Utah. Sage grouse priority habitat, as it is currently defined by the state of Utah, include 100% of Doherty's breeding density (occupied leks buffered out to 4 miles), plus associated winter habitat and associated breeding habitat with those leks, as delineated by the Utah Division of Wildlife Resources and recently updated (last month) on their website.

The newly-convened Utah Sage Grouse Working Group are starting the process of developing a

new age grouse plan for Utah. The maps they are using track Doherty's. Additionally, according to the state office of the BLM, going forward all land use planning and NEP A analysis

on Utah BLM lands will use this layer until the RMP amendments are completed, or until they receive the final preliminary priority habitat maps from the state.

With that layer, it appears that 10% of the areas that would be opened for oil shale under Alternative 2 overlap with sage-grouse habitat. There is about the same amount of overlap for tar sands in the Uinta Basin. (See Attachment 2.)

#53])> <([#54 [9.2.4] [3.7.4.8] B. Alternative 2(b)- Data Needs

In order for the BLM to meet its aforementioned goals, it is imperative that the agency closely scrutinize all research data and development proposals. Among other provisions, the Final PEIS should include language mandating that following completion of research activities lessees:

A. Document that development would protect core and priority sage-grouse areas, as defined at the point of a lease sale.

B. Document there would be no net decline in habitat or species viability, while furthering DOI's goal of maintaining or enhancing the health of sage-grouse populations.

90 DPEIS, at 6-82.

C. Establish that proposed activities would comply with all applicable federal agency sage grouse policies, as well as state policies or standards.

D. Analyze the cumulative impacts to grouse conservation of the proposed project, and other current and reasonably foreseeable projects or activities that could adversely affect populations.

#54])> <([#55 [3.7.5.1] [3.7.4.10] C. Additional details about the sage-grouse

As an umbrella species, the health of greater sage-grouse populations is a good indicator of overall ecosystem health for the sagebrush ecosystem. Landscape scale conservation strategies targeting the sage-grouse also benefit dozens of additional sagebrush obligate wildlife species, from pronghorns and pygmy rabbits to BLM Sensitive songbirds. 91 The maintenance of highquality

sagebrush steppe habitats, particularly nesting and wintering habitats, is necessary to maintain viable sage-grouse populations. That's why large sage-grouse core areas like South Pass and the Kinney Rim/Vermillion have been proposed for protection from future oil and gas leasing under the BLM's Wyoming sage-grouse plan amendment.

91 Mezquiza et al.

#55])> <([#56 [3.7.5.1] [3.7.4.8] Northwest Colorado has smaller greater sage-grouse numbers than Wyoming and may not retain

as many large contiguous blocks of relatively intact and unfragmented habitat as Wyoming. Accordingly, sage-grouse conservation in Colorado needs to be appropriately scaled to maximize the chances that these populations recover to healthy levels, leaving little room for error and no room for loss of important habitat in northwest Colorado.

#56])> <([#57 [3.7.5.1] [3.7.4.8] Additionally, Colorado, Utah and Wyoming sage-grouse populations are genetically connected.

Impacts from development to the populations in one state are likely to negatively influence populations in other states. As populations in Colorado and Utah are generally more compromised and at-risk than Wyoming, special care must be taken to appropriately scale conservation efforts to match with smaller populations. Corridors and genetic connections between different populations and across state lines must inform decision-making. Additional

habitat fragmentation and infrastructure impacts that further isolate populations must be avoided. #57])>

<([#58 [3.7.5.1] [3.7.4.8] To ensure viable sage-grouse populations, it is important to consider nesting, brood-rearing, and

winter habitats. Holloran and Anderson found that 64% of sage-grouse females nested within 5 km of a lek. 92 Connelly proposed comprehensive guidelines regarding the management of sagegrouse,

focused around the conservation of breeding/nesting habitat, late summer brood-rearing habitat, and wintering habitat. 93

In western Wyoming, Lyon found that sage-grouse moved an average of 1.1 km from the nest site for early brood-rearing, and late brood-rearing habitats averaged 4.8 km distant from the early brood-rearing areas. 94 In Bates Hole Holloran found that early brood rearing habitats are typified by decreased sagebrush cover and height and increased forb abundance, and movement to riparian sites occurred as uplands became desiccated. 95 In addition, as Erik Molvar, a Wyoming-based wildlife biologist and a signor to these comments explains in Attachment 3, “the availability of forage with a high nutritional content is an important factor determining brood success. Broods require forbs, insects and cover for growth, concealment and shade (Autenreith 1985).” Additionally, Molvar explains, “Mesic meadows and surface waters are focal points of sage-grouse activity during certain times of year. Mesic sites associated with springs, seeps, and streams are critical for sage-grouse on a year-long basis, and assume even greater importance as brood rearing habitat.”

As for winter habitats, non-migratory sage-grouse winter on their nesting and brood-rearing habitats, while migratory populations may travel some distance to winter on traditional wintering areas. A western Wyoming study determined sage-grouse traveled at least 35 lcm to separate wintering grounds. 96 In Colorado’s North Park, Beck found that grouse migrated 5-20 km away from breeding areas during winter. 97

Additionally, researchers appear to be unanimous in their recommendations that sage-grouse winter habitat be protected from disturbance. According to Beck and Braun, ““Areas of winter concentrations of sage-grouse need to be documented and afforded maximum protection.”98 Lyon recommended that sage-grouse wintering habitats be placed off-limits to oil and gas development. 99 Thus, in the oil shale and tar sands planning areas, the BLM needs to rapidly identify sage-grouse winter concentration areas and place the areas off-limits to surface disturbance. Since development would remove all shrubs, development clearly falls into the category of activities that should be prohibited by the BLM.

#58]> <(**#59** [3.7.5.2] [4.2] [3.7.4.6] In the PEIS the BLM must also evaluate the aggregated or cumulative effects of all industrial activities on sage-grouse populations. Strip mining for coal has been shown to impact sagegrouse populations through major local decreases in recruitment. 100 Because oil shale development either involves strip mining directly, or in the case of in situ methods a level of habitat destruction roughly equivalent to strip mining, areas near sage-grouse leks and other core and priority habitat 101 must be avoided with adequate buffers to avoid adverse impacts. Road development can also lead to lek abandonment. 102

100 Braun, C.E. 1986. Changes in sage-grouse lek counts with advent of surface coal mining. *Proc. Issues and*

Technology in the Management of Impacted Western Wildlife, Thorne Ecol. Inst. 2:227-231.

#59]> <(**#60** [3.7.4.6] [3.7.5.2] When evaluating these and other impacts, oil and gas development provide a good starting point for the BLM's analysis. As Molvar explains, over the past 10 years, oil and gas development has posed perhaps the greatest threat to sage-grouse viability. Over 8% of the total range of sagegrouse

has already been impacted by oil and gas development. in addition the Wyoming Basin and Colorado Plateau ecoregions are among those areas that have the greatest proportion of land under lease (and therefore at risk for future industrialization). In a study near Pinedale, Wyoming, sage-grouse from disturbed leks where gas development occurred within 3 km of the lek site showed lower nesting rates (and hence lower reproduction), traveled farther to food, and selected greater shrub cover than grouse from undisturbed lek . 103 Oil shale development, while having a much greater intensity of development- up to 100% landscape destruction rather than the 3-5% of a typical oil and gas field- also involves heavy vehicle traffic, human activity at the site of production, and networks of roads and potentially pipelines to support it.

101 The BLM defines "priority habitat" in Instruction Memorandum No. 2010-071.

102 Id.

#60]> <(**#61** [3.7.5.1] The best available science establishes that current BLM nest buffers for oil and gas of ~ mile for

NSO and 2 miles for seasonal stipulations have proven grossly inadequate to maintain sagegrouse

viability. The lek buffer must be based not only on maintaining the lek but also the nesting habitat that surrounds the lek. In addition, seasonal prohibitions that prohibit only construction activities near leks are pointless: If roads or wells are built near leks during the offseason,

the resulting regular vehicle traffic will have major negative impacts when the sagegrouse are present, effectively circumventing any mitigation value of delaying construction activities. We therefore recommend that the Final PEIS and RMP amendments include a 3-mile NSO and no surface disturbance/vegetation treatment buffer at minimum (5 miles would be preferable) for sage-grouse leks, winter habitat, and other vital sage-grouse habitats.

#61])> <([#62 [3.7.5.1] In summary, the BLM's sage-grouse analysis and decisions must be informed by the goal of maintaining or increasing sage-grouse abundance and distribution by conserving, enhancing or restoring the sagebrush ecosystem upon which populations depend. A broad group of stakeholders works for effective sage-grouse conservation policies that will foster the recovery of populations and habitat to avoid the need for a listing, the BLM must ensure that the oil shale and tar sands PEIS does not undermine that shared goal.

In addition to these comments, Erik Molvar's comments in Attachment 3 are included as part of these general comments and are incorporated herein. Those comments detail scientific justifications for our policy recommendations, and provide bases for additional use restrictions necessary to protect the sage-grouse.

#62])>

<([#63 [3.1.1] [2.3.1] IX. Lands with Wilderness Characteristics, ACECs, and Other Areas to be Protected

While we strongly endorse Alternative 3, we are encouraged that Alternative 2(b) would place off-limits to development both wilderness lands, including lands with wilderness characteristics, and ACECs. We also believe the preferred alternative can be strengthened.

In addition to the many areas discussed below, the BLM should protect core areas and corridors within Heart of the West Wildland Network Design from oil shale and tar sands development.

104

The Heart of the West conservation plan is a science- and GIS-based blueprint for sustainable development in the Wyoming Basins Ecoregion spanning southeast Idaho, southwest Wyoming, northwest Colorado and northeast Utah.

104 [http://www.voiceforthewild.org/Heart of the West/HeartoftheWestPlan.pdf](http://www.voiceforthewild.org/Heart%20of%20the%20West/HeartoftheWestPlan.pdf) (last accessed March 30, 2012)

#63])> <([#64 [9.2.1] [3.1.1] A. Wilderness areas and lands with wilderness characteristics

As we noted in our May 2011 scoping comments on this DPEIS, the congressional funding limitation for fiscal year 2011 limiting implementation of S.O. 3310 does not relieve the BLM from either considering wilderness as part of this PEIS, or relieve the BLM from fulfilling its statutory obligations to inventory and manage federal lands for wilderness characteristics.

FLPMA requires the BLM to "maintain on a continuing basis an inventory of all public lands and their resource and other values (including, but not limited to, outdoor recreation and scenic

values), giving priority to areas of critical environmental concern. This inventory shall be kept current so as to reflect changes in conditions and to identify new and emerging resource and other values.”¹⁰⁵ This requirement, we noted in 2011, stands despite the 2003 Norton-Leavitt settlement that rescinded the Wilderness Inventory Handbook, and the funding limitation Congress imposed prohibiting the BLM from implementing S.O. 3310 for fiscal year 2011. As the U.S. Court of Appeals for the Ninth Circuit recently held, wilderness characteristics are one of the resources of the public lands that the BLM must inventory under FLPMA, as confirmed by federal courts. As the Court stated, wilderness characteristics are among the “resource and other values” of the public lands to be inventoried under § 1711. BLM’s land use plans, which provide for the management of these resources and values, are, again, to “rely, to the extent it is available, on the inventory of the public lands, their resources, and other values.”⁴³ U.S.C. § 1712(c)(4).¹⁰⁶

In addition, the Ninth Circuit stated that it did not need to consider the legality of the 2003 Norton-Leavitt settlement, acknowledging that: “Wilderness values are among the resources which the BLM can manage under 43 U.S.C. §§ 1712 and 1732.”¹⁰⁷ In other words, BLM has ongoing obligations to fulfill FLPMA’s mandate to inventory and manage the resources of the public lands.

In addition to the agency’s legal obligations to inventory lands with wilderness characteristics, the BLM must make decisions regarding how to balance the management of resources on public lands, including wilderness-quality lands. Once the BLM identifies lands with wilderness characteristics, the agency should apply management to preserve those qualities under FLPMA and the Land Use Planning Handbook, notwithstanding the status of S.O. 3310.

For these and other reasons, we are encouraged that the DPEIS includes protections for lands with wilderness characteristics and urge BLM not to retract on these protections in the Final PEIS.

¹⁰⁵ 43 U.S.C. § 1711(a)

¹⁰⁶ Or. Natural Desert Ass’n v. BLM, 531 F.3d 1114, 1119 (9th Cir. 2008).

¹⁰⁷ Id. at 1132

#64] > <([#65 [3.1.1] B. Areas of Critical Environmental Concern (ACEC)¹⁰⁸

FLPMA defines ACECs as “areas within public lands where special management attention is required to protect and prevent irreparable damage to important historic, cultural, or scenic values, fish and wildlife resources, or other natural systems or processes, or to protect life or safety from natural hazards.”¹⁰⁹ Under FLPMA, BLM is obligated to “give priority to the designation and protection of areas of critical environmental concern.”¹⁰ As the DPEIS makes clear, BLM would not be able to prevent undue degradation to important values for which ACECs were designated should oil shale or tar sands development proceed:

Existing ACECs that are not closed to mineral development may be available for application for commercial oil shale leasing. Oil shale and transmission or pipeline development on any ACEC would result in a loss of all or a part of the resources or values for which the area was originally designated. Oil shale development within the viewshed of these areas may also result in adverse impacts on scenic values of these areas.¹¹¹

The DPEIS further provides:

ACECs that are not closed to mineral leasing include approximately 44,000 acres and are

shown in Table 6.1.1-1. Should oil shale development occur in these areas, the R&I values within these designated ACECs would be lost. 112

In the 2008 PEIS, BLM opened all ACECs to application for commercial leasing, except for lands where mineral development is not currently allowed. This commitment to protect only a portion of ACECs was insufficient. While all ACECs are designated to protect different and unique values, commercial-scale oil shale and tar sands development would undermine the values for which these ACECs were designated.

Moreover, the DPEIS, through the preferred alternative, improves upon the 2008 decision by excluding from commercial development all ACECs, including those areas under consideration for designation as ACECs under current planning processes. 11 We support those additional protections and urge their inclusion in the Final PEIS.

The BLM should go one step further by prohibiting potential development from all ACECs, even those already open for mineral development. Given the relatively small number of acres of designated ACECs that overlap prospective oil shale and tar sands development areas, all ACECs should be closed to oil shale and tar sands development. These areas where mineral development occurs, and thus oil shale and tar sands development would be allowed, contain critical values. Protecting those values, when combined with the significant impacts development would bring, are a strong reason to close all ACECs to oil shale and tar sands development in a Final PEIS.

108 In support of this discussion, please see Attachment 9, NRDC maps.

<([#66 [3.1.1] C. Wyoming: Adobe Town, ACECs, and Other Lands to be Protected

i. Adobe Town

The State of Wyoming's 2008 designation of the Adobe Town area as Very Rare or Uncommon under the state Environmental Quality Act is critical to protecting this area. We are thus encouraged that the BLM is proposing to protect Adobe Town from development in both Alternative 2(b) and Alternative 3. We strongly support this decision and urge the BLM to include such protections in the Final PEIS.

In the 2008 PEIS, only lands designated as WSA within Adobe Town were protected from commercial development. With Very Rare or Uncommon designation being finalized in 2008 following the issuance of the FPEIS, the BLM now has a strong basis for protecting this area's environmental and cultural resources. (Note: in Figure 2.3.3-3, Adobe Town is listed as "Rare and Irreplaceable Land". That should be changed to "Very Rare or Uncommon.")

Adobe Town has been called the crown jewel of the Red Desert, encompassing irreplaceable ecological, geological, historical and recreation values. At 180,910 acres, Adobe Town is Wyoming's largest and most spectacular desert wilderness. Stretching 26 miles north to south and 19 miles east to west, this area is one of the last places in Wyoming where visitors can take in views of pristine landscape that stretch from horizon to horizon. The landscape ranges from banded badlands to mazes of arches, pinnacles, and spires, offering spectacular scenic vistas and important wildlife habitat.

Adobe Town was designated “Very Rare or Uncommon” due to its geological, fossil, scenic, wildlife, and cultural/historical values. Non-coal surface mining (which would include oil shale) is expressly prohibited in Very Rare or Uncommon areas, except in cases where surface mining would not detract from such qualities. Because scenic qualities are part of the designation, there is no possibility that an exemption for oil shale mining could be issued.

In its formal designation of this area, Wyoming’s Environmental Quality Council stated, “The designation protects the area from non-surface coal mining only. The designation would prevent surface mining for oil shale and uranium, as well as gravel pit mining.” 114 While part of the Very Rare or Uncommon area is a WSA, the remainder is outside the WSA. All of Adobe Town as a state of Wyoming Very Rare and Uncommon area, not just the WSA, and should be protected from oil shale development. Further, Adobe Town geological formations, abundant fossil resources, historical and prehistoric sites and features, rare and sensitive (including crucial) wildlife habitats, and scenic values are comparable to existing national park w lits, and thus are of

national value. Left unprotected, these treasures are at risk of elimination.

The Adobe Town area should be managed on a landscape level, through a variety of management designations. By managing this area a a whole, the BLM can better protect its important and varied values. This concept i supported by the America’s Great Outdoors report, which recommends the agency incorporate landscape-scale conservation and restoration as a priority in BLM resource management plans and programs. 115

a. Adobe Town: Historical, prehistorical, and archaeological values

Adobe Town has a number of historical, prehistorical and archaeological values that meet the criteria for Very Rare or Uncommon designation. It is mentioned prominently in the journals of the Geological Exploration of the 401

h Parallel (circa 1869), and was used as a hideout for fresh

horses by Butch Cassidy and his gang during the Tipton train robbery of 1900. The area has a high density of archaeological sites dating back 12,000 years, and is still used as an important religious site by Native Americans today.

Adobe Town is mentioned prominently in the Report of the Geological Exploration of the 40th Parallel, authored by eminent geologist Clarence King in 1869. This area was identified by King as the most superlative geological landscape found along the survey route. King described the general landscapes as follows:

From twelve to fourteen miles southwest of the head of Bitter Creek are seen exposures of the soft green clays, marls, and whitish-gray ands of which the upper beds of the Bridger group are made. Passing eastward of Pine Bluffs [known today as Pine Butte], the country is covered with more or less drifting sand, which forms noticeable trains of dunes. The sand suddenly gives way to the soft Bridger beds which are intricately eroded into branching ravines [Adobe Town and Skull Rims]. This bad-land country extends southeastward to the mouth of a dry valley [Sand Creek] north of Cherokee Ridge [Powder Rim/Cherokee Rim], and from that point a chain of bluff escarpments extends northeasterly for twelve or fourteen miles. 116

Government Printing Office.

Comments: 2012 Draft Oil Shale and Tar Sands PEIS

Western Resource Advocates, eta/.

Page43

In addition to the historical noteworthiness of the Geological Exploration, Adobe Town is also unusually rich in archaeological sites. According to BLM, Significant archaeological resources are found throughout the (Adobe Town] WSA, representing continuous occupation from Paleo Indian through late Prehistoric periods, that is, for the past 12,000 years. The cultural site density of the WSA is estimated to be 30 surface sites per square mile, which is unusually high. 117

b. Adobe Town: Geological values

Adobe Town is a geological masterpiece, dominated by outcroppings of the Washakie formation, a deep bed of volcanic ash deposited 50 million years ago during the Yellowstone eruptions as airborne ash and fluvial deposits of ash interbedded with reddish sandstone that forms rimrock. In 1981, BLM described the geology of the rims as follows:

They are composed of green, gray, and red tuffaceous and arkosic sandstone and minor beds of green shale, light-gray and green tuff, gray siltstone and conglomerate. The exposed beds have created the colorful landscape the Adobe Town Area is known for. 118

These are the epitome of fragile lands, with highly erodible soils (both the tuffaceous sandstone and the stabilized sand dunes mantled with a fragile veneer of vegetation) and the towers, arches, and balanced rocks which would easily be toppled by mechanical disturbance.

Above the rims, unique geological features include desert pavement and stabilized sand dunes. The rims have been whittled by erosion into spires and pinnacles, solifluction caves (known locally as 'mud caves') large enough to walk through, natural arches, lone towers, groups of castellated pillars, window rocks, grottoes, buttes, caprocks, mushrooms hat rocks, and eroded badlands banded with pink, red, and purple tones. According to BLM, "Skull Creek Rim, in the core of the area recommended for wilderness, contains some of the most unique and extensive badlands formations in Wyoming." 119 BLM described the effect of this surreal landscape as follows:

Many of the spires take on strange life-like forms- stone sentinals (sic) frozen in time standing guard over their silent desert domain. Walking amidst groups of these strange spires gives one the eerie feeling of being watched- by beings who have witnessed the evolution of Adobe Town for millennia. 120

In addition, the paleontological resources of Adobe Town are among the finest deposits of Eocene mammals and reptiles in the world. According to BLM, "The Adobe Town area is known as one of the three most valuable sites in North America for certain types of mammalian fossils." 121 BLM further noted,

The WSA is nationally known for the educational and scientific study of paleontological resources. Fossil remains of mammals are numerous and widely distributed throughout the area. Two notable mammalian fossils found in the area are the Uintathere and Titanotheres. The Uintathere was a large mammal about the size and configuration of an African rhinoceros. The species of Titanotheres found in the WSA was a tapir-like mammal, about 40 inches in height. This area has been identified as one of the premiere sites in North America for paleontological resources. 122

c. Adobe Town: Wildlife values

Adobe Town also has a host of sensitive wildlife habitats that are crucial or vital to meeting the very rare or uncommon designation criteria. These habitats include nest sites, sage-grouse lek sites, prairie dog colonies, and big game crucial winter ranges. The cliffs and pillar found throughout Adobe Town provide ideal nesting habitat for raptors, offering numerous nesting platforms out of the reach of ground-based nest predators. Raptor nest sites, sage-grouse lek sites, and big game crucial winter ranges are exceptionally sensitive to, among other things, development as temporary disturbances can lead to nest failure or displacement of big game onto marginal ranges where they may not be able to survive.

The white-tailed prairie dog, a BLM Sensitive Species, is also recognized as a Sensitive Species by the Wyoming Game and Fish Department. There is a small white-tailed prairie dog colony observed at T 14N R97W sec. 12, SE V4, which has been active at least between 2001 and 2006. White-tailed prairie dogs were also observed in Section 13 NW Y4 of the Arne township in 2006. Active white-tailed prairie dog colonies also occur in Horseshoe Bend south of the Haystacks.¹²³

There are a number of known golden eagle nest sites, including two nest sites along the western end of The Haystacks (T16N R97W Sec. 10 NE ~and T16N R97W Sec. 15 SW 1/4), one along Haystack Wash as it leaves the rimrock area (T16N R96W Sec. 30 NW ~), and one on the lower rim (T15N R96W Sec. 18 NW ~). In the Rawlins Field Office, two golden eagle nests occur in the southern end of the WSA, with additional nests known from the Willow Creek Rim in the eastern proposed expansion unit and on outcrop to the west of Sand Creek in the southeastern part of the area.

The greater sage-grouse, another BLM Sensitive Species, is also listed as a Sensitive Species by the Wyoming Game and Fish Department. (Sage-grouse are discussed in further detail above.) There are three known sage-grouse leks- one in the southeastern proposed expansion, another north of the WSA and south of The Haystacks, and a third in the northeastern lobe of the WSA. Sage-grouse leks are the hub of nesting activity, and typically most of the hens bred at a lek nest within 3 miles of the lek site. Thus, the area around each lek also constitutes important nesting habitat.

There is a desert elk herd, known to the Wyoming Game and Fish Department as the Petition Herd, which is one of the few true desert elk herds in North America, spending the entire year in the Red Desert. This elk herd is therefore very rare. Its activities are centered on the Powder Rim.

Known prairie falcon nest sites within the proposed Very Rare or Uncommon area include one at T16N R95W Sec. 19 NW 1/4; two near Manuel Gap (T16N R97W Sec. 27 SW 1/4 and T16N R97W Sec. 28 SW 1/4); and T15N R96W Sec. 19 NE 1/4. ¹²⁴ Prairie falcons with fledgling young

were observed roosting on a pinnacle just off the Skull Creek Rim at T13N R97W during the early summer of both 2005 and 2006. Prairie falcons with fledgling young were also sighted at T15N R97W Section 19 SW 1/4 on July 9, 2006. A known prairie falcon nest also was recorded by BLM on the bluffs above Willow Creek in the eastern proposed expansion.

Several other raptors are on the BLM and Wyoming Game and Fish Department Sensitive Species List. The burrowing owl, which is a prairie dog obligate species that nests in burrows of prairie dog towns, has one known nest location in the southwestern corner of the WSA. The ferruginous hawk, the largest hawk in Wyoming, has nest sites confirmed by BLM two miles south of Manuel Gap and in the southeastern proposed expansion.

Due to the rugged and inaccessible nature of much of Adobe Town, no thorough and systematic

inventory of nesting raptors has ever been performed. For instance, there are several known nest sites of ferruginous hawks active in recent years which are not in the BLM's database, even in accessible areas. An occupied and active ferruginous hawk nest was observed by Erik Molvar and Joel Sartore on the eroded walls far below East Fork Point at T14N R96W Section 8 SWSE on May 4, 2004. In addition, an active and occupied ferruginous hawk nest was documented in the Haystacks at T17N R96W Section 33 SWSE by Liz Howell, and separately by Erik Molvar, during summer of 2005. The same nest was found to be active again in 2006 by Erik Molvar. The mountain plover is recognized as a BLM Sensitive Species and as a Sensitive Species by the Wyoming Game and Fish Department. Until recently, it was listed as Threatened under the Endangered Species Act (ESA). The Horseshoe Bend area south of the Haystacks contains vital mountain plover nesting habitat with a number of confirmed plover sightings. 125 Mountain plovers have also been sighted atop the Adobe Town Rim at T15N R98W Section 25 NE 1/4, and at the southern edge of the Adobe Town Rim.

The Great Basin gopher snake is listed as a BLM Sensitive Species. This species has been photographed along the Adobe Town Rim at T15N R97W Section 19, NW 1/4.

The Haystacks is identified by the Wyoming Game and Fish Department as crucial mule deer winter habitat. There is also a substantial amount of pronghorn crucial winter range south of Horseshoe Bend along the branches of Haystack Creek. In addition, portions of the area on the north slope of the Powder Rim are mule deer crucial winter range. 12

d. Adobe Town: Scenic values

The scenic values of Adobe Town are the most impressive of any desert landscape in Wyoming. It has long attracted the attention of writers and authors. In the 2006-2007 edition of *Wilderness* magazine, writer Allen Best characterizes Adobe Town as "a giant museum of geological curiosities." In 2004, Kerry Brophy wrote of Adobe Town in *Wyoming Wildlife* magazine as "about as lonesome and lovely a place as you're likely to find". Adobe Town is also featured in the guidebook *Wild Wyoming*, which characterized the area as "a landscape worthy of National Park status." World-renowned author Annie Proulx described Adobe Town as "The maze of badland formations, mesas, and buttes combine with brilliantly colored rock strata to create spectacular canyonland scenery."

More recently, Adobe Town has become a mecca for photographers, and photographs have been included in calendars, coffee table books such as *Wind River Wilderness* and *Red Desert:*

History

of a Place. A scenic photograph of Adobe Town appeared in the July 2005 issue of *National Geographic*. Internationally known nature photographer Tom Mangelsen noted, "Adobe Town is truly one of the crown jewels of the West, one of the signature Red Desert landscapes that cannot be allowed to fall under the blade of the bulldozer."¹²⁷ Photographer Ron Marquart described Adobe Town as follows: "Its landscape is comparable to Bryce Canyon, Canyonlands and Badlands National Parks, and represents the most intricate, outstanding badlands topography in the U.S." Adobe Town was also featured in the new book of photography published by Laguna Wilderness Press, *Wyoming's Red Desert: A Photographic Journey*.

These scenic values are also important economic values. Both must be protected.

#66])>

<([#67 [3.8.2] ii. ACECs and other areas in Wyoming

As the BLM recognizes, “Commercial oil shale development is incompatible with recreational use (e.g., hiking, biking, fishing, hunting, bird watching, OHV use, and camping). Recreational use would be excluded from areas leased for oil shale production once development activities begin.” 128 We strongly agree with this conclusion. For that reason, we are encouraged that the BLM in the preferred alternative is proposing to protect the following areas from development. We strongly support including these protections in the Final PEIS.

Further, because oil shale development includes 100 percent scarification to the land, and represents one of the most major types of visual intrusions possible on BLM lands, leasing should not allow any surface disturbance on lands of Visual Resource Management Class I, II, or III lands. The objectives for Class I and II lands are to ‘preserve’ and ‘retain’ the “existing character of the land, while Class III lands are managed to “partially retain the existing character of the land.”¹²⁹

Oil shale development cannot possibly meet these objectives. Based on the definitions for these lands, only the objectives for VRM Class IV, which “provide for management activities which require major modification of the existing character of the landscape” and permit a level of change that is “high,” are compatible with oil shale development. The BLM has recently completed a Visual Resource Inventory for portions of the Rawlins and Rock Springs Field Offices, and we recommend that this VRI be incorporated into the PEIS process for oil shale as

part of its Affected Environment analysis. Notably the Visual Resource analysis in the DPEIS for the Washakie Basin notes that this is “an area of active energy development” and that associated visual disturbances are found in the basin. This section fails to acknowledge that most of the Washakie Basin is in an undeveloped state, however, and contains some of the most outstanding scenic resources in either the Rawlins or Rock Springs Field Offices, including the Adobe Town Very Rare or Uncommon Area, the Kinney Rim citizens’ proposed wilderness areas, the Powder Rim, and the Adobe Town Dispersed Recreation Use Area. In order to maintain conformity with local RMPs pursuant to FLPMA, under the preferred alternative, the BLM should limit potential oil shale development to VRM Class IV lands.

128 DPEIS, at 4-20.

129 BLM Manual 8431 -Visual Resource Contrast Rating, Appendix 2.

#67)> <(**#68** [3.1.2] a. Little Mountain area, including Greater Red Creek ACEC, Red Creek WSA, and Sugarloaf Basin SMA

These areas were established under the Green River RMP and constitute an outstanding big game hunting resource. According to the Wyoming Game and Fish Department, the elk hunt in this area is the single most sought-after tag in the entire state. Oil shale activities would drive away elk and destroy the recreational quality of this area.

#68)> <(**#69** [3.1.1] [3.8.1] b. Adobe Town State Very Rare or Uncommon Area

As discussed above, the scenic and wilderness qualities in this area and its viewshed need to be protected from oil shale leasing in order to maintain the scenic and wilderness qualities in this area. Oil shale leasing should be precluded from this area in order to maintain FLPMA-required consistency with the state designation preventing non-coal surface mining. Portions of this area also now fall within the Adobe Town Dispersed Recreation Use Area designated under the Rawlins RMP.

#69)> <(**#70** [3.1.1] c. Adobe Town Dispersed Recreation Use Area (DRUA)

The Adobe Town DRUA was established under the Rawlins RMP, and includes not only the Very Rare or Uncommon area, but also portions of the Kinney Rim North and South citizens’ proposed wilderness areas, the western Powder Rim, and the Prehistoric Rim area to the east of Adobe Town. 130 The DRUA is of high value for dispersed and primitive recreation, including hiking, wildlife viewing, hunting, and camping. It should be excluded from oil shale leasing.

130 Record of Decision and Approved Resource Management Plan for Public Lands

Administered by the Bureau of

Land Management Rawlins Field Office, BLM, 2008, at Appendix 37, and see Maps 2-17 and 2-58.

#70)> <(**#71** [3.1.1] d. Kinney Rim North and Kinney Rim South citizens’ proposed wilderness areas

These lands provide a roadless, primitive/semi-primitive recreation experience, and represent an increasingly rare large tract of public land in the Red Desert that is free of industrial development. Parts of these now fall within the Adobe Town Dispersed Recreation Use Area designated under the Rawlins RMP.

#71)> <(**#72** [3.1.1] e. The Flaming Gorge National Recreation Area

This area lays entirely within the; area proposed for oil shale leasing in Wyoming. In the DPEIS, National Recreation Areas are not specifically listed as units of the National Landscape Conservation System that will be excluded from oil shale leasing. However, all of this NRA as

well as its viewshed should be excluded from oil shale leasing consideration in order to preserve the scenic and recreational qualities found here.

~~#72]~~ <([#73 [3.1.1] f. Jack Morrow Hills planning area

This is an area highly important for both dispersed recreation and elk hunting. It contains the Boars Tusk and White Mountains Petroglyph Site, both of which are culturally important to Native American tribes. In addition, an archaeological site in the northwest corner of this area is an ACEC and its setting needs to be protected as well. The “most prospective” oil shale area in Wyoming includes portions of the Jack Morrow Hills planning area, a subset of the Rock Springs Field Office set aside from the Green River RMP in the 1990s for special planning due to its outstanding wildlife resources and strong public interest.

~~#73]~~ <([#74 [3.1.1] iii.. Areas proposed for wilderness protections

The following areas are proposed for wilderness protection in Wyoming. These areas should be protected from oil shale development: Adobe Town, Kinney Rim North, Kinney Rim South, Devils Playground, 131 Red Creek Badlands, 132 Buffalo Hump, and Sand Dunes, including citizens’ proposed additions to existing WSAs. These lands are identified on GIS datasets included as Attachment 4.

The Adobe Town citizens’ proposed wilderness, which is discussed at great length above under the Adobe Town Very Rare or Uncommon Area, encompasses the entire citizens’ proposed wilderness. It is important to note that lands recognized as possessing wilderness characteristics (the “Adobe Town Fringe”) are not shown on Figure 3.1.1-13 and Figure 3.1.1-14; this oversight merits correction. We recommend that the entire Adobe Town citizens’ proposed wilderness outside the Wilderness Study Area be shown as “Lands to be Managed to Protect Wilderness Characteristics.”

Additionally, the Kinney Rim is a lofty ridge rising like a wave from a sea of sagebrush. The Kinney Rim North and South citizens’ proposed wilderness areas are listed as “Lands to be Managed to Protect Wilderness Characteristics” on Figure 3.1.1-13 and Figure 3.1.1-14, a designation with which we concur. These lands appear to be withdrawn from oil shale leasing under Alternative 2, a decision we strongly support.

131 See Attachment 5 for complete inventory.

132 See Attachment 6 for complete inventory. ~~#74]~~

<([#75 [3.1.1] The Devils Playground/Twin Buttes citizens’ proposed wilderness is a land of arid, windswept

badlands immediately to the west of Flaming Gorge National Recreation Area, offering outstanding hiking opportunities for visitors to the Recreation Area, in addition to habitat for the rare midget faded rattlesnake. The Devils Playground/Twin Buttes WSA is listed for the Rock Springs Field Office, but the corresponding citizens proposed wilderness (or WCA) has apparently been overlooked. 133 In light of the absence of industrial activity within the lands encompassed by the citizens’ proposed wilderness, this area should be protected. BLM should evaluate the WCA surrounding the existing WSA and protect all the lands contained therein from oil shale development. Neither the currently designated WSA nor the citizens’ proposed wilderness appear to be mapped as “Lands with Wilderness Characteristics” on Figure 2.3.3-3, and portions of this area appear to be made available for oil shale leasing under Alternative 2 in Figure 2.3.3-6. This oversight should be corrected, and these lands should be withdrawn from oil

shale leasing in the Final PEIS.

133 DPEIS, at Figure 3.1.1-14. #75)>

<(#76 [3.1.7] The Red Creek Badlands citizens' proposed wilderness encompasses a maze of shallow canyons through redbeds studded with junipers and pinyon pines. The "Lands with Wilderness Characteristics" mapped for the Red Creek unit do not appear to correspond with either the WSA or the citizens' proposed wilderness. See Figure 2.3.3-3. However, these lands being outside the "Most Geologically Prospective Area" do not appear to be offered for lease under any alternative, rendering this oversight of limited substantive importance.

#76)> <(#77 [3.1.1] [9.2.1] D. Utah: ACECs, lands with wilderness characteristics, and other lands

As the DPEIS and other BLM planning documents make clear, Utah is home to important landscapes. ACECs, proposed wilderness areas, and lands with wilderness characteristics, to varying degrees, overlap with oil shale deposits, and should be declared off-limits to research and development.

i. Utah proposed wilderness areas that should be protected from oil shale and tar sands development

As noted throughout these comments, we strongly support Alternative 3 which would exclude BLM identified wilderness character areas from oil shale and tar sands leasing while still leaving over 32,000 acres in the three state analysis area available for commercial oil shale leasing and 2,100 acres of tar sands leasing in Utah. BLM confirmed these areas' wilderness characteristics in a series of inventories leading up to the 2008 Vernal, Price, Richfield, and Monticello resource management plans and record of decision. 134

To the extent that BLM previously determined proposed wilderness areas to lack wilderness characteristics, but is now proposing to make them available for oil shale and/or tar sands leasing, those decisions should be revisited. Secretarial Order 3310 (December 23, 2010) acknowledges that BLM decisions made prior to the release of the Order regarding the management of non-WSA lands with wilderness characteristics must be revisited. 135 BLM recently released Manual 6310 which contains its "policy and guidance for conducting wilderness characteristics inventories under Section 201 of [FLPMA] and supersedes all previous guidance on this topic." 136 BLM's determinations in the Vernal and Price planning process that proposed Desolation Canyon wilderness areas lack such values was made before the March 2012 release of BLM Manual 6310. BLM should revisit these finding and incorporate any necessary changes before issuing its final decision. 137

134 See PEIS at 2-34 and 2-36, 2-43, 2-66 to -67, and 2-70 (explaining that under either Alternative 2 or 3 lands with

wilderness characteristics will not be available for oil shale or tar sands leasing).

135 SO §§ 5, 5(e)(3). See also id. §§ 1, 4 (The Order establishes that management of wilderness characteristics is a

"high priority" for BLM and directs the agency' to protect wilderness characteristics through land use planning and

project-level decisions unless the BLM determines, in accordance with this Order, that impairment of wilderness

characteristics is appropriate and consistent with other applicable requirements of law and other

resource management considerations.”) (emphases added).
 136 BLM Manual6310.01 (March 15, 2012).
 137 See BLM Manual6310.06(4).

#77])>

<([#78 [3.1.1] The following discussion concerns areas proposed for wilderness protection in Utah but that are not currently identified as lands with wilderness characteristics. The BLM should reinventory these areas, and once it determines that they contain wilderness characteristics, exclude them from potential oil shale and/or tar sands leasing and development. 138

a. Dirty Devil and Fiddler Butte

The Dirty Devil and Fiddler Butte Citizen Proposed Wilderness (CPW) contain an abundance of archeological resources. Studies by the NPS and the BLM in this area have suggested that this region contains an average density of twenty-four archeological sites per square mile. This means that in the Dirty Devil region alone there are likely hundreds and hundreds of rock shelters, campsites, lithic scatters, stone tool quarries, and petroglyph sites.

The Dirty Devil CPW wilderness is home to antelope, bighorn sheep, and at least nine species of plants and animals identified as “sensitive” by the BLM. It is a landscape of narrow redrock canyons surrounded by vast slickrock bowls and cliffs. Plateaus above the canyons provide important habitat for plants and animals. This area was also frequented by outlaws; Butch Cassidy and the Wild Bunch were the most famous of the lawbreakers to hang out here. The Dirty Devil has served as the setting for many Western novels, including one by Zane Grey.

The Fiddler Butte area possesses some of the most spectacular scenery in the United States. This area, along with the Dirty Devil River CPW, would be totally inappropriate for tar sands development.

The BLM agrees that the majority of the relevant Dirty Devil and Fiddler Butte CPWs contain wilderness characteristics. The relevant resource management plan even manages portions of this area to preserve those wilderness characteristics.

138 See PEIS at 2-34 and 2- (describing that under either alternative 2 or 3 “[a]ll areas that the BLM has identified or may identify as a result of inventories 26 conducted during this planning process, as [lands with wilderness characteristics] will not be available for leasing).

#78])> <([#79 [3.1.1] The following discussion concerns areas proposed for wilderness protection in Utah but that are

not currently identified as lands with wilderness characteristics. The BLM should reinventory these areas, and once it determines that they contain wilderness characteristics, exclude them from potential oil shale and/or tar sands leasing and development.

b. White Canyon/Fort Knocker Canyon 139

Each year nearly 100,000 visitors explore Natural Bridges National Monument, searching for the solitude, beauty, and silence that are unique to the Colorado Plateau. Few of these visitors realize that the 7,600-acre national monument is surrounded by thousands of acres of BLM wild lands including the drainages of White Canyon.

White Canyon has carved a maze of canyons deep into the Cedar Mesa Sandstone layer. These canyons are among the world's foremost displays of erosion sculpting, and the upper part of White Canyon was included within Natural Bridges National Monument in recognition of this distinction. The sinuous canyons on the BLM lands alternately narrow down into cool, dark, arm

span-width slots and then widen again into coves littered with 40-ton house-sized rocks and pocket forests of cottonwood, ponderosa, and fir.

The canyon walls are honeycombed with alcoves, arches, windows, hanging gardens, and grottoes; the canyon floors are riddled with potholes. In places, natural spring water forms deep pools, and occasional rainstorms bring torrents of floodwater raging through the boulder gardens and thundering over pour-offs in spectacular waterfalls. Well over 100 miles of narrow, winding canyons in the White Canyon proposed wilderness complex (including White Canyon, Fort Knocker Canyon and Tuwa Canyon) form a network so labyrinthine that outstanding solitude is assured. Fort Knocker Canyon winds through sandstone bench lands surrounded by thousandfoot high mesas and buttes, and feeds into the lower reaches of White Canyon before it flows into the Colorado River arm of Lake Powell. This remote area is becoming internationally recognized for its dark night skies, offering some of the best stargazing in the world.

White Canyon's intermittently flowing water is an attraction for wildlife, and surely attracted the Ancestral Puebloans to the area, as remnants of their culture, ranging from scattered stoneworking

sites to impressive cliff dwellings, are located throughout the proposed wilderness.

The Glen Canyon/San Juan River area contains significant cultural resources.

The cultural resources found within the jurisdiction of the [Monticello Field Office] constitute some of the most aesthetically appealing and scientifically significant resources anywhere on the Colorado Plateau. The more than 26,000 documented archaeological sites in the area, the majority on ELM-administered lands, constitute the most significant concentration of cultural resources in the state of Utah. The extraordinary number and density of sites (cf. DEIS 1-4) makes the region among the most significant concentrations of archaeological sites anywhere in the western United States. 140

A more recent report prepared by the Colorado Plateau Archaeological Alliance entitled "Farming and Foraging on the Southwestern Frontier," further details the significant cultural resources found within the proposed master leasing plan for this area. 141

139 See Utah Wilderness Inventory, at 94 (1999) (describing Fort Knocker Canyon). <http://www.access.gpo.gov/blm/utah/pdf/se94.pdf>. (last accessed April 23, 2012)

140 Colorado Plateau Archaeological Alliance Comments re: Monticello DEIS/DRMP at 3 (submitted Jan. 31, 2008).

141 A copy of "Farming and Foraging on the Southwestern Frontier" is available online at <https://research.wulib.wu.edu/443/dspace/handle/2376/2643>.

#79]>

<([#80 [3.1.1] c. Bitter Creek 142

The Bitter Creek proposed wilderness unit straddles the Colorado/Utah state lines high in the remote Eastern Book Cliffs. The area contains spectacular scenic vistas and offers sublime opportunities for solitude. Deep canyons cut through the pale Mesa Verde sandstone, and crenellated ridges buttress the sky. Within the unit, elevations range from 6,000 to 8,000 feet,

and canyon slopes rise 600 to 800 feet. Bitter Creek and Rat Hole Canyon two major drainages, wind through the area, each extending a number of side canyons like fingers into the surrounding mesas.

Vital riparian zone support box-elders and aspens, willows, sedges, and various reptile and amphibian species along the waterways in the canyon bottoms. Many wet meadow areas punctuate the folded landscape and support communities of grasses and wildflowers, insects and bird . At lower elevations, bench- and ridge-top vegetation consists of sagebrush, rabbitbrush, greasewood, and a variety of grasses. Above 7,400 feet, the drainages are dominated by pinyonjuniper

woodlands on south facing slopes, and by Douglas-firs and quaking aspens on the northern aspects. Peregrine falcons and golden eagles nest in the cliffs and hunt in the river drainages, deer and elk forage along the mesa tops and in the canyons, and black bears roam the broken terrain.

With its convoluted topography, screening vegetation and wide variety of plant and animal species, the Bitter Creek Addition provides outstanding opportunities not only :for solitude, but also for primitive and unconfined recreation. Hunting, fishing, camping, hiking, photography, and wildlife viewing are all popular in the area. Backpacking and horseback riding opportunities abound in the area' many and extensive scenic side canyons.

In addition to the inspiring scenery and vital habitat, a number of pictograph and petroglyph sites, as well as historic homesteads, grace the area, lending it archaeological and historical significance. Queen Chip eta, wife of Ute Chief Ouray, was intelligent, talented, and hardworking,

a model of constancy and courage during a desperate time. She acted as a messenger of goodwill between Indians and Whites, meeting with President McKinley and performing many acts of kindness and sacrifice, and thus earning her place among tribal leaders. Her eponymous canyon traverses the heart of the Bitter Creek Wilderness in Utah and provides access to many side canyons. Her legend informs the rich cultural heritage of the area.

142 In its 1999 Utah Wilderness Inventory, BLM determined that the so-called "Cripple Cowboy" wilderness

inventory area had wilderness characteristics, <http://www.access.gpo.gov/blnrlutah/pdf/ne142.pdf>, a determination

BLM confirmed in the Vernal RMP- along with acknowledging for the first time that the citizen's "Bitter Creek"

unit have wilderness characteristics. Vernal PRMP/FEIS at 3-45 to -47. See generally <http://www.blm.gov/ut/st/en/fo/vemal/planning/ supplemental nnpbackground documents.html>.

The citizen's

proposed "Bitter Creek" unit includes both the Cripple Cowboy and Bitter Creek units.

#80])> <([#81 [3.1.1] d. Dragon Canyon

The Dragon Canyon proposed wilderness unit consists of several large canyons that run south to north to Evacuation Creek. These include Davis, Side, Atchee, and Dragon Canyons in Utah, and Little Whiskey Creek in Colorado.

In this area, vital riparian zones support box elders and aspens, willows, sedges, and various reptile and amphibian species along the waterways in the canyon bottoms. Many wet meadow areas punctuate the folded landscape and support communities of grasses and wildflowers, insects and birds. At lower elevations, bench- and ridge-top vegetation consists of sagebrush,

rabbitbrush, greasewood, and a variety of grasses. Above 7,400 feet, the drainages are dominated by pinyon-juniper woodlands on south facing slopes, and by Douglas-firs and quaking aspens on the northern aspects. Peregrine falcons and golden eagles nest in the cliffs and hunt in the river drainages; deer and elk forage along the mesa tops and in the canyons; and black bears roam the broken terrain. Other wildlife species include Townsend's big-eared bat, dwarf shrew, ringtail cat, Lewis' woodpecker, and ferruginous hawk and black bear fall concentration area. Expanding upon the important watershed values in Utah, the area provides protection for Whiskey Creek, Little Whiskey Creek, Tent Creek, Davis Creek, and West Evacuation Creek.

Significant cultural resources are found within the broader area. According to the Colorado Office of Archaeology and Historic Preservation there are forty-three registered sites with the Colorado portion of the Dragon Canyon unit alone. The type and significance of these sights is not available to the public. It is likely that the Utah portion of the Dragon Canyon unit also contains a similarly-high density of archaeological sites.

Superior visual resources exist in the area. These values are also significant, relevant and important given the threats these and similar values face in the broader landscape. The Utah BLM found the Utah portions of the Dragon/ Atchee/Davis Canyon area to have relevant "Scenic,

cultural resources and natural systems." 143 Within the broader context of the Piceance Basin and

the threats to the area these values are of substantial significance and must be protected.

143 Vernal RMP DEIS, at G-7.

#81)> <(**#82** [3.1.1] e. Lower Bitter Creek

The Lower Bitter Creek proposed wilderness unit is dominated by Lower Bitter Creek itself, with its rich riparian corridor and intermittent stream that runs northwest to southeast through the center of the unit. Several deep washes enter Bitter Creek as it passes through this unit. In addition, some portions of the unit are desert landscape with sparse vegetation, while other locations support thick pinyon and juniper forests intermixed with sagebrush parks. The unit also has several prominent unnamed rock buttes that present striking features in the landscape. Bitter Creek and its drainage provide excellent wildlife habitat for many State sensitive species including ferruginous hawk, burrowing owl, sage grouse, bald eagle, dwarf shrew, ringtail cat, black-footed ferret, as well as big game species such as mule deer and elk. Occasionally, a cougar or a bobcat can be seen. This unit may also be home to the Graham Beardtongue (penstemon *Grahamii*), a state sensitive plant species. A short day hike to several of the buttes provides unsurpassed views of this unique geologic region.

In 2007, the Vernal Field Office determined that 11,417 acres of the proposed Lower Bitter Creek wilderness unit contain wilderness characteristics.

#82)> <(**#83** [3.1.1] f. Sunday School Canyon

The Sunday School Canyon proposed wilderness unit is adjacent to the northern boundary of the Winter Ridge WSA and is bounded topographically by Wood Canyon on the south, Buck Canyon to the north, the Willow Creek drainage on the west, and Seep Ridge to the east. Beyond adopting the name of its most prominent feature the unit encompasses the entire Sunday School Canyon drainage. Upper portions of this canyon system are broad, shallow, and park-like. The canyon becomes increasingly entrenched as one proceeds down through its multiple layers of exposed geology. During wetter periods, the area is drained by an intermittent stream that runs through this canyon.

Pinyon and juniper forests that dominate the higher elevations within the unit become less prominent in lower areas. Other vegetation, including sagebrush cactus, yucca, rabbitbrush, and native grasses are interspersed throughout the unit. The transition from lower desert to higher forested areas is important to wildlife and primitive recreation opportunities.

Wildlife viewing opportunities abound, as the unit is critical deer and elk winter habitat. In addition, on a hike up a canyon or along a ridge, a visitor may observe wild horses galloping through the landscape, or raptors circling for prey or soaring on thermals. The unit also contains either substantial, high-value, or substantial habitat for certain species of special concern, including: the state threatened ferruginous hawk, bald eagle, the burrowing owl, big free-tailed bat, sage grouse, Lewis' Woodpecker, ringtail cat, dwarf shrew, short-eared owl, Townsend's big-eared bat, and Utah Milk Snake. Special status plant species within the unit include the federally threatened Uinta Basin Hookless cactus, the Graham's beardtongue (an ESA candidate), and the Bameby's columbine, the Caespitose Cats-eye, the Grass Goldenweed, and Garrett's beardtongue.

The varied topography, wildlife, scenic vistas, and vegetation combine to create an overwhelmingly natural landscape with outstanding opportunities for solitude and a primitive, unconfined type of recreation. The unit offers incredible sight-seeing, with dramatic views of several prominent geological features including Big Pack Mountain, the Uinta Mountains, the Willow Creek drainage, the southern portions of Seep Ridge, and Bates Knolls. In addition, the potential for cultural sites exists along Willow Creek and its side drainages, as well as along Seep Ridge. #83]>

<([#84 [3.1.1] g. Seep Canyon

The Seep Canyon proposed wilderness unit is comprised of sandstone rimrocks, towering cliffs, broken slopes, broad valleys, and endless ridge lines. Besides Seep Canyon and Seep Ridge, other predominant canyons and ridges include Park Canyon, Park Ridge, Crooked Canyon and many other side canyons and nameless draws and ridge lines. The several canyon systems drain north toward Sweet Water Canyon. The scenery created by this topographic feature is both stunning and intricate, and more distant views of the prominent buttes within the Lower Bitter Creek proposed wilderness unit, and McCook Ridge are spectacular.

Dense pinyon and juniper forests that dominate the landscape are interspersed with sagebrush, grasses, oakbrush, cacti, yucca, and other species. Isolated stands of aspen and Douglas fir are also present within the unit.

The Seep Canyon wilderness unit is important habitat for elk, deer, and several other wildlife species; cougar and golden eagles are also present. In addition, the area overlaps lands subject to a long-term black bear study by Brigham Young University and sponsored by the Utah Division of Wildlife Resources. The area contains habitat for the federal and state threatened Mexican spotted owl, the federal and state endangered willow flycatcher, and the state threatened Ferruginous Hawk. The area also provides critical habitat for the northern goshawk, and ringtail cat. It is also high value habitat for the bald eagle, burrowing owl, Lewis' woodpecker, Williamson's sapsucker, Townsend' big-eared bat, and the Utah milk snake.

#84]> <([#85 [3.1.1] h. Turtle Canyon, Desbrough, and Desolation Canyon

All three of these units are found in the western Book Cliffs and West Tavaputs Plateau. They are remarkable areas, rich with wildlife habitat, soaring escarpments, and delicate ecology. The BLM agrees that these areas contain wilderness characteristics. Oil shale or tar sands development in any of these areas would destroy the primitive character of this area. These three

units help form possibly the largest unprotected roadless areas in the contiguous United States.

#85) > <(**#86** [3.1.1] i. Sids Mountain

The Sids Mountain citizen wilderness proposal area encompasses a large portion of the remarkable San Rafael Swell. This large geologic uplift is a maze of canyons, cliffs, shrubland, and arroyos. It is home to the largest population of desert bighorn sheep in Utah.

#86) > <(**#87** [3.1.1] ii. Potential ACECs in Utah that should be declared off-limits from oil shale

and tar sands development

As noted throughout these comments, we strongly support Alternative 3 which would exclude the following BLM identified potential areas of critical environmental concern from oil shale and tar sands leasing while still leaving over 32,000 acres in the three state analysis area available for commercial oil shale leasing and 2,100 acres of tar sands leasing in Utah. BLM confirmed these areas' relevance and important values in a series of inventories leading up to the 2008 Vernal, Price, Richfield, and Monticello resource management plans and record of decision. 144

The PEIS, however, mistakenly identifies in Figure 2.3.3-5 and Figure 2.4.3-2 portions of several BLM identified potential ACECs as in fact available for leasing under Alternative 2. 145 These errors should be corrected in the revised FPEIS. 146

144 See PEIS at 2-34 and 2-36, 2-43, 2-66 to -67, and 2-70 (explaining that under either Alternative 2 or 3 potential

ACECs will not be available for oil shale or tar sands leasing).

145 See *id.* at 2-41 (Figure 2.3 .3-5) and 2-69 (Figure 2.4.3-2).

146 The PEIS, Alternatives and 2 and 3, mistakenly identifies portions of the following BLM identified potential

ACECs as being available for leasing: Vernal RMP (Nine Mile, Four Mile Wash, Coyote Basin-Myton Bench,

White River, Bitter Creek, Bitter Cree/P.R. Springs, and Coyote Basin-Snake John); Price RMP (Nine Mile, Range

Creek, Sids Mountain, San Rafael Canyon Lower); Richfield (Dirty Devil/North Wash). See Attachment 12.

#87) >

<(**#88** [3.1.1] The following potential ACECs in Utah that should be protected from oil shale and tar sands

development:

a. Bitter Creek and Bitter Creek/PR Springs

This 147,425-acre potential ACEC is located high in the remote Book Cliffs of eastern Utah.

The

Vernal RMP considered this ACEC in order to protect "old-growth pinyon pine, cultural resources, historical features, and watersheds." 47 Utah BLM found the Bitter Creek and Bitter Creek-P.R. Springs area to meet relevance and importance criteria for designation as an area of critical environmental concern (ACEC) based on these same values, stating:

Relevance Criteria: The area has relevance due to the existence of an old growth forest, significant cultural and historic resources, important watershed, and critical ecosystem for wildlife and migratory birds.

Importance Criteria: The relevant values described above have substantial significance due to qualities that make it fragile, sensitive, rare, irreplaceable, exemplary, and unique.

The ancient pinyon forest is over 1,200 years old, and includes the Utah champion pinyon, which is irreplaceable. Within the unit is the ancestral home of the Northern Ute Tribe when they were relocated from Colorado in the late 1800s. Many features, including graves, are within the potential ACEC, but specific locations are not known. Also in the potential ACEC is the most extensive wetland in the multi-state Book Cliffs. It exists because of a uniquely perched water table. This wetland and surrounding watershed is unique as a critical ecosystem for migratory birds and a wide variety of wildlife. 148

All of these relevant values would be severely impacted by oil shale or tar sands development.

161 Id. at 3-89. ~~#96]~~ ~~([#97 [3.1.1]~~ The following potential ACECs in Utah that should be protected from oil shale and tar sands development: j. Sids Mountain Potential ACEC

The Sids Mountain potential ACEC was identified by the BLM as containing outstanding scenery with a large diversity of landforms and colors. “Landforms include rounded domes, high truncated buttes, and vertical cliffs dissected by deep canyons. The change in form and elevation is highly visible.” The BLM also stated that “[v]ivid colors range from light buff and brown sandstones to the light gray-green vegetation on the mesas and in the canyons.” ~~#97]~~

~~([#98 [3.1.1]~~ E. Colorado: ACECs, lands with wilderness characteristics, and other lands
As the DPEIS and other BLM planning documents make clear, Colorado is home to important landscapes. ACECs, proposed wilderness areas, and lands with wilderness characteristics, to varying degrees, overlap with oil shale deposits, and should be declared off-limits to research and development.

i. Colorado proposed wilderness and wilderness-quality lands should be protected from oil shale development

As noted above while we strongly endorse Alternative 3, we support the provision that Alternative 2(b) would exclude from commercial development “[a]ll areas that the BLM has identified or may identify as a result of inventories conducted during this planning process, as land having wilderness characteristics (LWC).”¹⁶² The DPEIS makes clear that impacts of oil shale development are not compatible with protection of wilderness quality:

Commercial oil shale development and associated development of transmission line and pipeline ROWs within areas with wilderness characteristics would cause a loss of those characteristics in and around the disturbed areas. Development of oil shale and related facilities on nearby lands within the viewshed of an area with wilderness characteristics also could result in adverse impacts on wilderness characteristics.¹⁶³

The dearth of areas that retain wilderness character within Colorado portions of the planning area, combined with the economic and environmental import of these areas, necessitate protection of wilderness character to the exclusion of any oil shale development.

While the DPEIS does a substantially better job addressing lands with wilderness character than the 2008 PEIS-the 2008 PEIS included virtually no discussion of these areas- the DPEIS does not include a complete list of areas within the geologically prospective study area with wilderness character. Nor too does the DPEIS describe LWCs in specificity in all cases. For example, for L WCs within the White River Field Office in Colorado, the DPEIS provides the number of acres to be protected, but does not provide a land description or place name. There is also no discussion of L WCs in the Grand Junction Field Office, and it is not clear at all that the Field Office has undertaken an updated and thorough review to date.

Similarly, a 2000 wilderness inventory undertaken for the Roan Plateau Planning Area found

19,322 acres of wilderness quality lands. 164 (That entire landscape has been included in federal wilderness legislation.) In a decision that has been challenged and remains unresolved the BLM decided not to manage these areas to protect the wilderness character. While not all of the LWCs inventoried in 2000 overlap with the area opened to oil shale development in 2008, 10,389 acres in the East Fork of Parachute Creek met the criteria for a WSA165 and were opened to oil shale development in the 2008 PEIS and corresponding R.MP amendments. This 2012 DPEIS indicates

that there are another five areas that retain wilderness character in the White River Field Office overlapping the most geologically prospective areas for oil shale development. 166 The five areas

retaining wilderness character in the White River Field Office total only 21,974 acres. 167 Because areas with wilderness character like East Fork Parachute Creek and the five areas identified in the White River Field Office retain a wealth of visual, botanical, wildlife, and ecological values, oil shale should be excluded from these areas.

As stated above, BLM does have a statutory obligation to maintain an active and updated inventory of wilderness quality lands and to consider protecting those areas in management decisions. A thorough and updated wilderness inventory is a necessary prerequisite to opening vast swaths of public land to oil shale development. The relatively few areas that retain wilderness characteristics should be protected from oil shale development in any final plan. To the extent that the BLM does not have an up-to-date inventory of lands with wilderness character for any of the impacted Colorado field offices, the agency must undertake such an inventory and consider protecting existing wilderness characteristics by disallowing development of oil shale. To the extent that recent inventories have been undertaken by the agency, those inventories must form the basis for analysis.

<([#99 [3.1.1] In addition, Colorado State Wildlife Areas (SWAs) should be protected from oil shale

development. Six SW As abut BLM lands or overlap with BLM managed subsurface resources opened for oil shale development in 2008. These areas include:

- Shell Oil SW A - hunting lease
- Yellow Creek Unit
- Square S Summer Range Unit
- Square S Ranch Unit
- Little Hills Unit
- North Ridge Unit of the Piceance SWA

These areas provide important habitat for wildlife, as well as recreational opportunities and an economic draw for local communities. These areas must be protected from both direct and indirect impacts associated with oil shale development.

#99)]> <([#100 [3.1.1] ii. Colorado ACECs that should be protected from oil shale development The following ACEC's should be protected from development in the Final PEIS.

a. East Fork Parachute Creek

It appears that BLM will revisit and correct the illegal decision made in the 2008 PEIS and corresponding Record of Decision to open Naval Oil Shale Reserves (NOSRs) Nos. 1 and 3 to oil shale leasing. That 2008 decision ignored a withdrawal on the NOSRs preventing those lands from being leased for oil shale development. See DPEIS at 3-7.

We support BLM's direction in the 2012 DPEIS to correct the 2008 decision opening the NOSRs to oil shale development. BLM must identify the NOSRs as unavailable for application for commercial oil shale leasing in any Final PEIS barring issuance of an opening order. Such a decision would eliminate the threat of commercial oil shale development in the East Fork of Parachute Creek. Again, we support the direction in the DPEIS and urge BLM to ensure that the East Fork Parachute Creek area is unavailable for research and development.

Further, the East Fork Parachute Creek area should be unavailable for oil shale development regardless of decisions made related to the NOSRs because of rare and important values that are incompatible with such development. The area was designated as an ACEC for visual, wildlife, fisheries, botanical and ecological values. 168 East Fork Parachute Creek is a biologically significant tributary to the Colorado River. 169 Any oil shale development in this area will likely have significant impacts on the important values for which this ACEC was designated.

This creek provides year-round habitat for Colorado River Cutthroat Trout (CRCT), the only native trout in the Colorado River basin. The CRCT has been designated a "special status species" by the BLM and is classified as a "sensitive species" by Regions 2 and 4 of the US Forest Service, and the states of Colorado, Utah, New Mexico and Wyoming. 170

East Fork Parachute Creek is also identified as one of the five areas containing conservation populations by the Conservation Agreement and Strategy for Colorado River Cutthroat Trout in the States of Colorado, Utah, and Wyoming. 171 These populations also meet the BLM's own criteria for a conservation population. 172 The Conservation Agreement gives highest priority for

management and protection to streams identified as containing conservation populations.

Populations of CRCT in East Fork Parachute Creek are at least 90% genetically pure. 173 The BLM considers the entire watershed to be important to the long-term functionality of vital ecosystem processes that maintain upland and stream habitats important to these fishes. 174

Also,

the BLM declared, "these streams are regionally and nationally important producers of native, genetically pure and naturally reproducing Colorado River cutthroat trout," going on to proclaim that these streams should be given the "highest priority for management and protection." 175

The importance of these trout populations is clear. This area must be protected from oil shale development in order to ensure the subspecies continues reproducing and recruiting. Oil shale development will likely result in increased sedimentation, reductions in water quantity and quality, ground water flow alteration, and increased likelihood of water contamination with toxic byproducts. These impacts will add stresses to CRCT populations and, in so doing, may undermine one of the values this ACEC was designated to protect.

Other values for which this ACEC was designated include scenery as well as unique and rare plant communities. Of special note is a 200-foot canyon waterfall. The BLM has described the waterfall as a "national park quality scenic attraction." The ROD for the Designation of ACECs for the Roan RMPA and EIS designated the lower stretches of the East Fork of Parachute Creek as a VRM 1. 176

A rare community of Mancos columbine, and a BLM “sensitive plant,” Eastwood’s monkeyflower, are also present in the unique hanging gardens in this ACEC. Also found are several plant communities such as the Colorado blue spruce/red osier dogwood, the boxelder, narrowleaf cottonwood, red osier dogwood community, and the Indian ricegrass shale barrens community. These communities are considered rare globally and in Colorado. There are also a few imperiled plants in this ACEC that may be particularly susceptible to oil shale development. Utah fescue, for example, is a perennial grass and an oil shale endemic species found within East Fork Parachute Creek ACEC. Hanging garden sullivania is found in this area. Southwest stickleaf, a BLM sensitive species, is an oil shale endemic that frequently occurs in the area. The Roan Plateau Final EIS makes it clear that this ACEC “contains a diversity of rare or uncommon riparian plant communities and BLM sensitive plant species.” 177 The EIS goes on to say: “the rare plants and plant communities found in this drainage are of excellent condition and abundance and are vulnerable to adverse change.” 178 For these reasons, East Fork Parachute Creek ACEC is inappropriate for oil shale research and development and should be closed to development in the Final PEIS.

<([#101 [3.1.1] Colorado ACECs that should be protected from oil shale development: b. Trapper/Northwater Creek ACEC

Trapper/Northwater ACEC is also almost entirely within the NOSR and cannot be opened for oil shale development absent issuance of an opening order reversing the withdrawal that currently applies to the areas. See DPEIS at 3-4. As with East Fork Parachute Creek, it appears that the BLM is prepared to correct the illegal decision made in 2008 opening the area to oil shale development. See supra discussion related to East Parachute Creek. We support that decision. Importantly, though, this area should be unavailable for development regardless of the existing withdrawal due to the myriad of unique and important values that are incompatible with oil shale development. This area was designated for wildlife, fisheries, botanical and ecological values, and all values therein should be protected. Trapper and Northwater Creek are tributaries to the

Colorado River, and the creeks provide year-round habitat for CRCT. This ACEC is a critical conservation area for the CRCT. Three of the five conservation populations of CRCT that exist atop the plateau are found within this ACEC. Included in these are “core conservation populations,” identified by a genetic purity of 99% or higher. 179

The BLM considers the entire watershed vital to the long-term functionality of ecosystem processes that maintain upland and stream habitats important to these fishes. 180 The BLM also said, “These streams are regionally and nationally important producers of native, genetically pure and naturally reproducing Colorado River cutthroat trout.”¹⁸¹ The nearly pure genetic populations of CRCT that exist in this area are irreplaceable, and should be protected from any habitat degradation that may accompany development of oil shale in the area.

Botanical and ecological values sought to be protected in this ACEC include hanging garden sullivania and Utah fescue. Combining known occurrences of hanging garden sullivania in the Trapper/Northwater Creek ACEC with known occurrences in the East Fork Parachute Creek ACEC accounts for 62% of total known occurrences. 182 Utah fescue is a perennial grass and an oil shale endemic. The Indian ricegrass shale barrens community can also be found in this ACEC. This community is found in only three other Western Colorado counties. 183

The important CRCT populations as well as rare plant communities and species in this ACEC, should be protected. Opening this area to oil shale development may undermine protection of these values and undermine stated BLM management priorities.

For these reasons, the Trapper/Northwater Creek ACEC is inappropriate for oil shale research and development, should be closed to development in the Final PEIS.

#102]>

<([#103 [3.1.1] iii. Potential ACEC's in Colorado that should be declared off-limits from oil shale development

The 2008 PEIS provided "potential ACECs that are currently under consideration for designation as part of ongoing land use planning efforts would be available for application for commercial leasing in the future." 87 The 2008 ROD opened these areas to oil shale development.

Given the critical nature of environmental values at risk in these ACECs and the BLM's admission that oil shale development is incompatible with other uses, including ACEC values, we urge BLM to make potential ACECs unavailable for future oil shale development. Alternative 2(b) would do exactly that. We support that part of the preferred alternative.

187 FPEIS (2008), at 4-21.

#103]> <([#104 [3.1.1] [3.7.4.2] Potential ACEC's in Colorado that should be declared off-limits from oil

shale development: a. Snake John Subcomplex of the Coyote Basin Complex

Portions of the Snake John Subcomplex that occur in the White River Field Office were nominated by the Center for Native Ecosystems (CNE; now Rocky Mountain Wild) in 2007 due to mapping of white-tailed prairie dogs. 18 This area and this habitat should be protected from oil

shale development.

The Snake John Subcomplex is also important habitat for the endangered black-footed ferret.

The black-footed ferret is one of the most endangered mammals in North America. Ferrets historically occupied more than 100 million acres of western grasslands, from the Rocky Mountains eastward throughout the Great Plains, but are now reduced to a handful of reintroduction sites in the wild. Healthy ferret populations require very large prairie dog complexes. Dramatic prairie dog declines have taken a brutal toll on the ferret. Prairie dogs make up 90% of the ferret's diet.

The Coyote Basin complex is thought to have been among the most robust white-tailed prairie dog colonies in Colorado historically. Reintroduced black-footed ferrets currently occupy the Wolf Creek complex in Colorado, the Coyote Basin complex in Utah and Colorado, and the Snake John complex in Utah. These complexes constitute the most important habitat for whitetailed

prairie dogs and black-footed ferrets in Colorado and Utah, and are within the portions of the white-tailed prairie dog's range in Utah and Colorado that are expected to see the most substantial increases in oil and gas development over the next 20 years. These areas were also opened to oil shale development through the 2008 PEIS and corresponding Record of Decision and RMPs. In areas where energy development overlaps occupied white-tailed prairie dog habitats, the resulting habitat loss and fragmentation will have negative effects on individuals and populations, including mortality, noise disturbance, and habitat loss and fragmentation. There is a threshold level at which point habitat loss and fragmentation will threaten local whitetailed

prairie dog populations and reduce prairie dog abundance to a level that is too low to provide an adequate prey base for black-footed ferrets.

In addition to being a federally listed endangered species black-footed ferrets are a Colorado Division of Wildlife Endangered Species and a Comprehensive Wildlife Conservation Strategy Science Forum Species of Most Concern. The fact that the endangered black-footed ferret is

dependent on healthy populations of white-tailed prairie dog warrants special management of the habitat that these species rely upon to protect them from oil shale development.

188 Attachment 10. #104)>

<(#105 [3.1.1] [3.7.4.2] Potential ACEC's in Colorado that should be declared off-limits from oil

shale development: b. Dudley Bluffs bladderpod and twinpod habitat outside of existing ACECs

There are occurrences of Dudley Bluffs bladderpod and Dudley Bluffs twinpod outside of existing ACECs. These areas were nominated as ACECs by the CNE in 2007. 189 In that nomination, CNE recommended 300-foot buffers protecting all known occurrences of these plants to ensure ongoing function of ecosystem processes. USFWS 's 1993 recovery plan and the agency's 2008 5-Year Review of the Dudley Bluffs bladderpod and Dudley Bluffs twinpod listed oil shale development as "the primary threat to both species ... " 190 The Review called oil shale development an "imminent" threat. 191 BLM's own analysis lists threats to these plants associated with oil shale development:

... direct injury and mortality of individuals, soil and seed bank disturbance and removal, vegetation clearing, habitat fragmentation, dispersal blockage, alteration of topography, changes in drainage patterns, erosion, sedimentation from runoff, oil and contamination spills, fugitive dust, increased human access and human collection, spread of invasive plant species, air pollution, and loss of pollinator habitat. 192

In the USFWS's 5-year review, the agency estimated that 36% of known occupied habitat for both the bladderpod and the twinpod is not protected by ACEC designation, and that "[p]ermanent protective land management designations are necessary on all, or nearly all, occupied BLM land in order to fully achieve recovery. 193 In other words, protection of occupied

Dudley Bluffs bladderpod and twinpod habitat in areas proposed for ACEC designation are necessary to ensure recovery of these listed species. The BLM should make these areas unavailable for oil shale development in the Final PEIS.

shale development: c. Graham's Penstemon habitat outside the Raven Ridge ACEC

In 2007 CNE petitioned for expansion of the existing Raven Ridge ACEC to include a USFWS designated critical habitat unit for Graham's penstemon. The petition included half-mile buffers around all known Graham's penstemon occurrences per recommendation of Dr. Vince Tepedino of the Logan Bee Lab. Half-mile buffers are necessary to protect Graham's penstemon pollinators. Again, these areas should be closed to oil shale development.

#106])> Potential ACEC's in Colorado that should be declared off-limits from oil shale development <(**#107** [3.1.1] Potential ACEC's in Colorado that should be declared off-limits from oil shale development: d. Narrow-stem gilia habitat outside the existing Lower Greasewood ACEC

In 2007 CNE petitioned for expansion of the existing Lower Greasewood ACEC to include known additional occurrences of narrow-stemmed gilia. Known occurrences should be protected from oil shale development with 300-foot buffers.

#107])>

<(**#108** [3.1.1] Potential ACEC's in Colorado that should be declared off-limits from oil shale development: e. Narrowleaf evening primrose habitat outside existing ACECs

In 2007 CNE petitioned for ACEC designation of two known narrow leaf evening primrose occurrences near existing and proposed ACECs in the White River Field Office. The petition also recommended a 300-foot buffer around known occurrences. These proposed ACECs should be protected from oil shale development.

#108])> <(**#109** [3.1.1] [3.7.1.1] X. Wild and Scenic Rivers, and Watershed Protection

We support management direction across the DPEIS alternatives that all areas eligible for Wild and Scenic River (WSR) designation be protected from oil shale and tar sands development. 194 As part of recent revisions of a number of land use plans, WSR inventories have been undertaken. Where a river or river segment is found to be "eligible" for inclusion in the WSR system as part of one of these inventories, the BLM's Land Use Planning Handbook(H-1601-1) (BLM 2005) directs the BLM to protect the lands along the eligible segment with a 1/4 mile buffer. We urge the BLM to go a step further and consider protection of these WSR segments and other critical river segments on a watershed scale.

In Colorado, BLM examined the eligibility of streams and stream segments for Wild and Scenic River status in 2002. The eligibility report showed portions of East Fork Parachute Creek, East Middle Fork Parachute Creek, Trapper Creek, and Northwater Creek are all eligible for Wild and Scenic River status. 195 These streams are all "free-flowing" and contain outstandingly, remarkable values -unique, rare, or exemplary botanical/ecological, scenic features or fishery values that are significant on a regional or national scale. These river segments hold many and various important values and should not be open to commercial oil shale development. These areas, along with all watersheds eligible for Wild and Scenic designation, should be offlimits to development.

In addition, many other watersheds deserve protection. Some of these areas may have special designations, such as the Parachute Creek Watershed Management Area and portions of Trapper and Northwater Creeks designated as an ACEC. 196 Other undesignated watersheds also deserve protection. For example, portions of Trapper and Northwater Creeks are not included in the Trapper/Northwater Creek ACEC, but deserve protection from oil shale development. In fact, it is the critical high reaches of these watersheds that were excluded from ACEC designation. Obviously, industrial development higher up in these water beds has the potential to impact downstream values, including the values for which the ACEC was designated. At risk, in this

case, would be nearly all of the Northwater Creek and a significant portion of the Trapper Creek populations of CRCT. In Wyoming, the BLM determined that Skull Creek is among the watercourses found to be eligible for Wild and Scenic River designation. 197

Potential impacts are serious. Sediment caused by surface disturbing activities may choke aquatic insects and trout eggs. In the event of a spill or a mining mishap, toxic effluent may do the same. In this drainage, downstream habitat is the best CRCT habitat. Below the confluence of Trapper and Northwater Creeks this drainage attains the volume and depth necessary to maintain suitable CRCT habitat. Allowing oil shale development, or any surface disturbing development, in the upstream portion of the Northwater drainage poses an unnecessary risk to CRCT populations lower in the watershed. In order to protect this sensitive resource, oil shale development be prohibited in the entire drainage. Importantly, we are not asking for expansion of the current ACEC boundary. We urge the BLM to eliminate the entire watershed from availability for future oil shale development to protect critical environmental values at risk. Other watersheds where oil shale development should not be allowed include: Clear Creek, Spring Creek, Corral Gulch, Ryan Gulch, Black Sulphur Creek, Fawn Creek, Hunter Creek, Willow Creek, West Fork Parachute Creek, Parachute Creek, Piceance Creek, and Dry Fork Piceance Creek. Protection of these important streams is important to protect values associated with fisheries, botanical resources, and municipal water quality.

Eligible Wild and Scenic Rivers in Utah are:

White River- The White River includes eligible segments for wild and scenic classification with the outstandingly remarkable values of scenery, fish, wildlife habitat, recreational resources, and historic resources. This remarkable river features a deep canyon often visited by canoeists and rafters. Importantly, it contains habitat for endangered fish.

Evacuation Creek- This eligible recreational river includes historic values that are outstandingly remarkable. Evacuation Creek flows through a high, remote stretch of the Book Cliffs.

Bitter Creek- This eligible scenic river includes the outstandingly remarkable values for fish, wildlife habitat, cultural resources, historic resources, and recreational resources. It creates the heart of a remarkable canyon where coyotes, elk, bear, and deer still roam unimpeded. This area is also home to historic resources, relicts of both Native American and European-based cultures.

Nine Mile Creek- Nine Mile Creek has formed the world-class Nine Mile Canyon, an area extremely rich in cultural resources. In fact, the BLM refers to this area as the “world’s longest art gallery” because of its high number of rock art sites. This eligible recreational and scenic river includes outstandingly remarkable values of scenery and cultural resources.

Range Creek - Range Creek is an area rich in cultural resources and remarkable wildlife habitat. This area was recently introduced to the public when a private ranch was transferred to public ownership. This eligible river includes the outstandingly remarkable values of cultural resources, scenery, historic resources, and wildlife.

Rock Creek- This eligible river includes the outstandingly remarkable values of cultural resources, recreation resources, scenery, historic resources, and wildlife. It ultimately flows into the Green River in the deep Desolation Canyon. Rock Creek is a superb wild area high in the Book Cliffs.

195 Roan FEIS (2006), at 3-121. see also DPEIS (2012) at 3-8.

196 The ROD for the Designation of ACECs for the Roan RMPA and EIS implemented a WMA for Parachute Creek.

This management tool was implemented to protect important watershed values in Parachute Creek from looming threats like natural gas development. See ROD (2008), at 6.

#109])>

<([#110 [3.7.4.1] [3.7.4.3] XI. Other Species Protections

The DPEIS lacks basic information about the current status and trends of many species that are threatened by the proposed action. Those species include oil shale endemics and federally listed species. For some special status species, the DPEIS omits or gets wrong basic life history needs. For example, there were a number of sensitive species considered to be Wyoming Species of Concern (WYSC) that were not included in the DPEIS, thereby precluding the BLM from analyzing and disclosing to the public impacts of the proposed action to those species.

In another example, Appendix E lists the habitat description for several other species, such as *Penstemon laricifolius* ssp. *Exilifolius*, as “not available.” However, a quick search on Natureserve (the Natural Heritage Program’s national database) provides eight citations with information relating to this subspecies. Where Appendix E lists this subspecies occurring only in one Wyoming county, Natureserve lists seven Wyoming counties and one Colorado county. Similarly, habitat descriptions for several species lack elevation ranges, or are otherwise so general as to preclude an impact analysis. For example, Appendix E lists habitat for *Phacelia salina* as simply “alkalai flats and clay slopes,” but fails to mention any elevation range or additional description of the plant’s habitat requirements. This sort of general habitat description precludes a meaningful impact analysis by failing to precisely identify the spatial coincidence of those species and the proposed development.

#110])> <([#111 [3.7.4.3] A. Sclerocactus

The case of *Sclerocactus* species provides another example of an inadequate analysis of current conditions and potential impacts to species from oil shale and tar sands leasing. As was the case with the 2008 PEIS, the DPEIS continues to confuse the *Sclerocactus* species. As noted in the Center for Biological Diversity’s comments on the 2008 DPEIS, *Sclerocactus glaucus* has been split into three distinct and federally threatened species; the two additional new species are *Sclerocactus wetlandicus* and *Sclerocactus brevispinus*. Appendix E lists *S. glaucus* as “Uinta Basin hookless cactus occurring in one Colorado and three Utah counties; USFWS lists *S. glaucus* as “Colorado hookless cactus” occurring in four Colorado counties. 198 Where USFWS lists *S. wetlandicus* as “Uinta Basin Hookless Cactus” occurring in three Utah counties, 199 neither the Chapter 6 nor Appendix E make any mention of *S. wetlandicus*. Whether the BLM is confusing nomenclature or entirely overlooking a threatened species is unclear.

Regardless, in its 2010 “Recovery Outline for the *Sclerocactus wetlandicus* (Uinta Basin Hookless Cactus), USFWS found that threats to *S. wetlandicus* from energy development, including oil shale and tar sands development, include outright destruction of individuals and habitat, soil erosion, soil compaction, sedimentation, dust accumulation and increased human collection and impacts from exotic plant spread facilitated by increased human access into energy development zones. 200 USFWS states that “energy development remains one of the

largest threats to this species through direct loss of habitat, and it is occurring in *S. wetlandicus* habitat at a rate much greater than existed at the time of the 1979 listing” and that “a significant portion of the species’ range also is within areas with oil shale development potential.”²⁰¹

The USFWS also describes significant cumulative impacts of energy development that form baseline conditions for evaluating impacts of the proposed action to the species:

[S]ixty-three percent of the total range of the species (approximately 117,000 ha or 289,000 ac) occurs within approved energy field development projects (Service 2009).

An additional 10 percent of *S. wetlandicus* potential habitat has been disturbed by historical energy field development. Seventy-nine percent of the potential range on Bureau of Land Management (BLM) land is within oil and gas development project boundaries. Thirty-seven percent of the potential range on tribal lands is within oil and gas development project boundaries. ²⁰²

None of this critical baseline information is included in the DPEIS, and the DPEIS fails to address *S. wetlandicus* altogether.

201 Id, at 4-5.

202 Id, at 4.

#111) <(**#112** [3.7.4.3] B. Additional deficiencies

There are other deficiencies of federally listed species. The DPEIS cursory information about bonytail chub does not reveal that the species is virtually extinct due to the transformation of the Colorado River ecosystem. Similarly, there is no description of specific recovery measures set forth in the 2002 recovery plan for Colorado pikeminnow, or that the humpback chub is experiencing a declining population trend. The DPEIS also fails to discuss the fact that an interagency

team declared in 1997 that the current strategy to recover the Utah prairie dog is not working and is unlikely to ever result in the recovery of the species, or that threats to the whooping crane include oil spills and gas leaks.

#112) <(**#113** [3.7.4.3] The DPEIS likewise fails to make clear that all known populations of clay reed-mustard are

located on federal lands that have been leased for oil and gas activities. The remaining individuals are underlain by oil shale deposits, and continued development of oil and gas wells and ancillary facilities, and future potential oil shale development, is likely to threaten the continued existence of this species. **#113)**>

<(**#114** [3.7.4.3] For many listed species-including the autumn’s buttercup, Ute ladies’-tresses, clay reedmustard,

Dudley Bluffs bladderpod, Dudley Bluffs twinpod, humpback chub, Jones cycladenia, last chance townsendia, Maguire daisy, Wright fishhook cactus, bonytail, Debeque phacelia, Parachute beardtongue, western yellowbilled cuckoo, and the White River beardtongue-the DPEIS lacks basic information about current status or population numbers, estimates or trends. For instance, the Dudley Bluffs bladderpod was surveyed in 2006, and the results indicate a declining population trend, but this information is not provided in the DPEIS. Meanwhile, the species is known to occur only in the Piceance Basin, an area where extensive oil shale

development would be permitted under the proposed action.

#114) <(**#115** [3.7.4.3] Similarly, the DPEIS does not mention that demographic monitoring of Wright fishhook cactus

populations conducted between 1993 and 2000 found no sizeable populations with adult cacti greater than 9cm wide (the size class responsible for the most reproduction). That same survey noted low recruitment and a low mortality to-recruitment ratio, and indicated that populations of Wright fishhook cactus appeared to be in a slow decline.

#115) <(**#116** [3.7.4.7] C. Climate impacts on species

While the DPEIS acknowledges that rare species are inherently more vulnerable to the effects of disturbance that would accompany oil shale or tar sands development, the BLM must also consider how proposed action will contribute to climate change and therefore further imperil rare species in the region. Many of the rare plants that will be affected by oil shale and tar sands development are edaphic endemics (species tied to very specific substrates, many only found growing on oil shale.) These species may be particularly hard-pressed to respond to climate change, because the soils they rely on may be restricted to very narrow elevation and/or latitudinal bands that do not allow for refuge from warmer, drier conditions. These plants are literally tied down to oil shale soils, and cannot march up a mountain or move north in response to climate change without leaving behind the soils they require. The IPCC has come to consensus about several factors relevant to the potential threat of climate change to endemic species, including the following:

- With global average temperature changes of 2°C above pre-industrial levels, many terrestrial, freshwater and marine species (particularly endemics across the globe) are at a far greater risk of extinction than in the recent geological past (medium confidence). 203
- Warming and drying trends are likely to induce substantial species-range shifts, and imply a need for migration rates that will exceed the capacity of many endemic species. 204
- The likely synergistic impacts of climate change and land-use change on endemic species have been widely confirmed. 205

The Final PEIS must include this information, so that the environmental consequences of the proposed action may be meaningfully considered. Without establishing these baseline conditions, there is no way for the BLM or the public to fully understand, at this crucial, programmatic scale, the effects that the proposed action will have on the environment.

203 Fishlin et. al. 2007 at p. 213.

204 Id. at p. 226.

205 Id. at p. 241.

#116) <(**#117** [6.1.1] XII. Lands with deposits 15 gallons/ton or more and 15 feet thick or less In Colorado and Utah, the most geologically prospective oil shale deposits are “those deposits that yield 25 gallons of shale per ton of rocks (gal/ton) or more and are 25 ft. thick or greater. “

206

In Wyoming, the standard is 15/15. The BLM’s determination to alter for Wyoming the definition of “geologically prospective” highlights how poor the deposits are in that state. It also raises serious questions regarding how the agency defines “geologically prospective.’ As the agency stated in the FPEIS, in Wyoming the oil shale resource is not as of high quality as it is in Colorado and Utah. 207

The BLM cites EAct as the basis for opening resource-poor oil shale deposit in Wyoming to commercial application. EAct provides the BLM “shall complete a programmatic environmental impact statement for a commercial leasing program for oil shale and tar sands resources on public lands, with an emphasis on the most geologically prospective lands within each of the States of Colorado, Utah, and Wyoming.”²⁰⁸ In requiring the BLM to evaluate “the most geologically prospective lands” in each state, EAct does not in turn require the BLM to open resource-poor lands to application for commercial development. That is a construct the BLM developed to meet a policy goal of opening large swaths of land for commercial development.

The BLM acknowledges that deposits less than the 25/25 standard are inferior resources and likely not suitable for development:

The BLM has determined that it would not make economic sense to open larger areas in Colorado and Utah to potential oil shale leasing where the resource is of low grade and unlikely to be developed at this time, because interest in future leasing would be directed at higher t.,rrade deposits In the future, once technology has progressed and the higher quality oil shale has been leased and developed, it may be economic to produce these lower--grade deposits. At that time, additional planning and NEPA analysis could be conducted to open these areas to leasing and development, where warranted. If however, technological progress and economic conditions rapidly come to support development of deposits less than 25 ft thick and yielding less than 25 gal/ton, the areas that would be open in Wyoming under Alternative 1, 2, or 4 would be available for future leasing without further land use planning amendments. 209

Additionally, because the BLM uses different standards for different states, the agency must define what “geologically prospective” means in each case. Congress did not define it, and nor did the BLM in the DPEIS. The closest the BLM comes to defining “geologically perspective” is found in footnote 4 on page 1-10. In that footnote, the BLM states that

Numerous sources of information were used to define the boundaries of the Green River Formation basins and the most geologically prospective oil shale resources. The basin boundaries were defined by digital data provided by the USGS taken from Green (1992), Green and Drouillard (1994), and Hintze et al. (2000). The most geologically prospective oil shale resources in the Piceance Basin were defined on the basis of digital data provided by the USGS taken from Pitman and Johnson (1978), Pitman (1979), and Pitman et al. (1989). In Wyoming, the most geologically prospective oil shale resources were defined on the basis of detailed analyses of available oil shale assay data (Wiig 2006a,b). In Utah, the most geologically prospective oil shale resources were defined by digital data provided by the BLM Utah State Office. 210

The question remains, if industry cannot economically develop the high-grade deposits found in Colorado and Utah, why would the BLM make available lands that fall below the 25/25 threshold in Wyoming. In October 2008, Scott Quillinan of the Wyoming State Geological Survey (WSGS) prepared a spatial analysis of oil shale deposits that met the 25/25 threshold. This analysis was based on data contained in the USGS Open-File Report 2008-1152, titled “Fischer assays of oil-shale drill cores and rotary cuttings from the greater Green River Basin, Southwestern Wyoming.” The WSGS analysis shows that a substantial acreage of Wyoming lands meet the 25/25 threshold. (See Attachment 7.) Thus, it is completely unnecessary to lower the threshold for oil shale leasing in Wyoming. The lack of a consistent standard across the

three-state region suggests the BLM is acting arbitrarily and capriciously. The BLM was right in making deposits unavailable for leasing in Colorado and Utah that were less than 25/25, but wrong to lower the standard in Wyoming. By adopting the 25/25 standard for all three states, the BLM can provide collateral protections from ill-considered oil shale projects for core or priority sage-grouse habitats, big game crucial ranges and migration corridors, and other valuable resources in Wyoming which are underlain by uneconomic oil shale deposits.

BLM Oil Shale and Tar Sands Draft Programmatic PEIS

Argonne National Laboratory

9700 S. Cass Avenue

EVS 240

Argonne, IL 60439

Subject : Comments on “2012 Oil Shale and Tar Sands Draft Programmatic Environmental Impact Statement (Draft PEIS)”.

Summary of Comments

The following statements summarize my general conclusions on the subject document as well as the DOI/BLM oil shale program as a whole:

<([#1 [1.5] 1. As with the 2008 Draft/Final PEIS, this 2012 “Draft” is not a PEIS for commercial leasing as mandated by the Energy Policy Act of 2005

(EPA2005).

2. The 2008 Draft/Final PEIS was the result of the Bush Administration/DOI/BLM and some old guard republican/democrat senators bungling combined with the conniving of big oil and odd lot snake oil salesmen. That group and its policies has resulted in the largest historical giveaway of US natural energy resources to big oil (with the lion's share going to foreign big oil at that) and snake oil promoters with essentially nothing in return for the US citizen. The 2012 Draft PEIS is a result of the Obama Administration/DOI/BLM and a few key democrat politicians combined with environmental special interest groups. Following this latest group's agenda will ultimately stop the development of this strategically important energy resource. Neither groups agendas are based on sound technical (engineering/science), economic, and environmental analysis combined with years of practical energy engineering experience. Both political groups and DOI/BLM administrators have systematically excluded small business/entrepreneur oil shale development that is based on sound technical, economic, and environmental science/engineering and may years of practical energy development experience.

3. If a new republican political administration is elected in November 2012, we can expect the Obama administration to follow suit with the previous Bush administration's action in late 2008/early 2009 wherein the Bushites rushed through so called "midnight" shale development regulations/legislation before Obama's inauguration in January 2009. If Romney is elected then it can be expected there will be significant midnight rushing by the Obamaites to finalize their oil shale development agenda-and subsequent action by the Romney administration to overturn the Obama agenda.

#1)> The following deals with specific statements made in the Draft and conclusions that can be drawn there from.

From the Draft, with content of particular interest marked in red type:

ES.6.3 Alternative 2, Oil Shale Conservation Focus Alternative (2a), and with RD&D First Requirement (2b), Oil Shale

RD&D First Requirement (2b). Under this alternative, the lands open for future leasing consideration would be the same as those in Alternative 2(a), but only for RD&D leases. The BLM would issue a commercial lease only when a lessee satisfies the conditions of its RD&D lease and the regulations at 43 CFR Subpart 3926 for conversion to a commercial lease. The preference right acreage, if any, which would be included in the converted lease, would be specified in the RD&D lease.

ES.7 PREFERRED ALTERNATIVE

2

At this stage in the planning and NEP A process, the BLM has chosen Alternative 2(b) as the preferred alternative for oil shale, and Alternative 2 as the preferred alternative for tar sands. With respect to oil shale, the BLM would like to maintain focus on RD&D projects, so as to obtain more information about the technological requirements for development of this resource, as well as the environmental implications, before committing to broad-scale commercial development. For instance, the BLM looks forward to gaining a clearer understanding of the implications of development of oil shale

for water quality and quantity.

2.3.3.1 Alternative 2, Oil Shale Conservation Focus (Alternative 2a), with RD&D First Requirement (2b)

Under this alternative, 10 land use plans in Colorado, Utah, and Wyoming would be amended to designate less than 830,000 acres (acreage opened under Alternative C in the 2008 OSTs PEIS) available for future commercial oil shale leasing. This alternative would exclude from commercial oil shale leasing the following categories or groups of categories of public lands and/or their resource values that may warrant protection from potential oil shale leasing and development:

The benefits of Alternative 2(b) would include facilitating a robust RD&D program. It would also avoid allowing a few companies to tie up large areas with speculative commercial leases. Thus it would promote access by innovative small companies to the federal oil shale resource for RD&D.

In the event that a commercially viable technology is demonstrated and becomes widely available in the near future, it is possible that Alternative 2(b) could result in delaying commercial leasing on federal lands. If that possibility, however speculative at the present, were to occur, the pertinent RMPs could be amended contemporaneously with review of proposed commercial leases. The oil shale leasing and management regulations at 43 CFR Part 3900 would not be affected by the selection of any alternative analyzed in this PEIS, and thus would remain available for future decisions concerning commercial leasing. As the Draft PEIS was being developed, the idea for this alternative emerged. It is presented here in brief. This alternative is not noted elsewhere in the document but will be developed further in preparation of the Final PEIS. Analytically, this subalternative is indistinguishable from Alternative 2(a) in terms of environmental consequences. Therefore further environmental analysis in preparation of the Final PEIS is not anticipated, although more detailed explanation may be provided, particularly in response to comments received.

3

Lands that fall under items 1 through 4, above, in and around the most geologically prospective oil shale areas in Colorado, Utah, and Wyoming are shown in Figures 2.3.3-1, 2.3.3-2, and 2.3.3-3, respectively. The Adobe Town “Very Rare or Uncommon” area is shown in Figure 2.3.3-3 in the eastern portion of the Washakie Basin in Wyoming. These various areas excluded from lands available for application under Alternative 2 are lands that were considered for exclusion under Alternative C of the 2008 OSTs PEIS as noted in item 5 above.

Lands available for application for oil shale leasing within the most geologically prospective area under Alternative 2 in Colorado, Utah and Wyoming are shown in Figures 2.3.3-4 2.3.3-5 and 2.3.3-6 respectively. Table 2.3.3-1 lists by state the approximate number of acres of BLM-administered land available for application for leasing under Alternative 2. Table 2.3.3-2 identifies the types of stipulations and restrictions in place for oil and gas leasing in each state that were used to identify those lands that would not be available for application for leasing for commercial oil shale development under Alternative C of the 2008 OSTs PEI. These lands total 57,657 acres.

[Commenter’s note: From Table 2.3.2.2 Alternative 2 lists 461,965 acres available for leasing with 35,308 acres in Colorado, 252,181 acres in Utah, and 174,476 acres in Wyoming. Of the 30,720 acres included in the existing RD&D leases only 6,612 acres within the current RDD leases would be available if current leaseholders relinquish their leases. Note also

Table 2.3.3.1 is for Alternative 1 as stated in the Table, not Alternative 2 as stated in the above text. The entire discussion of alternative 2 throughout the “Draft” is confusing and misleading to say the least including the following paragraph.]

In Alternative 2, portions of three of the five PRLAs for the Colorado RD&D leases are not identified as available for application for commercial leasing. These include portions of the areas associated with the Chevron, AMSO, and Shell Site 2 RD&D projects. For the other two Colorado RD&D projects, Shell Sites 1 and 3, none of the PRLAs coincide with the area identified as available for application for commercial leasing.

Also, as discussed in Section 2.3 .1, commercial leases for surface mining projects would be allowed only on those lands in Utah and Wyoming where the overburden is 0 to 500 ft thick. In Utah, under Alternative 2, lands available for application for leasing for surface mining projects total about 85,640 acres in the Vernal RMP planning area. In Wyoming, under Alternative 2, these lands total about 248,000 acres in the Green River RMP planning area.

4

2.4.3.2 Alternative 3, Tar Sands Pending Commercial Lease

This alternative is designed as an analogue to the Research Lands Focus Oil Shale Alternative 3, described in Section 2.3.3.2, in order to respond to scoping comments that called for consideration of closing public lands to all development other than research projects. Unlike with respect to oil shale, there is no specific RD&D ‘ program for tar sands. Therefore, this alternative would also analyze foregoing the leasing of tar sands for the commercial development of fluid mineral resources entirely except for one tar sands lease currently under consideration. The Asphalt Ridge tar sands lease application, shown in Figure 2.4.3-3, is located approximately 11 mi south of Vernal, and the expression of commercial leasing interest that forms its basis was submitted on November 16, 2009. This prospective lease is for a commercial tar sands project; however as with oil shale the technology to develop tar sands commercially for fluid minerals development is in its nascent stages.

My comments and conclusions based on the above report extracted statements:

<([#2 [2] 1. The rationale and basis for the four alternatives selected for consideration are never explained-and have no technical, economic, or rational basis in fact.

They are simply “political” selections without justification. This conclusion about “political selections” is made even more apparent by the last minute selection of alternative 2(b) as the preferred alternative for oil shale. The statements that Alternative 2(b) “emerged” apparently late in the development of the draft PEIS-and is described only briefly and will be developed further in the “FINAL” PEIS follows a pattern of the DOI/BLM not knowing what they are doing and also being directed politically to come up with some politicians correct answer. Recall that the PEIS mandated by the Energy Policy Act of 2005 started out as mandated by congress-however, half way through the whole effort was changed to a land use planning document without telling anyone. Furthermore, the Commercial Leasing Rule had a similar parallel-in that the final Rule lease rates were a big surprise in the FINAL Rule-they just appeared out of the blue without being included as a preferred alternative in the Draft Rule.

#2])> <([#3 [9.7] 2. “The benefits of Alternative 2(b) would include facilitating a robust RD&D program”. Just how is this robust RD&D program going to be facilitated or

evolve? Suggestions since 2004 to the DOI/BLM on the need for a common qualified RD&D site where all technologies could come and join in a national “cook off” have been dissed by the DOI/BLM under both the Bush and Obama administrations. Furthermore what has actually been done on the RDD leases issued to date? (1) next to nothing; (2) technologies proposed have been abandoned; and (3) technologies proposed are not new advanced technologies, but old in many cases. How will this new RDD program be any different? In most cases the technologies being pursued should be forbidden as a National Policy because of their lousy total energy (including kerogen) in to high quality energy out ratio, waste of kerogen not even processed, economics, and environmental impact. No RDD tests or commercial attempts are needed to demonstrate bad ideas and bad engineering. #3)>

5

<([#4 [6.3] 3. “It would also avoid allowing a few companies to tie up large areas with speculative commercial leases. Thus it would promote access by innovative small companies to the federal oil shale resource for RD&D”. [Section 2.3.3.1] What has happened in the past DOI/BLM oil shale development program-i.e. over the last 8 years since it was initiated in 2004? Large tracks of federal oil shale lands have become tied up by both big oil and smaller snake oil salesmen-all of which have been speculators, and two of which have already sold off their speculative leases-and both of which have changed their proposed technologies---one of which has changed technologies not only once but is now on their third technology. Furthermore although advanced new technology was a requirement for lease acquisition, in the one speculative case wherein three different technologies have been proposed and two abandoned-all three technologies are old technologies-not new, and certainly not advanced. As for the large big oil lease tracks what has been done--essentially nothing-and these tracks contain more recoverable oil than the total known proven conventional reserves of the US. And the small entrepreneur oil shale technology and project developer-has he obtained access to federal oil shale reserves for RDD/testing/cookoff? Thus far he has been excluded by one means or another. #4)>

<([#5 [10.3] 4. “In the event that a commercially viable technology is demonstrated and becomes widely available in the near future, it is possible that Alternative 2(b) could result in delaying commercial leasing on federal lands”. [Section 2.3.3.1] What’s implied here is that such a commercially viable technology could be developed outside of the DOI/BLM development program/agenda. If a viable technology is developed outside of the DOI/BLM program one would have to ask why did the developers have to accomplish this outside of having access to federal oil shale lands-must be something wrong with the DOI/BLM program.

#5)> <([#6 [2] 5. If the focus is going to be on RDD, then why are large total acreages being considered at all? All DOI/BLM RDD leases and private development not part of the DOI/BLM program will not utilize more than fractions of an acre or less than 5 acres maximum in terms of oil shale resource area plan area. There is no basis in fact for the need for lease acreages any larger than that.

#6])> <([#7 [2.2] 6. Alternative 2(b) excludes much of the PRLA land from commercial leasing although

this is contractually committed to current RDD leases for PRLA what does this mean? Although the entire description of Alternative 2 is less than brief because it just recently “emerged”, what description there is contradictory and confusing. If this is the “preferred” alternative you’d think DOI/BLM could at least write up a complete and comprehensive description of that alternative. It also means that land already contractually committed to in the RDD leases would now be reneged on by the DOI/BLM as far as any new applicants are concerned-just another twisted example of the fecklessness, incompetence, and corruption of the politicians who control the DOI/BLM and the willingness of the DOI/BLM administrators and staff to go along with folks in power. **#7])>**

<([#8 [6.3.5] 7. DOI/BLM continues to use the term “nascent” technologies and that these “nascent” technologies need RDD to prove their viability. The facts are most of the technologies under consideration are old and their viability has been discredited in prior projects. Other technologies which are regarded as new are either not new, or their viability can be debunked by thorough engineering analysis and no tests are required. This includes accurate estimates on energy input (including kerogen chemical energy) to high quality energy output, economics, environmental impacts, and total water use. For most of the technologies under development (old or new) they are non starters not worthy of the stockholders investment money, nor beneficial to the economy or strategic interests of the United States. DOI/BLM simply has no oil shale technology people, nor 3rd party consultants, qualified to conduct such analysis. Furthermore any meaningful environmental impact analysis must consider the specific technology--Otherwise the entire environmental impact analysis is meaningless. #8])>

<([#9 [1.1] 8. Bottom line-(1) other than maintaining legal standing for future possible litigation it’s been a waste of time providing comments to the DOI/BLM over the last 8 years. Time which would have been much better spent on the development of my proprietary BLACK BOX PYROLYSIS I & II processes; (2) The Federal Government (Presidential administrations, Senators, House of Representatives, and the DOI/BLM/EPA) is feckless, incompetent, and usually corrupt when it comes to stewarding the Federal land/resources as evidenced by the state of the DOI/BLM oil shale program. #9])>

This concludes my comments and conclusions. If there are questions or anyone within the DOI/BLM wishes to discuss the Draft PEIS or the DOI/BLM program or technologies under consideration feel free to contact me by mail, telephone, or e-mail. Sincerely,

Brent C. Fryer, ScD

Submission Text

Comments on the Draft Oil Shale and Tar Sands Resource Management Plan Amendments to address Land Use Allocation in Colorado, Utah, and Wyoming Programmatic Environmental Impact Statement

The U.S. Fish and Wildlife Service (Service) has reviewed the subject draft Programmatic Environmental Impact Statement (PEIS). These comments are submitted pursuant to our authorities under the National Environmental Policy Act (NEPA) of 1969, as amended (42 U.S.C. 4321 et seq.); Fish and Wildlife Coordination Act (16 U.S.C. §661 et seq.); Endangered Species Act of 1973, as amended (16 U.S.C. §§1531 to 1543 et seq.); Migratory Bird Treaty Act of 1918, as amended (16 U.S.C. §703 et seq.); Executive Order 13186 for the Conservation of Migratory Birds; and, the Bald and Golden Eagle Protection Act, as amended (16 U.S.C. §668 et seq.).

We appreciate the considerable task before the Bureau of Land Management (BLM) in achieving the requirements of Section 369 of the 2005 Energy Policy Act while also meeting the requirements of the NEPA. The subject draft PEIS analyzes the effects of amending 10 land use plans in Colorado, Utah, and Wyoming to describe those areas that will be open and those that will be closed to application for commercial leasing, exploration, and development of oil shale and tar sands resources.

The draft PEIS analyzes four alternatives in detail for allocation of oil shale leases (two of these include subalternatives) and four analogous alternatives for allocation of tar sands. The BLM has selected Alternative 2(b) as the Preferred Alternative for oil shale and Alternative 2 as the Preferred Alternative for tar sands. The Preferred Alternative would make something less than 830,000 acres available for future leasing applications for commercial oil shale, but only for research, development, and demonstration (RD&D) purposes. The BLM would issue a commercial lease only when a lessee satisfies the conditions of its RD&D lease and the regulations at 43 CFR Subpart 3926 for conversion to a commercial lease. The preference right acreage, if any, which would be included in the converted lease, would be specified in the RD&D lease. The Preferred Alternative also would make something less than 229,000 acres available for application for commercial tar sands leasing.

<([#1 [9.3] Our primary concern with the draft PEIS is the lack of information about the potential mining

technologies to be employed, to the extent that identifying and mitigating cumulative impacts is extremely difficult. The BLM identified this problem in the draft PEIS “Because commercial oil shale development technologies are still largely in a research and development phase, many details regarding the specific technologies that would be used in the future to produce oil from oil shale are unknown” (p. 2-16). To remedy this concern, it is our understanding that once

viable technologies are determined through the RD&D program, the BLM will conduct additional NEP A analyses to evaluate the large-scale cumulative effects of a leasing program, including specific areas to be leased and the conditions and stipulations under which leases will be sold. At the future leasing stage we believe there may be a need to consider additional programmatic NEP A review.

#1) **<([#2 [2.2.1]** The Service supports BLM's selection of Alternative 2(b)/Alternative 2 as the Preferred

Alternative. However, we believe more detailed information regarding direct, indirect, and cumulative impacts to water use and water quality in the Colorado River basin are needed to evaluate potentially substantial impacts on fish and wildlife resources. **#2)** **<([#3 [6.3]** In addition, more details

are needed about the type of heavy equipment, processing facilities, pipelines, storage tanks, industrial equipment, roads, and other infrastructure for fuel extraction and processing in order to adequately address the potential environmental implications.

#3) **>** We have provided General Comments in Attachment 1 and Specific Comments in Attachment 2

to assist the BLM in preparing the final PEIS. We appreciate the opportunity to provide comments. Please contact Michael Thabault, Assistant Regional Director- Ecological Services, at (303) 236-4210 if you have any questions or need further information.

General Comments on the BLM's Resource Management Plan Amendments and Draft PEIS for the Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the BLM in Colorado, Utah, and Wyoming (issued February 2012)

After reevaluating the earlier (2008) PEIS, the BLM proposes to amend 10 land use plans to designate lands available for commercial leasing of oil shale and tar sands. The BLM's preferred alternative for oil shale allocation is 2(b). This alternative would allow commercial oil shale development on available lease parcels only after the applicant satisfies the requirements under the Research, Development and Demonstration (RD&D) Program. The BLM's preferred alternative for tar sands land allocation is alternative 2. Under alternative 2, commercial tar sands development can occur without the RD&D program requirement. The areas excluded for leasing both minerals are:

- All areas that the BLM has identified or may identify as a result of inventories conducted during this planning process, as lands having wilderness characteristics;
- The whole of the Adobe Town "Very Rare or Uncommon" area, as designated by the Wyoming Environment Quality Council on April 10, 2008;
- Core or priority sage-grouse habitat, as defined by such guidance as the BL_M or the DOI may Issue;
- All Areas of Critical Environmental Concern (ACECs) located within the areas analyzed in the 2008 PEIS (76,666 acres in existing ACECs in the 2008 PEIS plus additional ACEC acreages as a result of Utah and Wyoming planning efforts recently completed); and
- All areas identified as excluded from commercial oil shale and tar sands leasing in Alternative C of the September 2008 PEIS.

USFWS understands that Section 369 requires the Department of the Interior to evaluate the effects of commercial leasing of ELM-administered lands in Colorado, Utah, and Wyoming, and we appreciate the stepwise fashion in which BLM has approached the development of a

commercial leasing program. It is our understanding that once viable technologies are identified through the RD&D program, BLM will conduct additional NEP A analyses to evaluate the large-scale impacts of a leasing program, including specific areas offered for lease and the conditions and stipulations under which leases will be sold.

<([#4 [6.3] The draft PEIS strives to assess the broad implications of designating lands that could be made

available for commercial leasing; however, that task is particularly difficult without knowing the viable mining technologies to be employed. More detail about the type of heavy equipment, processing facilities, pipelines, storage tanks, industrial equipment, roads, and other needed to extract these resources is necessary to appropriately evaluate impacts on wildlife resources.

#4)> <([#5 [9.3] Although the draft PEIS states that additional NEP A analysis will be required prior to

commercial leasing, it is unclear at what level additional analysis will take place. USFWS believes further NEP A analysis at the programmatic level will be needed to address the cumulative effects of a defined leasing program. We are concerned that without a programmatic level of analysis once technologies are determined and better understood, large-scale leasing may have significant impacts to certain listed and non-listed fish and wildlife resources. Cumulative effects resulting from incremental impacts on water quality, water quantity, air quality, traffic volume and other disturbance are some of the stressors that could affect populations of widely ranging species in the action area.

#5)> <([#6 [3.7.5.1] Sage Grouse

The preferred alternative (2b) in the oil shale/tar sands draft PEIS states that core or priority sage-grouse habitat would be excluded from leasing (Section 2.3.3.1; p. 2-34). However, the map of Colorado lands (Figure 2.3.3-4) that would be made available for oil shale lease applications under the preferred alternative appears to overlap areas that BLM has mapped [http://www.blm.gov/co/st/enfBLM_Programs/wildlife/sage-grouse.print.html] as sage-grouse priority habitat. We recommend that all priority sage-grouse habitat be excluded from application for oil shale and tar sands leasing and that apparent inconsistencies in maps be resolved.

#6)> <([#7 [3.7.4.3] [9.2] Bald and Golden Eagle

Information concerning eagles in Chapter 3, Affected Environment, should be revised and updated to reflect the USFWS' new regulations for take of bald and golden eagles and their nests under 50 CFR §§ 22.26 and 2.27, as summarized below.

Activities that take eagles or eagle nests may violate the Bald and Golden Eagle Protection Act (BGEP A). That Act defines the "take" of an eagle to include a broad range of actions, including to: "pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, or molest or disturb." In 2009, USFWS issued regulations (50CFR 22.3) that define "disturb" as:

to agitate or bother a bald or golden eagle to a degree that causes, or is likely to cause, based on the best scientific information available, (1) injury to an eagle, (2) a decrease in its productivity, by substantially interfering with normal breeding, feeding, or sheltering behavior, or (3) nest abandonment, by substantially interfering with normal breeding, feeding, or sheltering behavior.

Many of the field activities associated with oil shale and tar sands mining and processing have the potential to impact eagles, and protective measures necessary to comply with BGEP A will need to be considered.

On a limited basis, USFWS has the ability to authorize the take of eagles when: thresholds for

take in the eagle population have not yet been reached and take is compatible with stable or increasing breeding population; comprehensive measures to avoid and reduce take are developed in coordination with USFWS, and; any subsequent take is unavoidable. Permits will authorize limited, non-purposeful take of bald and golden eagles; authorizing individuals, companies, government agencies (including Tribal governments), and other organizations to disturb or otherwise take eagles in the course of conducting otherwise lawful activities. Removal of eagle nests would usually only be allowed when it is necessary to protect human safety or the safety of the eagles. Permits issued by USFWS may require pre- or post-project surveys, and may require that conservation measures be implemented to offset unavoidable take. #7)>

<([#8 [3.7.4.1] [9.3] [1.4] ESA Interagency Consultation

USFWS commends BLM for including a discussion within the draft PEIS of threatened and endangered species and critical habitat that are likely to be encountered by future oil shale and tar sands development projects. We also recognize the efforts of BLM to coordinate with USFWS in the development of measures to support the conservation of federally listed threatened and endangered species presented in Appendix F. However, USFWS remains concerned about the lack of information available on mining technologies and the potential for cumulative impacts to federally listed species.

With particular regard to the potential need for water and the impacts on water quality, the unknown effects of area-wide oil shale and tar sands development could threaten listed species within the Colorado River Basin. We encourage BLM to further develop and incorporate conservation measures for listed species in the final PEIS and into future NEP A documents associated with specific leasing and development actions. NEP A analyses should include specific conservation guidelines for special-status species that will be applied to site-specific NEPA, consultation, and implementation documents of all future proposed projects. We recommend that you contact our Field Offices for assistance in developing those guidelines. Including guidelines at this level of NEPA review would set standards to direct the future planning and implementation of oil shale projects and ensure that special-status species are considered in future site-specific projects within the PEIS study area.

BLM is proposing to conduct Section 7 consultations when developing supplemental Environmental Assessments associated with future lease sales and projects. We have concerns that a fragmented consultation process will preclude the ability to conduct a cumulative effects analysis, not only for oil shale and tar sands development but also for other land development in the action area. Therefore, we recommend that a landscape level evaluation be used once viable technologies and program details are identified. Species that should have landscape level plans based on land use and future oil shale tar sand development include the four endangered fish of the Colorado River and tributaries, black-footed ferret, white-tailed prairie dog, and the greater sage-grouse. Early consultation considering a landscape-scale view can identify concerns early in the planning process and help identify strategies to assist in recovery of listed species.

#8)>

Comment# EIS Section Page/Line Comment/Suggested Revision I

<([#9 [3.7.4.11] 1) Table 2.6.1 2-98: For Alternative 2 the PEIS states “no critical habitat will be impacted under this alternative.” We do I

not agree with this statement because water depletions from the upper Colorado River Basin, as well

as adverse changes to stream water quality, would have an adverse impact to critical habitat for

the

four endangered Colorado River Basin fish species. We recommend this statement of impacts be changed to indicate possible downstream impacts on critical habitat for listed fish.

#9)> <(**#10** [3.7.4.5] 2) Table 2.6.1 2-123: It appears that information in the Table for Alternative 2 is incorrect. We recommend the BLM

delete the reference to 4 71 acres designated as critical to the Mexican spotted owl from consideration for commercial tar sands leases under Alternative 2.

#10)> <(**#11** [3.7.3.2] 3) 3.7.3 and elsewhere: We do not believe wild horse and burros should be included as “wildlife” in the PEIS. BLM

manages these animals under separate legislation and programs from their wildlife management program. For purposes of the PEIS, feral horse and burro information, discussions, and analyses should be separate from that of “wildlife.” This would apply to Chapters 3, 4, 5 and 6.

#11)> <(**#12** [3.7.3.12] 4) Chapter 3, Section 3. 7.3 3-158, 1: It is unclear whether the statement here refers to BLM’s wildlife management objectives. If so,

please qualify the statement by explaining that in general the goals and objectives of wildlife management are broader than those stated here.

#12)> <(**#13** [3.7.3.12] 5) Chapter 3, Section 3. 7.3, 3-158, 7-9: If the text is supposed to be a statement about the U.S. Fish and Wildlife Service’s (USFWS) roles and responsibilities relative to wildlife management then the statement is inaccurate and fails to fully describe this for USFWS. However, if the statement is supposed to reflect USFWS’ role in wildlife

management relative to BLM lands then the statement should be revised to properly qualify it.

#13)> <(**#14** [3.7.3.12] 6) Chapter 3, Section 3. 7.3.2, 3-160, 14-15: “The following discussion describes important groups of birds ... “ This statement and the accompanying text infer an undefined ‘value’ on bird groups. Although some groups of migratory

birds have greater value to humans than others, the BLM has a responsibility to comply with the Migratory Bird Treaty Act (MBTA) (and BLM’s MOU pursuant to E.O. 13186) to conserve migratory birds regardless of whether these species are “valued” by humans.

#14)> <(**#15** [3.7.3.3] 7) Chapter 3, Section 3. 7 3.2, 3-159-3-162: Headers used for Section 3.7.3.2 Birds: The headers that are used do not address many bird species present in the PEIS study area. We suggest an alternate approach--to discuss each bird order that occurs in the PEIS area under a separate subheader.

#15)> <(**#16** [3.7.3.3] 8) Chapter 3, Section 3. 7.3.2, 3-161-3-162: The PEIS subsection for Neotropical Migrants is inaccurate since all of the birds listed on lines 41-46 on page 3-161 and lines 1-2 on page 3-162 are passerines, whereas the term ‘neotropical migrant’ refers to about 3 86 bird species from 18 bird orders (see <http://www.fws.gov/birdhabitat/Grants/NMBCA/BirdList.shtm>) not just passerine species.

#16)> <(**#17** [3.7.4.5] 9) Table 3.7.3-2, Figure 3.7.3-2, 3-167, 168: The organizational format, with a table and figure for wild horses within the “Threatened, Endangered, and Sensitive species” subsection, is inappropriate. We recommend that Table and Figure be moved.

#17)> <(**#18** [3.7.4.3] 10) Chapter 3, Section 3.7.4.5, 3-201, 19-33: We recommend the discussion on the bald eagle also include language describing the prohibition of take under the Bald and Golden eagle Protection Act (BGEPA) and USFWS regulations.

#18)> <(**#19** [6.3.2] 11) 4.1.2, 4.5.1.3 Waste Water, 4-9, 4-37: The PEIS states that retorts

produce 2 to 10 gallons of wastewater per ton of processed shale, which contains various organic and inorganic components that may need treatment depending on final use. Please quantify how much wastewater is likely to be produced overall, and how that water will be stored, treated and/or disposed.

#19)]> <([#20 [3.7.1.2] [3.4.6] 12) 4.5.1 Water Resources, 4-31 to 4-37: USFWS shares all the concerns of water quality impacts identified on pages 4-31 and 4-32 in Section 4.5. USFWS has particular concern for designated critical habitat for the Colorado pikeminnow, razorback sucker, bonytail, and humpback chub in the White and Green Rivers, plus their associated tributaries (e.g., Piceance and Yellow Creeks). The PEIS should clarify that water depletions would decrease the assimilative capacity of the receiving streams for any discharges associated with oil shale and tar sands development, and incorporating the following information:

Many kinds of contaminants enter into the upper basin rivers- e.g., mercury from airborne power plant emissions, selenium entering the river via groundwater irrigation return, hydrocarbons running off of oil and gas development sites, pesticides from agricultural areas.

In addition, this section should include more discussion on the possible contaminants that may come off of runoff from oil shale and tar sands operations, including selenium, which is of particular concern for endangered fishes. Water depletions and replacement with lower quality waters are of particular concern in feeder streams and backwater areas with limited flushing (Woodward et al. 1985). In sum, water depletions alone can lead to increased concentrations of existing contaminants; that is, water quality is tied to water quantity. If there is less water to dilute these contaminant loads in western rivers, the effect on all aquatic organisms, endangered fish included, is magnified.

#20)]> <([#21 [3.4.1] [3.7.1.2] [3.7.2] [3.7.3.4] [3.7.3.6] [3.7.3.11] 13) 4.5.1.3 Contaminants, 4-37 to 4-39: Oil shale and tar sands development may cause significant effects to threatened and endangered species, migratory birds and other wildlife species, as well as, ground and surface waters (Bartis et al. 2005).

Uncontrolled development associated with the oil shale industry in northeastern Estonia has resulted in significant ecological damage (Tuvikene et al. 1999). Runoff from oil shale mines, oil shale ash piles, and associated power plants have resulted in oil shale leachate polluting rivers and lakes (Truu 2004, Tuvikene et al. 1999). Pollution resulting from the leaching of oil shale deposits has also been documented in the United States (Amy et al. 1980, Stollenwerk and Runnells 1981).

There are interrelated and interdependent effects from infrastructure associated with oil shale and tar sands development including new roads, new reservoirs, new powerplants, pipelines, and powerlines. In future correspondence and ESA interagency consultation, the USFWS will request a more detailed analysis of all effects of the proposed action on federally-listed threatened and endangered species, migratory birds, and wetlands.

We recommend the BLM require ground and surface water quality data for each future project be measured and made available online. Waste water and leachate concentrations should be compared to established NPDES standards.

For contaminants where no NPDES levels have yet been set, we recommend that a Biological Technical Advisory Group (BTAG) be organized with EPA, BLM, and the USFWS to identify which contaminants should be monitored and what concentration levels would trigger enhanced mitigation to protect fish, wildlife, and plants.

#21)]> <([#22 [3.7.1.2] [3.7.4.6] 14) 4.5.2 Water Budget, 4-41: All of the alternatives would require extensive water resources. The upper Colorado River basin is a

heavily-developed, desert river system. If any future project (or series of projects) that requires large quantities of water from the upper basin rivers is authorized, meeting stream flow needs of endangered fishes will be difficult.

Critical habitat has been designated for endangered fish species along segments of various large rivers in the upper Colorado River Basin, including the Green and White Rivers. Most of these rivers have established flow recommendations for endangered fish. (Flow recommendations for the

White River are currently under development.) However, even when flow recommendations exist,

this does not guarantee the flow recommendation will be met. As an example, in the San Juan River

there is only one major dam being regulated by one agency and base flows are supposedly being protected by an established set of flow recommendations. Despite this, there have been years when

the prescribed base flows were not met. This was the case in 2002, when the recommended minimum base flows of 500 CFS were not being met in the river channel downstream of Farmington, NM. In fact, flows were less than 250 CFS for long periods of time in almost 150 miles

of river. This had highly detrimental effects on the native fish community, concentrating both contaminants and nonnative fish into the same small pool habitats with the native fish. While most

larger sub-adult and adult native fish were able to weather that low-flow summer, almost an entire

year-class of newly-spawned native fishes (e.g., razorback sucker, Colorado pikeminnow, flannelmouth sucker, and bluehead sucker) were lost to predation by birds and nonnative fishes, high

water temperatures (leading to temperature-related stress and “ich” { *Ichthyophthirius multiliis* } infections), and other associated stressors. The cumulative effect of large water depletion projects

on flows for endangered fish and critical habitat should be thoroughly considered and disclosed to

the public and other agencies in your analysis.

#22])> <([#23 [3.7.1.2] 15) Secs 4.5.2.1 and 4.5.2.2, 4-46-48: Upwards of 8,000 acre-feet of water could be required per project (less for underground projects).

Therefore, each project could be approaching 4.5 percent of the “available” water by 2050. We recommend that an analysis of how this might affect endangered fishes be included in the PEIS, and

we provide the following information for your consideration:

The White River, in particular, is at risk from oil shale related water depletions and potential . contamination. Flow recommendations are currently being developed by the Upper Colorado River

Endangered Fishes Recovery Program (Schmidt and Orchard 2002, Irving et al. 2002). Once the flow recommendations are finalized, a Programmatic Biological Opinion will be developed for the

White River. We recommend that BLM review the draft flow recommendations and determine the

effects of oil shale development on flows in the White River.

The White River has a relatively intact and healthy native fish community. Both the Utah Division

Water Budget for of Wildlife Resources (UDWR) and the USFWS have documented that both endangered Colorado

Colorado and Utah pikeminnow and the native three species (flannelmouth sucker, bluehead sucker, and roundtail chub)

of fishes are present in promising numbers in the White River. During the recent period, the number

of the endangered razorback sucker in the White River has increased, almost certainly due to augmentation of hatchery-raised fish. In 2011, razorback sucker larvae were collected in the White

River for the first time, indicating that natural spawning likely occurred.

The White River has relatively low numbers of nonnative fish species, which compete with native

endangered fish. Low, steady river flows that occur year-round and which lack high spring flow runoff tend to favor survival and proliferation of introduced, nonnative fishes over native fish species. Thus, any water development individually or cumulatively in the White River basin (or any

upper basin river), has the potential to modify the flow regime to favor introduced, nonnative fishes.

The PEIS provides no real cumulative quantification or rigorous landscape level analyses of change

given the overall developable acreage.

#23])> <([#24 [3.7.3.12] 16) 4.8 Impacts to Ecological Resources, Tables 4.8.1: Terms for impacts that are used in the PEIS such as “Large”/”Small” give no indication of how the impact was analyzed or the scale or scope of those impacts. It appears throughout the document that this was a judgment call. We recommend the PEIS provide more detail regarding the science, qualification, and scale of these impacts. #24])>

<([#25 [3.7.3.4] 17) 4.8.1.3 Wildlife and Migratory Birds 4-85: Please modify the wording because migratory birds do not always “fly over” mine sites. Whereas, water in contaminated leachate pools often attract them to mine sites, especially during migration.

The PEIS does not adequately address the potential use of wastewater impoundments or evaporation

ponds for wastewater disposal or identify measures to prevent migratory bird mortality in these facilities. Large tailings ponds are used in the tar sands development sites of Alberta. Those extensive impoundments have resulted in the loss of large numbers of birds.

#25])> <([#26 [3.7.3.12] 18) Chapter 4, Section 4.8.13.4 4-91,30-33: The PEIS states no raptors would be electrocuted because the spacing of the infrastructure would exceed that of the largest raptors in the study area. Without further definition of what the spacing would be this statement may be inaccurate. If the standard BLM intends to apply to any electric power lines constructed in conjunction with oil shale/tar sands development are those of the APLIC 2006 Suggested Practices manual then please be aware these standards will not eliminate raptor electrocutions. The current APLIC standards are based on “dry feather” conditions. That is the spacing recommendations from APLIC would prevent electrocutions only if the bird feathers are dry. If they are wet then the spacing requirements to fully prevent bird electrocutions would be

greater. The APLIC 2006 Suggested Practices manual discusses this point directly.

#26) > <(**#27** [3.7.5.1] 19) 4.8.2 (and 1.4.6) Greater sage-grouse Mitigation Measures, 4-124 to 4-126: We recommend that that the PEIS incorporate information related to the new effort by BLM to protect

the greater sage-grouse through range-wide resource management plan amendments, including the

relatively new delineation of priority and general habitat for sage-grouse (at least in Colorado).

We also

recommend incorporating the noise restrictions as set forth in the relatively new Disturbance Density

Calculation Tool that is used for projects located in core or priority habitat areas.

#27) > <(**#28** [3.7.3.4] [5] 20) 4.8.2.3 Migratory Birds 4-129: We recommend a more detailed discussion be provided outlining the potential for migratory birds to

be attracted to watery, yet contaminated, pits created for a project. Fencing and netting to prevent Wildlife and bird use may reduce potential impacts. Radar, noise makers, and regular effectiveness monitoring is also encouraged.

#28) > <(**#29** [3.7.3.5] 21) Chapter 5, Section 5.8.1.3.9, 5-84,45-46: We disagree with the statement in this section regarding raptor response to fire (burned habitat). Rangeland systems with repeated fire (i.e. cheat grass fire cycles) are over time converted to annual grasslands with negative consequences for raptor populations. Ongoing work in Utah (with involvement from UDWR and the USFWS) is demonstrating this quantitatively for golden eagle populations. This is likely true for many other raptors that inhabit rangeland systems but corresponding investigations to demonstrate this have not yet been undertaken.

#29) > <(**#30** [3.7.4.3] 22) Table 6.1.1-8, 6-38, Table 6.1.2-2, 6-97: Correction needed: The western yellow-billed cuckoo could be found in appropriate habitats in Colorado in Rio Blanco and Garfield Counties.

#30) > <(**#31** [3.7.4.3] 23) Table 6.1.1-8, 6-47: Correction needed: The Mexican spotted owl could be found in appropriate habitats in Colorado in Rio Blanco and Garfield Counties.

#31) > <(**#32** [3.7.5.1] 24) 6.1.2.7.4, Fig. 6.1.2-5 Greater sage-grouse Habitat, 6-80, 6-108: “Under this alternative [2], oil shale development would be excluded from core or priority habitats for the greater sage-grouse ... “ This statement and section, and associated maps, should be updated

with the new Colorado Parks and Wildlife greater sage-grouse priority habitat map that was issued

March 13, 2012 (http://www.blm.gov/co/st/en!BLM_Programs/wildlife/sage-grouse.html). This may result in some areas being removed from the preferred alternative that occur within priority habitat (e.g., scattered parcels in the southern portion of the potential lease area in Colorado).

#32) > <(**#33** [3.7.3.2] 25) Figure 6.1.2-3 6-81: It seems inappropriate to have the figure for wild herd management included here.

#33) > <(**#34** [3.7.4.5] 26) Table 6.1.2-3 Figure 6.1.2-4 Figure 6.1.2-5, 6-104 to 108: The location of this table and figure seems misplaced; they should be relocated to the section that refers to them. (This table and figure should be located where Figure 6.1.2.3 is.)

#34) > <(**#35** [4.3] 27) Sec. 6.2.6.1.1 Assumptions, 6-481: The assumptions presented here are based on data that are fairly old. We recommend that the information be updated. Most companies in the region are developing surface locations with multi- well pads (UDOGM, 20 12). Many existing 40-acre surface locations in Utah have

multiple wells; in Colorado, most well pads have multiple wells. This is good since it restricts the amount of 20-acre surface developments; however, pad sizes have increased. Reclamation has not occurred at the levels anticipated with the continued expansion to add more wells to existing facilities.

#35)]> <([#36 [4.2] 29) 6.2.6.2.4 Major Activities in Tar Sands Areas Table 6.2.6-4: Please clarify that phosphate and other mineral mining have the potential to become cumulative contaminant point sources for leachate contaminants (i.e., selenium and arsenic) along with Tar Sands development. In a large landscape such as the Colorado River basin, or the Diamond Mine area, each of these cumulative contaminant inputs have the potential to become highly significant over time and space with impacts to aquatic resources, Colorado River Basin fishes, and migratory birds.

#36)]> <([#37 [3.7.4.4] [9.2] 30) F.1: The PEIS states that all post-lease activities will be required to comply with ESA, BGEPA, and MBTA. However, compliance with the MBTA is challenging. Oil shale and tar sands resources development is likely to result in the take of MBT A species and there is currently no mechanism for USFWS to permit the unintentional (incidental) take of migratory birds associated with these actions. The PDEIS should encourage the applicants to communicate with the USFWS to address and minimize the potential for unintentional take of migratory birds.

#37)]> <([#38 [3.7.4.4] 31) F.1: Text of the opening paragraph on page F-3 refers only to listed species. The text should be corrected to indicate that the appendix addresses conservation measures for eagles covered under the BGEPA,

and birds covered under the MBTA, in addition to threatened and endangered species.

We suggest that the intent of the introductory paragraph of Appendix F is to provide measures to address each statute. If so, we suggest the use of separate headers for ESA, BGEPA, and MBT A

species and discuss conservation measures for each group of species covered under each of these Federal wildlife statutes. **#38)]>**

<([#39 [3.7.4.5] [5] 32) page F-8: For item 6 on page F-8, the APLIC manual for avoiding bird collisions with power lines should also be cited-- *Avian Power Line Interaction Committee (APLIC). 1994. Mitigating bird collisions with power lines: the state of the art in 1994. Washington, DC: Edison Electric Institute; 78 p* --along with a recommendation to follow all measures in the manual that apply. (A revised version of the APLIC manual is due to be issued in 2012.) **#39)]>**

<([#40 [3.7.4.4] 33) F.2.8 F-17: We recommend surveys for the Dudley Bluffs bladderpod and twinpod extend up to 600 meters (roughly 2,000 feet) from project activities within suitable habitat.

#40)]>

<([#41 [3.7.5.1] [3.7.5.3] 34) F.3.1 F-19: Please incorporate greater sage-grouse as a priority and include general habitat maps for sage-grouse. We also suggest changing the wording of #3 to state "When possible, avoid siting energy developments in priority habitats," rather than simply breeding habitats. **#41)]>**

<([#42 [3.7.4.3] [3.7.4.4] 35) F.3.2 F-20: To our knowledge, the yellow-billed cuckoo has not been documented within the oil shale lease area in Colorado. However, this could be due to lack of survey effort as cuckoos may occur in this area. The cuckoo conservation measures should be applied to suitable habitat in Colorado as well as in Utah.

#42])>

<([#43 [3.7.4.4] 36) F.4 F-21: The text provides three items that BLM recommends for migratory bird conservation. In addition to these three items, the USFWS recommends that project planning include surveys for migratory birds and nests that would be undertaken prior to construction activities, as well as the identification of measures that will be taken to conserve active nests when located.

OSTS_072_EPA_Email_OSTIS2012D00073.pdf (OSTS_072-59122.pdf Size = 2679 KB)

Submission Text

In accordance with our responsibilities under Section 102(2)(C) of the National Environmental Policy Act (NEPA), 42 U.S.C. Section 4332(2)(C), and Section 309 of the Clean Air Act (CAA), 42 U.S.C. Section 7609, the U.S. Environmental Protection Agency Region 8 (EPA) has reviewed the Bureau of Land Management's (BLM) Draft Programmatic Environmental Impact Statement and Possible Land Use Plan Amendments for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the BLM in Colorado, Utah, and Wyoming (Draft PEIS).

Background and Project Description

In 2008, the BLM amended twelve land use plans in Colorado, Utah and Wyoming to designate public lands administered by the BLM as available for commercial leasing for oil shale or tar sands

development through the preparation of a PEIS (2008 OSTIS PEIS). These 2008 amendments made

approximately 2 million acres of public land available for application for leasing and development of oil shale, and approximately 431 ,000 acres of public land available for application for leasing and

development of tar sands. In 2009 the 2008 OSTIS PEIS was challenged in a lawsuit brought by a coalition of environmental organizations. As part of the resulting settlement agreement filed with the

U.S. District Court in Colorado in February of 2011, BLM decided to take a fresh look at the land allocations analyzed in the 2008 OSTIS PEIS and consider excluding certain lands from future leasing of oil shale and tar sands resources.

It is important to note that the Preferred Alternative represents an approximate 77% reduction in land

proposed as available for application for oil shale leasing as compared to the 2008 OSTIS PEIS decision. Similarly for tar sands leasing, the Preferred Alternative represents an approximate 79% reduction in land proposed as available compared to the 2008 decision. These changes represent significant steps toward protecting environmental resources. The Draft PEIS analyses four alternatives: Alternative 1 (no action), Alternative 2 (conservation focus), Alternative 3 (research lands focus) and Alternative 4 (moderate development). Alternative 2 consists of two options for oil shale. Alternative 2(a) excludes all lands having wilderness characteristics (LWC), the whole of the Adobe Town “Very Rare or Uncommon Area,” core or priority sage-grouse habitat and all areas of critical environmental concern (ACEC). Alternative 2(b) lands available for application for leasing and development of oil shale would be the same as Alternative 2(a); however, only for research, development and demonstration (RD&D) leases. A key benefit of Alternative 2(b) would be facilitation of a robust RD&D program for oil shale development. The BLM has identified Alternative 2(b) as the Agency’s Preferred Alternative.

The EPA’s Comments and Recommendations

The EPA appreciates having had the opportunity to consult with the BLM on the Draft PEIS and to see that many of our specific comments have been addressed. We remain committed to working with BLM to seek ways to address a few additional comments. The EPA focuses these comments on the need for rigorous NEPA analysis at future leasing and project decisions, particularly analysis regarding water resources and air quality. Along with an explanation of these comments, we offer recommendations on how the BLM might address them.

<([#1 [9.3] A. NEPA at Future Leasing and Project Decisions

The EPA’s most essential remaining recommendation is that BLM make a strong and clear commitment in the Final PEIS that the agency will conduct additional NEPA analysis and disclosure prior to leasing any land for oil shale/tar sands development and also after development technologies and their potential impacts are better defined and understood. As the Draft PEIS explains, oil shale development will involve untested technologies where the magnitude and nature of impacts is currently undetermined, but may be significant. Furthermore, key information needed to evaluate and mitigate potential impacts is not yet available, including future project locations, operating characteristics, size and scope of the projects, and likely impacts and mitigation measures.

Given this situation, the EPA is reviewing this document with the assumption that the level of NEPA at future leasing and project decisions will be an EIS, and that BLM will perform rigorous NEPA analyses when technologies are better understood. We believe it is important for the Final PEIS to include a commitment to preparing EISs for future leasing and project decisions, and to confirm that BLM will fully disclose direct, indirect and cumulative impacts of future leasing and development decisions and apply mitigation necessary to reduce those impacts.

The Draft PEIS notes that the concept for the Preferred Alternative emerged during development of this document, is presented only in brief, and will be developed further in preparation of the Final PEIS (page 2-35). The EPA believes the Preferred Alternative gives BLM an opportunity to acquire important data during RD&D leasing and prior to commercial leasing that will be useful to inform future NEPA analyses. The EPA recommends the Final PEIS discuss how the BLM intends to use the RD&D leasing process to assess potential impacts on water resources and air quality, thereby positioning BLM to mitigate these potential impacts in the event commercial leasing becomes viable. In addition, we recommend the Final PEIS identify the

types of data sets that BLM may require be provided by RD&D lessees. #1)>

<([#2 [9.6] With respect to future leasing decisions, it would be useful to include information in the Final PEIS regarding criteria the BLM may be considering for converting research leases to commercial scale leases. This disclosure would be putting both industry and the public on notice regarding the decisionmaking process that BLM intends to undertake upon receipt of commercial lease applications.

#2)]> B. Water Resources

<([#3 [3.4.5] *I. Surface Water*

The EPA recommends that the Final PEIS include the most up-to-date information on the existing

quality of surface waters in these areas is included in the document, which can be obtained from each State (see below). This is particularly important since water bodies in portions of the study area

are already impacted where significant oil and gas development is occurring. The number of impaired streams listed on the current 303(d) lists of impaired waters within both the Piceance Basin

in Colorado and the Uinta Basin in Utah have increased since the previous listings, as outlined below.

Under the Clean Water Act (CWA), states are required to establish and maintain water quality standards to protect water bodies such as rivers, lakes and streams. Water bodies that do not meet these standards are placed on the State's Section 303(d) List of impaired waters. The Draft PEIS provides 2006 data for the 303(d) Lists from Colorado, Utah and Wyoming. Updated information is

now available to replace 2006 impaired water body data in Table 3.4.1-1 (pages 3-64 and 3-65) within the study areas of Colorado, Utah and Wyoming. 2010 data is available for Utah, while 2012

data is in the process of being finalized for Colorado and Wyoming. The EPA recommends that the

Final PEIS reflect these updates, as discussed in the following paragraphs.

In Colorado, the draft 2012 303(d) List indicates that water quality has become further impaired in

the Piceance Basin since 2006. This draft 2012 303(d) List identifies five additional river segments

in the basin. Colorado's Monitoring and Evaluation List (M&E List) identifies water bodies exhibiting some stress in the aquatic ecosystem, but where more data is needed to make an appropriate determination. The M&E List identifies one additional river segment within the Piceance-Yellow Creek watershed between the 2010 and 2012 lists. Based on the potential oil shale

development in this area in addition to ongoing and planned oil and gas development, there is a trend

toward further impairment and the potential for additional violations of surface water quality standards and the CWA if additional pollutant loads reach these impacted river segments.

Colorado

finalized their 2012 303(d) and M&E lists and submitted the 303(d) list to EPA on March 23, 2012

for approval. These lists can be found online at [http://www.cdphe.state.co.us/op/wqcc/Reports/303\(d\)/932012\(03\).pdf](http://www.cdphe.state.co.us/op/wqcc/Reports/303(d)/932012(03).pdf). The following table identifies 5 additional water segment impairments in the Piceance Basin.

Colorado ID/Water/Segment Impairment

COLCWH15/ Piceance Creek/ Aquatic Life (provisional)

COLCWH20/ Black Sulfur Creek/ Aquatic Life (provisional)

COLCWH23/ W. Douglas Creek/ Aquatic Life

Source: CDPHE, 2012

In Utah, the 2010 303(d) List indicates that water quality has also become further impaired in the Uinta Basin since 2006. Based on the ongoing and planned oil and gas development in this area in

addition to potential oil shale and tar sands development, there appears to be a high likelihood of further impairment and the potential for additional violations of surface water quality standards and

the Clean Water Act if additional pollutant loads reach these impacted river segments. The 2010 303(d) list can be found at <http://www.epa.gov/waters/ir/index.html>.

UT14060004-002/ Indian Canyon Creek/ Arsenic and boron (in addition to TDS)

UT 14060005-003/ Ninemile Creek/ Temperature

Source: UDEQ, 2010

In Wyoming, the draft 2012 303(d) List indicates that water quality impairments have not changed

within the project's study area portion of the Green River Basin since 2006. Wyoming finalized their

draft 2012 303(d) list on March 27, 2012. This list can be found at

http://deq.state.wy.us/wqd/watershed/Downloads/305b/2012/WY2012IR_Draft_Doc11-1058.pdf.

The EPA recommends that BLM include all updated 303(d) list information for each state in the Final PEIS. EPA also recommends that the Final PEIS provide a discussion of the changes between

2006 and 2012 to clearly disclose any increases in impaired water bodies for each state's study area.

Inclusion of this data represents a key piece of information needed to fully disclose current water quality conditions and to evaluate, and if necessary mitigate, impacts of any future oil shale and tar

sands development. #3]>

<[#4 [3.4.4] 2. Groundwater

In order to provide a baseline to accurately assess the potential impacts of the alternatives, we recommend that the Final PEIS add additional information to more thoroughly characterize

groundwater resources in Utah and Wyoming. Specifically, we recommend the Final PEIS include the delineated depth of underground source of drinking water (USDWs) in the study areas as well as the quality of each zone within these aquifers, to the extent there is existing information to do so. Without this information, the Draft PEIS provides little information regarding the location or depth of USDWs. All groundwater that has not been exempted through the aquifer exemption process and meets the definition of USDW at 40 C.F.R. § 144.3 is protected under the Safe Drinking Water Act.

A USDW is defined as an aquifer or portion of an aquifer that supplies any public water system or that contains a sufficient quantity of ground water to supply a public water system, and currently supplies drinking water for human consumption, or that contains fewer than 10,000 mg/1 total dissolved solids (IDS) and is not an exempted aquifer. Aquifers are presumed to be USDWs unless they have been specifically exempted or if they have been shown to fall outside the definition of a USDW (e.g., over 10,000 mg/L IDS). We provide the following sources for assistance to better characterize groundwater resources in the Final PEIS within Utah and Wyoming:

- In Utah, the Utah Geologic Survey has collected detailed groundwater information for its Uinta Basin Water Study. The purpose of this study is to better understand and characterize groundwater resources in the Uinta Basin in recognition of the fact that areas of potential oil shale development overlap with natural gas fields in the basin. The study can be found at http://geology.utah.gov/emp/UBwater_study/.

In addition, the Greater Natural Buttes Draft Resource Management Plan (RMP) provides extensive characterization of the three major aquifer systems in the Uinta Basin. This information is provided in Section 3.13.3 of the Draft RMP, and can be found at http://www.blm.gov/ut/st/enlfo/vemal/planning/nepa/_I_greater_natural_butttes.html.

- In Wyoming, the Water Development Office recently completed the 2010 Green River Basin Plan Update, which presents a basinwide perspective on water resources and includes identification of the major aquifers in the basin and the physical and chemical characteristics of their groundwater. The plan can be found at <http://waterplan.state.wy.us/planlgreenlgreenplan.html>.

#4)>

<([#5 [3.4.4] 3. Issues Pertaining to Both Groundwater and Surface Water

Baseline Characterization of Drinking Water Sources:

In order to accurately assess the potential impacts of the alternatives on drinking water sources, we

recommend that all sources of drinking water in the study area be characterized in the Final PEIS.

These sources include water in streams, rivers, lakes, springs and aquifers that is used as a supply of

drinking water. This can be accomplished by including a discussion in the Final PEIS of each State's

source water protection program, and including state-designated surface and groundwater

protection zones. The EPA recommends this step so that the reader can fully understand the extent and location of these important resources. We recommend including a map illustrating locations of source water protection zones (both groundwater and surface water) for municipal supply. In addition, we provide the following contacts for assistance obtaining this information for each state:

- John Duggan at the Colorado Department of Public Health and Environment, Water Quality Control Division at (303) 692-3534
- Kate Johnson at the Utah Division of Environmental Quality, Division of Drinking Water at (801) 536-4206
- Kim Medina at the Wyoming Department of Environmental Quality, Water Quality Division at (307) 473-3476, and Mark Pepper at the Wyoming Association of Rural Water Systems at (307) 436-8636 #5)>

<([#6 [3.7.2] 4. Wetlands

The Draft PEIS indicates that BLM will ensure that impacts to jurisdictional wetlands (those under the regulatory jurisdiction of the Clean Water Act (CWA), Section 404, and the USACE) would be avoided or mitigated. The EPA would like to clarify that the CW A §404(b)(1) guidelines require applicants to avoid, minimize and mitigate for impacts to all waters of the United States. We also note that according to Executive Order (EO) 11990, federal agencies are required to minimize the destruction, loss or degradation of wetlands, and to preserve and enhance the natural and beneficial values of wetlands in carrying out the agency's responsibilities, regardless of the jurisdictional status of the wetlands. To this end, we recommend that the Final PEIS include a commitment from BLM to comply with these requirements for all wetlands, not solely jurisdictional wetlands. Throughout the Draft PEIS the BLM requires future projects to mitigate for impacts to wetlands and riparian areas. CW A §404(b)(1) requires permit applicants to first avoid impacts to waters of the U.S., then minimize the unavoidable impacts, prior to mitigating the remaining unavoidable impacts. We recommend that the Final PEIS reflect these CWA 404(b)(1) requirements wherever there are anticipated impacts to waters of the U.S. This will ensure that potential applicants are on notice of the full extent of requirements for the protection of waters of the U.S.

C. Air Quality #6)>

<([#7 [3.5.8] [3.5.5] 1. Need for Additional Disclosure of New Clean Air Act Designations

The Draft PEIS is lacking recently published important information regarding two CAA

designations

that will affect future development in the study area. While not a part of the NEPA requirements that

must be included in the PEIS, before finalizing an approval of any project, the CAA requires that the

BLM conduct a general conformity analysis for any project emissions occurring in such areas designated as nonattainment or maintenance for the National Ambient Air Quality Standards (NAAQS). The CAA states that in such areas, a determination must be made that the emissions (either direct or indirect) from a federal action will not exceed a *de minimis* threshold level measured

in tons per year for the criteria pollutant of concern. If the Action exceeds the *de minimis* level, then

a conformity determination is required to document how the federal action will affect implementation of the applicable implementation plan to reach attainment.

The EPA issued a final rule on April 30, 2012, designating Sublette County and portions of Lincoln

and Sweetwater counties in Wyoming as a marginal nonattainment area for ozone. Some of the proposed area available for oil shale leasing under the Preferred Alternative in Wyoming overlaps

with this designated ozone nonattainment area in Sublette County and Sweetwater County. The final

rule also designated Duchesne and Uintah counties in Utah as an ozone unclassifiable area. Some proposed areas for oil shale and tar sands leasing under the Preferred Alternative in Utah overlap with this designated ozone unclassifiable area in both Duchesne and Uintah counties. Given this situation, during the NEPA process for future leasing and project decisions in these areas, it will be

important for BLM to fully analyze and disclose impacts and necessary mitigation, including the possibility of no net increase in emissions depending on the extent of the nonattainment problem.

Therefore, the EPA recommends that future oil shale leasing and plan development in the designated

ozone nonattainment area in Wyoming describe whether general conformity analysis is required (i.e., whether the relevant emissions exceed *de minimis* thresholds) and how the future proposed actions would comply with the applicable implementation plan. If a general conformity analysis is

necessary, the EPA recommends that it be included in the BLM's NEPA analysis. #7)>

<([#8 [6.2.1] 2. Power implications of in situ technologies for oil shale development

The Draft PEIS assumes future in situ projects would require 600 MW of additional electrical generation capacity when commercial production levels are reached, and that this new electricity capacity would be provided by conventional coal-fired plants. In view of the potential magnitude of

this additional energy need and the air quality in the region, it will be essential to fully analyze and

be prepared to discuss in future NEPA documents the potential environmental impacts and mitigation measures associated with additional energy sources. We also strongly recommend that BLM commit to analyze a range of power generation options, including natural gas and renewable

sources in view of currently development activity and air quality. #8])>

The EPA's Rating

<([#9 [1.4] Consistent with Section 309 of the CAA, it is the EPA's responsibility to provide an independent review and evaluation of the potential environmental impacts of this project. In accordance with our policies and procedures for reviews under NEP A and Section 309 of the CAA, the EPA is rating this Draft EIS as "Environment Concerns - Insufficient Information" (EC-2). The "EC" rating indicates that our review has identified environmental impacts that should be avoided in order to fully protect the environment. Corrective measures may require changes to the preferred alternative or application of mitigation measures that can reduce these impacts. The "2" rating indicates that the Draft EIS does not contain sufficient information for the EPA to fully assess environmental impacts that should be avoided in order to fully protect the environment. We have enclosed a description of the EPA's rating system for your convenience (Attachment 1). #9])>

We appreciate the opportunity to comment on this document, and hope our suggestions for improving it assist you with preparation of the Final PEIS. We would be happy to meet to discuss these comments and our suggested solutions. If you have any questions or requests, please feel free to contact either me at 303-312-6925 or David Fronczak of my staff at 303-312-6096.

Colorado State Director, Bureau of Land Management

Attn: Sherri Thompson, Programmatic EIS Manager

Regional Director, Intermountain Region

National Park Service comments on Draft Programmatic Environmental Impact Statement and Possible Land Use Plan Amendments for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah, and Wyoming.

The National Park Service (NPS) thanks you for the opportunity to comment on the Bureau of Land

Management's (BLM) subject Draft Programmatic Environmental Impact Statement (PEIS).

These

comments were developed jointly by the NPS's Natural Resource Stewardship and Science Directorate

and Intermountain Region staff reviewers.

NPS Selection of Preferred Alternative

We understand the scope of decision making under the PEIS is essentially an administrative action

designating public lands administered by the BLM as either available or unavailable (allocation) for

applications for commercial leasing, exploration, and development for oil shale and tar sands resources.

NPS also recognizes that the allocation is programmatic in nature and based only upon available and

known potential impacts on resources from BLM's oil shale and tar sands decision making.

Numerous NPS units, including: Arches, Black Canyon of the Gunnison, Canyonlands, Capitol Reef, and

Rocky Mountain National Parks; Colorado and Dinosaur National Monuments; Glen Canyon National

Recreation Area; National Historic Trails; and National Natural Landmarks could be potentially impacted

by the decision making on this PEIS. Resources potentially affected are: air quality and climate, natural

sound, ecological resources (aquatic, wildlife, plants, threatened and endangered species), visual, cultural

(cultural landscapes, historic structures and setting, archaeological sites), and night sky.

<([#1 [2.3.1] Lacking successful demonstration of technologies necessary for commercial development of oil shale and

tar sands, we believe it would be impractical to conduct site-specific National Environmental Policy Act

(NEPA) or Section 106 of the National Historic Preservation Act (NHPA) analyses on any application for

leasing oil shale or tar sand acreage at this time. We understand that BLM considers the most appropriate

time to raise and consider leasing issues to be "if and when" commercial viability for oil shale and tar

sands is demonstrated and leasing applications occur. Information gained from the BLM's oil shale and tar sands research, development, and demonstration program is critical and necessary to leasing considerations. Therefore, the NPS supports Alternative 3- The Research Focus Alternative as the PEIS's Preferred Alternative by chronological necessity.

#1))> In addition to our comments herein, we incorporate by reference our previous subject correspondence: 1) April 18, 2008 comment memo on the 2008 PEIS, 2) May 16, 2011 seeping comment memo for the current PEIS in support of our selection of Alternative 3 as the preferred alternative and for future use, and 3) November 11, 2011 comment memo on the Administrative Draft PEIS.

<(#2 [3.1.1] [3.9.1] National Historic Trails

The NPS conveyed preliminary comments from the National Trails Intermountain Region (NTIR) office

via a November 7, 2011 email to meet a comment deadline for Chapters 1 and 2.

The NPS supports the PEIS having a justified and current approach to management of National Historic

Trails. The NPS administers the California, Oregon, Mormon Pioneer, and Pony Express National

Historic Trails, which all cross the Green River Basin of Wyoming. The PEIS states that the national

historic trail corridor will consist of the trail and a corridor of "at least 0.25 mile" on either side of the

trail. However, recent revisions to BLM Resource Management Plans across the western states are

revising the past definition of a quarter-mile "trail corridor" and defining much broader corridors (up to

five miles or more on either side of the trail tread, depending on the nature of terrain that is visible from

contributing segments of the trail). In addition, new BLM guidance for the management of national

historic trails corridors, currently in national-level internal review, may adopt a similarly generous

definition of "trail corridor."

The NPS reiterates its belief that enough information exists at this time to devise a process for defining

appropriate adequate protective corridors for the National Trails. Without conducting site-specific

analysis, the PEIS could recommend a sufficient average protective corridor when calculating acreage

available or not available for application for commercial leasing. Instead of the specific acreage offered

in PEIS alternatives, the PEIS could use a range based on a defined process for corridor determination.

The NPS recommends this broader consideration of resource protection to National Historic Trails within this PEIS.

#2)]> <([#3 [2.3.1] Recommendation

While the NPS understands that additional analyses of specific proposals and technologies for the development and production of oil shale or tar sands are committed to in this particular PEIS, NPS

believes that only Alternative 3- the Research, Development, and Demonstration (RD&D) action alternative provides a phased process for resource protective decision-making. The NPS continues to

prefer Alternative 3 as the action alternative.

#3)]> NPS Contacts

The NPS appreciates the opportunity to provide comments on the PEIS. If you have questions, or if we

can be of any further assistance, please do not hesitate to contact either of the NPS Cooperating Agency

representatives: 1) Geologic Resources Division- Pat O'Dell at 303-969-2013, or 2)

Argonne, Illinois 60439

Subject: Draft Resource Management Plan (RMP) Amendments and Draft Programmatic
Environmental Impact Statement (PEIS) for the Allocation of Oil Shale and Tar Sands
Resources on Lands Administered by the Bureau of Land Management (BLM) in
Colorado, Utah, and Wyoming

Dear Sir,

As requested by your correspondence of January 27, 2012, the U.S. Geological Survey (USGS) has reviewed the subject draft resource management plan and draft programmatic environmental impact statement and offers the following comments.

COMMENTS

<([#1 [3.7.3.12] 3.7.3.2 Birds

General: The document does not include the data and information available from the USGS Breeding Bird Survey. The USGS Breeding Bird survey includes routes that are close to the project area. We suggest the Final EIS include the data and information available from the USGS Breeding Bird Survey.

Route locations are available at:

<http://www.pwrc.usgs.gov/BBS/results/routemaps/routeMapStatic.html>.

The list of species for each route is available at:

<https://www.pwrc.usgs.gov/BBS/PublicDataInterface/index.cfm>.

The routes are available at:

<http://www.pwrc.usgs.gov/BBS/results/routemaps/routeAssignMap.cfm>. #1)>

<([#2 [3.7.4.11] Pg. 3-185: We suggest that the Final EIS include the data and information on the home-range characteristics of adult Mexican Spotted Owls (*Strix occidentalis lucida*) in southern Utah available in: Willey, D. W.; van, Riper, III, C. 2007. Home range characteristics of Mexican Spotted Owls in the canyonlands of Utah. *Journal of Raptor Research* 41:10-15 #2)>

<([#3 [3.7.4.11] 6.2.1.7.4 Threatened, Endangered, and Sensitive Species

Table 6.2.1-9: The degree to which populations may be affected depends on the status of the species; however, the table does not provide information about the status of the listed species. We suggest the Final EIS provide a general summary of the status of the listed species. For example; the trends and status of the avian species listed can be found at <http://www.mbr-pwrc.usgs.gov/bbs/bbs.html> and in: Sauer, J. R., J. E. Hines, J. E. Fallon, K. L. Pardieck, D. J. Ziolkowski, Jr., and W. A. Link. 2011. *The North American Breeding Bird Survey, Results and Analysis 1966 - 2009*. Version 3.23.2011 USGS Patuxent Wildlife Research Center, Laurel, MD. #3)>

Thank you for the opportunity to review and comment on the Draft RMP and Draft PEIS. If you have any questions concerning our comments, please contact Gary LeCain, USGS Coordinator for Environmental Document Reviews, at (303) 236-1475 or at gdlcain@usgs.gov.

Sincerely,

/Judy Nowakowski signed for/

MATTHEW H. MEAD

GOVERNOR

May 4, 2012

Office of the Governor

Sherri Thompson, Project Manager

Bureau of Land Management

Colorado State Office

9700 S. Cass Ave.

Argonne, IL 60439

STATE CAPITOL

CHEYENNE, WY 82002

RE: Comments on the Draft Resource Management Plan Amendments and Draft Programmatic Environmental Impact Statement for the Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah, and Wyoming

Dear Ms. Thompson,

Thank you for allowing me to comment on the Draft Resource Management Plan (RMP) Amendments and Draft Programmatic Environmental Impact Statement (DPEIS) for the Allocation of Oil Shale and Tar Sands (OSTS) Resources. My comments are specific to Wyoming oil shale resources administered by the Bureau of Land Management (BLM). Wyoming state agencies will provide separate comment based on the particular charge of individual offices.

<([#1 [9.7] Oil shale development technologies have not been proven on a commercial scale.

Further

research, development, and demonstration (RD&D) is warranted. I am optimistic that sensible RD&D will result in recovery methods consistent with Section 369 of the Energy Policy Act of

2005. I support leasing land for RD&D, but not in the manner identified in any of the alternatives.

I believe lease areas that are least susceptible to adverse impacts from oil shale pilot projects and easiest to reclaim are best suited to RD&D objectives. #1)> <(#2 [1.3] The exclusions identified in Alternatives

2, 3 and 4 undermine a local, participatory approach to land determinations made via the RMP process in cooperation with state and local interests ..

The BLM is required to consider precluding oil shale development in these areas; however it is not required to make changes to management decisions.

#2)>

<(#3 [9.2.4] Sage Grouse Core Areas

The 2012 OSTs DPEIS requires the BLM to analyze and consider excluding oil shale development in the Greater Sage-Grouse core area. This decision is not consistent with Wyoming's Greater Sage-Grouse Core Area Protection strategy. Wyoming's Executive Order 2011-5 is recognized by the U.S. Fish & Wildlife Service as an adequate regulatory mechanism for the conservation of Greater Sage-Grouse. Executive Order 2011-5 does not preclude mineral development. It establishes conditions designed to maintain and enhance Greater Sage-Grouse habitat. The BLM should modify its management objective as it applies to Wyoming to maintain consistency with Wyoming's Greater Sage-Grouse Core Area Protection strategy.

#3)> <(#4 [3.1.3] [9.2.1] Lands with Wilderness Characteristics

The preferred alternative of the 2012 OSTs DPEIS proposes to exclude oil shale development in all areas the BLM has identified or may identify during the planning process, as having wilderness characteristics. Section 201 of the Federal Land Policy and Management Act requires the BLM to maintain an inventory of all public lands and their resources. There is no requirement to manage lands with wilderness characteristics. The Rock Springs Field Office is in the process of combining the Green River and Jack Morrow Hills RMPs to a single Rock Springs RMP. If the BLM precludes development in lands with wilderness characteristics, the BLM will unduly constrain the Rock Springs RMP range of alternatives. These decisions should be left to the RMP revision process.

#4)> <(#5 [3.1.5] Areas of Critical Environmental Concern

In the 2012 OSTs DPEIS preferred alternative, the BLM proposes to preclude oil shale development in all Areas of Critical Environmental Concern (ACEC), regardless of allowances for mineral development. This blanket decision should not be made. In Volume 1, (p. 2-10), the BLM states, "The BLM designates ACECs through land use plans that outline management objectives and prescriptions for each ACEC." Prior land use plans have determined that some ACECs are open for mineral development. Management objectives for ACECs should be left to the RMP revision process. I request that the BLM make no additional determinations for management of ACECs in this OSTs DPEIS.

At various points in the Draft RMP Amendments and DPEIS for the Allocation of OSTs Resources, as they relate to Alternative 2, the BLM precludes oil shale and tar sands leasing from "... all ACECs, but also areas that had been under consideration for designation as ACECs in the applicable plans undergoing revision or amendment at the time, but which were eventually not designated." [Emphasis added] This has the potential to exclude oil shale development from a majority of lands throughout the planning area. The BLM should remove this management decision from further consideration. #5)>

<(#6 [3.1.5] Adobe Town Very Rare and Uncommon Area

The BLM proposed decision to close the Adobe Town Very Rare and Uncommon Area to oil shale development is not consistent with the Wyoming Environmental Quality Council's decision allowing in-situ processes or underground mining.

#6)> Thank you for the opportunity to comment. Please do not hesitate to contact me or my staff if you have questions or would like clarification.

Sincerely,

Matthew H. Mead

THE BOARD OF COUNTY COMMISSIONERS

LINCOLN COUNTY, WYOMING

RESOLUTION#

OPPOSING THE BLM'S 2012 OIL SHALE AND TAR SANDS PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT, BLM PROJECT# W0-300-1310-PP-OSHL (HEREAFTER 2011 OSTs PEIS) FOR LANDS ADMINISTERED BY THE BLM IN COLORADO UTAH AND WYOMING

This Resolution is adopted in open meeting after due opportunity for public comment, by the Board of Commissioners of Lincoln County, in order to redress the many violations of law, regulation, and policy by the BLM with respect to the BLM's 2012 OSTs PEIS.

BACKGROUND

As background to this Resolution, Lincoln County recites the following grievances:

WHEREAS, On April 14, 2011 the BLM caused to be published in the Federal Register, Volume 76, No 72 Thursday, April 14, 2011, pages 21003-21005, a notice of intent to prepare the above-referenced 2012 OSTIS PEIS; and

<([#1 [9.2.1] [3.1.3] WHEREAS, the preliminary purpose and need statement in the notice of intent, states the PEIS

will analyze removing from oil shale and tar sands leasing “All areas that the BLM has identified or may identify as a result of inventories conducted during this planning process, as lands containing wilderness characteristics[.]” Id., at page 21004; and

WHEREAS, the notice of intent further states at page 21 004:

Lands that the BLM identifies as having wilderness characteristics will be considered during this planning initiative, as described above, and consistent with Secretarial Order No. 3310, dated Dec. 22, 2010, and BLM Manuals 6301 and 6302. Future leasing of lands determined by the BLM to have wilderness characteristics, if compatible with the allocation decisions stemming from this initiative, will subsequently be assessed in accordance with BLM Manual 6303, as appropriate (i.e., where the BLM has not determined, consistent with BLM Manual 6302, whether the lands with wilderness characteristics at issue should be receive a wild lands designation, BLM Manual 6303 will apply); and

WHEREAS, this language documents the BLM’s intent to implement, administer and/or enforce Secretarial Order 3310 and one or more of the BLM guidance manuals promulgated under Order 3310;and

WHEREAS, any attempt by the BLM to implement, administer and/or enforce Secretarial Order 3310, including any effort by the BLM to proceed further on the above-referenced Programmatic EIS, violates the spending moratorium of Section 1769 of the April 21, 2011 Congressional Continuing Resolution to Fund Fiscal Year 2011 through September 30, 2011, which states: For the fiscal year ending September 30, 2011, none of the funds made available by this division or any other Act may be used to implement, administer, or enforce Secretarial Order No. 3310 issued by the Secretary of the Interior on December 22, 2010; and

WHEREAS, this spending moratorium has been carried forward in all subsequent Congressional spending resolutions up to and including the current spending resolution; and

WHEREAS, the 2012 OSTIS PEIS, is an admitted attempt by the BLM to implement, administer and/or enforce Secretarial Order 3310 and its policies and objectives, all in violation of the Spending Moratorium of the 2011 Continuing Resolution; and [#1]>

<([#2 [9.8] WHEREAS, the 2008 Oil Shale and Tar Sands Programmatic EIS (2008 OSTIS PEIS) was

required under Section 369 (d) (1) of the Energy Policy Act of 2005 and was prepared in cooperation with 14 federal, state, and local governmental organizations; and

WHEREAS THE 2008 OSTIS PEIS was 3 years in the making, and it honored the input of a task force of Governors and other stakeholders as per requirement of the 2005 Energy Policy Act;

WHEREAS, the Record of Decision (ROD) for the 2008 OSTIS PEIS amended 10 land use plans in Colorado, Utah, and Wyoming to make approximately 2 million acres of public lands available for potential leasing and development of oil shale and approximately 430,000 acres available for tar sands leasing. Together with the regulations published in 2006 and 2008 for oil

shale and tar sands resources, the 2008 OSTs PEIS and subsequent land use amendments constituted a reasonable and rational establishment of an oil shale and tar sands program as mandated in the Energy Policy Act of 2005; and #2])>

<([#3 [6.1.2] WHEREAS, the oil shale and tar sands program to which the 2008 OSTs PEIS and related

regulations gave birth, was a reasonable response to the fact that oil shale and tar sands resources in the Green River Formation located in northeastern Utah, northwestern Colorado and southwestern Wyoming may reach 8 trillion barrels of oil; and #3])>

<([#4 [9.8] WHEREAS, the preferred alternative in the draft 2012 OSTs PEIS drastically shrinks,

diminishes and in many areas outright reverses virtually all of the lands made available for Oil Shale and Tar Sands development in 2008, and does so using the same data and science; and #4])> <([#5 [9.2.2] WHEREAS, such a drastic reversal in lands available for Oil Shale and Tar Sands development

between the 2008 PEIS and the 2012 preferred alternative, violates regulatory ran Task Force requirements of certainty for industry and investors; and

WHEREAS such a drastic reversal of lands available for Oil Shale and Tar Sands development in 2008, constitutes a de facto, piece-meal revision of previous BLM Resource Management Plans, in violation of the Section 202 Planning Process under FLPMA;

WHEREAS, the preferred alternative in the draft 2012 OSTs PEIS entirely ignores the input of the task force and stakeholders which the 2005 Energy Policy Act directed the BLM to honor and follow; and moreover the draft 2012 OSTs PEIS may well violate various memoranda of understanding (MOUs) with counties which require the BLM to publish the written input of cooperators who disagree with the preferred alternative;

WHEREAS the draft 2012 OSTs PEIS preferred alternative significantly restricts the acreage allotted in the 2008 PEIS for research and development leasing;

WHEREAS the draft 2012 OSTs PEIS preferred alternative threatens to arbitrarily undermine the process and the work utilized in creation of the 2008 OSTs PEIS, and essentially dismantle a reasonable and rational oil shale and tar sands program in violation of Section 369 of the 2005 Energy Policy Act; and #5])>

<([#6 [1.5] WHEREAS, the 2012 OSTs PEIS preferred alternative is the creature of a friendly lawsuit

settlement agreement between the BLM and ideological opponents to oil shale development, and is therefore entirely pre-determined and pre-decisional in violation of NEPA, with no apparent rationale for revising the acreages approved in 2008; and

#6])> <([#7 [2.2] WHEREAS, the BLM has settled on a preferred alternative in the 2012 OSTs PEIS admittedly

without having first analyzed its impacts; BLM should be required to withdraw the preferred status of the alternative until it has performed this analysis; and

WHEREAS, the acreage approved for Oil Shale and Tar Sands development in the draft 2012 OSTs PEIS preferred alternative bears no rational relationship to the stated purpose and need;

#7])> <([#8 [1.5] WHEREAS, the Department of Energy has basically abdicated the responsibility Congress

placed upon it to defend and uphold a viable oil shale energy program in America, leaving it instead to the BLM encumbered by a host of anti-oil shale pro-wilderness groups steering BLM's every move;

~~#8)~~ ~~(#9 [9.5] WHEREAS, the alternative adopted in the ROD of the 2008 OSTs PEIS is now the No Action Alternative of the draft 2012 OSTs PEIS; and WHEREAS, the 2008 OSTs PEIS chosen alternative is consistent with the multiple use, sustained yield of the Federal Land Policy Management Act (FLPMA); and WHEREAS, the 2008 OSTs PEIS chosen alternative is consistent with county general plans and policies which call for responsible development of available energy resources; and #9)~~ ~~(#10 [6.3.4] WHEREAS, the development and production of oil from oil shale has been proven beyond a doubt to be technologically and economically feasible; and #10)~~ ~~(#11 [6.3.2.1] WHEREAS, this same technology to extract oil from the oil shale rock is not only economically feasible, but it requires little to no consumption of water, contrary to the myths which falsely claim that oil shale extraction requires large consumption of water resources; and #11)~~ ~~(#12 [6.2.2] WHEREAS, the energy captured in the extract of oil from shale (natural gas capture, etc..) more than makes up for energy consumed in that extraction process, thus dispelling the myth that the oil shale extraction process consumes more energy than it produces; #12)~~ ~~(#13 [3.10.3] WHEREAS, the rising price of gasoline, coupled with ever increasing loss of good paying jobs due to the Administration's policies against energy development on western public lands, result in increasing hardships for families and the local economy, to the point where some fear the window of opportunity is about to close for a civil, lawful and orderly response as citizens feel more and more pressured and desperate financially; and #13)~~ ~~(#14 [6.3.3.1] WHEREAS, the 2012 OSTs PEIS improperly limits technology testing to strictly in situ efforts and does not allow for development of other technologies; and #14)~~ ~~(#15 [1.1.1] WHEREAS, the BLM has left insufficient time for the public and cooperators to meaningfully comment on the public draft 2012 OSTs PEIS by the present comment deadline of May 4, 2012, because a highly relevant commercial oil shale BLM regulation is not due to be published until May 15, 2012 and the public should have the right to view that regulation first and then submit comments on the draft 2012 OSTs PEIS in light of that regulation; and #15)~~ ~~(#16 [2.1.1] WHEREAS, the same problems with lack of consistency with local plans and policies and failure to honor the input of cooperators and all stakeholders, also besets many public lands EIS projects, in addition to the 2012 OSTs PEIS. The cooperators from Utah and Wyoming have already unanimously requested for the No-Action alternative in the draft 2012 OSTs PEIS become the preferred alternative.~~ ~~#16)~~ RESOLUTION ~~(#17 [9.2.1] NOW THEREFORE, BE IT RESOLVED BY LINCOLN COUNTY, STATE OF WYOMING AS FOLLOWS:~~

1. Lincoln County declares the BLM's continuing to administer and carry out the 2012 OSTs PEIS to be an open contempt and flaunting of the Congressional Spending Moratorium first imposed in the 2011 Continuing Resolution and carried forward in all subsequent

Congressional spending resolutions up to and including the present;

2. Lincoln County calls upon the BLM to cease all further activities with respect to administering and carrying out the 2012 OSTs PEIS, because doing so constitutes an open contempt and violation of the Congressional Spending Moratorium against implementing, administering and/or enforcing Secretarial Order 3310, which Spending Moratorium was first imposed in the 2011 Continuing Resolution and carried forward in all subsequent Congressional spending resolutions up to and including the present;

3. Lincoln calls upon the BLM to immediately cease and desist all activities related to the above-referenced 2012 OSTs PEIS and immediately publish a revised notice in the Federal Register signifying its cessation of all work on the Programmatic EIS in obedience to the above quoted Spending Moratorium. Otherwise, the BLM would be in contempt of Congress;

~~#17)~~ <(~~#18~~ [2.1.1] 4. Should BLM continue to go forward with the 2012 OSTs PEIS regardless of these

grievances, the only legally, viable alternative would be if the BLM adopted the No-Action Alternative, which is identical to the Alternative chosen in the ROD of the 2008 OSTs PEIS;

~~#18)~~ <(~~#19~~ [1.1.1] 5. The BLM should extend the May 4, 2012 deadline for public comment on the draft 2012

OSTs PEIS at least 30 days after publication of the expected oil shale regulation due to be published on or around May 15, 2012.

~~#19)~~ <(~~#20~~ [1.3] 6. The BLM should honor the input of cooperators, particularly if they are local

governments, as required by Section 202(c)(9) of FLPMA, in all matters, not just with respect to the 2012 OSTs PEIS. ~~#20)~~

Adopted at the regularly scheduled meeting of the Board of County Commissioners of Lincoln County, held on the 4th day of April, 2012.

STATE OF COLORADO)

)ss.

COUNTY OF GARFIELD)

At a regular meeting of the Board of County Commissioners for Garfield County, Colorado, held at the County

Administration Building in Glenwood Springs on the ___ day of 20___,) there were present:

_Tom Jankovsky, Commissioner

_Mike Samson, Commissioner

_John Martin, Commissioner Chairman

_Jean Alberico, Clerk to the Board

when the following proceedings, among others were had and done, to-wit:

RESOLUTION NO. 12-__

RESOLUTION OPPOSING THE BLM'S OIL SHALE AND TAR SANDS PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT, BLM PROJECT# W0-300-1310-PP-OSHL (HEREAFTER 2011 OSTs PEIS) FOR LANDS ADMINISTERED BY THE BLM IN COLORADO, UTAH AND WYOMING

WHEREAS, the Board of County Commissioners of Garfield County, State of Colorado ("BOCC") is a legal and political subdivision of the State of Colorado for which the BOCC is authorized to act; and

WHEREAS, this Resolution is adopted in open meeting after due opportunity for public comment, by the Board of Commissioners of Garfield County, in order to redress the many violations of law, regulation, and policy by the BLM with respect to the BLM's 2012 OSTs PEIS; and

BACKGROUND

As background to this Resolution, the BOCC recites the following grievances:

WHEREAS, on April 14, 2011, the BLM caused to be published in the Federal Register, Volume 76, No 72ffhursday, April 14, 2011, pages 21003-21005, a notice of intent to prepare the above-referenced 2012 OSTs PEIS; and

<([#1 [9.2.1] [3.1.3] WHEREAS, the preliminary purpose and need statement in the notice of intent, states the

PEIS will analyze removing from oil shale and tar sands leasing "All areas that the BLM has identified or may identify as a result of inventories conducted during this planning process, as lands containing wilderness characteristics[.]" Id, at page 21 004; and

WHEREAS, the notice of intent further states at page 21004:

Lands that the BLM identifies as having wilderness characteristics will be considered during this planning initiative, as described above, and consistent with Secretarial Order No. 3310, dated Dec. 22, 2010, and BLM Manuals 6301 and 6302. Future leasing of lands determined by the BLM to have wilderness characteristics, if compatible with the allocation decisions stemming from this initiative, will subsequently be assessed in accordance with BLM Manual 6303, as appropriate (i.e., where the BLM has not determined, consistent with BLM Manual 6302, whether the lands with wilderness characteristics at issue should receive a wild lands designation, BLM Manual 6303 will apply); and

WHEREAS, this language documents the BLM's intent to implement, administer and/or enforce Secretarial Order 3310 and one or more of the BLM guidance manuals promulgated under Order 3310; and

WHEREAS, any attempt by the BLM to implement, administer and/or enforce Secretarial Order 3310, including any effort by the BLM to proceed further on the above referenced

Programmatic EIS, violates the spending moratorium of Section 1769 of the April 21, 2011 Congressional Continuing Resolution to Fund Fiscal Year 2011 through September 30, 2011, which states:

For the fiscal year ending September 30, 2011, none of the funds made available by this division or any other Act may be used to implement, administer, or enforce Secretarial Order No. 3310 issued by the Secretary of the Interior on December 22, 2010; and

WHEREAS, this spending moratorium has been carried forward in all subsequent Congressional spending resolutions up to and including the current spending resolution; and WHEREAS, the 2012 OSTs PEIS, is an admitted attempt by the BLM to implement, administer and/or enforce Secretarial Order 3310 and its policies and objectives, all in violation of the Spending Moratorium of the 2011 Continuing Resolution; and **#1])>**

<([#2 [9.8] WHEREAS, the 2008 Oil Shale and Tar Sands Programmatic EIS (2008 OSTs PEIS)

was required under Section 369 (d) (1) of the Energy Policy Act of 2005 and was prepared in cooperation with 14 federal, state, and local governmental organizations; and

WHEREAS, the 2008 OSTs PEIS was 3 years in the making, and it honored the input of a task force of Governors and other stakeholders as per requirement of the 2005 Energy Policy Act; and

WHEREAS, the Record of Decision (ROD) for the 2008 OSTs PEIS amended 10 land use plans in Colorado, Utah, and Wyoming to make approximately 2 million acres of public lands available for potential leasing and development of oil shale and approximately 430,000 acres available for tar sands leasing. Together with the regulations published in 2006 and 2008 for oil shale and tar sands resources, the 2008 OSTs PEIS and subsequent land use amendments constituted a reasonable and rational establishment of an oil shale and tar sands program as mandated in the Energy Policy Act of 2005; and **#2])>**

<([#3 [6.1.2] WHEREAS, the oil shale and tar sands program to which the 2008 OSTs PEIS and related regulations gave birth was a reasonable response to the fact that oil shale and tar sands resources in the Green River Formation located in northeastern Utah, northwestern Colorado and

southwestern Wyoming may reach 8 trillion¹ barrels of oil; and

¹On information and belief, Garfield County believes 4 trillion barrels to be a more accurate estimate.

#3])>

<([#4 [9.8] WHEREAS, the preferred alternative in the draft 2012 OSTs PEIS drastically shrinks,

diminishes and in many areas outright reverses virtually all of the lands made available for Oil Shale and Tar Sands development in 2008, and does so using the same data and science; and

#4])>

<([#5 [9.2.2] WHEREAS, such a drastic reversal in lands available for Oil Shale and Tar Sands development between the 2008 PEIS and the 2012 preferred alternative, violates regulatory ran Task Force requirements of certainty for industry and investors; and

WHEREAS such a drastic reversal of lands available for Oil Shale and Tar Sands development in 2008, constitutes a de facto, piece-meal revision of previous BLM Resource Management Plans, in violation of the Section 202 Planning Process under FLPMA; and WHEREAS, the preferred alternative in the draft 2012 OSTs PEIS entirely ignores the input of the task force and stakeholders which the 2005 Energy Policy Act directed the BLM to honor and follow; and moreover the draft 2012 OSTs PEIS may well violate various memoranda of understanding (MOUs) with counties which require the BLM to publish the written input of cooperators who disagree with the preferred alternative; and

WHEREAS the draft 2012 OSTs PEIS preferred alternative significantly restricts the acreage allotted in the 2008 PEIS for research and development leasing; and

WHEREAS the draft 2012 OSTs PEIS preferred alternative threatens to arbitrarily undermine the process and the work utilized in creation of the 2008 OSTs PEIS, and essentially dismantle a reasonable and rational oil shale and tar sands pro grant in violation of Section 369 of

the 2005 Energy Policy Act; and **#5])>**

<([#6 [1.5] WHEREAS, the 2012 OSTs PEIS preferred alternative is the creature of a friendly lawsuit settlement agreement between the BLM and ideological opponents to oil shale development, and is therefore entirely pre-determined and pre-decisional in violation of NEPA, with no apparent rationale for revising the acreages approved in 2008; and #6])>

<([#7 [2.2] WHEREAS, the BLM has settled on a preferred alternative in the 2012 OSTs PEIS admittedly without having first analyzed its impacts; BLM should be required to withdraw the preferred status of the alternative until it has performed this analysis; and

WHEREAS, the acreage approved for Oil Shale and Tar Sands development in the draft 2012 OSTs PEIS preferred alternative bears no rational relationship to the stated purpose and need; and

#7])> <([#8 [1.5] WHEREAS, the Department of Energy has basically abdicated the responsibility

Congress placed upon it to defend and uphold a viable oil shale energy program in America, leaving it instead to the BLM encumbered by a host of anti-oil shale pro-wilderness groups steering BLM's every move; and

#8])> <([#9 [9.5] WHEREAS, the alternative adopted in the ROD of the 2008 OSTs PEIS is now the No

Action Alternative of the draft 2012 OSTs PEIS; and

WHEREAS, the 2008 OSTs PEIS chosen alternative is consistent with the multiple use, sustained yield of the Federal Land Policy Management Act (FLPMA); and

WHEREAS, the 2008 OSTs PEIS chosen alternative is consistent with county general plans and policies which call for responsible development of available energy resources; and #9])>

<([#10 [6.3.4] WHEREAS, the development and production of oil from oil shale has been proven

beyond a doubt to be technologically and economically feasible; and

2 Garfield County states this recital as: "WHEREAS the development and production of oil from oil shale in some

processes has been proven to be technologically feasible; and, **#10])>**

<([#11 [6.3.2.1] WHEREAS, this same technology to extract oil from the oil shale rock is not

only

economically feasible, but it requires little to no consumption of water, contrary to the myths which falsely claim that oil shale extraction requires large consumption of water resources³; and

³ Garfield County states this recital as: “WHEREAS, this same technology to extract oil from the oil shale rock requires little to no consumption of water; and” **#11)**>

<(#12 [6.2.2] WHEREAS, the energy captured in the extract of oil from shale (natural gas capture,

etc..) more than makes up for energy consumed in that extraction process, thus dispelling the myth that the oil shale extraction process consumes more energy than it produces; and

#12)> **<(#13** [3.10.3] WHEREAS, the rising price of gasoline, coupled with ever increasing loss of good

paying jobs due to the Administration’s policies against energy development on western public lands, result in increasing hardships for families and the local economy, to the point where some fear the window of opportunity is about to close for a civil, lawful and orderly response as citizens feel more and more pressured and desperate financially; and **#13)**>

<(#14 [6.3.3.1] WHEREAS, the 2012 OSTs PEIS improperly limits technology testing to strictly in situ

efforts and does not allow for development of other technologies; and

#14)> **<(#15** [1.1.1] WHEREAS, the BLM has left insufficient time for the public and cooperators to

meaningfully comment on the public draft 2012 OSTs PEIS by the present comment deadline of

May 4, 2012, because a highly relevant commercial oil shale BLM regulation is not due to be published until May 15, 2012 and the public should have the right to view that regulation first and then submit comments on the draft 2012 OSTs PEIS in light of that regulation; and

#15)> **<(#16** [2.1.1] WHEREAS, the same problems with lack of consistency with local plans and policies

and failure to honor the input of cooperators and all stakeholders, also besets many public lands EIS projects, in addition to the 2012 OSTs PEIS. The cooperators from Utah and Wyoming have already unanimously requested for the No-Action alternative in the draft 2012 OSTs PEIS become the preferred alternative.

#16)> **<(#17** [9.2.1] NOW THEREFORE, BE IT RESOLVED BY THE BOARD OF COUNTY

COMMISSIONERS OF GARFIELD COUNTY, STATE OF COLORADO AS FOLLOWS:

1. Garfield County declares the BLM’s continuing to administer and carry out the 2012 OSTs PEIS to be an open contempt and flaunting of the Congressional Spending Moratorium first imposed in the 2011 Continuing Resolution and carried forward in all subsequent Congressional spending resolutions up to and including the present.
2. Garfield County calls upon the BLM to cease all further activities with respect to administering and carrying out the 2012 OSTs PEIS, because doing so constitutes an open Contempt and violation of the Congressional Spending Moratorium against implementing, administering and/or enforcing Secretarial Order 3310, which Spending Moratorium was first imposed in the 2011 Continuing Resolution and carried forward in all subsequent Congressional spending resolutions up to and including the present.

3. Garfield County calls upon the BLM to immediately cease and desist all activities related to the above-referenced 2012 OSTs PEIS and immediately publish a revised notice in the Federal Register signifying its cessation of all work on the Programmatic EIS in obedience to the above- quoted Spending Moratorium. Otherwise, the BLM would be in contempt of Congress.

#17)> <([#18 [2.1.1] 4. Should BLM continue to go forward with the 2012 OSTs PEIS regardless of

these grievances, the only legally, viable alternative would be if the BLM adopted the No-Action Alternative, which is identical to the Alternative chosen in the ROD of the 2008 OSTs PEIS.

#18)> <([#19 [1.1.1] 5. The BLM should extend the May 4, 2012 deadline for public comment on the

draft 2012 OSTs PEIS at least 30 days after publication of the expected oil shale regulation due to be published on or around May 15,2012.

#19)> <([#20 [1.3] 6. The BLM should honor the input of cooperators, particularly if they are local governments, as required by Section 202(c)(9) of FLPMA, in all matters, not just with respect to the 2012 OSTs PEIS.

HCM 2012-034

RESOLUTION OF MESA COUNTY

STATE OF COLORADO

OPPOSING THE BLM'S 2012 OIL SHALE AND TAR SANDS PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT, BLM PROJECT #W0-300-1310-PP-OSHL (HEREAFTER 2011 OSTs PEIS)

FOR LANDS ADMINISTERED BY THE BLM IN COLORADO, UTAH, AND WYOMING,

This Resolution is adopted in open meeting after due opportunity for public comment, by the Board of Commissioners of Mesa County, in order to redress the many violations of law, regulation, and policy by the BLM with respect to the BLM's 2012 OSTs PEIS.

BACKGROUND

As background to this Resolution, Mesa County recites the following grievances:

WHEREAS, On April 14, 2011, the BLM caused to be published in the Federal Register, Volume 76, No 721 Thursday, April 14, 2011, pages 21003-21005, a notice of intent to prepare the above-referenced 2012 OSTs PEIS; and

<([#1 [9.2.1] [3.1.3] WHEREAS, the preliminary purpose and need statement in the notice of intent, states the PEIS

will analyze removing from oil shale and tar sands leasing "All areas that the BLM has identified or may identify as a result of inventories conducted during this planning process, as lands containing wilderness characteristics[.]" Id., at page 21004; and

WHEREAS, the notice of intent further states at page 21004:

Lands that the BLM identifies as having wilderness characteristics will be considered during this planning initiative, as described above, and consistent with Secretarial Order No. 3310, dated Dec. 22, 2010, and BLM Manuals 6301 and 6302. Future leasing of lands determined by the BLM to have wilderness characteristics, if compatible with the allocation decisions stemming from this initiative, will subsequently be assessed in accordance with BLM Manual 6303, as appropriate (i.e., where the BLM has not determined, consistent with BLM Manual 6302, whether the lands with wilderness characteristics at issue should be

receive a wild lands designation, BLM Manual 6303 will apply); and

WHEREAS, this language documents the BLM's intent to implement, administer and/or enforce Secretarial Order 3310 and one or more of the BLM guidance manuals promulgated under Order 3310; and

WHEREAS, any attempt by the BLM to implement, administer and/or enforce Secretarial Order 3310, including any effort by the BLM to proceed further on the above-referenced Programmatic EIS, violates the spending moratorium of Section 1769 of the April 21, 2011 Congressional Continuing Resolution to Fund Fiscal Year 2011 through September 30, 2011, which states: For the fiscal year ending September 30, 2011, none of the funds made available by this division or any other Act may be used to implement, administer, or enforce Secretarial Order No. 3310 issued by the Secretary of the Interior on December 22, 2010; and

WHEREAS, this spending moratorium has been carried forward in all subsequent Congressional spending resolutions up to and including the current spending resolution; and

WHEREAS, the 2012 OSTs PEIS, is an admitted attempt by the BLM to implement, administer and/or enforce Secretarial Order 3310 and its policies and objectives, all in violation of the Spending Moratorium of the 2011 Continuing Resolution; and **#1)**>

<([#2 [9.8] WHEREAS, the 2008 Oil Shale and Tar Sands Programmatic EIS (2008 OSTs PEIS) was

required under Section 369 (d) (1) of the Energy Policy Act of 2005 and was prepared in cooperation with 14 federal, state, and local governmental organizations; and

WHEREAS the 2008 OSTs PEIS was 3 years in the making, and it honored the input of a task force of Governors and other stakeholders as per requirement of the 2005 Energy Policy Act; and WHEREAS, the Record of Decision (ROD) for the 2008 OSTs PEIS amended 10 land use plans in Colorado, Utah, and Wyoming to make approximately 2 million acres of public lands available for potential leasing and development of oil shale and approximately 430,000 acres available for tar sands leasing. Together with the regulations published in 2006 and 2008 for oil shale and tar sands resources, the 2008 OSTs PEIS and subsequent land use amendments constituted a reasonable and rational establishment of an oil shale and tar sands program as mandated in the Energy Policy Act of 2005; and

#2)]> **<([#3 [6.1.2] WHEREAS, the oil shale and tar sands program to which the 2008 OSTs PEIS and related**

regulations gave birth, was a reasonable response to the fact that oil shale and tar sands resources in the Green River Formation located in northeastern Utah, northwestern Colorado, and southwestern Wyoming may reach 4 trillion barrels of oil; and **#3)]>**

<([#4 [9.8] WHEREAS, the preferred alternative in the draft 2012 OSTs PEIS drastically shrinks,

diminishes and in many areas outright reverses virtually all of the lands made available for Oil Shale and Tar Sands development in 2008, and does so using the same data and science; and **#4)]>**

<([#5 [9.2.2] WHEREAS, such a drastic reversal in lands available for Oil Shale and Tar Sands development

between the 2008 PEIS and the 2012 preferred alternative, violates regulatory and Task Force requirements of certainty for industry and investors; and

WHEREAS such a drastic reversal of lands available for Oil Shale and Tar Sands development in 2008, constitutes a de facto, piece-meal revision of previous BLM Resource Management

Plans, in violation of the Section 202 Planning Process under FLPMA; and
 WHEREAS, the preferred alternative in the draft 2012 OSTs PEIS entirely ignores the input of the task force and stakeholders which the 2005 Energy Policy Act directed the BLM to honor and follow; and moreover the draft 2012 OSTs PEIS may well violate various memoranda of understanding (MOUs) with counties which require the BLM to publish the written input of cooperators who disagree with the preferred alternative; and
 WHEREAS the draft 2012 OSTs PEIS preferred alternative significantly restricts the acreage allotted in the 2008 PEIS for research and development leasing; and
 WHEREAS the draft 2012 OSTs PEIS preferred alternative threatens to arbitrarily undermine the process and the work utilized in creation of the 2008 OSTs PEIS, and essentially dismantle a reasonable and rational oil shale and tar sands program in violation of Section 369 of the 2005 Energy Policy Act; and **#5])>**
<([#6 [1.5] WHEREAS, the 2012 OSTs PEIS preferred alternative is the creature of a friendly lawsuit
 settlement agreement between the BLM and ideological opponents to oil shale development, and is therefore entirely pre-determined and pre-decisional in violation of NEPA, with no apparent rationale for revising the acreages approved in 2008; and **#6])>**
<([#7 [2.2] WHEREAS, the BLM has settled on a preferred alternative in the 2012 OSTs PEIS admittedly
 without having first analyzed its impacts; BLM should be required to withdraw the preferred status of the alternative until it has performed this analysis; and
 WHEREAS, the acreage approved for Oil Shale and Tar Sands development in the draft 2012 OSTs PEIS preferred alternative bears no rational relationship to the stated purpose and need; and **#7])>**
<([#8 [1.5] WHEREAS, the Department of Energy has basically abdicated the responsibility
 Congress
 placed upon it to defend and uphold a viable oil shale energy program in America, leaving it instead to the BLM encumbered by a host of anti-oil shale pro-wilderness groups steering BLM's every move; and **#8])>**
<([#9 [9.5] WHEREAS, the alternative adopted in the ROD of the 2008 OSTs PEIS is now the
 No Action
 Alternative of the draft 2012 OSTs PEIS; and
 WHEREAS, the 2008 OSTs PEIS chosen alternative is consistent with the multiple use, sustained yield of the Federal Land Policy Management Act (FLPMA); and
 WHEREAS, the 2008 OSTs PEIS chosen alternative is consistent with county general plans and policies which call for responsible development of available energy resources; and **#9])>**
<([#10 [6.3.4] WHEREAS, the development and production of oil from oil shale has been
 proven beyond a
 doubt to be technologically and economically feasible; and **#10])>**
<([#11 [6.3.2.1] WHEREAS, this same technology to extract oil from the oil shale rock is not
 only economically
 feasible, but it requires little to no consumption of water. contrary to the myths which falsely claim that oil shale extraction requires large consumption of water resources; and
#11])> **<([#12 [6.2.2] WHEREAS, the energy captured in the extract of oil from shale (natural gas capture, etc.,) more**
 than makes up for energy consumed in that extraction process, thus dispelling the myth that the

oil shale extraction process consumes more energy than it produces; and
#12)> <(**#13** [3.10.3] WHEREAS, the rising price of gasoline, coupled with ever increasing loss of good paying jobs due to the Administration's policies against energy development on western public lands, result in increasing hardships for families and the local economy; and
#13)> <(**#14** [6.3.3.1] WHEREAS, the 2012 OSTs PEIS improperly limits technology testing to strictly in situ efforts and does not allow for development of other technologies; and
#14)> <(**#15** [1.1.1] WHEREAS, the BLM has left insufficient time for the public and cooperators to meaningfully comment on the public draft 2012 OSTs PEIS by the present comment deadline of May 4, 2012, because a highly relevant commercial oil shale BLM regulation is not due to be published until May 15, 2012 and the public should have the right to view that regulation first and then submit comments on the draft 2012 OSTs PEIS in light of that regulation; and
#15)> <(**#16** [2.1.1] WHEREAS, the same problems with lack of consistency with local plans and policies and failure to honor the input of cooperators and all stakeholders, also besets many public lands EIS projects, in addition to the 2012 OSTs PEIS. RESOLUTION NO. 2012- _

A RESOLUTION OF THE BOARD OF COUNTY COMMISSIONERS OF RIO BLANCO COUNTY, COLORADO, OPPOSING THE UNITED STATE BUREAU OF LAND · MANAGEMENT'S (BLM) 2012 OIL SHALE AND TAR SANDS PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT, BLM PROJECT# W0-300-1310-PP-OSHL (HEREAFTER 2012 OSTs PEIS) FOR LANDS ADMINISTERED BY THE BLM IN COLORADO,

UTAH AND WYOMING

Concerning Secretary of the Interior Secretarial Order 3310 issued December 22, 2010 ("Secretarial Order 3310").

WHEREAS, On April14, 2011, the BLM caused to be published in the Federal Register, Volume 76, No 72/Thursday, April14, 2011, pages 21003-21005, a notice of intent to prepare the above-referenced 2012 OSTs PEIS; and

<([#1 [9.2.1] [3.1.3] WHEREAS, the preliminary purpose and need statement in the notice of intent, states the 2012

OSTS PEIS will analyze removing from oil shale and tar sands leasing “All areas that the BLM has

identified or may identify as a result of inventories conducted during this planning process, as lands containing wilderness characteristics[.]” /d., at page 21004; and

WHEREAS, the notice of intent further states at page 21004:

“Lands that the BLM identifies as having wilderness characteristics will be considered during this planning initiative, as described above, and consistent with Secretarial Order No. 3310, dated Dec. 22, 2010, and BLM Manuals 6301 and 6302. Future leasing of lands determined by the BLM to have wilderness characteristics, if compatible with the allocation decisions stemming from this initiative, will subsequently be assessed in accordance with BLM Manual 6303, as appropriate (Le., where the BLM has not determined, consistent with BLM Manual 6302, whether the lands with wilderness characteristics at issue should be receive a wild lands designation, BLM Manual 6303 will apply)”; and

WHEREAS, this language documents the BLM’s intent to implement, administer and/or enforce Secretarial Order 3310 and one or more of the BLM guidance manuals promulgated under Order3310;and

WHEREAS, any attempt by the BLM to implement, administer and/or enforce Secretarial Order 3310, including any effort by the BLM to proceed further on the 2012OSTS PEIS, violates the spending moratorium of Section 1769 of the April 21, 2011 Congressional Continuing Resolution to Fund Fiscal Year 2011 through September 30, 2011, which states:

“For the fiscal year ending September 30, 2011, none of the funds made available by this division or any other Act may be used to implement, administer, or enforce Secretarial Order No. 3310 issued by the Secretary of the Interior on December 22, 2010”; and

WHEREAS, this spending moratorium has been carried forward in all subsequent Congressional spending resolutions up to and including the current spending resolution; and

WHEREAS, the 2012 OSTS PEIS, is an admitted attempt by the BLM to implement, administer and/or enforce Secretarial Order 3310 and its policies and objectives, all in violation of the Spending Moratorium of the 2011 Continuing Resolution; and #1)>

Concerning the 2008 OSTS PEIS

<([#2 [9.8] WHEREAS, the 2008 Oil Shale and Tar Sands Programmatic EIS (2008 OSTS PEIS) was required

under Section 369 (d) (1) of the Energy Policy Act of 2005 and was prepared in cooperation with 14 Federal, state, and local governmental organizations; and

WHEREAS, the 2008 OSTS PEIS was three years in the making, and honored the input of a task force of Governors and other stakeholders as required by the 2005 Energy Policy Act; and

WHEREAS, the Record of Decision (ROD) for the 2008 OSTS PEIS amended 10 land use plans in

Colorado, Utah, and Wyoming to make approximately 2 million acres of public lands available for potential leasing and development of oil shale and approximately 430,000 acres available for leasing and development of tar sands. Together with the regulations published in 2006 and 2008 for oil shale and tar sands resources, the 2008 OSTS PEIS and subsequent land use amendments constituted a reasonable and rational establishment of an oil shale and tar sands program as mandated in the Energy Policy Act of 2005; and

#2])> <([#3 [6.1.2] WHEREAS, the oil shale and tar sands program which the 2008 OSTS PEIS

and related

regulations delivered, was a reasonable response to the fact that oil shale and tar sands resources in the Green River Formation located in northeastern Utah, northwestern Colorado and southwestern Wyoming are estimated to be the equivalent of 8 trillion barrels of oil; and **#3])> <([#4** [9.8] WHEREAS, the 2008 OSTs PEIS chosen alternative is consistent with the multiple use, sustained yield of the Federal Land Policy Management Act (FLPMA); and **#4])> <([#5** [9.5] WHEREAS, the 2008 OSTs PEIS chosen alternative is consistent with the County Master Plan and policies which call for responsible development of available energy resources; and WHEREAS, the alternative adopted in the Record of Decision (ROD) of the 2008 OSTs PEIS is now the No Action Alternative of the draft 2012 OSTs PEIS; and **#5])>**

<([#6 [9.8] Concerning the 2012 OSTs PEIS

WHEREAS, the preferred alternative in the draft 2012 OSTs PEIS drastically shrinks, diminishes and in many areas outright reverses virtually all of the lands made available for Oil Shale and Tar Sands development in 2008, and does so using the same data and science; and **#6])> <([#7** [9.2.2] WHEREAS, such a drastic reversal in lands available for Oil Shale and Tar Sands development between the 2008 PEIS and the 2012 preferred alternative, violates regulatory Task Force requirements of certainty for industry and investors; and WHEREAS, such a drastic reversal of lands available for Oil Shale and Tar Sands development in 2008, constitutes a de facto, piece-meal revision of previous BLM Resource Management Plans, in violation of the Section 202 Planning Process under FLPMA; and WHEREAS, the preferred alternative in the draft 2012 OSTs PEIS entirely ignores the input of the task force and stakeholders which the 2005 Energy Policy Act directed the BLM to honor and follow; and moreover the draft 2012 OSTs PEIS may well violate various memoranda of understanding (MOUs) with counties which require the BLM to publish the written input of cooperators who disagree with the preferred alternative; and WHEREAS, the draft 2012 OSTs PEIS preferred alternative significantly restricts the acreage allotted in the 2008 PEIS for research and development leasing; and WHEREAS, the draft 2012 OSTs PEIS preferred alternative threatens to arbitrarily undermine the process and the work utilized in creation of the 2008 OSTs PEIS, and essentially dismantle a reasonable and rational oil shale and tar sands program in violation of Section 369 of the 2005 Energy Policy Act; and **#7])> <([#8** [6.3.3.1] WHEREAS, the 2012 OSTs PEIS improperly limits technology testing to strictly in situ efforts and does not allow for development of other technologies; and **#8])> <([#9** [1.5] WHEREAS, the 2012 OSTs PEIS preferred alternative is the creature of a friendly lawsuit settlement agreement between the BLM and ideological opponents to oil shale development, and is therefore entirely pre-determined and pre-decisional in violation of NEPA, with no apparent rationale for revising the acreages approved in 2008; and **#9])> <([#10** [2.2] WHEREAS, the BLM has settled on a preferred alternative in the 2012 OSTs PEIS admittedly

without having first analyzed its impacts; the BLM should be required to withdraw the preferred status of the alternative until it has performed this analysis; and WHEREAS, the acreage approved for Oil Shale and Tar Sands development in the preferred alternative of the draft 2012 OSTs PEIS bears no rational relationship to the stated purpose and need; and **#10)**>

Concerning Oil Shale Facts

<(#11 [6.3.4] WHEREAS, the development and production of oil from oil shale has been demonstrated to be

technologically and economically feasible elsewhere in the world; and

#11)> **<(#12** [6.3.2.1] WHEREAS, some technologies to extract oil from the oil shale rock are not only economically

feasible, but require little or no consumption of water; and

#12)> **<(#13** [6.2.2] WHEREAS, the energy captured in the extraction of oil and other hydrocarbons from shale more

than makes up for energy consumed in that extraction process; and

#13)> Other Concerns

<(#14 [3.10.3] WHEREAS, the rising price of gasoline, coupled with ever-increasing loss of good paying jobs

due to the Administration's policies against energy development on western public lands, results in increasing hardships for families and the local economy; and

#14)> **<(#15** [1.5] WHEREAS, the Department of Energy has basically abdicated the responsibility Congress placed

upon it to defend and uphold a viable oil shale energy program in America, leaving it instead to a BLM encumbered by a host of anti-oil shale pro-wilderness groups steering the BLM's oil shale

policy; and **#15)**>

<(#16 [1.1.1] WHEREAS, the BLM has left insufficient time for the public and cooperators to meaningfully

comment on the public draft 2012 OSTs PEIS by the present comment deadline of May 4, 2012, because a highly relevant commercial oil shale BLM regulation is not due to be published until May 15, 2012, and the public should have the right to view that regulation first and then submit comments on the draft 2012 OSTs PEIS in light of that regulation; and

#16)> **<(#17** [2.1.1] WHEREAS, the same problems with lack of consistency with local plans and policies and failure

to honor the input of cooperators and all stakeholders, also besets many public lands EIS projects, in addition to the 2012 OSTs PEIS. The cooperators from Utah and Wyoming have already unanimously requested for the No-Action alternative in the draft 2012 OSTs PEIS become the preferred alternative;

#17)> **<(#18** [9.2.1] NOW, THEREFORE, BE IT RESOLVED BY THE BOARD OF COUNTY COMMISSIONERS OF RIO BLANCO COUNTY, COLORADO, THAT:

1. Rio Blanco County declares the BLM's continuing to administer and carry out the 2012 OSTs PEIS to be an open contempt and flaunting of the Congressional Spending Moratorium first imposed in the 2011 Continuing Resolution and carried forward in all subsequent Congressional spending resolutions up to and including the present one in effect.

2. Rio Blanco County calls upon the BLM to cease all further activities with respect to administering and carrying out the 2012 OSTs PEIS, because doing so is an open contempt and

violation of the Congressional Spending Moratorium against implementing, administering and/or enforcing Secretarial Order 3310, for which the Spending Moratorium was first imposed in the 2011 Continuing Resolution and carried forward in all subsequent Congressional spending resolutions up to and including the present.

3. Rio Blanco County calls upon the BLM to immediately cease and desist all activities related to the above-referenced 2012 OSTs PEIS and immediately publish a revised notice in the Federal Register signifying its cessation of all work on the Programmatic EIS in obedience to the abovequoted

Spending Moratorium. Otherwise, the BLM would be in contempt of Congress.

#18)> <(**#19** [2.1.1] 4. Should BLM continue to go forward with the 2012 OSTs PEIS regardless of these grievances,

the only legally, viable alternative would be if the BLM adopted the No-Action Alternative, which is identical to the Alternative chosen in the ROD of the 2008 OSTs PEIS.

#19)> <(**#20** [1.1.1] 5. The BLM should extend the May 4, 2012, deadline for public comment on the draft 2012

OSTs PEIS by at least 30 days after publication of the expected oil shale regulation which is due to be published on or around May 15, 2012. **#20)**>

<(**#21** [1.3] 6. The BLM should honor the input of cooperators, particularly if they are local governments, as

required by Section 202(c)(9) of FLPMA, in all matters, not just with respect to the 2012 OSTs PEIS.

#21)> DULY MOVED, SECONDED, AND PASSED ON A VOTE OF __ FOR AND ---A GAINST THIS DAY OF 2012.

MOFFAT COUNTY COMMISSION

RESOLUTION NO. #1012-51

**A RESOLUTION OPPOSING THE BLM'S 2012 OIL SHALE AND TAR SANDS
DRAFT PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT,
BLM PROJECT #W0-300-131 0-PP-OSHL (HEREAFTER 2012 OSTs DPEIS)
FOR LANDS ADMINISTERED BY THE BLM IN COLORADO, UTAH AND WYOMING**

This Resolution is adopted in open meeting after due opportunity for public comment, by the Board of

Commissioners of Moffat County, in order to redress the many violations of law, regulation, and policy by the

BLM with respect to the BLM's 2012 OSTs DPEIS.

BACKGROUND

As background to this Resolution, Moffat County recites the following grievances:

WHEREAS, On April 14, 2011, the BLM caused to be published in the Federal Register, Volume 76, No

72/Thursday, April 14, 2011, pages 21 003-21005, a notice of intent to prepare the 2012 OSTs DPEIS; and

<([#1 [9.2.1] [3.1.3] WHEREAS, the preliminary purpose and need statement in the notice of intent, states the PEIS will analyze

removing from oil shale and tar sands leasing "All areas that the BLM has identified or may identify as a result

of inventories conducted during this planning process, as lands containing wilderness characteristics[.]' Id., at

page 21 004; and

WHEREAS, the notice of intent further states at page 21004:

Lands that the BLM identifies as having wilderness characteristics will be considered during this planning initiative, as described above, and consistent with Secretarial Order No. 3310, dated Dec. 22,

2010, and BLM Manuals 6301 and 6302. Future leasing of lands determined by the BLM to have wilderness characteristics, if compatible with the allocation decisions stemming from this initiative, will

subsequently be assessed in accordance with BLM Manual 6303, as appropriate (i.e., where the BLM

has not determined, consistent with BLM Manual 6302, whether the lands with wilderness characteristics at issue should be receive a wild lands designation, BLM Manual 6303 will apply); and

WHEREAS, this language documents the BLM's intent to implement, administer and/or enforce Secretarial

Order 3310 and one or more of the BLM guidance manuals promulgated under Order 3310; and

WHEREAS, any attempt by the BLM to implement, administer and/or enforce Secretarial Order 3310,

including any effort by the BLM to proceed further on the 2012 OSTs DPEIS, violates the spending

moratorium of Section 1769 of the April 21, 2011 Congressional Continuing Resolution to Fund Fiscal Year

2011 through September 30, 2011, which states:

For the fiscal year ending September 30, 2011, none of the funds made available by this division or any

other Act may be used to implement, administer, or enforce Secretarial Order No. 3310 issued by the

Secretary of the Interior on December 22, 2010; and

WHEREAS, this spending moratorium has been carried forward in all subsequent Congressional spending

resolutions up to and including the current spending resolution; and

WHEREAS, the 2012 OSTs DPEIS, is an admitted attempt by the BLM to implement, administer and/or

enforce Secretarial Order 3310 and its policies and objectives, all in violation of the Spending Moratorium of

the 2011 Continuing Resolution; and ~~(#1)~~>

~~(#2)~~ [9.8] WHEREAS, the 2008 Oil Shale and Tar Sands Programmatic EIS (2008 OSTs PEIS) was required under

Section 369 (d) (I) of the Energy Policy Act of 2005 and was prepared in cooperation with 14 federal, state, and

local governmental organizations; and

WHEREAS, the 2008 OSTs PEIS was 3 years in the making, and it honored the input of a task force of

Governors and other stakeholders as per requirement of the 2005 Energy Policy Act;

WHEREAS, the Record of Decision (ROD) for the 2008 OSTs PEIS amended 10 land use plans in Colorado,

Utah, and Wyoming to make approximately 2 million acres of public lands available for potential leasing and

development of oil shale and approximately 430,000 acres available for tar sands leasing.

Together with the

regulations published in 2006 and 2008 for oil shale and tar sands resources, the 2008 OSTs PEIS and

subsequent land use amendments constituted a reasonable and rational establishment of an oil shale and tar

sands program as mandated in the Energy Policy Act of 2005; and

~~(#2)~~> ~~(#3)~~ [6.1.2] WHEREAS, the oil shale and tar sands program to which the 2008 OSTs PEIS and related regulations gave birth, was a reasonable response to the fact that oil shale and tar sands resources in the Green River Formation

located in northeastern Utah, northwestern Colorado and southwestern Wyoming may reach 4 trillion barrels of

oil; and

~~(#3)~~> ~~(#4)~~ [9.8] WHEREAS, the preferred alternative in the 2012 OSTs DPEIS drastically shrinks, diminishes and in many

areas outright reverses virtually all of the lands made available for Oil Shale and Tar Sands development in

2008, and does so using the same data and science; and

#4)]> <([#5 [2.2] WHEREAS, the 2012 OSTIS DP~IS fails to analyze alternative 2b, and the BLM admits as much on pages 2-35 of the 2012 OSTIS DPEIS; and

#5)]> <([#6 [9.2.2] WHEREAS, such a drastic reversal in lands available for Oil Shale and Tar Sands development between the 2008 PEIS and the 2012 preferred alternative, violates regulatory Task Force requirements of certainty for industry and investors; and

WHEREAS, such a drastic reversal of lands available for Oil Shale and Tar Sands development in 2008, constitutes a de facto, piece-meal revision of previous BLM Resource Management Plans, in violation of the Section 202 Planning Process under FLPMA;

WHEREAS, the preferred alternative in the 2012 OSTIS DPEIS entirely ignores the input of the task force, and stakeholders which the 2005 Energy Policy Act directed the BLM to honor and follow; and moreover the 2012 OSTIS DPEIS may well violate various memoranda of understanding (MOUs) with counties, cities \which require the BLM to publish the written input of cooperators who disagree with the preferred alternative; and

WHEREAS, the 2012 OSTIS DPEIS restricts the acreage allotted in the 2008 PWID for research and development leasing;

WHEREAS, the 2012 OSTIS DPEIS threatens to arbitrarily undermine the process and the work utilized in creation of the 2008 OSTIS PEIS, and essentially dismantle a reasonable and rational oil shale and tar sands program in violation of Section 369 of the 2005 Energy Policy Act; and

#6)]>

<([#7 [1.5] WHEREAS, the 2012 OSTIS DPEIS is the creature of a friendly lawsuit settlement agreement between the BLM and ideological opponents to oil shale development, and is therefore entirely pre-determined and predecisional in violation of NEPA, with no apparent rationale for revising the acreages approved in 2008; and

#7)]> <([#8 [2.2] WHEREAS, the BLM has settled on a preferred alternative in the 2012 OSTIS DPEIS admittedly without having first analyzed its impacts; BLM should be required to withdraw the preferred status of the alternative until it has performed this analysis; and

WHEREAS, the acreage approved for Oil Shale and Tar Sands development in the 2012 OSTIS DPEIS preferred alternative bears no rational relationship to the stated purpose and need; **#8)]>**

<([#9 [1.5] WHEREAS, the Department of Energy has basically abdicated the responsibility Congress placed upon it to defend and uphold a viable oil shale energy program in America. leaving it instead to the BLM encumbered by a host of anti-oil shale pre-wilderness groups steering BLM's every move; #9)]>

<([#10 [9.5] WHEREAS, the alternative adopted in the ROD of the 2008 OSTIS PEIS is now the

No Action Alternative of the 2012 OSTIS DPEIS; and
 WHEREAS, the 2008 OSTIS PEIS chosen alternative is consistent with the multiple use, sustained yield mandate of the Federal Land Policy and Management Act (FLPMA) ; and
 WHEREAS, the 2008 OSTIS PEIS chosen alternative is consistent with county general plans and policies which call for responsible development of available energy resources; and **#10)**>
<([#11 [6.3.2.1] WHEREAS, even prior to 2008, technology to extract oil from the oil shale rock is not only economically feasible, but certain oil shale recovery processes require little to no consumption of water, contrary to the myths which falsely claim that oil shale extraction requires large consumption of water resources; and
#11)> **<([#12 [6.2.2] WHEREAS, the energy captured in the extract of oil from shale (natural gas capture, etc..) more than makes up for energy consumed in that extraction process, thus dispelling the myth that the oil shale extraction process consumes more energy than it produces;**
#12)> **<([#13 [3.10.3] WHEREAS, the rising price of gasoline, coupled with ever increasing loss of good paying jobs due to the Administration's policies against energy development on western public lands, result in increasing hardships for families and the local economy; and**
#13)> **<([#14 [6.3.3.1] WHEREAS, the 2012 OSTIS DPEIS improperly limits technology testing to strictly in situ efforts and does not allow for development of other technologies; and**
#14)> **<([#15 [1.1.1] WHEREAS, the BLM has left insufficient time for the public and cooperators to meaningfully comment on the public 2012 OSTIS DPEIS by the present comment deadline of May-4, 20 12, because a highly relevant commercial oil shale BLM regulation is not due to be published until May I 5, 2012 and the public should have the right to view that regulation first and then submit comments on the 2012 OSTIS DPEIS in light of the regulation; and**
#15)> **<([#16 [2.1.1] WHEREAS, the same problems with lack of consistency with local plans and policies and failure to honor the input of cooperators and all stakeholders, also besets many public lands EIS projects, in addition to the 2012 OSTIS DPEIS. The cooperators from Utah and Wyoming have already unanimously requested for the NoAction alternative in the 2012 OSTIS DPEIS become the preferred alternative.**

#16)> 0 • • , •

RESOLUTION

<([#17 [9.2.1] NOW TH EREFORE, BE IT RESOLVED BY MOFFAT COUNTY, STATE OF COLORADO AS FOLLOWS:

I. Moffat County declares the BLM's continuing to administer and carry out the 2012 OSTIS DPEIS, and updating any inventory of lands having wilderness characteristics, to be an open contempt and flaunting of the

Congressional Spending Moratorium first imposed in the 2011 Continuing Resolution and carried forward in all subsequent Congressional spending resolutions up to and including the present;

2. Moffat County calls upon the BLM to cease all further activities with respect to administering and carrying out the 2012 OSTs DP EIS, because doing so constitutes an open contempt and violation of the Congressional Spending Moratorium against implementing, administering and/or enforcing Secretarial Order 3310, which Spending Moratorium was first imposed in the 2011 Continuing Resolution and carried forward in all subsequent Congressional spending resolutions up to and including the present;

3. Moffat County calls upon the BLM to immediately cease all activities related to the 2012 OSTs DPEIS and immediately publish a revised notice in the federal Register signifying its cessation of all work on the Programmatic EIS in obedience to the above-quoted Spending Moratorium. Otherwise, the BLM would be in contempt of Congress;

#17)> <(**#18** [2.1.1] 4. Should BLM continue to go forward with the 2012 OSTs DPEIS regardless of these grievances, the only legally, viable alternative would be if the BLM adopted the NO-Action Alternative, which is identical to the Alternative chosen in the ROD of the 2008 OSTs PEIS; **#18)**>

<(**#19** [9.5] 5. Should BLM decide to proceed with the 2012 OSTs DPEIS, it is still obligated under FLPMA to be consistent with State and Local plans to the maximum extent possible: **#19)**> <(**#20** [1.1.1] 6. The BLM should extend the May 4, 2012 deadline for public comment on the 2012 OSTs DPEIS at least 30 days after publication of the expected oil shale regulation due to be published on or around May 15, 2012. **#20)**> <(**#21** [1.3] 7. The BLM should honor the input of cooperators, particularly if they are local governments, as required by Section 202(c)(9) of FLPMA and the relevant terms of the BLM-Cooperator MOUs, in all matters, not just with respect to the 2012 OSTs DPEIS. **#21)**> APPROVED AND ADOPTED by the Board of County Commissioners of Moffat County Commissioners of Moffat County this 23th day of April, 2012.

sthompso@blm.gov

Dear Ms. Thompson,

<([#1 [I.1.1] Please accept this correspondence as the Board of Commissioners of Carbon County, Utah's request for at least a 30-day extension to the comment period on the on the Draft Programmatic Environmental Impact Statement (PEIS) and Possible Land Use Amendments for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the BLM in Colorado, Utah and Wyoming. #1])>

<([#2 [I.3] As we understand it, the reason that this action has taken place is to quell a legal challenge. The DOI has since agreed to a settlement. Since the terms of that settlement agreement has not been shared with us; we as cooperators have not been given the full ability to make substantive comments. In all likelihood the additional information would probably rate additional comments from us pertaining the planning and implementation of this action. Without knowing the need of or terms for the settlement, we in fact are not being allowed to comment on the scope of or purpose for this important action. Until such time as the settlement information is brought forth and we are given a reasonable amount of time to comment we doubt that BLM has legally adhered to the dictates of federal land management planning through the processes of coordination (as described in FLPMA 43 U.S.C. 1712 and 43 CFR 1610 (BLM)) and cooperating agency status (as described in Section 1501.6 of NEPA and 40 CFR 1508.5 (CEQ) Real cooperation will not happen until all information needed to initiate a true NEPA planning process is met. Until then it is not appropriate to expect us to think our comments are really given due diligence or consideration. #2])>

We will await your reply.

Thank you for your consideration on this request.

Re: Bureau of Land Management (BLM) Oil Shale and Tar Sands (OSTs)
Draft Programmatic Environmental Impact Statement (PEIS) for
Colorado, Wyoming, Utah (tri-state area).

Responsible Officials:

Thank you for the opportunity to provide comments for the Draft OSTs PEIS; these comments, submitted by Center for Biological Diversity, Grand Canyon Trust and Living Rivers/Colorado Riverkeeper, supplement attached comments submitted by sixteen conservation groups dated April 27, 2012, which we incorporate by reference here. These supplementary comments specifically address cumulative impacts to water resources, air quality, climate, conservation of public lands, and conservation of threatened and endangered species. Our organizations are opposed to new or continued oil shale and tar sands development, leasing, or research on public lands. Commitments of public lands or resources to such greenhouse gas intensive energy development are incompatible with an energy or public lands policy to reduce greenhouse gas emissions on the timeframe that scientists tell us is absolutely necessary; such commitments also threaten Upper Basin water quality, water quantity,

imperiled species and biological diversity, recreational, agricultural and other values.

<([#1 [1.5] 1. Alternatives

We appreciate the work of BLM and Argonne Labs in the development of the OSTs PEIS, however we do not fully support any of the proposed alternatives offered. It is our opinion that any study to develop unconventional oil reserves in the Colorado River Basin remains presumptuous as stated in our scoping comments of May 16, 2011. No alternative has been presented that would provide unequivocal protection of water and air resources and biological diversity in the Colorado River watershed; therefore the DPEIS as presented is incomplete and needs additional review.

#1])> <([#2 [3.4.1] [9.2] [3.7.1.2] If the 2005 Energy Policy Act is designed to provide energy security for the nation, it

conversely creates water insecurity for the Colorado River Basin. Simply stated, water is the fundamental resource allowing any prosperity to exist in the arid Southwest and development of water intensive energy resources such as OSTs will threaten water security for millions of downstream users.

The cumulative loading of excessive greenhouse gases and dust into the atmosphere is already causing the annual snowpack of the Colorado River System to melt faster in the spring, creating runoff that will not be absorbed into mountain watersheds. Water moving too quickly through the system prevents groundwater absorption and prevents critical aquifers from recharging.

Attempts to improve critical wildlife habitat in the Colorado River Basin are failing and especially for aquatic species. For example, the cooperative agreement for the Endangered Fish Recovery Program has been extended primarily because the original objectives have not been met, and the established goals are weakening administratively over time.

In the Lower Basin of the Colorado River, two pieces of protective legislation have been introduced by Representative Raul Grijalva (D-AZ): 1) The Lower Colorado River Protection Act, and 2) The Grand Canyon Watershed Protection Act. It is important that decision makers and federal agencies understand that fossil and nuclear fuel development in the Upper Basin of the Colorado River, as detailed in the 2005 Energy Policy Act, would nullify the intent of this proposed legislation, if it is ever passed, and harm the drinking water supply of 25 million downstream users.

In the Upper Basin, downstream water users came together with citizens of Moab, Utah to effect cleanup of the massive Atlas uranium mill tailings pile on the banks of the Colorado River. If watershed protection legislation had been implemented decades ago, for the entire Colorado River System, taxpayers would not be saddled with paying to clean up toxic waste dumps sited in the river floodplain. Sane energy policy would include protecting and securing the water resources of the Colorado River System in perpetuity.

#2])> 2. Water Resources

<([#3 [3.4.1] The Colorado River Basin no longer has surplus water. According to recent science compiled by the Department of Interior: 1) the Colorado River Compact is over-allocated by 2 million acre feet; 2) the demand for Colorado River water presently exceeds the natural supply; 3) the annual supply in the last 50 years has decreased one million acrefeet, and; 4) the decline in the annual flow is expected to further reduce another one million acre-feet by 2060. Excluded from these studies is the annual loss of 750,000

acre-feet due to sublimation of the Rocky Mountain snowpack caused by fugitive dust derived from human activity and increasing aridity from anthropogenic climate change. According to the GAO report on oil shale development in the tri-state area, the amount of water necessary to fully develop this reserve is equivalent to 30 to 40 years of the entire Colorado River supply. Since water supply and demand is clearly imbalanced in the basin, all proposed OSTs development can only be speculative. Oil corporations may deliver clever messaging to the public about the ample resource awaiting full exploitation, but there is not enough water in the system to practically begin that development in the next decade. Also, there is no guarantee that existing water resources will not be further degraded by current development activity.

The Uinta Basin watershed in Utah contains two types of aquifers, shallow and deep. Deep aquifers would be completely exhausted by proposed strip mining and processing operations in the region. Eventually, to continue mining, developers would have to procure water from the mainstems; the White, Green and Colorado Rivers. These water sources are currently over-allocated to downstream users. #3]>

<([#4 [3.7.4.10] In a strip mining scenario in the Uinta Basin, shallow aquifers, comprised of alluvium,

would be transformed into piles of rubble and dust. Cloudbursts would mobilize toxins from residual chemical solvents used in processing, and stored in surface waste pits, and send them downstream toward the mainstems. The Colorado River via Westwater Creek is the closest mainstem to the PR Springs Special Tar Sands District. The mouth of Westwater Creek is home to a population of humpback chub in Westwater Canyon. Desolation Canyon on the Green River is prime spawning habitat for the Colorado pikeminnow. Labyrinth and Stillwater Canyons on the Green are prime nursery habitat for all the endangered fish species of the Colorado River.

#4])> <([#5 [3.4.6] [6.3.2] In regard to oil shale development, for mining and surface retorting, water is needed for

dust control during materials distraction, crushing, and transport; for cooling and reclaiming spent shale; for upgrading raw shale oil; and for various plant utilities associated with power production and environmental control (Bartis et al. 2005). The U.S. Water Resources Council estimates that oil shale development will increase annual consumptive water use in the Upper Colorado Region by about 150,000 acre-feet per year for each million barrels per day of production (Bartis et al. 2005). While the in situ process reduces a number of these water requirements, the facilities will still need considerable volumes for oil/natural gas extraction, postextraction cooling, products upgrading and refining, environmental control systems and power production (Bartis et al. 2005). Likewise, tar sands production also relies on large amounts of water (Dyer et al. 2008). It takes approximately 2-4.5 barrels of water to extract and upgrade one barrel of oil from a tar sands mine (Dyer et al. 2008). This is important because at the same time production of fuel from oil shale and tar sands in the U.S. will depend on large amounts of water, the greenhouse gas emissions from the project will contribute to the global warming which dangerously threatens the water supply.

In a recent article published in Science, researchers found that an increase in atmospheric greenhouse gases has contributed to a “coming crisis in water supply for the western United States” (Barnett 2008). The research found that between 1950 and 1999, a shift in the character of mountain precipitation occurred, with more winter

precipitation falling as rain instead of snow, earlier snow melt, and associated changes in river flow (Barnett 2008). The variants among the “most important metrics of the western and the average January through March temperatures in the mountainous regions of the western U.S. (Barnett 2008). Using several climate models and comparing the results, the researchers found that “warmer temperatures accompany” decreases in snow pack and precipitation and the timing of runoff, impacting river flow and water levels (Barnett 2008). These researchers concluded with high confidence that up to 60 percent of the “climate related trends of river flow, winter air temperature and snow pack between 1950-1999” are human-induced (Barnett 2008). This, the researchers wrote, is “not good news for those living in the western United States.” (Barnett 2008). #5]>

<([#6 [4.2] [3.4.1] The impact greenhouse gas emissions and global warming is having on the western

United States’ water resources is a critical consideration that the BLM must analyze in its final EIS. Likewise, it must analyze how the changes in the water systems in the project area will affect plants and animals that will be impacted by the project. Many species will be detrimentally affected not only by the direct impact of water usage by oil shale and tar sands facilities, but also by the cumulative impact the facilities will have on global warming and the resulting adverse effect on the river flow and water levels. The DPEIS must also analyze how the project’s direct impact on species from impacts like habitat destruction may act in a cumulative and synergistic way with impacts to species from global warming. #6]>

<([#7 [3.5.2] [4.2] [3.5.4] [3.5.8] 3. Air Quality

We emphatically endorse the comments of our colleagues, Western Resource Advocates et al regarding air quality issues in attached document. Specifically, more time should be taken to adequately study cumulative air impacts establishing baseline information for existing impacts from industrial development in the region covered by the OSTs PEIS and from the reasonably foreseeable development scenario proposed as required by NEPA.

In Utah, air quality monitoring in the heavily developed Uinta Basin over the past two winters revealed some of the nation’s highest ozone measurements, even outpacing San Bernardino County in Los Angeles. Emissions from Uinta and Duchesne counties’ 15,000 oil and gas wells are suspect. The problem is being investigated in a 5.5 million dollar study conducted by the state, NOAA, EPA, the University of Colorado, BLM, the Energy Dynamics Lab, Uintah Impact Mitigation Special Service District and the Western Energy Alliance. Preliminary results and conclusions are scheduled for release in July 2012, however due to the lack of snow on the ground this winter which contributes to ozone formation; data gathered in winter 2012 will not reflect conditions present during snowy years.

Air quality data used for analysis in the OSTs PEIS, if obtained from industry sources, should be verified by BLM, EPA, NOAA or some entity without financial interests in development scenarios.

Fugitive emissions from oil and gas development infrastructure including pipelines, compressor stations, wells, storage tanks and transport trucks is a major source of methane, Volatile Organic Chemicals and Hazardous Air Pollutants, all of which is unmonitored and unmeasured. The DPEIS must assess and acknowledge impacts from

fugitive emissions. The EPA has used FLIR video cameras to reveal the presence of these otherwise “invisible” sources. For example see www.youtube.com/watch?v=N2cHGx0Q1qM&feature=relmfu

For a comprehensive database on known chemicals used in the oil and gas development industry and their effects on human health please see www.endocrinedisruption.com. The population of the Uinta Basin is at 30,000 residents, and any heavily concentrated oil/gas development scenario such as proposed in the OSTs PEIS, which augments existing impacts, should assess possible effects on human health. #71)>

<(#11 [3.5.1.1] a. The DPEIS Must Assess Carbon Dioxide Emissions

Carbon dioxide is one of the most important greenhouse gases and tends to stay in the atmosphere for centuries (Archer 2005). The IPCC found that emission rates of carbon dioxide have grown by 80 percent from 1970 to 2004 and that the 2005 atmospheric concentration of carbon dioxide at 379 parts per million greatly exceeded the natural range over the last 650,000 years (Bernstein et al. 2007). The rise of carbon dioxide emissions in the air is commensurate with the rise of global temperatures.

Scientists have described the atmospheric carbon dioxide ceiling that must not be exceeded in order to avoid a dangerous rise in temperatures. Previously, scientists have described this “ceiling” as approximately 450 parts per million (ppm) of carbon dioxide, and have warned that this may need to be adjusted downwards (Hansen 2006, Hansen 2006a,b). Recently, Dr. James Hansen has stated that the limit will need to be revised downward to 350 ppm (McKibben 2007). We are already well past that ceiling at 383 ppm (McKibben 2007).

It is possible to slow and then reverse the increase in carbon dioxide emissions concentrations by slashing anthropogenic emissions, improving land use, and utilizing alternative energy sources. See, e.g. Hansen 2006, Hansen et al. 2006a,b; Hansen and Sato 2004. However, the necessary measures have not yet been implemented, and carbon dioxide emissions have continued to increase by 2 percent per year since 2000 (Hansen 2006; Hansen et al. 2006a,b). If this growth continues, the 35 percent increase in carbon dioxide emission between 2000 and 2015 will make it impossible to get below even the previously identified ceiling of 450 ppm (Hansen 2006; Hansen et al. 2006a,b).

b. The DPEIS Must Assess Methane Emissions

Methane is the most important of the non-CO₂ pollutants, with a global warming potential 21 times greater than carbon dioxide, and an atmospheric lifetime of 12 years (Forster and Ramaswamy 2007). Methane constitutes approximately 20% of the anthropogenic greenhouse effect globally, the largest contribution of the non-CO₂ gases. As a precursor to tropospheric ozone, methane emissions have an even more powerful impact on climate. In the Arctic, which is already struggling in the face of global warming, this impact is strongest in winter months, which can result in an acceleration of the onset of spring melt (Shindell 2007). Tropospheric ozone, unlike other greenhouse gases, absorbs both infrared radiation and shortwave radiation (visible light). Thus, tropospheric ozone is a particularly powerful greenhouse gas over highly reflective surfaces like the Arctic, because it traps shortwave radiation both as it enters the Earth’s atmosphere from the sun and when it is reflected back out again by snow and ice. Reducing global methane emissions will reduce ozone concentrations in the sensitive Arctic and elsewhere.

c. The DPEIS Must Assess Black Carbon or Soot Emissions

Black carbon, or soot, consists of particles or aerosols released through the inefficient burning of fossil fuels, biofuels, and biomass (Quinn et al. 2007). Black carbon warms the atmosphere, but it is a solid, not a gas. Unlike greenhouse gases, which warm the atmosphere by absorbing longwave infra-red radiation, soot has a warming impact because it absorbs shortwave radiation, or visible light (Chameides and Bergin 2002). Black carbon is an extremely powerful greenhouse pollutant. Scientists have described the average global warming potential of black carbon as about 500 times that of carbon dioxide over a 100 year period (Hansen et al. 2007; see also Reddy and Boucher 2007). This powerful warming impact is remarkable given that black carbon remains in the atmosphere for only about four to seven days, with a mean residence time of 5.3 days (Reddy and Boucher 2007).

Black carbon presents a particularly troubling problem for the Arctic. It contributes to warming in this region through the formation of “Arctic haze” and through deposition on snow and ice which increases heat absorption (Quinn et al. 2007; Reddy and Boucher 2007). Arctic haze results from a number of aerosols in addition to black carbon, including sulfate and nitrate (Quinn et al. 2007). The effects of Arctic haze may be to either increase or decrease warming, but when the haze contains high amounts of soot, it absorbs incoming solar radiation and leads to heating (Quinn et al. 2007).

Soot also contributes to heating when it is deposited on snow because it reduces reflectivity of the white snow and instead tends to absorb radiation. A recent study indicates that the direct warming effect of black carbon on snow can be three times as strong as that due to carbon dioxide during springtime in the Arctic (Flanner 2007). Black carbon emissions that occur in or near the Arctic contribute the most to the melting of the far north (Reddy and Boucher 2007; Quinn et al. 2007). Black carbon is a significant contributor to global climate change, and, like methane and carbon dioxide, its emissions must be reduced to curb future warming of the earth.

d. The DPEIS Must Assess Nitrous Oxide and All Other Greenhouse Gas Pollutants

Nitrous oxide has a global warming potential 310 times that of carbon dioxide and an atmospheric lifetime of approximately 114 years (Forster and Ramaswamy 2007). It constitutes the second largest proportion of anthropogenic non-CO₂ gases at 7%. The main sources of nitrous oxide emissions are agriculture, wastewater, fossil fuel combustion, and industrial adipic and nitric acid production. As discussed further below, because oil shale and tar sands production relies heavily on fossil fuel combustion, and because the fuel eventually produced will also be burned by consumers, the project will likely lead to an increase in nitrous oxide emissions. The BLM must explore these emissions in its DPEIS. The BLM must also discuss any other greenhouse gas pollutants that may result from the proposed project.

In sum, the science concerning greenhouse gases and global warming is advanced and makes clear that we must stop the growth of greenhouse gas emissions, and then rapidly reduce overall emissions to a very small fraction of current levels. The DPEIS fails to fully acknowledge this critical context in which the oil shale and tar sands development’s greenhouse gas emissions must be analyzed. The greenhouse gas intensive oil shale and tar sands development is completely incompatible with any rational energy policy to reduce greenhouse gas emissions on the timeframe that

scientists tell us is absolutely necessary. Without analyzing the greenhouse gas emissions from the proposal within the overall context of the climate crisis we are facing, the BLM cannot comply with its legal obligations to fully analyze and disclose the unacceptable impact that a commercial leasing program will have on the environment. #11)>

<([#8 [3.1.1] 4. Public Lands

The current custom and culture of the BLM allows even multi-national corporations to appropriate U.S. public lands and sue the federal government for obstructing their rights to develop wherever they please even when The Department of Interior chooses to withdraw certain special lands from mining activity. Such is the case with Interior's recent uranium mining withdrawal at the Grand Canyon. Clearly there is a need for reform of the system. In the interim we are losing far more public land to destructive industrial development than is being protected by conservation measures; this status is not representative of balanced management.

When the BLM was established in 1946 from the melding of the General Land Office and the Grazing Service, a preference for mining and grazing uses for federal public lands was embedded in the culture of the agency. Although implementation of the Federal Land Policy and Management Act of 1976 allowed public participation in creation of BLM Resource Management Plans and gave a voice to other user groups such as hunters, fishermen, recreationists and other values such as clean air, clean water, intact wildlife habitat and wilderness; it did not effectively loosen the preferential grip of mining and grazing interests on public lands. We understand that Multiple Use does not mean every use on every acre of land, however the mining activities covered in the OSTS PEIS would relegate proposed mining areas to a single use in perpetuity. We do not believe that is an acceptable outcome.

The Tavaputs Plateau and the Uinta Basin of northeast Utah includes Dinosaur National Monument, Flaming Gorge National Recreation Area, and counties including Daggett, Duchesne, Carbon, Emery, Grand and Uintah. The BLM has identified about 650,000 total acres of potential contiguous wilderness in northeast Utah. These units include Bull Canyon (12,297 acres), Coal Canyon(61,430 acres), Cold Spring Mountain (17,682 acres), Cripple Cowboy (15,200 acres) Daniels Canyon (2,496 acres), Desolation Canyon (290,845 acres), Diamond Breaks (35,380 acres), Floy Canyon (72,605 acres), Flume Canyon (50,800 acres), Jack Canyon (7,500 acres), Moonshine Draw (3,900 acres), Turtle Canyon (33,690 acres), Spruce Canyon (20,900 acres), White River (13,500 acres) Westwater Creek (10,100 acres), Wild Mountain (500 acres).

Additionally, the citizen's proposal contained in America's Red Rock Wilderness Act identifies a total of 838,600 acres of wilderness in this region.

The special tar sands districts in the San Rafael Swell, the Triangle Tar Sands and White Canyon should be completely eliminated from the PEIS for reasons of their close proximity to extensive wilderness lands, Canyonlands National Park, Capitol Reef National Park, Glen Canyon National Recreation Area and the formerly proposed San Rafael Swell National Monument.

Keeping these wilderness lands intact is an excellent opportunity to preserve pristine ecosystem functions for both wildlife and human enjoyment. In Utah, surface and underground mining for either tar sands or oil shale would be devastating to wilderness and national park values. Which of these uses is an appropriate and balanced management decision for the nation's public lands? #8])>

<([#9 [9.2.2] 5. The Program Would Not Meet the Requirements of Section 369 of the EAct. Oil Shale and Tar Sands Development Cannot Proceed Because, as the DPEIS Demonstrates, it Cannot Be Done in an “Environmentally Sound Manner.”

Section 369 of the EAct makes clear that as a substantive matter, oil shale or tar sands development on public lands in the Rockies may proceed, if at all, only in an “environmentally sound manner.” Thus, while NEPA standing alone does not necessarily mandate an environmentally sound outcome as a substantive matter, such result is required here. See, e.g., *Wyo. Outdoor Council v. U.S. Army Corps of Eng’rs*, 351 F. Supp. 2d 1232, 1240 (D. Wyo. 2005) (“NEPA mandates that federal agencies take into consideration the impacts of their actions on the environment in the hopes that such consideration will lead to environmentally sound decisions that balance the needs of humans and the environment in which they live”).

The DPEIS and other studies demonstrate, however, that oil shale and tar sands development, as would be facilitated by the proposed action, would not proceed in an “environmentally sound” way. According to the DPEIS, the proposed development could destroy habitat, alter topography, displace birds and animals, kill animals, destroy plants including many oil shale endemic species, and could even drive some highly imperiled plant species to extinction, like the clay reed-mustard, Dudley Bluffs bladderpod, Dudley Bluffs twinpod, shrubby reed-mustard, and Uinta Basin hookless cactus. It will also, as described below, require vast energy inputs that may produce up to four times more greenhouse gas pollution than conventional oil production—rendering a global warming impact that the nation and world simply cannot afford.

Indeed, such impacts are not just possible, but quite likely. Many studies have documented the severe environmental effects of oil shale and tar sands development. See, e.g., Environmental Defense (2008) at 7-18 (documenting impacts of tar sands development, including toxic contamination of air and water, and increased global warming); WWF (2008) at 13-53 (documenting impacts to land, air, water, and climate); Rand (2005) at 35-43 (documenting environmental and social impacts of oil shale development in the United States); OTAa (1980) at 255-356 (discussing environmental considerations relevant to oil shale development in the United States); OTAb. For example, tar sands development in Canada is some of the most polluting, toxic, greenhouse-gas emitting, energy-intensive, destructive, and unsustainable activities on earth, and it is most certainly not “environmentally sound.” Environmental Defense (2008); WWF (2008). Oil shale development on public lands is likely to have longlasting, devastating consequences. Rand (2005); OTAa (1980). As unconventional sources of fossil fuel energy, there really is no way to avoid the insidious impacts that will inevitably result from oil shale and tar sands development, or minimize them to an “acceptable” degree.

At the very least, it is clear that the BLM lacks sufficient information to be able to evaluate fully the environmental consequences of such development—in particular, about project-specific technologies and their impacts to sensitive species and their habitats—as the agency itself acknowledges. If the BLM cannot determine whether oil shale and tar sands development will proceed in an environmentally sound manner, it cannot proceed with the proposed action. [#9]>

<([#10 [3.7.4.7] 6. The DPEIS Must Analyze Greenhouse Gas Emissions’ Threat to

Ecosystems and Endangered Species

The dangerous consequences of continued “business as usual” greenhouse gas emissions are all too foreseeable. Global warming is already profoundly changing our planet, representing the most significant and pervasive threat to biodiversity worldwide and affecting both terrestrial and marine species from the tropics to the poles.

The IPCC report recognizes this, finding that the resilience of several ecosystems is likely to be overcome this century by a dangerous brew of climate change, associated disturbances, such as flooding, drought, wildfire, insects and ocean acidification, and other environmental drivers like pollution and over-exploitation of resources (Bernstein et al. 2007). Along with increases in global average temperatures beyond 1.5-2.5° C and accompanying increased levels of atmospheric carbon dioxide concentrations will come major changes in ecosystem structure and function, species’ ecological interactions, and species’ geographical ranges (Bernstein et al. 2007). In fact, global warming has already resulted in the extinction of at least dozens of species (Pounds et al. 2006). Absent major reductions in greenhouse gas emissions, by the middle of this century upwards of 35 percent of the earth’s species will be extinct or committed to extinction as a result of global warming (Thomas et al. 2004).

Other scientific reports have reached the same conclusion as the IPCC that anthropogenic warming has had a recognizable influence on biological systems (Adger et al. 2007). In a study published in *Nature* in 2003, the authors reported a “globally coherent fingerprint of climate change impacts across natural systems” (Parmesan and CBD, GCT, LR/CR comments for OSTS Draft PEIS 9

Yohe 2003). In documenting this “fingerprint” of global warming on ecosystems, scientists have predicted three categories of measurable impacts from recent warming: (1) earlier timing of spring events and later autumn events (i.e. changes in “phenology”), (2) extension of species’ range poleward or upward in elevation, and (3) a decline in species adapted to cold temperatures and an increase in species adapted to warm temperatures (Parmesan and Galbraith 2003).

In the abstract, changes in phenology, distribution, or even an abundance of a species may not by themselves be harmful to the species’ long-term persistence. But if such changes put essential life history traits of the species out of sync with other components of the ecosystem, or if natural or anthropogenic barriers prevent poleward or upward migration, the consequences can be catastrophic.

The Edith’s checkerspot butterfly (*Euphydryas editha*) and the American pika (*Ochotona princeps*), two North American species, demonstrate such deleterious effects of global warming. The Edith’s checkerspot butterfly is one of the first species for which scientists documented a clear range shift due to global warming. The butterfly’s range has moved both northward and upward in elevation in response to a 0.72° C increase in regional warming (Parmesan and Yohe 2003). The range shift was not due to butterfly populations actually moving, but instead to a higher proportion of population extinctions in the southern and lowland portions of the range (Parmesan and Yohe 2003). These population extinctions are the result of the fact that the species’ host plant, *Plantago erecta*, now develops earlier in the spring, while the butterfly’s caterpillars continue to hatch at the same time (Parmesan and Yohe 2003). As a result, the caterpillars now hatch on plants that have already completed their lifecycle and dried up, instead of on younger edible plants (Parmesan and Yohe 2003). The tiny checkerspot caterpillars are

unable to move far enough to find other food and, as a result, starve to death (Parmesan and Yohe 2003).

Another animal struggling under the heavy hand of climate change is the American pika. This small mammal, a relative of the rabbit, is adapted to life in talus piles on high, treeless mountain peaks. Fossil evidence demonstrates that pikas once ranged widely over North America, but their range has contracted to a dwindling number of isolated peaks during the warm periods of the last 12,000 years (Krajick 2004). Pikas are limited by their metabolic adaptation to their cold habitat niche (Krajick 2004).

Hence, while more mobile alpine species such as birds may be able to shift their ranges poleward as warming temperatures and advancing treelines, competitors, and predators impact their mountain habitat, pikas are generally incapable of such long range dispersal (Krajick 2004). Rather, they can only migrate upslope as the climate warms (Krajick 2004). In large portions of its range, however, the American pika is already occupying the highest elevation talus habitats that exist on a given mountain range; in such cases there is no upslope habitat to migrate to, and the mountain's population will ultimately disappear as the climate continues to warm. Already, at least 9 of 25 (36%) of pika populations found in the Great Basin have been extirpated and the pika range has shifted upslope by 900 feet in this region. This small creature may well become one of global warming's first victims.

Species like the checkerspot butterfly and American pika demonstrate how climate change brought about by global warming will influence the earth's biodiversity as various species struggle to adapt to their changing habitats. Likewise, sensitive ecosystems, some literally melting under the impacts of global warming, have provided even more evidence of the dire consequence global warming will have on the earth's biological balance. #10]>

RE: Comments on DES 12-01

Oil Shale and Tar Sands

Thank you for the opportunity to comment on some aspects of the BLM management plans for oil shale. My comments are limited to the Piceance Basin, Colorado. I have 12 years experience as a Geologist-Hydrologist in the Interior Dept's 1970's-80's prototype program.

Because of location problems with several maps in the EIS, I may send additional comments.

<([#1 [9.7] This EIS, presumably aimed at reducing the acreage available for oil shale leasing, includes several statements and maps that appear to be in error and/or misleading. Their use can adversely affect the prudent management/development of this very large oil shale reserve. (The 1.5 trillion bbl of shale oil in Piceance Basin, if fully recovered, could supply our country's current needs for oil (20 million BP Day) for 200 years!) This EIS does not appear to take the long-term view on such a valuable resource.

This reviewer has no great problem with reducing the acreage available.

We need a long period of intense R&D ahead before continuing to lease under present lease terms (most envision only a 20/40% recovery with no plans for recovery of several co-products). Some studies suggest that co-products (aluminum, cement, lithium, fertilizer, etc.) could double the value of oil shale.

Current RD & D Leases:

Because of the large array of uncertainties involving in-situ recovery, it would seem prudent to allow the existing leases (in Piceance) to "mature", and thus provide a usable knowledge base, prior to issuing more leases based on in-situ methods. #1)> <([#2 [6.3.3] Several problems with in-situ methods are noted below:

1. Low resource recovery. The publicly available projected resource recovery for in-situ ranges from less than 20% to about 40%. For an 8 square mile "commercial" lease (15 billion+ bbl resource) such low recovery is not good, is probably unacceptable to the taxpayer owners [at current prices \$1.5 trillion], and appears to be contrary to the "waste of resources" provisions in the Mineral Leasing Act. A "prudent" resource owner would not normally settle for a return of 50 cents on the dollar, when more efficient methods are available.

#2)> <([#3 [6.3.2] Several problems with in-situ methods are noted below:

2. Water for In-Situ. Water needs and effects on groundwater are as yet unknown. Residual spent shale in in-situ retorts could require years of leaching or "rinsing", and, thus, lots of water. Subsidence effects on the

post-recovery aquifers are likely to be significant, and not beneficial, but are, as yet, unknown.

#3])> SPECIFICCOMMENTS

<([#4 [3.4.4] 1. VI PP.76, 77, 78

The message that the lower aquifer ground water is of “unusable” quality is in error. USGS Report (open-file report 78-734, prepared in cooperation with BLM & EPA) is the definitive data source on ground water quality. It notes that the average TDS in the lower aquifer is 3460 mg/L, and only one test hole encountered highly saline water. Thus, perhaps several million acre-feet of stored ground water there cannot be casually written off, or placed in the “unprotected” EPA category of water quality regulation. **#4])>**

<([#5 [6.3.6] 2. V2 P .2-20, paragraph 2 lines 17-19 (Exclusion of surface mining leases): The rather remarkable conclusion that the 0-500’ overburden zone, although being “Geologically Prospective” is “ ... very limited, and it would be difficult to assemble a logical mining unit”, is an ill-drawn conclusion, according to the opinions of several experienced oil shale geologists and engineers. Along the NW edge of the basin are about 65 square miles of Federal oil shale with less than 500’ overburden. Oil shale resource here is about 20 billion bbl, or about 2.5 Billion bbl on the eight (8) standard leases that would fit into the area. This federally owned area of less than 500’ of overburden (see Donnell, USGS PP 131 0) probably contains a minimum of 20 billion bbl oil equivalent. To not consider surface mining and retorting as a recovery method, even for this small area, is to potentially “waste” or lose about ½ or more of the resource, which would be about 10+/- billion bbl with a current oil value of \$1 trillion (and perhaps \$100 billion in royalties to The Public Treasury (Fed & State). Surface mining, in the long run, probably would be less expensive and less detrimental to the environment than other methods. **#5])>**

<([#6 [3.15] [6.1] 3. Map, P 3-11 (“Decisions” Map) raises several questions. The small scale and lack of “locatable” features make reviewing it an uncertain effort.

A. Around 100 mi² of shallow shale, containing perhaps 50-100 billion bbl of oil, appears to be left blank in the northern part of the basin (see Donnell Fig. USGS PP 1310). This area includes much/most of the “less than 500’ overburden area.

B. The “multi-mineral” zone appears to generally match the thickest Nacholite area, but does not include a larger area of Dawsonite (alumina) resource.

C. Why does the “underground mining” areas in the NW exclude a much larger area of “geologically prospective” resources?

The existence of the two patterns on the map do not support such a decision.

#6])> Note: per our recent phone conversation, I plan to submit

more detailed review on some aspects of the above, many of the maps are difficult to interpret, especially as to more exact locations. I'm awaiting map data from other sources.

Sincerely,

Glen Miller

RE: Comments on DES 12-01

Oil Shale and Tar Sands

Dear Ms. Thompson:

Thank you for the opportunity to comment on some aspects of the BLM management plans for oil shale. My comments are limited to the Piceance Basin, Colorado. I have 12 years experience as a Geologist-Hydrologist in the Interior Dept's 1970's-80's prototype program.

Because of location problems with several maps in the EIS, I may send additional comments.

This EIS, presumably aimed at reducing the acreage available for oil shale leasing, includes several statements and maps that appear to be in error and/or misleading. Their use can adversely affect the prudent management/development of this very large oil shale reserve. (The 1.5 trillion bbl of shale oil in Piceance Basin, if fully recovered, could supply our country's current needs for oil (20 million BP Day) for 200 years!) This EIS does not appear to take the long-term view on such a valuable resource.

This reviewer has no great problem with reducing the acreage available. We need a long period of intense R&D ahead before continuing to lease under present lease terms (most envision only a 20/40% recovery with no plans for recovery of several co-products). Some studies suggest that co-products (aluminum, cement, lithium, fertilizer, etc.) could double the value of oil shale.

Current RD & D Leases:

Because of the large array of uncertainties involving in-situ recovery, it would seem prudent to allow the existing leases (in Piceance) to "mature", and thus provide a usable knowledge base, prior to issuing more leases based on in-situ methods. Several problems with in-situ methods are noted below:

1. Low resource recovery. The publicly available projected resource recovery for in-situ ranges from less than 20% to about 40%. For an 8 square mile "commercial" lease (15 billion + bbl resource) such low recovery is not

good, is probably unacceptable to the taxpayer owners [at current prices \$1.5 trillion], and appears to be contrary to the “waste of resources” provisions in the Mineral Leasing Act. A “prudent” resource owner would not normally settle for a return of 50 cents on the dollar, when more efficient methods are available.

2. Water for In-Situ. Water needs and effects on groundwater are as yet unknown. Residual spent shale in in-situ retorts could require years of leaching or “rinsing”, and, thus, lots of water. Subsidence effects on the post-recovery aquifers are likely to be significant, and not beneficial, but are, as yet, unknown.

SPECIFIC COMMENTS

1. VI P.79, last paragraph, P. 80 cont’d:

The message that the lower aquifer ground water is of “unusable”

quality is in error. USGS Report (open-file report 78-734, prepared

in cooperation with BLM & EPA) is the definitive data source on

ground water quality. It notes that the average TDS in the lower aquifer is 3460 mg/L, and only one test hole encountered highly saline water. Thus, perhaps several million acre-feet of stored ground water there cannot be casually written off, or placed in the “unprotected” EPA category of water quality regulation.

2. V2 P .2-20, paragraph 2 lines 17-19 (Exclusion of surface mining leases): The rather remarkable conclusion that the 0-500’ overburden zone, although being “Geologically Prospective” is “ ... very limited, and it would be difficult to assemble a logical mining unit”, is an ill-drawn conclusion, according to the opinions of several experienced oil shale geologists and engineers. Along the NW edge of the basin are about 65 square miles of Federal oil shale with less than 500’ overburden. Oil shale resource here is about 20 billion bbl, or about 2.5 Billion bbl on the eight (8) standard leases that would fit into the area. This federally owned area of less than 500’ of overburden (see Donnell, USGS PP 131 0) probably contains a minimum of 20 billion bbl oil equivalent. To not consider surface mining and retorting as a recovery method, even for this small area, is to potentially “waste” or lose about ½ or more of the resource, which would be about 10+/- billion bbl with a current oil value of \$1 trillion (and perhaps \$100 billion in royalties to The Public Treasury (Fed & State). Surface mining, in the long run, probably would be less expensive and less detrimental to the environment than other methods.

3. Map, P 3-11 (“Decisions” Map) raises several questions. The small scale and lack of “locatable” features make reviewing it an uncertain effort.

A. Around 100 mi² of shallow shale, containing perhaps 50-100 billion bbl of oil, appears to be left blank in the northern part

of the basin (see Donnell Fig. USGS PP 1310). This area includes much/most of the “less than 500’ overburden area.

B. The “multi-mineral” zone appears to generally match the thickest Nacholite area, but does not include a larger area of Dawsonite (alumina) resource.

C. Why does the “underground mining” areas in the NW exclude a much larger area of “geologically prospective” resources?

The existence of the two patterns on the map do not support such a decision.

Note: per our recent phone conversation, I plan to submit more detailed review on some aspects of the above, many of the maps are difficult to interpret, especially as to more exact locations. I’m awaiting map data from other sources.

Sincerely,
Glen Miller

Re: Further Comments on the Piceance Basin part of DES 12-0; and my letter dated 5-3-12

Dear Ms. Thompson,

<[#1 [3.1.8] [6.1] During my review of the DES, I initially overlooked Figure 2.3.3.1

(Exclusions,

Alternative 2). The “Wilderness Characteristics” designation of a large area (more than 70 square miles of oil shale resource is surprising. I did not find this in the 2008 FES 08-32. Using the resource map of Donnel (1987, Figure 19), the resource here ranges from about one-half million to more than 2 million bbl/acre, and contains more than 50 billion barrels. The “Wilderness” area appears to include 20-30 square miles of the “multi-mineral” area, which contains a large amount of Nahcolite and Dawsonite (aluminum). The area is underlain by productive gas-bearing strata. The “shallow” gas reservoir contains a large reserve, and the deeper (“Niobrara”-Mancos, etc.) resource may be larger.

Several issues are apparent:

1. I am a proponent of The Wilderness Act, have worked in the area, and am of the opinion that it falls far short of the necessary features for “Wilderness.”
2. There are several well-used roads crossing the area.
3. My map data are incomplete, but there appears to be several oil and gas leases and several wells in the area.
4. The “Wilderness” coverage of most of the readily surface-mineable shale in northern Piceance Basin is of interest. The mid-2000’s RMP draft revision proposed a ban on surface mining. This proposed “Wilderness,” if put in place would do so.

#1])> Glen A. Miller letter to Ms. Sherri Thompson dated May 4, 2012 -Page 2

<([#2 [6.3.6] If the BLM has a policy against surface mining in Piceance, it owes the public an explanation. Too much is at stake. Potential market value of oil in the area is on the order of 5 to 10 trillion dollars (and hundreds of billions in royalties). The value of natural gas, aluminum, and other co-products (fertilizer, lithium, etc.) could be several multiples of this value. However, the true value is much greater as raw materials for our industry, and eventually as consumer products.

Discouraging surface mining will delay the much-needed R & D for this method, which currently is the ONLY known method to approach 100% resource recovery, and to recover potential co-products. Many reclamation experts, engineers and geologists are of the opinion that proper surface mining will cause minimum environmental damage and much better postmining land reclamation than other methods.

#2])> Thank you for your interest in this important national resource.

Sincerely,

Glen A. Miller

Oil Shale and Tar Sands Resources Draft Programmatic EIS

Argonne National Laboratory
9700 South Cass Avenue - EVS/240
Argonne, IL 60439

Re: Samson Resources Company Comments on the Oil Shale and Tar Sands
Resources Draft Programmatic Environmental Impact Statement

Ladies and Gentlemen:

Samson Resources Company (Samson) hereby submits the following comments in response to the Bureau of Land Management’s (BLM) Oil Shale and Tar Sands and Resources Draft Programmatic Environmental Impact Statement (Oil Shale DEIS) as announced in the Federal Register on February 6, 2012. 77 Fed. Reg. 5833 (Feb. 6, 2012). Samson submits these comments to the BLM because of the potential impact the Oil Shale DEIS, and the information contained therein, may have upon Samson’s ongoing and future oil and gas operations on public lands within Wyoming.

GENERAL COMMENTS

Samson owns significant federal oil and gas leases within the United States, including the State of Wyoming. Samson has its principal place of business in Tulsa, Oklahoma, but maintains offices throughout the western United States including Denver, Colorado and Rawlins, Wyoming. Samson owns and operates numerous oil and gas fields in Colorado and Wyoming. Samson operates approximately 200 wells, 166,000 acres of federal oil and gas leases, and in 2011 produced approximately 13,638 bcf of natural gas and 149 mbl of oil from federal lands. Given its existing operations on federal lands, and particularly those in Wyoming, Samson may be potentially significantly impacted by some of the BLM’s information analyses contained in the Oil Shale DEIS.

Samson is particularly concerned about impacts of information analyses contained in the Oil Shale DEIS on its conventional oil and gas development projects in Wyoming.

Representative of Samson, John Witucki, attended the BLM’s open house for the Oil Shale DEIS in Rock Springs, Wyoming on March 15, 2012.

Samson is the operator of three (3) federal units located within the Green River Resource Management Area (GRRM) and the Rock Springs Resource Management Area (Rock Springs RA) in south central Wyoming. In particular, Samson is the operator of the Barricade Federal

Oil and Gas Exploratory Unit, BLM Serial Register No. WYW-16399X; the Endurance Federal Oil and Gas Exploratory Unit, BLM Serial Register No. WYW-168995X; and the Desolation Road Federal Oil and Gas Exploratory Unit, BLM Serial Register No. 177629X. These units are all located in or adjacent to areas the BLM has suggested contain wilderness characteristics. Samson currently operates 30 wells within these units and the surrounding lands. Samson's oil and gas development within these units is a significant source of employment and local revenue for the federal government, the State of Wyoming, and the surrounding communities. Samson has expended over \$71 million dollars developing oil and gas resources in the area, which has led to the direct and indirect employment of approximately 100 people per each of 20 wells drilled. Oil and gas development is critically important to the economy of Wyoming and, in particular, the communities surrounding Samson's oil and gas operations in the region.

<([#1 [1.5] Samson understands and acknowledges that "oil shale" as used in the Oil Shale DEIS does not include conventional oil and gas development or so-called shale oil. Oil Shale DEIS, pg. 2-15. Samson is, however, concerned that some of the information analyses in the Oil Shale DEIS is inaccurate, misleading, and may impact conventional oil and gas development on its lands and leases within the Rawlins RA and the GRRRA [Green River Resource Management Area].

#1)> <([#2 [3.1.7] Lands with Wilderness Characteristics

Samson is concerned and opposed to, BLM's decision to "designate" or "identify" lands with wilderness characteristics (LWCs) within the GRRRA [Green River Resource Management Area] or the Rawlins RA in the Oil Shale DEIS. These designations are not consistent with or supported by the existing land use plans for the area or the actual condition of the lands in question. Samson is also opposed to the BLM's decision to identify LWCs outside of a local, resource management plan (RMP) revision or amendment process.

Under Alternatives 2 and 4 in the Oil Shale DEIS, the BLM has identified LWCs in which oil shale leasing and development will be prohibited. Oil Shale DEIS, pgs. 2-34- 2-36, 2-43 - 2-54. Unfortunately, the BLM's analyses with respect to the Rawlins RA is incorrect because the BLM has identified LWCs that are different from, and even inconsistent with, those identified with even recently completed RMPs. The BLM also arbitrarily misinterpreted current land use designations and allocations in the existing Rawlins RMP and Green River RMP. The BLM should not use a programmatic process, such as that for oil shale and tar sands development, to create new and de facto LWCs in Wyoming. Instead, the BLM should rely upon locally driven RMP amendments and revisions to identify and develop appropriate mitigation measures for lands that allegedly contain wilderness characteristics. In the Oil Shale DEIS, the BLM suggests that the agency has identified LWCs in both the GRRRA and the Rawlins RA that are inconsistent with past decisions of the BLM, past approvals of the BLM, and the current conditions on the ground. The BLM should remove any and all suggestions that the lands surrounding the Adobe Town Wilderness Study Area (Adobe WSA) contain or should be managed to protect LWCs. Although the BLM may intend the information analyses in the Oil Shale DEIS to apply only to future oil shale and tar sands leasing and development, opponents to conventional oil and gas development will certainly use the information analyses contained in the Oil Shale DEIS to prevent, delay or impair future oil and gas development, even on existing leases, within this area. For the past twenty (20) years, non-governmental organizations advocating the expansion of the Adobe WSA have challenged and delayed oil and gas development in the area arguing that the BLM is required to protect alleged wilderness characteristics and values within the area. Samson sets further additional information with

regard to each resource area described in the Oil Shale DEIS below. #2])>

<([#3 [3.1.7] Green River RMP

The BLM has identified two (2) areas outside of the Adobe WSA, but within the GRRRA [Green River Resource Management Area], and suggested they are or should be managed for wilderness characteristics. These areas include

the so-called Adobe Fringe Area and the Adobe Rare or Uncommon Area, a reference to an Order from the Wyoming Environmental Quality Council designating certain lands in Wyoming as Rare or Uncommon in April of 2010. See Oil Shale DEIS. Figure 3.1.1 - 13, pg. 3-35.

Neither of these areas should be subject to a L WCs designation.

Over the last several decades, the BLM has extensively considered the potential wilderness characteristics of lands outside of the Adobe WSA and declined to manage these lands to preserve any wilderness characteristics. The area was not included in the lands believed to have wilderness characteristics when the BLM prepared its recommendations for wilderness protection during the inventory and review process required by Section 603 of the federal Land Policy and Management Act of 1976 (FLPMA). 43 U.S.C. § 1782(a). The lands within the area are neither included in the 85 710 acres contained within the Adobe WSA nor the 10,920 acre subset of the Adobe Town that the BLM actually recommended for inclusion in the Wilderness System. See generally Adobe Town- Ferris Mountains Wilderness Final Environmental Impact Statement (1987). The BLM specifically did not recommend more than 10,920 acres of the Adobe WSA for wilderness protection because of the area's high potential for natural gas development and the likelihood of development. "The remaining 74 790 acres were recommended for non-wilderness because of the area's high potential for the development of natural gas. Given the WSA's high potential for natural gas it is likely that development would indeed occur here, with a potential for wells located throughout the nonwilderness portion. Wyoming Statewide Wilderness Study Report Wilderness Study Area Specific Recommendations, Vol. I, pg. 187 (Sept. 1991).

Further, as early as 1987 the BLM considered and rejected the option of creating a larger Adobe WSA because of low wilderness values and high potential for oil and gas development. "Through this examination, it was found that larger partial wilderness alternatives would either increase conflicts with oil and gas development on pre-FLPMA leases in areas of high wilderness values, or would add areas of low wilderness values on post-FLPMA leases." Adobe Town - Ferris Mountains Wilderness Final Environmental Impact Statement, pg. 6. Even back in 1987 the BLM recognized that a larger wilderness alternative was "unmanageable" and the agency properly eliminated a larger Adobe WSA from consideration. Id.

Then, as part of the planning process for the Green River RMP in the late 1990s, the BLM again evaluated the lands north of the Adobe WSA in the EIS accompanying the Green River RMP (BLM 1997). At the end of this multi-year process, which included extensive consultation with State and local governments, the BLM determined that the federal lands and minerals north of the Adobe WSA should be made available for oil and gas leasing and development under specific management guidelines and objectives. Green River RMP, pg. 37. In light of these determinations, the BLM cannot and should not suggest the areas surrounding Adobe WSA be treated as lands with wilderness characteristics. "BLM is not required to consider the likely effects of oil and gas exploration and development on wilderness characteristics or the overall suitability of the affected lands for wilderness designation or regard such impacts as significant, when it has previously determined, with administrative finality, that

the area of public lands at issue does not qualify for wilderness designation.” Biodiversity Conservation Alliance, 171 IBLA 218, 234 (2007) (citing cases). The Interior Board of Land Appeals (IBLA) has made clear that “BLM need not consider the impact of such activity on possible future recognition by Congress or the Department, since it constitutes a remote and highly speculative impact.” *Id.*

Moreover, the BLM should not treat these lands as L WCs simply because a nongovernmental organization suggests that they should be managed as such. The IBLA has also clearly recognized that the BLM is not required to manage areas for wilderness protection simply because a citizen group has suggested a different management approach from that contained in the governing land use plan.

We have repeatedly rejected the notion that BLM must manage the public lands in light of proposals by the public to designate lands as wilderness ... We have repeatedly held that we know of no legal mandate that required BLM to manage [a public land area] on the basis that, although finally rejected as a [wilderness study area], it might, at some unspecified future time, be designated by Congress as a protected wilderness area.

Biodiversity Conservation Alliance, et al., 171 IBLA 313, 318-19 (2007) (citations and quotations omitted). The IBLA has recognized the BLM’s treatment of LWCs remaining consistent with a new inventory conducted. “We again reject the notion that citizens’ groups may negate or undermine BLM’s statutory authority and discretion by conducting their own inventory and then arguing that BLM must reconsider its inventories when it attempts to undertake land use decisionmaking.” *Id.* The BLM has repeatedly declined to manage lands around the Adobe WSA to preserve their alleged natural character.

Existing Development

Consistent with the management decisions in the Green River RMP, the BLM approved the Desolation Flats Oil and Gas Development project in 2004 (Desolation Flats). The Desolation Flats project approved the development of three hundred eighty five (385) natural gas wells from three hundred sixty one (361) locations, five hundred forty two (542) miles of new or upgraded access roads, three hundred sixty one (361) miles of pipelines, one (1) gas processing plant, four (4) compressor stations, ten (10) water wells and two (2) water disposal wells. Desolation Flats Development Project Record of Decision, pg. 2; Desolation Flats Development Project Final Environmental Impact Statement, pg. 1-2. The Desolation Flats project was appealed to the IBLA on two (2) occasions and affirmed in both instances. See Biodiversity Conservation Alliance, et al., IBLA No. 1 (2008); Biodiversity Conservation Alliance, et al., IBLA No. 2005-218 (Jan. 31, 2007). The Desolation Flats Project area completely surrounds the Adobe WSA to the east and north, precisely within the areas the BLM has identified as L WCs as

part of the Adobe RUC. This entire area has been extensively developed with more than 66 wells and approximately 45 miles of pipelines. Although the BLM and operators in the area strive to reduce potential impacts, it is impossible to suggest the area contains or could be managed for wilderness characteristics. Please find attached as Exhibit A is a map showing existing oil and gas development and the areas allegedly being managed as L WCs.

Further, the lands identified as the Kinney Rim North and Kinney Rim South L WCs are, again, far from undeveloped. Indeed, much of this area is already leased for oil and gas development, therefore making it impossible to suggest the area has been or could be managed

for wilderness characteristics. As indicated on Exhibit A, these areas have been extensively developed for oil and gas resources. The area has been crisscrossed with miles of existing and upgraded roads and even a State Highway. Despite the erroneous allegations in the Oil Shale DEIS, these lands have not been managed for wilderness characteristics.

More recently, the BLM evaluated lands north of the Adobe WSA area for wilderness characteristics in 2007 and again found them lacking. The BLM determined that the checkerboard portion (interspaced private and federal lands and minerals) of the lands in this area fails to meet the size and naturalness requirements necessary to manage the lands for wilderness characteristics. Ex. B, Desolation Road Amended EA, pgs. 24-25 (BLM 2010). The BLM also concluded that a slightly larger contiguous area of land managed by the BLM south of the checkerboard does not meet the naturalness and solitude requirements associated with wilderness characteristics. *Id.*

In the Desolation Road Amended EA, the BLM confirmed its prior discussions that lands within the area north of the Adobe WSA lacked wilderness character. The BLM observed that the small size and isolated nature of federal lands in the area precludes wilderness management. *Id.* Further, the BLM determined that the larger contiguous portion of federal lands within the Desolation Road Project Area contained existing roads and other intrusions that precluded its management for wilderness characteristics. *Id.* Additionally, the BLM rejected the contention that the lands north of the Adobe WSA were undeveloped, explaining, “A number of existing approved and unapproved two-track roads exist in the Proposed Project Area. Grazing also occurs in the area.” *Id.* at 145. The BLM also observed that “[n]umerous two-tracks from light vehicles and off-road vehicles (ORVs) are evident throughout the Project Area.” *Id.* at 47. Thus, the BLM has consistently determined that the lands surrounding the Adobe WSA lack wilderness character. It is inconsistent with existing and past determinations of the BLM to suggest lands surrounding the Adobe WSA have been or could be managed for wilderness characteristics.

Monument Valley Management Area

In the Oil Shale DEIS the BLM also suggests that lands within the Monument Valley Special Management Area (Monument Valley MA) could be more managed as L WCs. Oil Shale DEIS, pg. 3-37, lines 21 - 25. The Monument Valley MA is an area the BLM manages to provide protection of wildlife, geologic, cultural, watershed, scenic, and scientific values. Green River RMP/Record of Decision, pg. 37. The BLM has made lands within the Monument Valley MA open to oil and gas leasing, exploration, and development provided mitigation can be applied to protect resource values. *Id.* Additionally the BLM has authorized three (3) separate oil and gas projects that are partially inside the Monument Valley MA: the Desolation Flats Project, the Mulligan Draw Project, and now the Desolation Road Project. Desolation Road EA pg. 23. As demonstrated above, the lands in this area are not managed for wilderness characteristics, nor has the BLM made a public, formal determination that such lands contain wilderness characteristics. As a practical matter, the lands to the north and east of the Adobe WSA have been extensively developed for oil and gas resources. To date there are currently 107 oil and gas wells in the lands and federal oil and gas leases immediately north and adjacent to the Adobe WSA. The BLM should not manage or suggest the lands to the north or east of the Adobe WSA should be, or could be, managed as L WCs. The simple and undisputed fact is that the lands have been managed for multiple use for the past twenty (20) years, and will continue to be managed for multiple use, including oil and gas development, in the years to come. #3]><([#4 [3.1.7] Rawlins RMP

The BLM also suggest that lands within the Rawlins RMP, and specifically in the area identified as the Kinney Rim South Area, should be managed for wilderness characteristics. Oil Shale DEIS, Figure 3.1.1-13, pg. 3-35. In fact, neither the Rawlins RMP nor the EIS accompanying said RMP contain any reference to the Kinney Rim area. The record of decision for the Rawlins RMP unequivocally states that there are no lands within the entire Rawlins RA managed for the protection of wilderness characteristics. Rawlins Record of Decision, pg. 1-3; see also, Director's Protest Resolution Report, Rawlins Resource Management Plan pgs. 149-153. The BLM itself seems to recognize this fact in the Oil Shale DEIS by noting that no lands within the Rawlins RA are currently managed for wilderness characteristics. Oil Shale DEIS, pg. 3-34, lines 42- 45. Despite this clear admission, the BLM later suggested that lands within the Rawlins RA are managed as L WCs. The BLM must explain this inconsistency and provide information to the public demonstrating how and why lands within the Rawlins RA are or should be managed for wilderness characteristics despite the unequivocal language in the Rawlins RMP. #4])>

<([#5 [3.1.5] Adobe Town Rare or Uncommon Area

Finally, the BLM suggests that lands within the Adobe Town Very Rare or Uncommon Area (RU) as designated by the Wyoming Environmental Quality Council (WEDQ) require the lands to be managed for wilderness characteristics. The BLM's position is untenable for several reasons. First, and as described above, the lands to the north and east of the Adobe WSA have been leased for oil and gas development and extensive oil and gas development has already been approved within those areas. As described above, the rare and uncommon area contains 22 wells and 100 miles of roads and pipelines. Second, the EQC RU designation approved by the WEDQ on April 10, 2008, specifically and unequivocally does not relate to or impact oil and gas operations. See Exhibit C EQC Order ~ 34, 35, and 36. Further, the RU designation does not prevent the construction of roads or other changes and current allowable uses. EQC Order~ 45. Oil and gas leasing development was specifically authorized prior to April 10, 2008, and is therefore not impacted by the RU designation. EQC Order ~ 45. Further, the Wyoming Supreme Court itself has recognized the RU designation does not, by itself, prohibit other activities including non-coal mining operations. *Ristler&McMurry Co. v. State*, 917 P.2d 1157, 1162-63 (Wyo. 1996). The BLM's position that the RU designation somehow equates to a wilderness characteristics management approach is inconsistent with the BLM's specific guidance for lands to the north and east of the Adobe WSA, inconsistent with Wyoming state law, and unsupportable. #5])>

CONCLUSION

<([#6 [3.1.7] Overall, Samson has no disputes relating to BLM's proposed management for oil shale

and tar sand leasing and development, so long as such development does not interfere with
1 Instead, that term only appears in proposals from non-governmental organizations advocating the creation of

additional wilderness areas within the Rawlins RA.

conventional oil and gas development. Samson is concerned, however, and strenuously opposes the BLM's description of lands with wilderness characteristics in both the GRRA and the Rawlins RA as the BLM's descriptions of these areas are inaccurate., misleading, and simply untrue. There are no lands north or east of the Adobe WSA that have been, or ever could be, managed for wilderness characteristics. As described herein, and in the BLM's resource management plans for both the Green River RMP A and the Rawlins RMP A, the lands to the

north and east of the Adobe WSA have been extensively leased and developed for oil and gas resources. It would appear from Samson's review of the Oil Shale DEIS that BLM has followed the advice and recommendations of a few isolated, non-governmental organizations in their belief these areas can or should be managed for wilderness characteristics. Samson strenuously urges the BLM to update the information in the final environmental impact statement for the oil shale and tar sands leasing analyses to more accurately reflect accurate information. If the BLM prefers to withhold these areas from future oil shale or tar sands leasing, the BLM can certainly justify that decision based on other factors rather than on unsupported and erroneous assumptions regarding wilderness characteristics. Such characteristics are simply not present and any suggestion by the BLM to the contrary is incorrect and could lead to substantial delays in future oil and gas development projects including those proposed by Samson. If you have any questions or comments regarding this matter please contact me at the letterhead address or by phone at (303) 222-0973. #6]>

Re: Comments on DES 12-01

I have reviewed electronic copies of the document and have the following comments.

<([#1 [3.15] 1. Important maps in the document, Figure 2.3.3-1 (included as Exhibit A here) as an example contain no geographic registration information. i.e. Lat-Lon tick marks, township and range lines, etc. to accurately locate the items featured. I do not believe that the maps meet any reasonable standard of best practice nor does it meet criteria in Reference Manual on Scientific Evidence where rules on the reliability of scientific evidence consistent with the Supreme Court opinion in *Daubert v. Merrell Dow*, 509 where rules were set out. The lack of registration data inhibits evaluation of data presented. Further, no GIS data files were made available to allow for individual manipulation. The maps must be corrected.

#1])> <([#2 [6.1.1] 2. The term “Most Geologically Prospective Area” is not defined in the glossary and is not a standard term used in resource assessments. I find no place in my review of the material in the OSTs where it is defined and what methods were used to determine the location. This is definitely a very subjective term that undoubtedly does not meet the above mentioned criteria in the Reference Manual on Scientific Evidence. To the best of my knowledge it is not a term used in the USGS DDS-69-Y Johnson, R.C. et al, 2010, An Assessment of In-Place Oil Shale Resources in the Green River Formation, Piceance Basin, Colorado. A more technically correct method must be used to evaluate the Oil Shale area. #2])>

<([#3 [2] 3. Important shallow Oil Shale Resources that may be amenable to surface mining where total recovery is possible were placed outside the “Most Geologically Prospective Area”. These resources are substantial as Exhibit B - Map from DDS-69-Y indicates. Something in the range of 60 billion bbls. The failure to consider and provide for opportunities for research and commercial developments that involve surface mining makes the DES 12-01 incomplete. This again fails to meet the criteria for scientific evidence. Surface Mining must be considered. The map on the following page is from DDS-69-Y and shows the resource estimates.

#3])>

<([#4 [3.1.7] 4. In order to evaluate the “Lands with Wilderness Characteristics” on Figure 2.3.3-1, an image of the map page was stretched and squeezed into a mapping program that I use. A copy is shown as Exhibit C. This is a busy map, but it shows several things, some of which are better displayed in a subsequent map that I made incorporating oil and gas wells from the Colorado Oil and Gas Commission, the Mahogany Outcrop from GIS data associated with DDS-69-Y, Local Roads from the Colorado Department of Transportation, and Oil Shale Core holes from the GIS data associated with DDS-69-Y.

I have been in the area on the ground and do not believe the area should be considered to have “Wilderness Characteristics” There are roads, oil and gas wells, and Oil Shale Core Holes. I challenge the designation as having Wilderness Characteristics. From the map the fabled flag pole looks to be in place. This means that dust from the road can blow in my face in the Wilderness. This is a corruption of the definition of Wilderness - Untouched by the hand of man.

Further, I downloaded the Wilderness Study Area data from the Colorado BLM office and I do not see this area listed there. How and when were these lands designated to have Wilderness Characteristics? Who did the work? When was the work done? Was any of this work done recently when it is my understanding

that Congress has forbidden any money to be spent on Wilderness Characterization?

Clearly this does not meet a standard of best practices. #4)>

<([#5 [3.4.6] 5. The characterizations of the aquifers on pages 3-77 and 3-78 do not incorporate data from hydrology wells drilled in the last 15 years on BLM lands in the Northern Piceance basin. The Upper and Lower aquifers are an oversimplification, and the distribution of dissolved solids has been further refined. In general, only in near proximity to the dissolution surface will the water in the “Lower Aquifer” be above 10,000 IDS. Thus the OSTs fails to meet standards of best practice because not all data has been used.

#5)> <([#6 [3.10.3] 6. On page 3-270 that statement is made that “the three-state ROI is primarily used for hunting and other forms of dispersed outdoor activities” I question this assertion. Being a hunter myself and an outdoor person, I also know what pays the freight with the economies. Look at the values generated from oil and gas in the Piceance Basin as an example. Look at the local tax bases. Look at the monies to the Federal Government. All of that is missing in this OSTs.

The implication is that recreation is at odds with other uses. This is a false choice.

I believe the economic analysis is incomplete and not supported by sound economic evaluation. This is best stated by the following: Dr. Thomas Sowell in his book Basic Economics has an entire chapter on “Non-Economic Values”:

“Beware the people who moralize about great issues; moralizing is easier than facing hard facts. John Corry ...

While economics offers many insights, and makes it easier to see through some popular notions that sound good but will not stand up under scrutiny, economics has also acquired the name ‘the dismal science’ because it pours cold water on many otherwise attractive and exciting - but fallacious - notions about how the world can be arranged. One of the last refuges of someone whose pet project or theory has been exposed as economic nonsense is to say: ‘Economics is all very well, but there are also non-economic values to consider.’ Presumably, these are supposed to be higher and nobler concerns that soar above the level of crass materialism.

Of course there are non-economic values. In fact, there are only noneconomic values. Economics is not a value in and of itself. It is only a way of weighing one value against another ...

What lofty talk about ‘non-economic values’ often boils down to is that some people do not want their own particular values weighted against anything. If they are for saving Mono Lake or preserving some historic building, then they do not want that weighted against the cost - which is to say, ultimately, against all the other things that might be done instead with the same resources

In the world that people live in, and are likely to live in for centuries to come, trade-offs are inescapable. Even if we refuse to make a choice, circumstances will make choices for us, as we run out of resources for many important things that we could have had, if only we had taken the trouble to weigh alternatives.”

I believe that the economic evaluation done in the OSTs exactly matches the situation discussed above by Dr. Sowell. Where is a discussion of values for the Oil shale? #6)>

<(#7 [3.10.3] 7. The BLM has a history of ignoring sound economics, and I urge you to do better. On April 7, 1995 I submitted the following comment on the White River Resource Draft Management Plan:

“No determination or comparison of Values

8. During the “Scoping” process the planning issues (page 1-7) included “Comparing the public values of oil and gas development with the public values of other alternative uses which may be precluded or impacted.”

Also see 6/90 letter “Dear public land user” p. 3 which contains identical language and was used by the BLM during the scoping process.

- The RMP does not determine the value of oil and gas resources.”

On page A-81 of the June 1996 White River Resource Area Proposed Resource Management Plan and Final Environmental Impact Statement the response by the BLM to my question (480) above was:

“Response: The value of oil and gas resources are difficult to measure, as well as being very price dependent.”

This response was insulting and displayed an appalling lack of economic literacy. It is proof to me that in the past, unsound economic analysis was done by the BLM during the planning process. This kind of action leads to impoverishment of the country.

For this OSTs-What about the Oil and Gas in the Area? Where does that fit in?

#7)> <(#8 [1.1] 8. I have reviewed the document and see that some Colorado entities are involved as

cooperating agencies. I have also reviewed the preparers and best I can and it appears to me that there is not one Colorado Registered Engineer involved with the OSTs. Is that true? If so, is that not a violation of Colorado Regulations. Was the engineering in the OSTs done without a license? Very clearly this violates any kind of best practices effort. I do believe it is fair to question the technical expertise of the BLM preparers. #8)>

Statement of Qualifications: I am a member of a Western Colorado Territorial Family and I was raised outside of Meeker Colorado. I have been in Grand Junction for the past 25 years. I hold a Master of Science in Geology from the University of Colorado. I have worked as a geologist for over 30 years. I have first hand experience in the Piceance Basin.

It is my belief that not everyone is entitled to an opinion. People are only entitled to an informed opinion. No one is entitled to be ignorant.

My Father’s School Picture - Summer of 1934 Southeast of Meeker, Colorado

This is what it looks like when resources are not available or miss-used.

Do NOT let this come again.

Oil Shale and Tar Sands Resources Draft Programmatic EIS
Argonne National Laboratory .
9700 South Cass Avenue-EVS/240
Argonne, IL 60439

To whom it may concern:

Please accept these comments from the Wyoming Outdoor Council regarding the Bureau of Land Management's (BLM) "Draft Programmatic Environmental Impact Statement and Possible Land Use Plan Amendments for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah, and Wyoming" (hereinafter Oil Shale PEIS). The Wyoming Outdoor Council is Wyoming's oldest statewide environmental advocacy group and has a 45-year history of seeking to ensure public lands management is protective of the natural environment on these important national assets. :

Support for Provisions in the Oil Shale PEIS Preliminary Preferred Alternative.

<([#1 [2.2] Areas of Support.

The Wyoming Outdoor Council supports several of the provisions proposed for the preferred alternative specified in the Oil Shale PEIS, alternative 2(b). The preferred alternative would make approximately 461,965 acres available for future consideration for commercial oil shale leasing (174,476 acres in Wyoming), but only for research, development, and demonstration (RD&D) leases. This is a significant reduction from the approximately 2 million acres approved for oil shale leasing pursuant to the environmental impact statement

(EIS) BLM prepared in 2008. We appreciate that under the preliminary preferred alternative the following areas or kinds of lands would be excluded from oil shale leasing: (1) lands with wilderness characteristics; (2) the whole Adobe Town Very Rare or Uncommon area in south-central Wyoming; (3) Greater sage-grouse core areas; (4) all areas of critical environmental concern (ACEC); and (5) other areas identified as excluded pursuant to the 2008 EIS, including a requirement for future NEP A analyses and consultation activities to occur prior to any decision to lease and/or develop oil shale and tar sands resources, and a decision that the BLM will consider and give priority to the use of land exchanges to facilitate commercial oil shale development pursuant to Section 369(n) of the Energy Policy Act of 2005.

In addition, under all alternatives commercial leasing would be excluded from all designated Wilderness Areas, wilderness study areas (WSA), areas that are components of the National Landscape Conservation System (NLCS), and lands within incorporated town and city limits. Moreover, the following areas also would not be available for leasing under all alternatives: (1) areas in the trona mining area in Wyoming; (2) segments of rivers and a 0.25 mile corridor on either side that the BLM has determined to be potentially eligible for Wild and Scenic River status; (3) historic trails identified by the BLM Wyoming State Office and a corridor 0.25 miles wide on either side of the trails; (4) the Monument Valley Management Area in the BLM's Rock Springs, Wyoming Field Office; (5) Management Area 3 in the Jack Morrow Hills Planning Area in Wyoming; (6) urban expansion areas around Rock Springs and Green River, Wyoming; and (7) lands within incorporated towns and cities.

We appreciate these provisions and urge the BLM to adopt them in its final EIS for this management decision and in the accompanying record of decision.

We believe that making these areas unavailable for leasing is well justified and well supported. Wilderness quality lands have values of remoteness and opportunities for primitive and unconfined recreation that should not be compromised. Making these areas unavailable for leasing is consistent with BLM's wild lands policy. The Adobe Town Very Rare or Uncommon Area "exhibits surface geological, historical, archeological, wildlife, and scenic values that is very rare or uncommon when compared to other areas of the state or region. These values are seldom found within the state and could become extinct or extirpated if left unprotected."¹ Sage-grouse core areas are critical to conserving sage-grouse populations and maintaining the long-term viability of this species, and thus perhaps avoiding a listing of this species pursuant to the Endangered Species Act.² ACECs are established specifically because special management is required "to protect and prevent irreparable damage to important historical, cultural, or scenic values, fish and wildlife resources or other natural systems or processes, or to protect life and safety from natural hazards."³ 43 U.S.C. § 1702(a). These areas are only established after an exhaustive planning process that determines their "relevance" and "importance" and thus they should not be degraded by industrial development occurring within them. The other areas that would be excluded from leasing, such as components of the NLCS, historic

trails, potential additions to the Wild and Scenic Rivers System, and areas such as the Monument Valley Management Area and Area 3 zones in the Jack Morrow Hills, also have important values making oil shale leasing in these areas unadvised. Consequently, we again support BLM's proposed decision to make these areas unavailable for oil shale leasing.

¹ Wyoming Environmental Quality Council, In the Matter of the Petition of Biodiversity Conservation Alliance for Designation of "Adobe Town" as Very Rare or Uncommon, Findings of Fact, Conclusions of Law and Order, at 19 (April 10, 2008).

² See generally State of Wyoming Executive Department Executive Order, Order No. 20 II-5 (June 2, 2011) (establishing the State of Wyoming's sage-grouse core area policy which has been widely adopted and supported by agencies such as the BLM and the U.S. Fish and Wildlife Service). #11)>

<([#2 [3.1.1] Areas of Improvement Needed in the Preliminary Preferred Alternative.

While we appreciate the above provisions that would accompany implementation of alternative 2(b), we believe there are shortcomings in this proposal that should be rectified or improved upon.

First, under this proposal some lands in the Adobe Town area in southcentral Wyoming would remain available for oil shale leasing. Oil Shale PEIS at Fig. 2.3.3-6. In our view no lands in the Adobe Town Area should be available for leasing. As shown in Figure 3.1.1-13 of the Oil Shale PEIS, there are a number of tremendously important areas or values that would essentially be adjacent to the areas available for leasing, such as the Monument Valley Management Area, Adobe Town WSA, the Adobe Town Very Rare or Uncommon Area, and the Kinney Rim North and Kinney Rim South lands with wilderness characteristics. As shown in Figure 6.1.2-8, the areas available for leasing in Adobe Town are within 5 miles or 15 miles of scenic resource areas, namely the Adobe Town WSA. There are also mule deer and elk winter ranges located in these available for leasing areas. Oil Shale PEIS at Figs. 6.1.2-1 and 6.1.2-2. Numerous sensitive species could potentially be negatively impacted by leasing in the Adobe Town area. Oil Shale PEIS at Table 6.1.2-2.

Given these potential impacts, oil shale leasing should not be permitted anywhere in the Adobe Town area. Essentially the BLM is proposing to close this area to leasing with the exception of two rather small areas that would remain available for leasing, one on the north side of the area and the other on the west or southwest side of the area. See Oil Shale PEIS at Figs. 2.3.3-6 and 3.1.1-13.

However, these two relatively small areas create potentially serious and destructive intrusions into the heart of the larger protected area, as Figure 3.1.1-13 shows. These intrusions into this generally protected area should not be permitted because oil shale development would threaten wilderness, open space, and wildlife values in the overall protected area. We would note that if these areas were not available for leasing it would have little impact on the overall area that would remain available for leasing, even in Wyoming, as shown by Figure 2.3.3-6. The BLM should fulfill the overall protective management approach for the Adobe Town area evident in alternative 2(b) by ensuring the area is fully

protected and not allow potential threats to the entire protected area by opening these two relatively small areas to oil shale leasing.

The second area of concern we have relative to alternative 2(b) relates to the Jack Morrow Hills (JMH) area. It appears to us that a very small portion of this area would remain available for oil shale leasing. Oil Shale PEIS at Fig. 3.3.3-6. This figure shows a very small area of leasing availability that is east of U.S. Highway 191. In our view, no lands east of highway 191 that are in the JMH planning area should be available for leasing. The JMH is replete with special values, including important wildlife habitats; special management areas such as ACECs, WSAs, and lands with wilderness characteristics; and national historic trails and numerous other historical, archeological, paleontological features. This area should not be allowed to be threatened by potential oil shale development, even on a small scale. See generally Figure 6.1.2-8 (showing scenic resource areas within 5 or 15 miles of this potential leasing area). Not making this area east of U.S. Highway 191 unavailable for leasing would have essentially no impact on the overall availability of lands for oil shale leasing in Wyoming. #21)>
<(#3 [2.3.1] The BLM Should Adopt Alternative 3 As its Preferred Alternative in the Final EIS and the Record of Decision.

Pursuant to alternative 3 in the Oil Shale PEIS, rather than the 461,965 acres that would be available for leasing under alternative 2(b), only 32,640 acres would be available for potential oil shale leasing. Due to the highly experimental and uncertain environmental and social aspects and impacts of oil shale development we believe the BLM should adopt this alternative as its final decision for oil shale leasing.

Under alternative 3, the six existing RD&D leases and the three new lease proposals would be available for development. These leases are in Colorado and Utah. We believe that development of these initial leases is the place to start in determining whether oil shale development will be acceptable from environmental and social standpoints, and that it would be inappropriate to open much larger areas to oil shale leasing before these impacts are fully illuminated and understood.

The BLM has made a number of statements that emphasize the uncertain and experimental nature of oil shale development. For example in the press release related to the Oil Shale PEIS available at http://www.blm.gov/wo/st/en/info/newsroom/2012/february/NR_02_03_2012.html, the BLM made these statements:

- “Because there are still many unanswered questions about the technology, water use, and impacts of potential commercial-scale oil shale development, we are proposing a prudent and orderly approach that could facilitate significant improvements to technology needed for commercial scale activity. If oil shale is to be viable on a commercial scale, we must take a common-sense approach that encourages research and development first.” Statement of BLM Director Bob Abbey.
- To date, technological and economic conditions have not combined to support a sustained commercial oil shale industry in the United States, and

there is currently no commercial development of oil shale in the areas under review in the draft PEIS.

- Additionally, following the recommendations of the Government Accountability Office³
 - which determined that several fundamental questions about oil shale technologies remain unanswered, including critical questions about water demands- the United States Geological Survey (USGS) is undertaking an analysis of baseline water resources conditions to improve the understanding of groundwater and surface water systems that could be affected by commercial-scale oil shale development. Given these uncertainties, it is appropriate to initially allow for only approximately 32,000 acres of oil shale leasing, as would occur under alternative 3, rather than the approximately 460,000 acres that would be available for leasing pursuant to alternative 2(b).
- Moreover, other statements made by the BLM in the Oil Shale PEIS emphasize the uncertain and experimental nature of this technology. For example,
 - “With respect to oil shale, the BLM would like to maintain focus on RD&D projects, so as to obtain more information about the technological

³United States Government Accountability Office, Energy-Water Nexus, A Better and Coordinated Understanding of Water Resources could Help Mitigate the Impacts of Potential Oil Shale Development, GAO 11-35 (Oct. 2010).

requirements for development of this resource, as well as the environmental implications, before committing to broad-scale commercial development. For instance, the BLM looks forward to gaining a clearer understanding of the implications of development of oil shale for water quality and quantity.” Oil Shale PEIS at ES-9.

- “While it is not presently known how much surface water will be needed to support future development of an oil shale industry, or the role that groundwater would play in future development, it is likely that additional agricultural water rights could be acquired. Depending on the locations and magnitude of such acquisitions, there could be a noticeable reduction in local agricultural production and land use when the water is eventually converted to supporting oil shale development.” Oil Shale PEIS at 4-19. #3])> <([#4 [3.4.1] In the PEIS the BLM emphasized some of the potential significant impacts to water resources, stating that there was concern regarding:
 - Degradation of surface water quality caused by increased sediment load or contaminated runoff from project sites;
 - Surface disturbance that may alter natural drainages by both diverting and concentrating natural runoff;
 - Surface disturbance that becomes a nonpoint source of sediment and dissolved salt to surface water bodies;
 - Withdrawal of water from a surface water body that reduces its flow and degrades the water quality of the stream downgradient from the point of the withdrawal;
 - Withdrawals of groundwater from a shallow aquifer that produce a cone of

depression and reduce groundwater discharge to surface water bodies or to the springs or seeps that are hydrologically connected to the groundwater;

- Accidental chemical spills or product spills and/or leakages could potentially contaminate surface water and/or groundwater;
- Construction of reservoirs that might alter natural streamflow patterns, alter local fisheries, increase salt loading, cause changes in stream profiles downstream, reduce natural sediment transport mechanisms, and increase evapotranspiration losses;
- Discharged water from a project site that could have a lower water quality than the intake water that is brought to a site;
- Spent shale piles and mine tailings that might be sources of contamination for salts, metals, and hydrocarbons for both surface and groundwater;
- Degradation of groundwater quality resulting from injection of lower quality water; from contributions of residual hydrocarbons or chemicals from retorted zones after recovery operations have ceased; and, from spent shales replaced in either surface or underground mines;
- Reduction or loss of flow in domestic water wells from dewatering operations or from production of water for industrial uses; and
- Dewatering operations of a mine, or dewatering through wells that penetrate multiple aquifers, that could reduce groundwater discharge to seeps, springs, or surface water bodies if the surface water and the groundwater are connected.

Oil Shale PEIS at 4-31 to 4-32. Moreover, in the Oil Shale PEIS BLM estimates that for a 30,000- to 50,000-bbl/day in situ project in Wyoming, the amount of water consumption is estimated to be 2,800 to 8,700 ac-ft/yr. An underground mine with a surface retort project or a surface mine with surface retort projects at 25,000 to 30,000 bbl/day are estimated to consume 2,450 to 4,500 ac-ft/yr of water. The remaining available water from the Colorado River in Wyoming is expected to decline from 226,000 ac-ft/yr in 2000 to a range of 80,000 to 202,000 ac-ft/yr in 2030. With a range of 4,900 to 34,700 ac-ft/yr required for individual oil shale development projects, the water requirements per project represent 1.1 to 3.9% of the currently available water and would be 1.2 to 10.9% of the water available in 2030. Oil Shale PEIS at 4-49. **#4])>**

<([#5 [2.3.1] So again, given these difficulties and uncertainties relative to water quality and supply it is proper and appropriate that only 32,000 acres be made available for oil shale leasing at this time rather than 460,000 acres. **#5])>**

<([#6 [3.5.7] In addition to impacts to water quality, oil shale development could also have significant impacts on air quality. Given that formerly pristine areas in Wyoming and Utah are rapidly moving into noncompliance with the National Ambient Air Quality Standard for ozone, the BLM should be cautious about unleashing industrial development that could exacerbate these problems.

#6])> **<([#7 [2.3.1]** In addition to uncertain impacts related to water and air quality, the potential for oil shale development to significantly impact wildlife resources is clear. And there are very real concerns about the “boom and bust” economic difficulties that have accompanied oil shale development proposals in the past. So again, alternative 3 should be adopted as BLM’s final approved proposal for oil

shale leasing in Colorado, Utah, and Wyoming because this alternative will afford the BLM the best opportunity to address and mitigate the impacts of oil shale development.

#7])> Conclusion.

Provisions made in alternative 2(b) of the Oil Shale PEIS, BLM's current preferred alternative for oil shale development, would include important provisions for protecting important resources such as sage-grouse habitats and wilderness quality lands. For that reason we support these provisions and urge the BLM to adopt them in its final plan. However, in our view alternative 3, which would make less land available for oil shale leasing, is preferable to alternative 2(b) because this alternative would better allow the BLM to investigate and consequently mitigate the numerous uncertain and unknown impacts of oil shale development, particularly relative to water and air resources, as well as impacts to wildlife and local communities. For that reason we believe the BLM should adopt alternative 3 as its preferred alternative in the record of decision for this project. Sincerely,

Wyoming Outdoor Council

Re: Draft OSTs PEIS

Dear sir /madam;

1-800-864-4405

(970) 824-5689

(Y70) 824-0231 (fax)

Thank you for the opportunity to offer input on the 2012 oil shale PEIS. It is important that the voice of

local businesses and the community at large be heard during this important process.

<([#1 [I.3] Whereas Moffat County connects the Green River Basin with the Piceance Basin oil shale reserves,

making it a transportation hub for oil shale development; and, whereas, commercial oil shale development represents a major economic opportunity for the Western Slope and for the Craig region,

The Craig Chamber of Commerce believes that the Bureau of Land Management should honor the input

and opinions of the cooperating agencies and local communities when considering modifying any existing

land management plans. #1])>

<([#2 [II] The Craig Chamber of Commerce fully supports responsible, commercial-scale development of our

energy reserves.

As you are aware, there have been some incredible advances made in the production of oil from shale,

which are encouraging to say the least. Shell has recently made huge strides towards commercialization,

in fact successfully producing several hundred barrels of oil from its RD&D lease in the Piceance Basin.

The biggest obstacle to large-scale commercial development seems to be bureaucratic, as federal land use

restrictions block the access required to pursue such development.

In the interests of the long term economic health of our region, we would hope that the BLM will consider

the input of those of us who live and work in the impacted areas.

#2])> Sincerely,

Executive director

SIERRA
CLUBDraft OSTs PEIS
Argonne National Laboratory
9700 S. Cass Ave.
EVS/240
Argonne, IL 60439
GLEN CANYON GROUP--UTAH CHAPTER
P.O. BOX 622
MOAB, UT 84532

April 26, 2012

<([#1 [2.3.1] Research Design and Development of tar sands and oil shale has not yet come up with solutions to environmental, economic, and social issues. As steward of our public lands, the BLM has an obligation to make sure safeguards are in place before leases are issued. For this reason, the Glen Canyon Group of the Sierra Club advocates a decision which reduces lands available for leasing to those already allocated for RD&D. We endorse Alternative 3. If and when companies are ever able to mine the tar sands and oil shale on public lands in a manner that is not harmful to the water, the air, the habitat, the wildlife, and the people, then and only then should the BLM grant these leases. #1)>

<([#2 [3.4.1] [6.3.2.2] Preserve Water Quality and Quantity of Flow We can live without oil, but we cannot live without water. Utah is the second driest state in the United States. We need to take care of and cherish the water we have. It is our most precious commodity. The developers must prove that the energy they produce does not kill us in the

process. That may seem like a radical statement, but in reality it is not. We cannot live without water. Yet producing a barrel of oil from oil shale takes 4 - 5 barrels of water and producing a barrel of oil from tar sands takes 4-6 barrels of water. With the recent and ongoing reduction in snowpack in the Rocky Mountains caused by climate change, our Colorado River will have less water flowing into it. With the growth in populations in Utah as well as in all areas downstream that depend on the Colorado River, human demand will be increasing for drinking water. With that population growth will come the need for more irrigation for agriculture. The bottom line is that tar sands and oil shale developers must not only prove they will not need large amounts of water to produce this energy source, they must also prove that they will be able to mine and produce it without the use of toxic chemicals that will contaminate our surface water, ground water, aquifers, watersheds, and the Colorado River.

#2) <([#3 [3.7.4.10] Protect Endangered Fish

There are several endangered species of fish that live in the Colorado River. They need large amounts of water to survive. The endangered species are the canaries in the coal mine - they are indicators to us that we in fact are in danger. It is time to take care of them.

#3) <([#4 [3.5.4] Preserve Air Quality

Tar sands and oil shale developers must not be allowed to pollute our air or produce greenhouse gases. Health consequences of breathing polluted air completely undermine the quality of life for any species, whether human or wild.

The RD&D sites are poor examples of responsible use of our air. In the process of building the site, strip mining the land, processing materials, extensive traveling on the roads, creating energy to run the operation, the strip miners create many toxic substances as well as ozone depleting chemicals and particulates. Citizens are protected from these forms of pollution by the Clean Air Act. Yet the pollution remains. The visibility, noise level of operating machinery, light pollution at night which disrupts wildlife habits, toxic contamination of the air, and creation of greenhouse gases are all reasons to limit acreage available for RD&D until the developers have proven that they can mine the tar sands and oil shale without polluting the air or contributing to global warming. They need to be proven to be in line with the Clean Air Act before they are issued leases. #4)>

<([#5 [3.10.2] Preserve Local Communities and Their Economies

Tar sands and oil shale mining will hurt our communities and our way of life. Many people come to our area for recreation opportunities of hiking, biking, jeeping, river rafting, bird watching, hunting, fishing, camping, rock climbing, horseback riding, and any other activities in which they can experience clean air, clean water, scenic open vistas, quiet. The tourist and recreation industries in this part of Utah provide our livelihoods as well as a way of life. Service industries such as new hospitals, recreation centers, senior centers have grown up in the small towns. Retirees have moved to these areas because of the healthy community spirit and

beautiful surroundings. The economies and way of life of the rural communities would be destroyed and would be replaced by inflation, inadequate infrastructures, population explosion, housing shortages, increase in demands on social services like schools, police protection, fire protection, health care. We in the small towns cannot afford these mining operations. The BLM should require mining companies to pay communities in advance for updating infrastructures as well as increases in all the other expenses the local communities will have to bear.

#5)> <([#6 [8] Preserve Public Lands for Multiple Uses

Public lands have historically been used for many purposes including hunting, camping, grazing, trail riding, recreation, fishing, etc. These multiple uses will have to cease if the mining of tar sands and oil shale causes environmental damage. The BLM should grant more permits for Research and Development for nonpolluting renewable sources of energy esp. wind and solar in Utah. The influx of those industries would benefit our energy development, benefit our environment, and benefit our communities.

#6)> <([#7 [3.7.5.1] Preserve Wildlife Habitat for Endangered Greater Sage Grouse

Wildlife habitat on public lands must be preserved. The Greater Sage Grouse is under protection of the Endangered Species Act and requires a contiguous range that encompasses its needs during various seasons and during various times in the life and breeding cycle. The Resilient Habitats Campaign of the Sierra Club has as its goal the preservation of critical habitats to insure the survival of species in the face of climate change, which causes the suitable available habitat to shrink in area. The developers who want to lease public lands must not be permitted any leases within the sagebrush ecosystem that is so critical to the survival of the Greater Sage Grouse.

#7)> <([#8 [3.1.1] Preserve Lands with Wilderness Characteristics and ACEC's

The BLM should consider all lands with Wilderness Characteristics or Areas of Critical Environmental Concern off limits to leasing for tar sands or oil shale exploration or Research Design and Development. The RD&D that we have seen so far greatly pollutes the water, the air, and completely destroys the land. These areas cannot undergo the burden of irresponsible development when the companies still have not proven they have the technology to develop the strip mining process.

#8)> <([#9 [2.3.1] Choose Alternative 3

In summary, the Glen Canyon Group of the Sierra Club endorses Alternative 3. The RD&D projects already have 32,640 acres available for them to develop technologies that extract oil in an environmentally sound manner. If they can prove to interested third parties that the technologies are dependably predictable and safe for the water, air, wildlife, and community impact, the BLM can issue permits at that time. Until that time, the land should be kept intact, safe from their experimentation with all its consequences. We must not put the cart before the horse, giving away our land without regard to the long term consequences.

#9])> Thank you for your consideration of these issues.

Sincerely,

Deb Walter

Volunteer, Glen Canyon Group of the Sierra Club

Draft OSTs PEIS

Argonne National Laboratory

9700 S. Cass Ave.

EVS/240

Argonne, IL 60439

Dear Sirs;

<([#1 [2.1.1] The Grand Junction Area Chamber of Commerce, an organization of 1,000 mostly small

businesses representing over 30,000 employees in Mesa County Colorado opposes the BLM preferred alternative number 2 found in the Draft OSTs PEIS. This alternative will drastically reduce the federal acreage available for potential development of oil shale in our area and impact our long term ability to create jobs and strengthen the local economy. Our organization joins more than 70% of the fourteen cooperating agencies in supporting alternative number 1, the NO ACTION OPTION.

As an organization that represents business interests and understands and supports economic development we take this action based on the following;

- Businesses will only invest in research and development if there is some degree of certainty that the raw materials for their processes will be available in sufficient quantities to recoup their upfront costs and make a profit. By drastically reducing the potential acreage that could be available in the future the BLM effectively insures that businesses will not make the upfront investments in technology that will be necessary to recover this national resource and kills any hope of developing the resource in the future.

- The fact that 2,000,000 acres were deemed available for leasing in the 2008 PEIS does not mean that anywhere near that amount would be leases or developed. Industry would choose the acreage that it believed could be profitably developed. BLM has the discretion under its current proposals to limit acreage to be leased. BLM already has the authority to control development through environmental analyses and approval of development plans.
 - The oil shale resource is a huge domestic energy asset that should be developed for the benefit of the American people and American businesses, especially in light of the looming increases in the prices we pay at the pump based upon the price of imported oil that is out of our control.
 - The time to get into production is long, and even though it may be years away, we must start now to develop all our domestic energy supplies, including oil shale.
- #1])> <([#2 [9.8] [2.1.1]** • Businesses need some degree of certainty within the regulatory framework in order to make long term investments. There was no valid reason for redoing the PEIS and Regulations completed in 2008. There is little if any new information to be considered, and the new draft PEIS looks largely as a reprint of the 2008 PEIS -except for BLM's preferred alternative that dramatically reduces the acreage available for leasing.
- Most local residents are more worried about jobs and economic development than the rehashing of the politics of oil shale development. The current re-visitation by this administration is just delaying the time that oil shale can provide more jobs in the region. Members of the Grand Junction Area Chamber include tourism entities and business owners that live in the region and support responsible development of all energy resources in a manner that allows free enterprise to thrive while protecting and enhancing the environment. This PEIS was not needed, is clearly not balanced in its approach and as a result the preferred alternative should be rejected in favor of the no change alternative.
- #2])> <([#3 [1.1.1]** Additionally, we would request that the comment period on the PEIS be extended 90 days to allow for more thoughtful review. This is a reasonable request in light of the fact that the regulations regarding this PEIS are scheduled to be released AFTER the current comment period has expired on May 4th. **#3])>**

Sincerely,

c;8u~

Phyllis Norris

To whom it may concern,

April 15, 2012

<([#1 [9.8] As the state's leading grass-roots free-market economic policy and advocacy organization, American's For Prosperity Colorado would like to express some key concerns and recommendations regarding the 2012 oil Shale PEIS.

First, and most critical, is our dismay at the reason for this most recent PEIS in the first place. The initial PEIS, completed in 2008, was very professionally done, and was the end product of three years of study, research, and input by many scientists, energy and environmental experts, every local government, and many members of the public. There has been no significant new information or evidence develop in the interim, and yet taxpayers money is being spent to completely redo the document. It seems incredible that the information contained in the 2012 is virtually identical to that in the 2008 version, and yet the BLM's conclusions are different. It is no secret, of course, that this is due to a settlement resulting from a lawsuit directed against the Department of the Interior over the findings of the 2008 PEIS, from environmental extremist lobby groups. We believe that it sets a terrible precedent, that any special interest group unhappy that the results of a public process did not fit their ideological agenda, can hijack that process using the courts.

#1])> <([#2 [2.2] Beyond that, the BLM's preferred alternative in the 2012 re-write, is far too restrictive, and hostile to commercial development of oil shale. The 2008 PEIS identified 2,017, 714 acres of the most geologically prospective oil shale lands in the tri-state area as being available for application for commercial leasing. This
www.afpcolorado.com

did not mean, of course, that all that acreage was to be opened for development, but simply for application for leasing. This was a reasonable amount of land, which protected identified sensitive areas, and provided for an environmental review of individual lease application, but still provided the industry with the flexibility required to allow for future planning of commercial operations. The new Preferred Alternative, 2b, drastically slashes that acreage by more than 70% overall, and by almost 90% in Colorado. It also places almost all of the Preference Rights Acreage off limits, and disperses the little bit of land it does leave available for leasing in small pockets throughout the area, with no consideration for access, geology, commercial viability, or any other relevant factors. As if all of that were not disincentive for investment and commercial expansion enough, Alternative 2b also places a draconian requirement for companies to demonstrate to the satisfaction of a federal bureaucrat, that their production technology is viable; this is an arbitrary determination, and something that no other industry must submit to. It should be up to the individual companies if they want to take the risk on paying for leases before their technology is ready, not the federal government.

#2])> <([#3 [3.10.3] Oil shale is a vital national resource, representing 4 trillion barrels of recoverable oil, which holds the potential for American energy independence, and self-reliance. It can create jobs, prosperity and growth for a region currently experiencing 10% unemployment. This growth will generate revenue for local governments to remedy their funding shortfalls without raising the tax burden on their citizens. And it will do all this without government money- all of the investment currently in oil shale development is private, not subsidized with tax payer dollars. #3])>

<([#4 [2.1.1] With all of this in mind, we recommend that the BLM remove the government created obstacles to job growth and regional success, and adopt Alternative 1, the no-action Alternative, which re-instates the ROD from the 2008n PEIS, and offers the best chance at providing for economic recovery and prosperity, while protecting truly at-risk eco-systems. #4])>

2012 OS/TS PEIS

Argonne National laboratory

9700 S. Cass Ave

EVS/240

Argonne, IL 60439

To whom it may concern,

April 27, 2012

<([#1 [9.8] I believe that this redoing of the 2008 oil shale PEIS is a waste of valuable tax dollars, and sets a terrible precedent for the future. Since the only reason that another PEIS was undertaken on this issue was because extreme environmentalist groups sued the federal government over the outcome of the one done in 2008, I presume we can now expect that it will be the status quo to sue whenever a public process does not produce a result that some particular interest group disagrees with.

This is making a mockery out of the processes in place to establish such management plans, and of the EIS system in particular. Clearly, the process means nothing if its results are swept aside at the first complaint from society's fringe. The 2008 PEIS incorporated the testimony, evidence and input from several local governmental, industry, environmental, and scientific organizations, experts, and studies, and was completed after months of work and evaluation. Is the BLM suggesting that all of that was for nothing?

If this farce is continued, someone needs to take public responsibility for the millions of taxpayer dollars, and the hundreds of man-hours wasted in redoing what was adequately completed only a few short years ago. #1)> <([#2 [2.1.1] The only logical thing to do is

for the BLM to choose the no action alternative.

This 2012 PEIS would be a stereotypical caricature of government waste and mismanagement, if the stakes for the nation and the affected regions were not so high. #2)>

Sincerely,

Draft OSTs PEIS

Argonne National Laboratory

9700 S. Cass Ave.

EVS/240

Argonne, IL 60439

Re: 2012 Oil Shale Programmatic Environmental Impact Statement

To whom it may concern,

<[#1 [2.1.1] Oil shale development represents an incredible opportunity for northwestern Colorado, and indeed, the

rest of the nation. The trillions of barrels of oil that exist in our own backyard easily outstrip the reserves

in the middle east, and that can mean energy independence for America in a relatively short time.

Given

the advances made in oil shale recovery technology made not only by companies here in Colorado, but

around the world, it seems the only thing standing in the way of realizing the potential of this vast

resource is our own government.

This PEIS offers four alternatives for the BLM to pursue going forward with regards to oil shale; only one,

the alternative which calls for maintaining the acreage decided upon in the 2008 PEIS, even comes close

to helping foster a commercial oil shale industry in this country. Alternative one will allow roughly 2

million acres to be available for leasing - not actually open to development mind you - which means that

each company that applies for a commercial lease will need to sweat out yet another

Environmental

Impact Statement, and the related red tape before they can proceed. In fact, this will inevitably mean that

many of these acres will actually be placed of limits.

This, however, is better than the other alternatives, including the BLM's preferred one, which will cut that

acreage available for leasing by over 70%. And not only is the acreage slashed, but the parcels that are left

available are isolated little outposts here and there, selected with no regard whatsoever to the geology of

the oil shale resource, or practical considerations for the energy companies trying to extract it.

I, like most in western Colorado, appreciate the need to balance conservation and development.

However,

it appears that the scales are being tilted dangerously towards no development at all. As important as environmental factors are, the economic effects can not, and should not, be ignored. Allowing for commercial development of oil shale is good for the local economy, national energy security, and is in line with the 2005 Energy Policy Act. Alternative 1 is the only option in the PEIS that accomplishes all of the goals that the BLM should be pursuing. #1)>

Bureau of Land Management

Argonne National Laboratory

9700 S. Cass Ave

EVS/240

Argonne, IL 60439

Colorado River Valley Field Office

2300 River Frontage Road

Silt, CO 81652

Ref: 2012 Oil Shale Programmatic EIS

<([#1 [2.1.1] [9.8] I would like to express my profound disappointment over the re-hashing of the 2008 effort to establish a set of rules and processes for oil shale development.

As a result of a pair of lawsuits, and the subsequent settlement by the federal government, the entire

years-long process, that involved work of hundreds, and input from many local counties, municipalities,

and specialists, as well as hours of further input from the public, is being needlessly redone, at the

expense of the taxpayer.

The 2008 PEIS identified just over 2,000,000 acres for which a company could apply for a lease for future commercial development. This did not open up these 2,000,000 acres for development, merely made them available for lease application, subject to full NEPA analysis, EIS studies, etc. This would simply provide oil shale companies some flexibility in their long-term planning, and establish an orderly process for the expansion of the industry into large-scale commercialization.

The alternative to this, the restriction of leasing to merely RD&D, is perpetual delays, an unfriendly environment of uncertainty for current and potential producers, and a denial of economic activity to one of the hardest hit regions in the state.

A further result of rejecting the 2008 findings is to set our region up for a haphazard, impromptu development plan if and when circumstances, such as a national emergency, demand that oil shale be put on line in relatively short order, with predictable consequences for the environment and local municipalities.

For these reasons, the only responsible course of action for the BLM to take is to either scrap the renewed PEIS altogether, or at the very least to adopt Alternative 1 (no action) as the preferred alternative.

#1])> Sincerely,

RE: BLM 2012 OS/TS PEIS

To whom it may concern,

<([#1 [9.8] I do not believe that there was any for a do-over on an Environmental Impact Statement

that was already done in 2008. It seems to be a waste of tax payer's money at a time when the government is supposed to be looking for ways to cut fat from the budget. This is exactly the type of redundant spending that makes people suspicious of, and angry at, the government. #1)>

<([#2 [2.1.1] With that said, the most sensible option for the BLM now is to adopt the No Action alternative, and enact the provisions in the original EIS. These call for 2 million acres of prime oil shale land to be made available for leasing, giving oil shale companies the flexibility to be able to plan ahead in an orderly manner for commercial development. #2)>

<([#3 [6.3.5] Despite what some opponents of energy development are saying, the technology is there

to take the next step; oil shale is being produced on a commercial scale in Estonia and China, and Shell has recently reported commercial success with its project here in Colorado.

#3)> <([#4 [9.8] The biggest obstacle to progress, the reason oil shale is "always 10 years away", is largely

due to land use restrictions, and failure on the part of government to enact a long-term management plan.

The 2008 PEIS laid the groundwork for such a plan; the land allocation alternatives described in the 2012 PEIS will only serve to keep development on hold. It is bad enough that the government is wasting money redoing work already done, but for it to deny economic opportunity at the same time is frankly offensive.

#4)> Thank you for allowing this opportunity to submit comment on this important matter.

Apr. 22, 2012

Re: 2012 Oil Shale Programmatic EIS

<([#1 [2.1.1] I am writing in support of the no-action Alternative in the current PEIS. The no-

action alternative (Alternative 1) offers the best balance of economic growth, conservation, and longterm

planning. By keeping the same amount of acreage available for application for commercial leasing as was allowed in the previous 2008 PEIS, the BLM would allow not only for the widest range of options to be available to the industry for expansion and commercial development, but for an orderly system to be established for the commercial development of this important strategic resource. Failure to have such a system in place early on (for instance, by prohibiting commercial leasing as the BLM's preferred alternative, and Alternatives 3 and 4b do), would only lead to the distinct likelihood of a more haphazard production system being implemented when and if development of oil shale becomes a national priority due to some emergency or shortage.

Alternative one does not blindly open up large swaths of land to the oil shale industry, but offers them up for commercial lease application, which would involve a lengthy environmental audit and evaluation. Not all, perhaps even not most, of the land made available will ever actually developed - but keeping that acreage available at least presents more options to companies wishing to expand and commercialize, than the dispersed, isolated little pockets made available in Alternative 2b (the BLM's current preference).

Keeping these lands open for consideration is a much preferable approach than arbitrarily excluding huge tracts of land based on habitat studies that have not even yet been completed, wilderness characteristics that no one but congress has any business designating, and areas once under evaluation as Areas of Critical Environmental Concern, that later had that designation removed. Only Alternative One offers a controlled, orderly path to commercialization, and the economic and strategic benefits that come with it, while protecting the environment. #1])>

To whom it may concern,

<([#1 [1.1.1] I am writing to ask the BLM to please extend the public comment period for the 2012

Oil Shale/Tar Sands Programmatic EIS, long enough to allow important information that directly impacts this issue to be released to the public.

A new set of oil shale leasing regulations are due to be released on May 15, 11 days after the deadline for public comment on the PEIS. It seems only fitting that enough time be allowed for interested persons to review these regulations before commenting on the PEIS and the land use alternatives presented within.

Furthermore, some of the alternatives exclude land from future oil shale leasing, based on Sage Grouse habitat, even though the study that designates that habitat has not yet been made public. It again would be useful to those who wish to participate in the process to have this information prior to making any sort of comment as to the suitability of the various alternatives.

Please extend the 2012 OS/TS PEIS public comment period sufficiently to allow for review and incorporation of these critical documents. [#1]>

Apr. 27, 2012

RE: 2012 OSTs PEIS

To whom it may concern:

<([#1 [10.6.3] I was disappointed by the BLM's decision to scrap the oil shale PEIS done in

2008, and

replace it with one that is far more restrictive, and that severely limits the commercial potential of oil shale. The regions in question contain as much as 4 trillion barrels of recoverable oil, far more than even the Middle East, and enough to satisfy America's demand for oil for many, many years. It is as much a matter of national security that we develop this resource as it is an economic issue for the local region.

#1) > <(**#2** [2.1.1] Allowing the acreage that was made available in the 2008 PEIS to remain available for

potential commercial leasing will go a long way towards realizing this potential, without posing any danger to the environment. The BLM, and other federal agencies, have strict processes in place to evaluate each lease individually. As the current PEIS even states clearly, not all of the 2 million-plus acres that the 2008 PEIS, as reflected in the No Action Alternative (Alt.1), leaves available for application for leasing, will ever actually be developed, due to these processes. Alt.1 will, however, provide far more options to companies wishing to expand, go commercial, or enter the oil shale market. The technology is there, and improving steadily, as demonstrated not only in places like Estonia and China, which are successfully producing oil from shale, but even here, as Shell commercially produced several thousand barrels from its limited RD&D lease in the Piceance Basin last month. I would therefore ask that you select Alt. 1 as the management plan.

#2) > <(**#3** [1.1.1] I would further ask that the public comment period be extended; as I understand it, the

BLM is releasing a critical set of regulations regarding oil shale on May 15, 2012, and it would make sense for the public to see what these rules are, in order to make informed decisions and offer the best input. **#3)** >

Thank you for your time and for listening to the local communities on this issue.

Sincerely,

2012 OSPEIS

Argonne National Laboratory

9700 S. Cass Ave
EVS/240
Argonne, IL 60439
BLM Colorado River Valley Field Office
2300 River Frontage Road
Silt, CO 81652

Dear Director,
Apr. 27, 2012

<([#1 [2.1.1] I would like to urge the Bureau of Land Management, that if they must continue with this redundant PEIS, to select Alternative one as their final management plan. Alternative one restores the available acreage to that which was decided upon after 3 years of intensive study and community input in the 2008 PEIS. This

acreage allows oil shale developers the most flexibility and options in determining their long-term commercial plans.

This is as opposed to the new PEIS, which closes off thousands of acres of land for even consideration for leasing, prohibits commercial production on any land remaining, and even places the existing Preferred

Right Lease Areas. All that the land allocation alternatives (2 -4b) will accomplish is to delay indefinitely the commercial development and production of oil shale, and the jobs and opportunities that would come with such development. #1)>

<([#2 [3.10.3] It is unconscionable that this sort of economic development would be delayed further, at a time when the region is experiencing heavy unemployment, when families who have lived in the area for years, have made roots here, have aging parents living nearby, and kids in local schools, are forced to follow energy jobs to other parts of the country- and take their money with them -when this region sits on top of enough energy resource to keep these people and many others employed, and the nation's engine running, for years to come. #2)>

<([#3 [1.1.1] Please not only reconsider completely undoing years of work and forward planning, and perpetually delaying economic development in the region, but I would also ask that you extend the public comment period at least until after the BLM oil shale regulations are published on May 15, 2012, in order allow sufficient time for the people of our affected communities to properly weigh in with all the facts. #3)>

Sincerely,

OSTS_101**Organization:** Janet Spach**Received:** 4/27/2012 12:00:00 AM**Commenter1:** Janet Spach - Fruita, Colorado 81521 (United States)**Organization1:****Commenter Type:** Member of the Public**Classification:** none**Submission Category:** Letter**Submitted As:** Postal Mail**Form Letter Category:****Form Letter Master:****Current Task:** Issues Entered **Assigned/Due:** mMcHugh 5/17/2012 12:00:00 AM**Attachments:** OSTs2012D00102.htm (OSTs_101-59183.htm Size = 1 KB)

Bureau of Land Management
 2012 Oil Shale Programmatic EIS
 Argonne National Laboratory
 9700 S. Cass Ave
 EVS/240

Argonne, IL 60439

Dear Sir or Madam;

<([#1 [2.1.1] I support the adoption of Alternative 1 (no-action) as outlined in the 2012 PEIS for 3 main

reasons; 1) the economic benefits that commercial oil shale development will bring to our region; 2) the advantages of having a structured process for commercialization in place, especially as related to local municipalities, and 3) the balanced approach that this Alternative offers.

#1])> <([#2 [3.10.3] The socio-economic benefits of Alternative 1 are described in detail in Chapter 6 of the

PEIS. Commercial oil shale development will bring hundreds of jobs to the region, in the form of construction, operations, homebuilding, and various support industries. These jobs will support the economies of the local municipalities and counties, and provide for growth and increased tax receipts for those local governments. These are good paying jobs that this industry will create, and that income will have a ripple effect on the region, and will benefit all local industries, including recreation and tourism.

In addition, I support the orderly system of commercialization that Alternative 1 provides for, one that will simultaneously accommodate the industry's growth, and give local governments a cushion to be able to plan for the complications that tend to arise from such growth. Is this not a more preferable approach than one where the sudden emergency need for oil shale production ends up overwhelming other planning concerns? I believe it is.

#2])> <([#3 [2.1.1] I also feel that this Alternative, which preserves the actions agreed upon in the initial

2008 PEIS, offers the most balanced approach between economic development, and the protection of the region's environment. Both Alternative 1, and the 2008 PEIS, identify just over 2,000,000 acres as being available for application for commercial leasing; however, as part of the process, each of these leases would be subject to a full NEPA analysis, including individual EIS's, to determine any potential negative impact to any sensitive areas, before a lease could be issued. This provides the industry with the flexibility necessary for planning of commercial operations, while also ensuring that sensitive ecosystems will be properly identified and protected. #3])>
 <([#4 [1.1.1] Finally, I would ask that the BLM extend the public comment period at least 30 days, in order to give people the opportunity to see and evaluate the latest round of oil shale regulations that are set for release on May 15. This would give us all a clearer picture of how oil shale development might be impacted, or proceed under the various alternatives. #4])> Very Sincerely,

OSTS_102

Apr. 27, 2012

ATTN:

Argonne National Laboratory

9700 S. Cass Ave

EVS/240

Argonne, IL 60439

To whom it may concern,

<([#1 [2.1.1] I am writing in support of the no-action Alternative in the 2012 oil shale Programmatic Environmental Statement. This Alternative (No.1) offers the best balance of commercial development opportunity, certainty for the industry, conservation of sensitive environmental areas, and an established process for orderly economic expansion in the region.

By keeping the acreage available for application to leasing that was provided for in the initial, non-politicized PEIS in 2008,

Alternative 1 provides oil shale companies more options in how to proceed with their long-term plans for expansion and commercial development. #1)> <(#2 [2.2] The drastically reduced acreage prescribed in your preferred alternative (No.2b), in addition to cutting off from availability most of that land, the remaining parcels that are open for lease application are small, widely spread out, and not cited with any consideration to access, interoperability with other leases, geological suitability, or any other factor that a business would need to take into consideration. This alone, in effect, blocks commercial development even from existing companies by denying them any reasonable opportunity for future planning and expansion. It certainly serves as a disincentive for any new company to move into the area.

#2)> <(#3 [9.6] The other elements of the preferred alternative stifle commercialization as well. The requirement that a viable technology be demonstrated prior to the issuing of any commercial lease is a clear barrier to future planning. A company will not go through the expense and hassle of beginning development of a lease until they are certain they can get a return on their investment. However, as they near commercialization, they will want to have a long-term plan in place to properly manage their operations over the ensuing years. This includes, first and foremost, securing commercial leases, and starting the arduous NEPA ball rolling so that there is as little delay as possible, and as a cushion in the, oftentimes likely, event that their applied for lease is restricted due to the EIS identifying sensitive habitat or ecosystems. The land allocation alternatives prevent this sensible, and important, business step from taking place. #3)> <(#4 [3.10.3] The tragedy of this is the loss of job growth that will result from overly restrictive BLM practices. With an unemployment rate stubbornly around 10% on the western slope, this is desperately needed economic development. This is not 1980 either; many things have changed, including the technology, management practices, and the source of capital - all of the current investment in oil shale is private, meaning that it is far less prone to being carelessly risked than was the government money that funded the industry prior to “Black Sunday”. Many lessons have been learned over the years. Many of those lessons were incorporated in the 2008 PEIS. It would be a shame to disregard them all for the shallow political considerations of a noisy minority.

#4)> Cordially,

April. 15, 2012

2012 OSPEIS

Argonne National Laboratory

9700 S. Cass Ave

EVS/240

Argonne, IL 60439

To whom it may concern,

<([#1 [2.1.1] I would like to preface my comments by stating that I am an environmentalist, and one

who believes in conserving our land, resources, and ecology. That is why I support the no-action alternative, and American oil shale development. #1])>

<([#2 [10.8] Oil shale is already being produced in other places in the world, including China, and

Estonia, places with environmental records that are dismal at best. The United States has some of the world's most stringent environmental controls and processes in place to monitor and protect air, water, plant and animal species, and sensitive eco-systems; therefore I would much sooner have the oil that the economic and industrial survival of our nation depends on produced here, where it is subject to such controls, than overseas, where no such controls exist, or are at best intermittently enforced. We may not be able to stop those countries from producing oil shale, but we need not cede the monopoly to them. #2])>

<([#3 [9] There is common agreement that oil shale will be produced at some time. It is quite simply too valuable a resource, not to develop. The question is, do we put an ordered system, and a long range plan in place now, or when we have no time for such steady, incremental growth? I believe that by keeping the maximum amount of suitable land open for consideration and planning, under the aegis of an evaluative process, we will create that essential long term planning, and avoid the massive impacts of pell-mell development on local communities. Allowing for commercialization now will provide time, impetus, and even money (through taxes garnered from the added employment, as projected in the PEIS Impacts of Alternatives chapter) to prepare for these impacts.

#3])> <([#4 [2.1.I] Alternative one is the most responsible alternative environmentally, economically, and in terms of forward planning, and I would urge the BLM, as one who wishes to see the best for the region, and the world, to adopt it in place of the current preferred alternative.

#4])> Signed,

Bureau of Land Management

2012 OSTs PEIS

Argonne National Laboratory

9700 S. Cass Ave.

EVS/240

Argonne, IL 60439

Dear Sir/Madam,

<([#1 [1.5] I wish to register my objection to the overall tone of this latest Environmental Impact Statement regarding

oil shale management on federal lands, as being one that is heavily tilted towards dissuading commercial

development. The Environmental Protection Act of 2005 explicitly calls for the establishment of separate

research and commercial development tracks for oil shale; however, the BLM's preferred alternative, 2b,

specifically does not allow for a commercial leasing option. This would seem to be in clear violation of an

existing federal statute.

#1])> <([#2 [2.2] Additionally, the amount and location of the land that is made available for application to leasing under

Alternative 2b would suggest that the BLM has little or no interest in providing for commercial, or even

R&D, expansion. The available acreage, reduced from 2,017,714 acres to 461, 968 (or from

346,609 acres

35,308 acres in Colorado), is located in small, isolated, non-contiguous pockets, with no regard given to

commercial viability, access, or future expansion. Not only that, but the existing preferred rights leasing

areas are almost entirely placed off limits, further discouraging commercial expansion, and the vast

majority of existing RD&D leases would also be excluded from development if the current leaseholders relinquish the lease.

#2]> **<([#3** [2.1.1] In contrast, Alternative 1, which would simply recognize the existing ROD from the 2008 PEIS, leaves a

fairly contiguous 2,017,714 acres available for lease application, and leaves the preferred rights lease

lands intact, and permits development of existing leases in the event that the current lease holder relinquishes the lease. It is recognized that not all 2 million+ acres will actually be open to develop, as

BLM NEPA processes will place much of the land off limits, but it does provide a much higher degree of

flexibility for the industry, and some incentive to expand commercially.

It should be incumbent upon the BLM to uphold existing government statutes and policies to enable a

viable oil shale industry. No one is asking for preferential treatment for the industry, nor for subsidies;

just for a reasonable policy of access to this invaluable national resource by private industry, as established in the 2008 PEIS.

#3]> Thank you,

April 27, 2012

Draft OSTs PEIS

Argonne National Laboratory

9700 S. Cass Ave.

EVS/240

Argonne, IL 60439

Re: 2012 Oil Shale /Tar Sands Programmatic Environmental Impact Statement

Dear Sir:

<([#1 [3.10.3] Thank you for the opportunity to express my opinions over this PEIS. I am concerned that the provisions outlined in this current draft would place undue restrictions on future oil shale development, and correspondingly limit job growth and economic opportunity for our region of north western Colorado. #1])>

<([#2 [2.1.1] The PEIS seeks to change the outcome of a previous PEIS, completed in 2008, which set aside

just over 2,000,000 acres for possible commercial lease consideration. The preferred alternative (2) in the current one reduces that acreage by an almost unbelievable amount- by 77% overall (including the land in Utah and Wyoming), and by a staggering 90% in Colorado alone. This is especially striking when you look at the maps contrasting Alternative 1 and Alternative 2.

I ask you to choose Alternative One, which leaves the land allocations originally made available in the 2008 document as is. There is no compelling reason to change the rules of the game on oil shale development right now. We should give the companies pursuing this resource some predictability and consistency in the regulatory scheme so that they can focus on getting this resource out of the ground.

Please don't buckle to political pressure from extremists. Out in Western Colorado, we need these jobs.

#2])> Thanks for your consideration.

April. 25, 2012

2012 OSPEIS

Argonne National Laboratory

9700 S. Cass Ave

EVS/240

Argonne, IL 60439

To whom it may concern,

<([#1 [3.10.3] I am deeply concerned about the effect that re-visiting the PEIS on oil shale will have on the

industry and the prospects for the overall region. This redo will only serve to delay the commercialization of oil shale development, and the jobs and economic growth that it would bring to the tri-state area. Western Colorado is currently experiencing double-digit unemployment, with the effects being felt throughout the region. Most of the people who live out here welcome the introduction of a major industry that produces a vital product, and provides jobs and income for thousands of families.

#1])> <([#2 [9.8] Oil shale projects take a significant amount of time to construct and get up and running, so

any delay now will only postpone actual development and production. This new PEIS is just the latest in a string of artificial delays that are keeping oil shale from achieving its full potential. The industry needs predictability in the regulatory and land allocation framework in order to make the investments needed to commercially develop oil shale. There is no reason to change the rules in the middle of the game.

#2])> <([#3 [11] This is an important national resource that needs to be developed for the sake of national

security, economic prosperity, and fuel supply stability. I call on the BLM to put an end to the delays, and allow the industry to move forward with oil shale development and the resulting job creation. #3])>

TO: 2012 OSPEIS

Argonne National Laboratory

9700 S. Cass Ave

EVS/240

Argonne, IL 60439

Dear Sir/Madam,

<([#1 [11] I would like to offer my full support for oil shale development in northwestern Colorado, and the

surrounding regions, and for BLM management practices that recognize the importance of this valuable resource. #1)>

<([#2 [10.6.3] Oil shale is an immense energy source that can help move America towards energy independence, and wean our nation off foreign oil. An estimated 4 Trillion barrels of recoverable oil lie underneath the lands being discussed in the current PEIS, enough to meet the United States' energy needs for decades to come.

#2)> <([#3 [6.2.2] [6.3.2.1] Oil shale is also efficient, in that it produces much more energy than it consumes in its development, at a ratio of between 3:1 and 6:1, depending on the retorting technology used. As well, the production of oil from shale uses far less water than its opponents would lead some to believe, in fact far less than some other fuel sources, such as biomass from corn, which requires irrigation. Many companies already own water rights sufficient to meet long-term, large scale commercial development.

#3)> <([#4 [10.8] This vital resource can and will be developed responsibly. The main companies engaged in current oil shale RD&D have strict and well established environmental policies in place, and the track records to show successful stewardship. To back even that up, the United States, and Colorado in particular, have some of the most stringent environmental protections in the world, especially compared to some of the other places where oil shale development is taking place. It would be an environmental shame if oil shale companies and investors were to locate in these places, rather than develop the resource more responsibly in the U.S.

#4)> <([#5 [2.1.1] All of these are reasons for a policy that simply allows oil shale development to occur. Restricting land access and delaying commercial leasing will not help in this regard. Alternative 1, no-action, provides the best balance of orderly conversion to commercialization, and a cushion to ensure protection of the environment, and to allow local municipalities the chance to adapt to the economic and population growth that will result. Please adopt Alternative 1 in the 2012 Oil Shale PEIS.

#5)> Sincerely,

OSTS_108

Bureau of Land Management

2012 OS/TS PEIS

Argonne National Laboratory

9700 S. Cass Ave

EVS/240

Argonne, IL 60439

Dear Sir/Madam,

April. 28, 2012

<([#1 [2.2] It is no mistake that of the 14 cooperating agencies in the 2012 Oil Shale PEIS, not one

supported the BLM's preferred alternative, 2b. It is similarly not surprising that a majority of them support Alternative 1, the no-action alternative, which keeps the acreage provided for in the original 2008 PEIS.

The local governments out here know how important commercial oil shale development is to their communities, and they reflected that in their selections for a preferred alternative. By selecting 2b, which slashes the amount of land available for potential future lease applications by almost 80% overall, and allows only RD&D leases to applied for, the BLM shows just how out of touch it is with the people who live and work in the area they are establishing the plans for. #1)>

<([#2 [9.8] The entire re-working of the PEIS shows a level of contempt for not only the local governments, but of the many individuals, businesses, groups and associations which contributed hundreds of hours of work and testimony to the 2008 initiative. By arbitrarily rejecting the conclusions of that study, without any new evidence or information coming to light, the BLM is signaling that all that work and public comment was worthless, and that all that really matters is the opinion of a handful of activists who use the legal system to try and get their way. #2)>

<([#3 [2.1.1] I join with the majority of cooperating agencies in calling for the BLM to support Alternative 1. #3)>

Sincerely,

CENTENNIAL

INSTITUTE

April 12, 2012

Bureau of Land Management

Argonne National Laboratory

9700 South Cass Ave

EVS/240

Argonne, IL 60439

Ref: 2012 Oil Shale/Tar Sand Programmatic EIS

To whom it may concern,

Centennial Institute is a nonpartisan, nonprofit public policy center affiliated with Colorado Christian

University. Our issues research, supported by the Centennial Fellows policy board of scholars and experts,

includes a focus on energy, environment, economic growth, federalism, and regulatory reform.

Based on this, we strongly recommend that the BLM adopt the No-Action Alternative (Alternative 1) as

presented in the 2012 Oil Shale PEIS, and restore the land allocation plan decided on in the 2008 PEIS.

<([#1 [9.8] Oil shale development is important to both the regional economy of northwestern Colorado, and the energy

security of the United States as a whole. As such, the federal government, which manages the majority of the

land under which this valuable resource is deposited, should make it a priority to encourage responsible

commercial development and production of oil shale by removing as many bureaucratic obstacles as possible,

while still ensuring the protection of sensitive ecosystems. Unfortunately, this latest PEIS seems to take a much

more restrictive approach, one which will actually discourage commercialization and development.

The initial PEIS, completed in 2008, was thoroughly researched, and incorporated the input of many experts in

the field, local governmental and economic development entities, and the public. The result of the many months of work that went into it was the identification of 2,017,714 acres of some of the most oil shale-rich land in the world as eligible for commercial lease application. The fact that these 2,000,000- plus acres were only made available for lease applications all but ensured that not all of it would be developed- each commercial lease that was applied for under the plan would be subject to another full analysis, involving a new NEPA process, and several government agencies, before the lease would be granted. Clearly, this was not a land give-away to the oil shale industry. Nevertheless, a small number of vocal environmental extremists took issue with the results of the process, and initiated two lawsuits against the government, the settlements of which resulted, in part, with the current redone PEIS- redone, in spite of no new information being developed in the interim period which might otherwise justify the immense cost to the taxpayer, and further delays in the production of an important strategic resource, associated with restarting such an undertaking.

#1) > <(**#2** [2.3] [2.2] Under this new PEIS, the BLM has adopted as its preferred Alternative, one which would close off some 70% of the land deemed suitable in 2008 for eligibility for commercial leasing. Among the lands placed off limits are areas that may have wilderness characteristics (even though such a designation is strictly a Congressional responsibility and privilege), lands considered at one time for ACEC designation that were later determined not to qualify for such distinction, and sage grouse habitat- with no specification as to exact location or definition of such habitat. Not only is the acreage drastically reduced, but the remaining acreage is in isolated and noncontiguous portions, with absolutely no consideration given to geological suitability, or economical access. In fact, the preferred Alternative, like the other land allocation alternatives offered in the 2012 redone PEIS, does not allow for near-term commercial development at all, calling instead for companies to demonstrate viability- an arbitrary requirement that lacks specific guidelines as to how viability is determined- which will necessarily exclude many smaller companies from entering the oil shale market. Alternative 3 goes so far as to disallow any development beyond existing RD&D leases whatsoever. Both of these approaches are in contravention of the Energy Policy Act of 2005, which prescribed a dual and concurrent RD&D and commercial

leasing program for oil shale. #2])>
 <([#3 [1.5] The current PEIS ignores the science, expertise, and proven technological advances surrounding oil shale recovery, and instead caters to a narrow, agenda-driven interpretation of the facts, as promulgated by certain well-heeled interest groups. The facts are that oil shale generates many times more energy than it takes to extract it, uses far less water to produce than some other energy sources (such as biomass), and is well within reach of commercial production with current technologies. The main impediment to large scale oil shale production is the bureaucratic hurdles put up by the federal government. #3])>
 <([#4 [2.1.1] The 2008 PEIS was a step in the direction of removing those hurdles in a responsible, environmentally conscious manner. It is the responsibility of the BLM, as an agency of the national government, to respect the honest work that went into drafting that professional PEIS, as well as to recognize the national strategic importance- and the economic benefits locally and to the state- of oil shale, and to adopt Alternative 1. #4])>

Argonne, IL 60439

April 26th, 2012

<([#1 [9.8] In regards to the 2012 Oil Shale PEIS, I have some concerns I would like to share

with the BLM. The first revolves around the fact that a new PEIS is even being considered. A full PEIS was completed in 2008, following months of input from local residents and the scientific community. Since that time, the federal government under the current administration has been steadily dismantling the programs put in place previously to provide for oil shale development, such as downsizing the second round of RD&D leasing so much as to make the available acreage unattractive for the industry, and settling lawsuits brought forth by radical environmental lobbyists in the plaintiffs favor, which the current PEIS re-do is a result of.

This has all been done for purely political reasons, and not based on any new scientific or environmental evidence. #1]>

<([#2 [2.1.1] With this in mind it only seems proper for the BLM to select the no-action Alternative, which will restore the acreage and use plans developed and accepted in the initial, legitimate PEIS. The other presented alternatives in the current one will prevent commercial development from going forward by drastically reducing the land available for leasing for such development. The economic advantages to developing oil shale are clear, both locally and nationally. There has been incredible progress made towards commercialization- Shell has in fact been able to produce thousands of barrels from their limited RD and D leases.

Anti-development opponents to energy and oil shale production like to say that oil shale is always 10 years away from commercial production- which they will be if public policies keep them from expanding and actually going commercial. I would ask the BLM to allow the industry to break that cycle by keeping the maximum amount of land available for them to apply for expansion and development, as represented by the no-action alternative. #2]>

EVS/240

Argonne, IL 60439

Ref: 2012 OSTIS PEIS

To whom it may concern,

<([#1 [2.1] I appreciate the opportunity to extend comment on the current PEIS for oil shale in Northwestern

Colorado, Southwestern Wyoming and Northeastern Utah. This is a very important issue for many of us

who live in the region, due to the tremendous economic impact that commercial oil shale development will bring. I think it is difficult for people who don't live here to understand just how important oil shale

development would be to our small towns in Western Colorado.

A PEIS done in 2008 identified 2 million acres as being suitable for being kept available for possible

development. In an action that has become far too common, certain lobby groups sued the government

over this, and the settlement resulted in the PEIS needlessly being redone. As a resident of western

Colorado, I resent my economic future, and that of my kids, being held hostage by political games. As a

taxpayer, I am outraged that the government would waste my money on redoing an assessment that was

done only a few short years ago, when nothing material has changed.

There will always be small segments of society that object to development, however the vast majority of

them do not live in the areas they are trying to lock up, and do not have to live with the consequences of

their actions. It is unfortunate that these few can hold up the advancement of an entire industry that is as

important to our nation's energy strategy as it is to our regional economy. The only responsible approach

for the BLM to take in regards to this PEIS is to select Alternative 1, which will restore the acreage

properly allocated in 2008, and hopefully some sanity to the situation.

There is absolutely no reason to reduce the acreage available for oil shale research and commercial

development to less than what was decided in the 2008 PEIS. #1)>

Regards,

v

RE: 2012 Oil Shale and Tar Sands Programmatic Environmental Impact Statement.

To Whom It May Concern:

<([#1 [2.1.1] The Vernal Area Chamber of Commerce, as part of our mission to advance the economic growth and health of our community, would like to offer our support for the adoption of Alternative 1 in the above referenced PEIS.

Commercial Oil Shale development is important both on a local and a national scale. Locally, it will bring much

needed employment, income, and economic growth to our region, both directly and indirectly.

Nationally, oil shale

represents a major resource that can fuel our economic recovery, lower the price of energy, and go a very long ways

towards securing American energy independence.

Alternative 1 of the current PEIS keeps the roughly 2 million acres of oil shale rich land

available for commercial lease application that was identified in the original 2008 PEIS, thus maximizing the potential for the industry to pursue long range development and production. The other Alternatives, including the BLM's preferred alternative, number 2, place most of this acreage permanently off limits, and discourage commercialization. This is clearly out of synch with the majority of local governments, businesses, economic development organizations, and Chambers of Commerce who wish to see this valuable resource developed in a responsible and economic manner, and may also violate the 2005 Energy Policy Act, which prescribes a dual track - R&D and commercial - for oil shale development. The Vernal Area Chamber does not feel it is in the best interests of our community and region for the Federal Government to continue to place unnecessary obstacles in the way of oil shale development. We firmly believe that we can produce the resources available in our own back yard in a responsible and balanced manner, without the Federal Government needing to micromanage every step of the way. In fact, we feel that this current PEIS is a waste of time and taxpayers money, considering that a very thorough and complete PEIS was done in 2008. No new scientific or ecological information has been developed in the interim, making this effort superfluous. That 8 of the 14 cooperating agencies in this process chose Alternative 1 (no action from the 2008 PEIS) is indicative that this sentiment is widespread throughout the affected region. We further believe that it sets a poor precedent when such a vast undertaking is re-done in response to a lawsuit by special interests who were unhappy with the previous outcome. That said, we appreciate the opportunity to contribute to the process, and strongly encourage the BLM to adopt the only economically responsible Alternative available, which is Alternative 1 (No Action). #1)> Sincerely,

RE: 2012 Oil Shale/Tar Sands Programmatic Environmental Impact Statement.

Gentlemen:

<([#1 [2.1.1] The purpose of this letter is to offer our comments and recommendation on the 2012 Oil Shale Programmatic

Environmental Impact Statement (PEIS). The Board of Directors of the Grand Junction Area REAL TORS®

Association voted unanimously to support the selection of Alternative No. 1 as the option to be adopted by the

Bureau of Land Management (BLM). We have made this recommendation based on the following comments:

The current PEIS draft forecasts the impacts that the implementation of Alternative 1 would have on the local

housing market. As detailed in the “Impact Assessment for Oil Shale and Tar Sands Alternatives” section under

“Socio-Economic Impacts”, oil shale development and directly related projects will result in upwards of 1300

housing construction jobs, representing over \$25 million in revenue. In addition, the oil shale development

provided for under Alternative 1 is projected to result in a population increase that could absorb 2.9% to 6.2% of

housing vacancies in the area. Two other projects directly related to commercial oil shale development, a power

plant for the in-situ processing facility, and a coal mine, could absorb 3.8%- 6.4%, and .5%- 2.9% of vacancies

respectively, under Alternative 1.

In contrast, the implementation of Alternative 3 is projected to result in only approximately 500 housing

construction jobs, representing \$12 million in revenue- the overwhelming majority of that would be temporary

housing and would have no measurable effect on the vacancy rate. The housing impacts for Alternatives 4, and

the BLM's preferred Alternative 2, were not analyzed in the PEIS. The document merely states that the impacts would be similar to those of Alternative 1, only to a lesser extent due to less acreage being made available for leasing in these options. On that basis, and taking into account that Alternative 2 cuts available acreage by roughly 70%, and 2(b) limits that acreage currently to RD&D leases, this could be considered to be a major understatement.

At the outset, we find it questionable and disappointing that the BLM via the Secretary of the Interior would see fit to revisit this Issue in this manner and in this time frame. The companies involved in these operations need to be able to depend on the commitment of BLM to stand by the agreements that were made originally. For this reason and in light of the positive effects that Alternative 1 will have on the housing market, in general, and specifically the vacancy rate of the local area, we fully support the adoption of this Alternative. #1)> <([#2 [I.I.I] In addition, it is our understanding that the comment period for the 2012 Oil Shale PEIS expires on May 4, 2012, with implementation of the new Alternative scheduled for May 15, 2012. We would respectfully request the extension of this period to allow a reasonable amount of time for other members of the business community to comment on the PEIS. #2])>

Ref: 2012 Oil Shale Programmatic EIS

<([#1 [9.8] I would like to express my profound disappointment over the re-hashing of the 2008 effort to establish a set of rules and processes for oil shale development.

As a result of a pair of lawsuits, and the subsequent settlement by the federal government, the entire

years-long process, that involved work of hundreds, and input from many local counties, municipalities,

and specialists, as well as hours of further input from the public, is being needlessly redone, at the

expense of the taxpayer. #1])>

<([#2 [2.1.1] The 2008 PEIS identified just over 2,000,000 acres for which a company could apply for a lease for future

commercial development. This did not open up these 2,000,000 acres for development, merely made

them available for lease application, subject to full NEPA analysis, EIS studies, etc. This would simply

provide oil shale companies some flexibility in their long-term planning, and establish an orderly process

for the expansion of the industry into large-scale commercialization.

The alternative to this, the restriction of leasing to merely RD&D, is perpetual delays, an unfriendly

environment of uncertainty for current and potential producers, and a denial of economic activity to one of

the hardest hit regions in the state.

A further result of rejecting the 2008 findings is to set our region up for a haphazard, impromptu development plan if and when circumstances, such as a national emergency, demand that oil shale be

put on line in relatively short order, with predictable consequences for the environment and local

municipalities.

For these reasons, the only responsible course of action for the BLM to take is to either scrap the renewed PEIS altogether, or at the very least to adopt Alternative 1 (no action) as the preferred alternative. #2]>

Draft OSTS PEIS

Argonne National Laboratory

9700 S. Cass Ave.

EVS/240

Argonne, IL 60439

Re: 2012, Oil Shale Programmatic Environmental Impact Statement

To whom it may concern,

<([#1 [2.1.1]) As a resident of the Western Slope, I felt compelled to offer my opinion that the responsible

development of the vast oil shale resources in our region should be encouraged, and further that Alternative 1 in the current PEIS is the best solution for doing so.

Enabling the development of oil shale on a commercial basis will bring many economic benefits to northwestern Colorado. The job growth that the adoption of Alternative 1 is estimated to generate will have direct and positive impacts on the quality of life within the region, not only through the direct jobs and income produced by the oil shale industry itself, but the residual job growth that such development will bring, from housing construction, to service industries, to retail growth. As well, the growth of a commercial oil shale industry will mean increased tax revenue at all levels, which will help provide for our local infrastructure needs, public schools, and police, fire, and ambulance services, along with other public amenities.

Alternative 1 reflects the great efforts of many that went into formulating the 2008 EIS and management plan. By leaving over 2 million acres of resource-rich land available for application for commercial leasing, a balance is struck between maximizing the economic benefits of development, and the need to preserve our natural heritage. Each of these potential leases would be required to go through a full NEP A analysis prior to commercial leases being granted;

therefore, any concerns over endangered species habitat, sensitive area's and water issues would be addressed, without simply placing wide swaths of potential land off the table.

We in Western Colorado take stewardship of our land and resources very seriously, and take great pride in our ability to provide for both economic prosperity and natural conservation. Denying our region the opportunity to realize our full economic potential by arbitrarily closing hundreds of thousands of acres to development of a resource of national importance is not only unsound, but unnecessary. Please strongly consider Alternative 1 as you go ahead with developing a plan to manage oil shale in our area. #1)>

Thank you for your time and efforts,

Bureau of Land Management
2012 Draft Oil Shale/Tar Sands PEIS
Argonne National Laboratory
9700 S. Cass Ave
EVS/240
Argonne, IL 60439

Dear Director,

<([#1 [2.1.1] I am writing to express my support for Alternative 1 in the 2012 Draft OSTs PEIS.

This is the only alternative that

takes into account the social and economic benefits of commercial oil shale development. #1)>

<([#2 [3.10.3] Chapter six of the

document outlined the job growth and income generation that is projected to occur if Alternative 1 is adopted, as

well as housing construction impacts. A similar analysis of Alternative 3 demonstrates dramatically how these

benefits would be reduced.

No such detailed analysis was conducted for either the Preferred Alternative or Alternative 4.

This is, in my opinion,

a critical oversight. I do not believe that a land allocation plan should be prescribed without first

assessing how that plan will impact the people, businesses and communities of the affected region. #2])>
 <([#3 [2.1.1] Allowing a commercial oil shale industry to establish itself will not just bring jobs to the region, but also increase revenues going to local, state and federal government, through individual income taxes, sales and business taxes, and lease payments. This will help restore some of the funding shortfalls experienced in recent years, mostly as a result of high unemployment. The importance of this to the national economy should also not be overlooked. Production of oil shale would provide for the United States a steady, abundant source of energy, and contribute to American energy independence. Selecting Alternative 1 will signal to potential oil shale investors that the federal government will not stand in the way of commercial expansion beyond what is absolutely necessary to protect the most sensitive ecosystems, and in doing so will help the people of western Colorado provide for their own future. #3])> Sincerely,

OSTS_118

9700 S. Cass Ave

EVS/240

Argonne, IL 60439

Ref. 2012 Oil Shale PEIS

Ladies and Gentlemen,

<([#1 [9.8] As someone who lives in a region that depends on energy production, and as someone whose livelihood also

depends on energy, I find the 2012 oil shale PEIS very worrisome. If the BLM can whisk aside three years of study

and effort on oil shale simply because an environmental obstructionist group decides to sue over the outcome, what is to stop them from doing the same every time any energy project is proposed on federal lands (which make up around 70% of the land in western Colorado)? By re-doing this PEIS, and tailoring the conclusions to the agenda of the environmentalists, the BLM has given the anti-development groups a potent weapon they can use against any new energy project or expansion of an existing one - be it oil shale, gas drilling, or mining. #1)> <(#2 [2.2] In this case, the conclusions they have accepted include reducing the amount of land available for oil shale leasing by roughly 80%; disbursing the remainder into small, widely separated bits; placing the preference rights lease areas around existing RD&D leases mostly off limits; restricting leases to only RD&D; and only allowing commercial leases to be awarded if the applicant can demonstrate their production technology ahead of time. These provisions will ensure that a commercial oil shale industry does not get up and going in northwestern Colorado anytime soon. Sadly, it also means that many communities in northwestern Colorado will continue to suffer. #2])>

BLM 2012 OS!TS PEIS

C/O Argonne National Laboratory

9700 S. Cass Ave

6/S/240

Argonne, IL 60439

Cc. BLM Colorado River Valley Field Office

2300 River Frontage Road

Silt, CO 81652

Dear Sir or Madam,

<([#1 [2.2] I would like to ask the 8LM to not unduly restrict oil shale development, as the provisions in your preferred Alternative in the 2012 PEIS dearly would do. Alternative 2b excludes almost 90% of the land in Colorado that was determined suitable for oil shale lease application in the original 2008 document, and limits the remaining small, isolated parcels to further RD&D only. It places most, or in some cases all, of the preferred rights acreage surrounding the current RD&D leases off limits as well. This acreage was in place specifically to allow for commercial expansion from those existing RD&D leases. We need to provide as much area as possible to make any future development viable. Limiting the availability of the resource will limit the viability. This is not unlike telling a retail business that they can expand, they just can't buy or construct a new building, and by the way, you can't use the parking lot anymore either. If this is not a disincentive to commercial development. I would hate to see what is.

Eliminating commercial leasing also shuts out smaller companies that might have otherwise been in a position to invest in oil shale development, and bring their operations, shops, money and jobs into the region. But who can blame any company for not wanting to take that step if they know that their hopes for commercial production could be kept years away by nothing other than government policy. Chances are they would set up shop somewhere else, perhaps Estonia or China where commercial oil shale development is already taking place, without, I might add, the environmental protections in place in this country.

#1])> <([#2 [2.1.1] [1.1.1] As a final note, the draft 2012 oil shale regulations are not due for release until May 15, 11 days after the deadline for public comment. In addition to calling on your office to adopt Alternative 1, which would restore the reasonable acreage provided for in the 2008 PEIS, and which is the only alternative to truly allow for commercial expansion of the industry, I also would ask that you extend the public comment period past the May 15th release of oil shale regulations. I believe that the full 2,000,000 acres should be restored as previously studied. Enough study has been done, we need to progress with research and development. Do not restrict these to research only. Provide surety that development of the resource is going to happen if the research works.

#2])> Yours Cordially,

Don Pettygrove, P.E

Re: BLM Draft 2012 OSTs PEIS

To whom it may concern,

<([#1 [9.8] There is no valid reason for this PEIS to have been re-done. The 2008 PEIS was a complete and thoroughly

prepared document that took in all of the data, and resulted in a management plan that allowed for responsible oil

shale development, and environmental preservation at the same time. Re-doing the entire PEIS, following yet another

lawsuit by the green lobby, is a complete waste of taxpayer's money, and will delay even longer the job growth and

other socio-economic benefits of oil shale. #1]>

<([#2 [2.2] I ask the BLM to not be cowed by anti-development extremists who poison the well with many misconceptions and

falsehoods about oil shale. The technology is available, as Shell demonstrated a few weeks ago, which means that

the largest obstacle to unlocking this treasure remains the federal government and its regulations and restrictions.

The Preferred Alternative in the 2012 PEIS is a clear example; by shutting out nearly all of the land previously made

available for oil shale leasing, and excluding commercial leasing, the BLM is making it harder for companies to plan

for the future, thereby making oil shale artificially unattractive.

#2]> <([#3 [2.1.1] I ask that instead, the BLM revert to the 2008 land use plan, by adopting the no-action alternative. Doing so will take

into account all of the information gathered in the initial process, and meet the dual objectives of allowing responsible

development, and caring for sensitive environmental areas.

Please do what is right for the people of the Western Slope, not the well-paid lawyers of the

green lobby.

Re: 2012 Oil Shale and Tar Sands PEIS

To whom it may concern,

<([#1 [2.2] I am deeply concerned by a number of provisions in the 2012 oil shale PEIS, particularly as they relate to the possibility of commercial production.

The Preferred Alternative (Alternative 2b) reduces the amount of land made available for leasing in the 2008 PEIS by an astonishing 77% overall-- even worse in Colorado, at 90%. It also eliminates commercial leasing, restricting leases to RD&D only. And the land that is left available is relegated to tracts so small and segregated that they cannot realistically support commercial-scale projects.

This is sending a very clear statement that the BLM does not welcome commercial development of this rich resource on federal lands, under which most of the oil shale is located. This is a shame, when you consider the tremendous economic benefits that such development would bring.

#1])> <([#2 [2.1.1] A commercial oil shale program, as mandated in the 2005 Energy Policy Act, would

bring hundreds of new jobs to the tri-state region. It would also provide a revenue boost to local and state governments, whose budgets have been stretched thin for the last several years. The taxes, royalties, and lease payments would provide more money for local schools, emergency personnel, and other vital services.

With this in mind, I recommend the BLM adopt the No Action Alternative, Alternative 1, for this PEIS, which retains the actions decided upon in the 2008 PEIS.

WCJA

ATIN: BLM Draft 2012 OS/TS PEIS

Argonne National laboratory

9700 S. Cass Ave

EVS/240

Argonne, IL60439

To whom it may concern,

April 30, 2012

<([#1 [2.2] We would like to object strongly to the 2012 Oil Shale PEIS on a number of grounds. First, the

Preferred Alternative, 2b, places such extreme restrictions on commercial oil shale leasing as to effectively ban it. It reduces the amount of land available to the industry in Colorado to apply for leasing by 90%, and distributes what remains into small, segregated bits with no consideration given to any economic factors.

Among the lands placed off limits are the vast majority of Preference Rights lease Areas, in place to accommodate commercial development from existing RD&D leases. This is a major disincentive to commercialize even the existing research acreage, where some companies have shown considerable potential, and only need to expand on what they have to make it viable. In fact, Alternative 2b, as well as 4b, disallows the issuance of commercial leases altogether, until an applicant can demonstrate their production technology to the satisfaction of government officials.

Each of these proposals alone would serve as a serious impediment to commercial development of oil shale, and the job growth it would create. Together, they effectively shut down any prospects for economic growth, energy development, and regional prosperity from the oil shale industry whatsoever, for the foreseeable future.

This is occurring in an area that is experiencing some of the worst unemployment in the state, if not the nation. Tourism and recreation, important as they are, cannot sustain themselves without a solid industry to form an economic base. Oil shale is at a point where it could provide this base for the long term, but the land allocation alternatives as spelled out in the 2012 PEIS would deny the region this opportunity, for no good reason.

#1])> <([#2 [9.8] The most troubling issue surrounding this 2012 PEIS is that there shouldn't even be a 2012

document. Starting in 2005, the federal government dedicated three years, millions of dollars, and a great deal of effort to complete a PEIS, and develop a management plan for oil shale that complied with all relevant statutes, including the Energy Policy Act of 2005. They included the thousands of hours of input and testimony from a variety of local sources, agencies, governments, and the public, and came out in 2008 with a reasonable, workable model that identified just over 2,000,000 acres for potential future application for commercial leasing. **#2])> <([#3 [2.1.1]** Radical environmental groups, in continuing their attack on the western slope, filed a lawsuit

against the DOI over these findings. Now, as part of a settlement, the government is completely re-doing the PEIS, with the exact same information, only this time with a preferred alternative that mirrors the anti-development demands of the extremists who used the court system to bully the federal government.

This is entirely unacceptable. The people of the Western Slope have a vested interest in preserving their natural heritage, but we realize that we can do that without sacrificing jobs and economic opportunity. The 2008 PEIS recognized this as well, and that is why we support the no-action alternative, Alternative 1, in the current PEIS.

#3])>

April25,2012

Ref: BLM 2012 OS/TS PEIS

Dear Sir/Madam,

<([#1 [2.1.1] In reviewing this PEIS, it was interesting to note that of the 14 cooperating agencies taking part In its preparation, not a single one chose the BLM's Preferred Alternative, 2b, as their own. A majority selected Alternative 1, the same one I am encouraging the BLM to adopt. Alternative 1 reinstates the Record Of Decision arrived at as a result of this very same process having been done in 2008. That process was three years in the making, and involved the cooperation and input of many stakeholders, including local governments, and a multi-state Governors task force. It culminated in opening around 2 million acres of oil shale land for possible future leasing. This was in compliance with the 2005 Energy Policy Act, which mandated the establishment of a commercial oil shale program along with the RD&D program. This would lead to the beginning of an industry that would start producing the 4 trillion barrels of oil that lies underneath our region. This is enough resource to make America energy independent, and supply our demand for oil for generations. More locally, it would mean a vibrant industry creating jobs in our own backyard. Northwest Colorado needs this economic development, and the people of the region overwhelmingly support the establishment of a viable oil shale industry. What we do NOT support is the way a handful of environmentalists decided that they could hijack the system, and through litigation and a friendly settlement with their allies in the federal government, force the BLM to undermine all the work done on the 2008 PEIS, and ram through their anti-energy development agenda instead. Alternative 1 will help bring jobs and economic growth to this region, as detailed in the "Impacts" chapter of your PEIS. I urge you to adopt it, as opposed to Alternative 2b, as the BLM's final Alternative. #1])> Sincerely,

Re: 2012 Oil Shale Programmatic EIS

Apr. 29, 2012

As part of the Public comment phase of this process, I want to point out a number of flaws that I see in the 2012 Oil Shale PEIS.

<([#1 [2.2] The first and most obvious is the extreme reduction in the amount of land being made available for application for leasing in the BLM's preferred alternative, 2b. The massive reduction in acreage is excessive and unnecessary. The 2 million acres allowed for under the 2008 PEIS, and the no action alternative, are not actually open for development, but only for application for leasing. As the PEIS points out, this application process will include a full round of EIS studies and evaluations, which will consider many different statutes. Much of this land will in fact be excluded under this process. But by leaving the maximum amount of acreage available to undergo the process, the BLM would be affording oil shale exploration and development companies a measure of flexibility in planning that is not afforded under the more restrictive alternatives.

#1])>

<([#2 [9.6.1] Second is the bias against commercial development inherent in the 2012 PEIS. The reduced acreage in 2b, and the dispersed placement of the remaining available parcels, makes commercial planning and expansion, let alone new investments, most impracticable. 2b, the BLM's preferred Alternative, further hinders commercialization by refusing to award ANY commercial leases until the applicant demonstrates viable technology. This is a very subjective and arbitrary request, and one that is not required of any other industry, even within the energy sector. The simple economic fact is that a company may wish to secure leases in preparation for commercial expansion, as part of their long-term planning process. 2b and 4b would deny them that management option. In addition, Alternative 3 prohibits any leasing beyond the existing RD&D leases currently held, and both 2 and 3 exclude most or all of the preferred rights lease areas around those RD&D leases, put in place specifically to allow expansion of those leases in the event of commercial success. #2])>

<([#3 [9.2.1] Finally, I am concerned with the legal ramifications. In the first place, the alternatives that hinder or prohibit commercial leasing seem to be doing so in direct defiance of the Energy Policy Act of 2005, which calls for parallel commercial development programs in oil shale; The lands excluded under 2 and 2b for reasons of having "wilderness characteristics", may represent an attempt at circumvention of the right of congress alone to define areas as "wilderness"; and the whole reason for doing the 2012 PEIS- a response to a lawsuit by

environmental extremists - sets a bad precedent for the future, and for the EIS process in general.
#3])>

For these reasons, I recommend Alternative 1.

Craig Freebo

RE: 2012 Oil Shale/Tar Sands Programmatic Environmental Impact Statement

Dear Sir or Madam,

<([**#1** [2.1.1] I recommend Alternative 1 as the option to be adopted by the BLM regarding the current PEIS.

As spelled out in Chapter 6, "Impact Assessment for Oil Shale and Tar Sands Alternatives" under "SocioEconomic

Impacts", commercial oil shale development, as provided for under Alternative 1, is projected to will

provide thousands of jobs, and millions of dollars in personal and corporate income, and government revenue.

This development, and directly related projects, will also be responsible for area population growth that will

spur further economic activity, absorb housing vacancies, and attract even more, diversified services and

industries to the region. **#1])>**

<([**#2** [3.10.3] In contrast, the economic impacts of the ELM's Preferred Alternative, 2b, were not analyzed, the document

simply stating that the impacts would be similar to alternative 1, but lesser in scale due to the decreased acreage.

This is not only an understatement, but signals to me that the BLM did not sufficiently do its homework in this regard before settling on a Preferred Alternative. The same is true of Alternative 4. The socio-economic impacts of Alternative 3 were analyzed, and the results are a tiny fraction of the job creation and income generation that Alternative 1 would produce. #2]>
 <([#3 [2.1.1] In light of the positive effects that Alternative 1 will have on the regional economy, to say nothing of the benefits to the nation of developing such a rich energy resource, I wholeheartedly recommend the adoption of this Alternative.
 #3])> Respectfully Submitted.

Bureau of Land Management

2012 osrrs PEIS

Argonne National Laboratory

9700 S. Cass Ave

EVS/240

Argonne, IL 60439

Apr. 17, 2012

Dear Sir/Madam,

<([#1 [11.2] I consider myself an environmentalist; I care deeply for the land, air, and water, enjoy spending time outdoors, and hope that this beautiful landscape will be around for my great-grand children to enjoy. But I am embarrassed and insulted by those who claim to be environmentalists, and seem to have only one agenda, and that is to stop anything that could be considered development in its tracks, and do so through any means possible.

The current debate over oil shale, and this PEIS in particular, is unfortunately being shaped by these sort of individuals. When a PEIS was published that did not agree with their idea's 100%,

they took it to court, wasting precious time and fiscal resources to hold up the entire oil shale process for years longer. Now they are actively pushing for the BLM to adopt the most restrictive of possible alternatives, one that would not allow any expansion of oil shale whatsoever. It was bad enough that they got their way with the Preferred Alternative, which slashes acreage previously available for leasing into bit pockets here and there, and limits any lease application to RD&D only.

As I noted, I too care about the environment - but that does not mean that I support keeping it all closed down, off limits to all but a few. It also does not mean that I am blind to economic realities. The counties in this region are hurting, and allowing orderly, responsible expansion of an industry as important to our national economy and security as oil shale, only makes sense. If a process is not established now, it is quite possible that in a few years time, when some national disaster or emergency requires that we put oil shale online as soon as possible, that development will occur in a much more haphazard and environmentally damaging way. **#1)**>

<(**#2** [10.8] I also do not want to cede energy production of this scale to countries like Estonia and China, where the environmental controls are rather less stringent than what we are accustomed to. **#2)**>

<(**#3** [2.1.1] Therefore, as an environmentalist, I recommend the selection of Alternative 1 as the most responsible, forward thinking option in the current PEIS. **#3)**>

BLM 2012 Draft Oil Shale/Tar Sands PEIS

Argonne National laboratory

9700S. Cass Ave

EVS/240

Argonne II 60439

CcBLM CRVFO

2300 River Frontage Road

Silt, CO 81652

To whom it may concern,

<(**#1** [2.1.1] Thank you for allowing this chance to comment on the 2012 Oil Shale / Tar Sand

Programmatic Environmental

Impact Statement. I fully support Alternative 1 and would urge the BLM to do the same.

Keeping the amount of

land provided for in the 2008 PEIS in place will provide a sense of security to oil shale producers that they will

I have options available to them in the coming years as they plan their long-term strategies in regards to

commercial-scale oil shale recovery.

Choosing this Alternative will also provide some assurances to local residents that federal government agencies

and regulations will not unnecessarily block this industry from getting off the ground.

Unemployment remains

high in the region, many businesses are closing their doors, and many families are moving away.

People in the

region simply want to know that their government will work with them, not against them, as they try to recover

from the grim past four years.

Alternative 1 represents an example of government working with the local population. and should be considered

for adoption by your agency. #1)>

Regards,

c;JA

BLM 2012 OS/TS PEIS

Argonne National Laboratory

9700 S. Cass Ave

EVS/240

Argonne, IL 60439

Cc. BLM CRVFO

2300 River Frontage Road
Silt, CO 81652

To whom it may concern,
April 15, 2012

<([#1 [9.8] In reference to the current Oil Shale Programmatic Environmental Impact Statement (PEIS), it is important to note that one was already completed in 2008, which opened 2,017,714 acres of geologically prospective oil shale land for possible (not preapproved) leasing, providing the best possibility for commercialization, expansion, job creation and economic development. This determination was based on three years of intensive work and study, and the input of geologists, environmental scientists, biologists, industry leaders, economists, local governments, and the public. #1])>

<([#2 [2.2] The preferred alternative of this new PEIS not only cuts that available land by over 70% overall (around 90% in Colorado), but situates it in small, isolated pieces over the area, making it virtually impossible for any company to formulate any sort of long-range commercial production plan - contravening the clear directives of the Energy Policy Act of 2005 - and also making it unattractive for any new company to invest in the region.

#2])> <([#3 [2.1.1] Regardless of the fact that this new PEIS was undertaken merely as the result of a

lawsuit by fringe environmental factions against the 2008 one, it should not be the role of the BLM to actively dissuade any particular economic activity on the land under its care. The BLM is supposed to manage public lands for the good of the nation, not any specific interest group with their own political agenda. Oil shale is a strategic national resource with economic, trade, and national security implications. The BLM should be looking for the best way to manage the recovery of this resource, while concurrently minimizing impact on the environment, and maximizing the local and national socio-economic benefits.

The 2008 PEIS accomplished this. It is therefore an egregious waste of taxpayer's money, and the nation's time and resources, to restart the process all over again, in the absence of any new information or empirical evidence to justify it.

I therefore call on the BLM to abandon this fool's errand, or, if seeing this redundant farce through is a foregone conclusion, to at least adopt Alternative 1, the no action alternative, which would restore the decisions properly made in the 2008 PEIS. #3])>

<([#4 [1.1.1] I further call on the BLM, in that event, to extend the public comment period at

least until the ELM's newest oil shale regulations are released on May 15th, to allow for comments based on the most complete information possible. #4])>

Re: Draft OSTIS PEIS

To whom it may concern,

<([#1 [1.2] In regards to the most recent PEIS on oil shale development in Northwestern Colorado, I would

like to weigh in as a resident. Oil shale development represents a major opportunity for our region, in terms of job growth, economic development, revenue, and stability. This industry simply needs to be allowed to proceed without the type of hindrances that actions such as those prescribed in the 2012 PEIS Preferred Alternative, as well as alternatives 3 and 4b. #1])>

<([#2 [2.2] The Preferred Alternative, 2b, takes so much land off the table that it essentially shuts down

any chance for a viable, commercial oil shale industry. The companies that would otherwise pursue this resource will look elsewhere if they are denied the opportunity to be able to plan future expansion, and to continue operating in the area in the long term. There is no question that oil shale is more expensive to produce than traditional energy, and no business will take the risk in the absence of a clear, set plan that provides some long-term assurances.

Eliminating 70 -90% of the oil-shale prospective land from leasing, and limiting the few spots that remain to only RD&D leasing does not provide this stability and assurance.

It is also well established that oil shale projects take longer to become operational, so any delay inflicted on the industry just pushes farther off the day that the industry can become profitable and begin generating greater royalty revenue. #2])>

<([#3 [2.1.1] With all of this in mind, I choose to support Alternative 1, which will reopen a reasonable

amount of land for application for leasing, and I urge the BLM to do the same. #3])>

Sincerely,

Dear Sir or Madam,

April 15, 2012

<([#1 [2.1.1] The purpose of this letter is to express both my support for Alternative 1 in the 2012 Oil Shale PEIS, and my outrage at the reason for the new PEIS in the first place.

First, I support Alternative 1 because it provides the best opportunity for allowing a viable, profitable oil shale industry

to take hold in this region. It keeps in place the outcome of the 2008 PEIS, leaving just over 2,000,000 acres available

to the industry for commercial lease application. Since each lease would have to undergo an individual NEPA

analysis, so any threat to sensitive environmental areas would be negated. It also allows for a commercial oil shale

program to be established, in accordance with the direction given in the Energy Policy Act of 2005. All of this is

important because of the great importance of oil shale to the nation and the region .

Nationally, oil shale provides us a way to wean ourselves off of overseas oil. There is far more oil in the oil shale

areas of the west, than there is in the entire middle east. This will provide for our nation's demand for oil for such

things as fuel, plastics, soap, and any number of other products.

Regionally, oil shale means jobs, income, and a bright economic future for northwestern Colorado. Chapter 6 of the

PEIS documents how many jobs this Alternative will help generate just for construction and operation of a few

production facilities and in housing. In contrast, no similar jobs analysis was done on the Preferred Alternative presumably

because the results would not be pleasant. [#1])>

<([#2 [9.8] As for the reason that a new PEIS was done, let me just say that it is infuriating that a small group of environmental

extremists can hire lawyers, and keep this development, and all of its benefits on hold for years.

Even worse, is that

as a result of their lawsuit, the taxpayer is now footing the bill for a whole new study, complete with a predetermined conclusion that oil shale development is bad, and should be severely limited. #2])> It is important that extremists on all sides get the message that they cannot use the courts to so flagrantly manipulate the public policy process. Please help me do so by selecting Alternative 1, and restoring the work and properly formulated conclusions of the first PEIS.

Cc. BLM Colorado River Valley Field Office
2300 River Frontage Road
Silt, CO 81652

To whom it may concern :

<([#1 [2.1.1] This most recent PEIS for oil shale is widely missing the mark, in my opinion. The bulk of the three

land allocation Alternatives, including the BLM's preferred Alternative, make no allowance for commercial expansion, the next major step in realizing the potential for oil shale. There is in the neighborhood of 4 trillion barrels of oil in this region, waiting to be tapped and used by our nation for

domestic fuel, feedstock for a multitude of products, and for export. Allowing commercial production of

oil shale could mean energy independence for America, and a permanent severing of any reliance on

places that are unstable and hostile to the United States for energy needs.

Placing giant swaths of land off limits to commercial leasing, including the preferred rights lease acreage at existing RD&D locations, and relegating the industry to a handful of tiny, remote, isolated

bits scattered around the overall area, only AFTER they have proven to the federal government's satisfaction that they have the technology the need, is in no way conducive to enabling this development. It is also more than a little insulting to the investors and engineers that devote their time, money and labor to recovering this energy.

A far more sensible and pragmatic approach would be to return to the findings of the 2008 PEIS, which left just over 2 million acres available for potential leasing. This plan effectively balanced environmental protection by requiring that each lease applied for be subjected to a full EIS, and economic development, by providing oil shale companies the maximum flexibility and opportunity for

planning their commercial operations. It also allowed for adequate expansion of existing RD&D leases

into commercial by leaving the preferred rights acreage intact.

Please reconsider your position on this PEIS, and adopt the No-Action alternative, Alt.1, which would

restore a common-sense, scientifically based approach to oil shale development in our region.

RE: BLM 2012 Oil Shaleff ar Sands Programmatic EIS

Dear Madam/Sir,

<([#1 [1.1.1] I would like to ask the BLM to extend the public comment period for this PEIS by lit le.1st 30 days, to allow more information to develop, and to allow public review of the 2012 Oil Shale leasing guidelines that are due for release on May 15th. I think it is important to have this extra time allotted to make sure that local residents and businesses have all the pertinent information they need to make an honest assessment of this PEIS. This is especially vital given

that much of the land excluded from potential leasing in Alternative 2b, the BLM's Preferred Alternative, is done so on the basis of information that has not yet been made public, namely Sage Grouse habitat. The Forest Service has yet to release details of Sage Grouse habitat locations, but the Alternative excludes lands due to their containing this habitat. Similarly, knowing the details of the leasing regulations could prove very helpful when evaluating and commenting on land allocation alternatives that will determine what land is available for this leasing. #1)>

<([#2 [2.1.1] Should the BLM see fit not to extend the comment period, Alternative 1, which calls for no change from the 2006 Record of Decision, should be adopted. This Alternative keeps 2 million acres available to oil shale developers to apply for commercial leasing, while keeping the most truly vulnerable ecosystems protected. This balances the economic need for development with the need to conserve. #2])>

EVS/240

Argonne, IL 60439

Re: BLM 2012 OSTs PEIS

I believe that this newest PEIS, and especially the Preferred Alternative, is invalid.

April 15, 2012

<([#1 [9.8] It is a re-do of the 2008 PEIS, without there being any new information to justify a revision or review, let alone

a complete from the start do-over. It is simply being done in response to litigation put forth by environmental

special interest groups who were not satisfied with how the process turned out the first time. This should not set

the precedent of how public business is carried out. These groups had ample opportunity to present their

opinions and offer their input during the public comment phase. The facts simply were not in their favor, as the

results of the 2008 PEIS reflected. But for them to now go to the courts and use a bogus lawsuit to get your agency to change its conclusions (after needlessly spending tax dollars to rehash the same information), is ridiculous, and cannot be allowed to stand in a society that values process and rule of law. #1)> <([#2 [9.2.1] [3.1.3] As for the new Preferred Alternative, by eliminating from consideration lands that the BLM has identified as having “wilderness characteristics”, the document violates a spending moratorium put in [place by Congress last year banning funds from being used to implement Sec. Order 3310, which would have granted the BLM that ability. As it is, only an act of Congress can designate a wilderness area. #2])> <([#3 [2.2] Finally, by allowing only RD&D leases, the Alternative violates the 2005 Energy Policy Act, which called for a dual track (RD&D, and commercial approach to oil shale development. Alternative 2b clearly does not allow for a separate commercial development track, placing it at odds with the statute. Alternatives 3 and 4b also run afoul of this law, by excluding commercial leasing. #3])> <([#4 [2.1.1] As such, Alternative 1 remains the only Alternative that is legal and valid. #4])>

Re: 2012 Oil Shale Programmatic EIS

Ladies and Gentlemen:

April 23, 2012

<([#1 [2.1.1] Thank you for extending this opportunity to express our views and concerns over this most recent PEIS involving oil shale. As a non-native resident of the Western Slope, I appreciate the natural heritage and beauty of Northwest Colorado. I also appreciate the fact that the people of this area are hurting due to double-digit unemployment; that Americans across the country are hurting from high fuel prices. This resource can be developed and produced in an environmentally responsible manner, and that can create enough jobs and economic activity to return prosperity and growth to the region. The tax revenue generated by a healthy and vibrant commercial oil shale industry will also ease the strain on local, state, and federal budgets, and help fund schools, roads, emergency personnel, and other key local government functions. Furthermore, having the ability to produce energy here at home will help relieve pressure on fuel prices, and enable the United States to scale back its reliance on foreign sources of oil. The 2008 PEIS, and the first, “No-Action” Alternative in the 2012 version that retains the recommendations of that thoroughly prepared document, is the best, most responsible and most legally acceptable approach to seeing these benefits come to fruition. The recommendations in the current PEIS, on the other hand, will only hinder and delay commercial production and economic development for well into the future. The BLM’s preferred Alternative, 2b, for example, would drastically scale back the amount of land available for application for commercial leasing, from 2,017,714 acres to 461,968 acres. #1)>

<([#2 [1.1.1] I would also urge the BLM to extend the public comment period for at least 30 days, in light of the fact that the draft 2012 oil shale leasing regulations are due to be released on May 15, nearly two weeks after the public comment period closes. Extending the period would help citizens to form comments with the benefit of more thorough information. #2)>

Thank you again for the opportunity to express my concerns, and I encourage you to adopt Alternative 1.

To: BLM 2012 OS/TS PEIS
Argonne National Laboratory
9700 S. Cass Ave
EVS/z4o

Argonne, IL 60439

Cc: BLM CRVFO

z300 River Frontage Road

Silt, CO 8165z

Dear Sir/Madam,

z340 Promontory Court

Grand Junction, CO 81507

April 30, 2012

<([#1 [2.1.1] This letter is intended to provide comment on the 2012 Oil Shale/Tar Sand Programmatic Environmental Impact

Statement (PEIS), which is a redo of the initial PEIS and Oil Shale Leasing Regulations completed in 2008. This current

PEIS is being done as a result of a settlement between the Department of Interior and certain environmental groups

who sued over the outcome of the 2008 PEIS and Regulations. There is little or no new information on which to base

this second PEIS, and in fact the information contained in it is virtually identical to the information in the 2008 study.

Despite this, the BLM settled on a different Preferred Alternative in the current one, Alternative 2b, which substantially

reduces the amount of land available for application for leasing, and eliminates commercial leasing.

These terms are a disincentive to oil shale development, make it much harder for smaller companies to enter into the

market, and delay the economic benefits of this development, such as jobs, growth, increased revenues to local and

state governments, and the addition of domestically produced energy to the national mix.

Alternative 1 in the current PEIS, the "No Action Alternative", preserves the Record of Decision made in the 2008 PEIS,

and should be adopted by the BLM in the Final PEIS draft.

#1)> <([#2 [1.1.1] In addition, it should be noted that the 2012 draft of the Oil Shale Leasing Regulations are not being released until 11 days after the close of the public comment period. I

believe that that comment period should be extended long enough to allow for those regulations to be released, and to give the public, local governments, businesses and other interested parties sufficient time to review these regulations, which are such an important part of the overall oil shale picture.

Thank you for taking the time to consider my comments.

#2])> Yours Sincerely,
Carol Skubic

Argonne, IL 60439

Ref: 20 12 Oil Shale PEIS

To Whom It May Concern,

<([#1 [9.8] I would like to express my outrage over this latest PEIS. At the very least it is a massive waste of the taxpayer's money, since this is a redo of a PEIS finished in 2008.

There was absolutely no new information develop between the 2008 PEIS and the current one, and still the BLM pursued this new one. The only reason they did so was in response to a lawsuit by a certain "Green" groups. It is outrageous that a handful of extremists would be able to hold jobs and economic development hostage, and more so that the BLM, an agency of the federal government, would allow it to happen.

Oil shale development could mean hundreds, if not thousands, of jobs for western Colorado. The technology is quickly emerging, in some cases is in place already. The industry is no longer "10 years behind". Commercialization is a distinct reality, and it is irresponsible of the federal government to needlessly hinder this based on the protests of a minority. The 2008 PEIS was a very well thought out, balanced document that allowed the maximum amount of land to be available for potential expansion,

while still making sure that the environment is protected, and should be returned to. Please do not continue to let this fringe element dictate how the BLM and the people of western Colorado conduct their business. #1)>

Draft OSTs PEIS
Argonne National Lab
9700 S. Cass Ave.
EVS/240
Argonne, IL 60439

To the Bureau of Land Management:

<([#1 [12.3] [2.5] I am writing regarding the BLM's "draft programmatic environmental impact statement" for oilshale

and tar-sands development in Colorado, Utah and Wyoming.

I am well beyond 'concerned' about the dilatory environmental effects if the BLM opens a commercial leasing program for oil-shale and tar-sands development. It would pollute our land, our

air and our water and it would exacerbate climate change. Endemic, threatened and endangered species would be lost. People would be harmed.

It is hard for me to imagine a much less prudent use of public lands than oil-shale and tar-sands development, which would contribute to the crisis of global warming, exacerbate species extinctions, and further deplete the Colorado River!

I oppose action by the BLM to continue or to authorize any new oil-shale or tar-sand development

on public lands, or to create or continue land-use allocations that would allow for such uses ever. The draft programmatic environmental impact statement should have included an alternative that

does not in any way endorse additional public-land use for this unproven industry- one we already

know is harmful on many fronts.

#1])> <([#2 [3.10.4] [3.10.5] The Congressional Budget Office confirmed that the oil shale industry is not expected to produce significant revenues through 2022. Even if oil shale were an economic boom for a few, it would be

devastating for the many-- simply NOT WORTH IT.

The land on top of the oil-shale resources in Utah, Colorado and Wyoming is some of the best wildlife habitat in the West, and outdoor recreation and tourism are huge economic drivers for the

region. We must protect this sustainable economy by making smart decisions based on sound information. It is not smart to des troy these lands, and it would be particularly stupid and shortsighted

to do so for oil shale or tar sands.

#2])> <([#3 [3] I ask that you evaluate carefully and disclose fully the serious impacts of all new energy required

for oil-shale and tar-sand production and its potentially devastating impacts to our climate, as well

as the threat it poses to wildlife, special-status , threatened and endangered species, and to the water,

air and land on which people and communities depend. **#3])>**

Re: 2012 Oil Shale/ Tar Sands Programmatic EIS

To whom it may concern,

<([#1 [2.2] We appreciate the opportunity to weigh in on this most recent Oil Shale PEIS draft.

We feel that the

BLM's preferred alternative, 2b, is the wrong direction to go when planning the future of oil shale

development. The sharp reduction in land available for leasing will present major obstacles to investment, development, and expansion of this important industry. Few companies, of any size, will be

willing to expend the capital and other resources to develop an RD&D lease, without some assurance

that they will be allowed to expand commercially in the future.

The tragic result of this will be the denial of the many economic and social benefits to Western Colorado that such development would produce. Delaying or denying commercial oil shale development

means delaying or denying good paying jobs in operations, construction, engineering, transport, finance, retail, and a host of other fields. It also means delaying or denying economic growth and increased tax receipts for not only the immediate area, but for the state and federal coffers as well. It

could very well mean delaying or denying the opportunity for a bright, prosperous future for the people

of this region.

In addition, this would be delaying or denying the nation access to a vital resource that could fuel a

national economic recovery, wean us off of foreign oil, and provide energy security for the long term,

providing a cushion to allow the private sector to develop a replacement for oil. #1)>

<([#2 [2.1.1] Alternative 1 restores the findings of the 2008 PEIS, which took all of this, as well as important

environmental factors, into account and produced a balanced, pro-growth land use plan. We recommend

that Alternative 1, therefore, be selected as the BLM's blueprint going forward.

#2)> <([#3 [1.1.1] We would also ask that the public comment period be extended until early June. This will provide

enough time for the public, including organizations like ours, to examine and take into consideration the

new round of oil shale leasing regulations that are to be released on or near May 15th.

#3)> Thank you for listening to our concerns, and we trust the BLM will take them into consideration during

its final decision-making process.

Sincerely,

Dear BLM,

<([#1 [12] I am concerned to see oil and gas development on the western slope growing because I value my water, wildlife, and air quality. I feel the BLM is leasing land that belongs to every American and not considering the public opinion. I am extremely weary about “research” done by companies who have no stake in the land they destroy. I want the BLM to fully understand the repercussions of this “research” and the environmental impacts it could have. Once we alter the land there is no going back. Please consider caution before destruction. #1])>

Draft OSTs PEIS

Argonne National Laboratory

9700 S. Cass Ave.

EVS/240

Argonne, IL 60439

To whom it may concern,

<([#1 [2.1.1] I would like to offer my recommendation for Alternative 1, the no action alternative, in the 2012 Oil Shale

Programmatic EIS.

This recommendation is based on a number of factors; first, it represents the hours of hard work and input by various individuals, groups, and government agencies that went in to the initial PEIS, completed in 2008. There has been no new information developed since that time to warrant a new PEIS process, and therefore I feel that the findings and acreage made available for commercial lease application identified in the 2008 document should stand.

Second, I am concerned that the remaining alternatives, including the BLM's preferred one, contravene the 2005 Energy Policy Act, which explicitly called for a separate commercial development track for oil shale, alongside an RD&D one. None of the other Alternatives presented in the 2012 PEIS allow for a concurrent commercial leasing program.

Third, I believe that having an established process in place ahead of time, to allow for commercialization of this vast resource, is preferable to a hastily implemented, ad hoc program in the event of circumstances (national emergency, geo-political turmoil, external market conditions, etc.) dictating its rapid development. Under Alternative 1, the maximum amount of land is made available for commercial leasing; however, each lease applied for would be subject to a full NEPA evaluation, and individual EIS's.

This ensures the best balance between economic development, and environmental protection. Having such a program in place will also provide for an orderly adjustment on the part of local municipalities to cope with the effects of this development, including population increase, housing construction, infrastructure demands, and the like.

Finally, I cannot ignore the social and economic benefits that will come to the region as a result of allowing commercial oil shale production. In addition to the jobs that will be created, the tax revenue generated by the additional workers, royalties, severance taxes and the like will help backfill the funding shortfalls experienced in recent years by local, county and state governments.

I believe that Alternative 1 offers the most balanced, forward-thinking, and strategic option for going forward with the development of a local oil shale industry.

#1])> Sam Susuras

Re: ELM Draft 2012 Oil Shale/Tar Sand Programmatic EIS

Dear Sir or Madam,

<([#1 [2.1.1] I would like to state for the record that I have some concerns with this PEIS.

Northwestern Colorado, along

with parts of neighboring Utah and Wyoming, holds up to 4 trillion barrels of oil, according to the U.S.

Geological Survey. That is 5 times as much oil as in the Middle East, trapped in shale. Industry has been

researching this for years, and is now at the point where the technology is there to produce this oil. In fact, the

Chinese and Estonians are already producing oil shale on a commercial scale. Here at home, Shell Oil, on one of

its tiny research leases in Colorado, has already produced several hundred thousand barrels - off a research

lease. Clearly, the industry is ready to move on to the next stage.

In 2008, recognizing this, ELM conducted a PEIS which incorporated input from all the local governments,

energy and environmental experts, and the public. The result was a reasonably balanced evaluation that

identified just over 2 million acres of the most geologically prospective oil shale lands as being available for

application for commercial leasing.

Radical environmentalists sued the Department of the Interior over the outcome of the PEIS.

Now, as a result of

this lawsuit by the obstructionists, the ELM is redoing this PEIS- at a cost of millions of tax

dollars - despite

the fact that nothing has fundamentally changed. Not the science, not the environmental risks, not the input;

just the ELM's conclusion.

This time, the ELM's preferred alternative will slash the available acreage down by over 70%, and what is left

available to the oil shale industry is scattered in small, isolated pockets that will only dissuade companies from

investing in this resource, and in this region. In Colorado, the acreage is reduced by a shameful 90%.

Meanwhile, the people of Northwestern Colorado wait, struggling under double-digit unemployment.

I ask your agency to please select Alternative 1, and go back to the good work done in the 2008 PEIS. We do

not wish any harm to the environment, and would never countenance any; we just want a viable industry to be

allowed to establish itself here. #1)>

Sincerely,

OSTS_142

Bureau Of Land Management

2012 Oil Shale/Tar Sands Programmatic EIS

To whom it may concern,

<([#1 [2.1.1] I would like to ask the Department of the Interior, and the BLM, to not give in to pressure from radical

environmental groups, and adopt Alternative 1 as your final decision in regards to this PEIS.

Alternative 1 will help put in place the framework needed to establish a commercial oil shale industry in

northwestern Colorado, by implementing the findings of the 2008 PEIS, by keeping available for leasing

some 2 million acres of rich oil shale land.

The Preferred Alternative would significantly reduce that land, disregarding the work and conclusions of the 2008 PEIS, and also making it infinitely more difficult for companies to expand, or enter the oil shale market.

The industry is ready for this expansion. Not only is oil shale currently being produced commercially by other countries, certain companies here have had tremendous success with their RD&D projects, and need the assurance and flexibility provided by having land available to lease.

The region is ready for this as well. We have been hurting since the recession took hold, and have experienced high unemployment, layoffs, businesses closing, and families moving away. We welcome an

industry that will bring good jobs, spin off economic benefits, and that will produce a vital resource

cleanly and responsibly. Oil shale can do this for us.

The benefits of adopting Alternative 1 were well analyzed, yet no such analysis was provided for the

preferred alternative. A full socio-economic evaluation should be done before selecting an alternative as

the preferred one.

The BLM should adopt Alternative 1; it offers the best balance of conservation and development, allows

for a commercial oil shale program, job creation and economic vitality, and reflects the best work done by

various agencies. #1]>

Re: 2012 Draft Oil Shale/Tar Sands Programmatic EIS

To Whom it May Concern,

<([#1 [9.8] This latest version of the Oil Shale PEIS is an insult to the people of the Western Slope and a waste of taxpayer's money.

The initial PEIS, completed in 2008, was the culmination of 3 years of intensive study, hard work, and input from local governments, geological and environmental scientists, and the residents of the area in question. The PEIS concluded that just over 2,000,000 acres of the most geologically viable oil shale land was suitable for application for commercial leasing. Political opponents of oil shale development were unhappy with this result and sued the Department of the Interior. The product of the resulting settlement is this new PEIS, the preferred alternative, which cuts the acreage available for leasing by over 70% and limits those leases to RD&D only. #1])>

<([#2 [2.1.1] The new PEIS provides disincentives to commercialization and economic development. This

makes absolutely no sense at a time when fuel prices are rising and America is seeking ways to cut its dependence on foreign oil. Unemployment rates remains unacceptably high, a problem that could be directly addressed by the original PEIS. With tremendous advances in responsible oil shale recovery technology, the industry is poised to take the next step, only to find the wall of government bureaucracy in front of it.

Adopting Alternative 1 for this PEIS, and keeping in place the findings of the 2008 study, would go a long way in removing this wall and bring jobs to the Western Slope. I would ask the BLM to please consider this, to not make policy at the behest of environmental extremists, and put the needs of the people of Colorado first.

#2])> Ray Scott

EVS/240

Argonne, IL 60439

RE: 2012 Oil Shale/Tar Sands Programmatic Environmental Impact Statement.

To whom it may concern,

<([#1 [9.8] To the extent that this PEIS is valid, I would like to express my support for Alternative 1, and urge the BLM to do the same.

I phrase it in such a way, because I believe that there was absolutely no legitimate reason to revisit the PEIS

that was completed in 2008 following the input from many experts, local governments, and the community. A

frivolous lawsuit leveled by one particular group unhappy with the outcome is not sufficient reason to waste tax

payer's money, and impose further delays on an industry and the region it supports, when there has been no

new information come to light to support such a drastic move. #1])>

<([#2 [2.1.1] That said, Alternative 1, which will restore the Record of Decision arrived at from the 2008 PEIS, is the only

logical, and moral choice. The excessive land restrictions and exclusion of commercial leasing prescribed in the

Preferred Alternative are not decisions based on sound, un-biased scientific analysis but instead are the product

of a friendly legal settlement with a special interest group. This is not the way public policy should be decided in

this country.

Commercial oil shale development is critical to the economic well being of the Western Slope, and to the nation

at large. It is an immense energy resource that can supply our needs for many, many years to come, and provide

growth and good paying jobs to an area that is suffering tremendously from the ongoing recession. There is no

question, of course, that oil shale is a complex resource that require time and cutting-edge technology to bring

on-line, but that is all the more reason to stop the endless delays and restrictions. The ingenuity inherent in the

American private sector will find a way to produce this safely, responsibly, and profitably, if only it is allowed to

do so. Recent developments suggest the industry may be at that point now, and Alternative 1 is the only option

on the table that will allow this industry, and this region, a future. #2])>

Yours very sincerely,

BLM 2012 OS/TS PEIS

Argonne National laboratory

9700 S. Cass Ave

EVS/240

Argonne, Il60439

To whom it may concern,

<([#1 [9.8] I appreciate the opportunity to comment on this important issue, although I find it appalling that

this is even coming up again. A thoroughly prepared, well-thought-out EIS was completed only a few short years ago, in 2008. There have been no fundamental changes, new studies, or any information at all that would justify spending taxpayer money on redoing the PEIS.

Nevertheless,

because an extreme environmentalist group sued the government over the outcome, the BLM saw

fit to do just that.

In doing so, they kowtowed to the “green” lobby, by agreeing to cut the available acreage previously set aside for potential commercial oil shale leasing, from 2,017,714 acres to 461, 965, and not allowing commercial leases. #1)> <([#2 [9.6.1] Additionally, the requirement to first demonstrate a viable

production technology to the government before being able to convert up to a commercial lease is a requirement not imposed on any other industry; certainly not the wind and solar industries, for example. #2)>

<([#3 [2.1.1] I strongly recommend adoption of Alternative 1 as the BLM’s preferred alternative, keeping the

land use plans as determined in the 2008 PEIS. #3])>

Bureau of Land Management
2012 OS/TS PEIS
Argonne National Laboratory
9700 S. Cass Ave
EVS/240
Argonne, IL 60439

To whom it may concern,

<([#1 [2.1.1] The benefits of allowing a commercial oil shale industry in the western United States far outweigh any potential environmental costs. The national benefits are obvious; tapping the 4 trillion barrels of oil- at least 500,000,000,000 of which are estimated as recoverable - would be a huge leap towards American energy independence. Additionally, having such a prolific domestic source of oil would help level and stabilize gas and other fuel prices.

At the local level, oil shale will bring jobs and income to a very hard hit part of the nation. The environmental impacts will be minimized largely by processes currently in place. The NEPA analysis that will need to be done on each lease will ensure that environmental issues and concerns are adequately dealt with.

I implore the BLM to take a hard look at this PEIS, and look at it from a cost/benefits analysis standpoint; I am convinced that if you do, you will arrive at the same conclusion as your agency did four years ago, and keep land available for commercial leasing opportunities. To that end, I support Alternative 1, and urge you to do the same. #1)>

Cordially,

<([#1 [2.2] I have a number of concerns regarding this PEIS I would like to share.

The first involves the amount of land taken off the table in the preferred alternative. The 2008 PEIS identified a little more than 2 million acres for potential oils shale leasing; the current preferred alternative cuts that down by almost 80%. This drastically reduced acreage is then made even more unattractive to investors by being scattered over a large area, in small, segregated parcels. Moreover, much of this newly-excluded land is shut down on the basis of undefined Sage Grouse habitat, lands once considered for ACEC designation that are no longer, and lands that the BLM determines to have “wilderness characteristics”, in spite of Congress last year passing a spending moratorium that prohibited the BLM from using this designation as an end-run around Congressional authority to alone designate wilderness areas. #1])>

<([#2 [9.8] My second concern involves the manner in which this PEIS came into being. The previously mentioned 2008 PEIS was an extensively researched and prepared study; the 2012 PEIS is a complete re-start of this effort, for no good reason. There has been no new information come about between 2008 and now, that would justify spending tax dollars re-doing the PEIS, only a settlement of a lawsuit brought against the DOI by radical environmentalists. This PEIS is solely the product of that settlement, which to me is a very corrupt way of doing business. #2])>

<([#3 [1.1.1] Third, I am concerned about when the public comment period ends in relation to the release of related, relevant information, including the Sage Grouse habitat designation, and the new oil shale leasing regulations coming out on May 15th. I would ask that the public comment period be extended at least 30 days to accommodate for this. #3])>

<([#4 [3.10.3] Finally, my greatest concern is with the lack of attention given to the socio-economic impacts of the Preferred Alternative. While a fairly detailed projection was provided for the job creation, income, and

housing impacts of

Alternative 1, there was no similar analysis done for 2 or 2b (the Preferred Alternative.)

Considering the enormous

benefits that the entire region will enjoy should a commercial oil shale industry emerge, and the fact that

unemployment and reduced revenue is a huge continuing problem for the Western Slope, one would think that an full

evaluation of the comparative impacts of the various alternatives would be a given. #4)>

<([#5 [2.1.1] With all of these factors in mind, I have no choice but to recommend Alternative 1 as the final option for the BLM in its deliberations. #5])>

<([#1 [6.2.2] [6.3.2.1] [6.3.5] A few facts about oil shale should serve to make the direction your agency should take a little more clear.

1) The technology is available to economically develop this resource. Oil shale is already being produced commercially in China, Estonia, and Brazil, and the same processes being used in Estonia are ready for adaptation in the Utah portion of the field. And Shell has demonstrated the viability of its process by producing 117,000 barrels of oil from its RD&D lease in Colorado. To the extent that the technology is behind, it is only because of disincentives inflicted by government- why would anyone invest in R&D if the opportunity to go commercial is uncertain, or denied?

2) Energy efficiency. Oil shale is an efficient source, providing more energy than it takes to produce it. Depending on the development process utilized, the efficiency ratio is between 1:3 and 1:6, units of energy consumed to units produced.

3) Water usage. Oil shale development will not take up near the water resources claimed by its opponents. Independent and government studies confirm that a large

scale oil shale industry will use only a fraction of the water available, less even than some other forms of energy (biomass, for example, which relies on irrigated corn). Also, many new processes use even less water-some almost none.

4) Environmental damage. Opponents like to paint oil shale development as whole-scale strip mining-in fact most of the technologies being perfected are in-situ, meaning they occur underground, more like traditional drilling. Also, the industry in the U.S. has a long history of good environmental stewardship, many of the best practices having been developed and instituted by the industry itself.

#1])>

<([#2 [2.1.1] The fact is that oil shale IS more expensive and time-consuming to produce; but that

does not mean that it is impossible, or impracticable. It DOES suggest that if we as a nation and a region wish to benefit from this resource, we had better start planning for it now. Alternative 1 offers the best option for accommodating such planning, and should be the Alternative adopted by your agency. #2])>

<([#1 [2.1.1] As a resident and Representative of Northwest Colorado, where a great deal of the land under consideration in this PEIS is located, I would like to support the adoption Alternative 1, the “no-action” Alternative which would restore the findings of the initial PEIS, completed in 2008.

I embrace an “all-the-above” strategy when it comes to energy development in this country, and I believe that oil shale can be an important part of that strategy. Estimates by the U.S. Geological Survey place the amount of oil in place in the oil shale region at around 4 Trillion barrels- well more than the reserves of the entire Middle East. Allowing American companies to tap this resource would create hundreds of new, good paying jobs for northwestern Colorado,

and provide new revenues to local, state, and federal governments for education, public safety and other important projects. It will also help make America more energy self-sufficient, and no longer reliant in any way upon volatile, oftentimes tyrannical regimes, many of which wish our country and her people harm.

The 2008 PEIS, which was completed after three years of solid effort on the part of many people, organizations, and agencies, identified 2,017, 714 acres of geologically prospective oil shale land as being suitable for application for leasing. Each of those individual lease applications would then undergo a full NEPA analysis, making sure that nothing was being done that would harm critically sensitive environment. This approach offered the most opportunity and flexibility to the oil shale industry for long term planning purposes, while utilizing effective, existing processes to protect the land, water, air, and wildlife.

This approach unleashes the entrepreneurial spirit of the American people, and the power of innovation and invention that has always permitted Americans to accomplish any goal they set their minds to. All too often, government, albeit with the best of intentions, only stifles that spirit, and mutes that power-- more often than not resulting in consequences more damaging than what they had hoped to remedy. I unfortunately find that to be the case with the land allocation alternatives in the 2012 PEIS, which severely limit land access, and place unreasonable restriction on the commercialization of this strategic resource. #1)>

<([#2 [9.8] Just as troubling to me and many of my constituents, is the reason why we are spending taxpayer money to re-do the PEIS-a settlement by the Department of the Interior in response to a lawsuit by a special interest group representing a minority of the population. I am forced to ask myself, how can the federal government re-do the same study, talk to the same people, and analyze the same data as they did only four years ago, and come up with different results? This is an all-too-common case of government pending money it doesn't have on something it doesn't need to spend money on. #2])>

<([#3 [9.2.1] And finally, I am concerned with the legality and propriety of this new PEIS; first, by not allowing for a distinct commercial leasing track, the Land Allocation Alternatives would seem to be in contravention of the Energy Policy Act of 2005. Also, in making unavailable for lease application lands with what the document states are "lands with wilderness characteristics", the BLM seems to be attempting to circumvent Congress, which

defunded Secretarial

Order 331 0 which would have granted the BLM the right to designate such areas, a right and duty which falls solely to the Congress. I am certain this is not the case, and trust this was simply an oversight on the part of the BLM.

#3])>

<([#4 [2.1.1] Alternative 1, and the 2008 PEIS whose findings it reinstates, offers the best avenue for adopting a truly “All The Above” energy strategy, creating much needed wealth and job growth to get this economy moving again, and putting America on the path to energy independence, without causing harm to our environment. I hope and trust that the BLM

will adopt this alternative as the most responsible, pragmatic, and balanced option available

#4])>

<([#1 [I.I.I] As the Commissioners have been preparing their comments for the 2012 OSTIS PEIS it has come to our attention that the Draft BLM Oil Shale Regulations are not to be published until May 15, 2012. That date is almost 2 weeks after the aforementioned comments are due and yet it would seem that the OSTIS PEIS and draft Oil Shale Regulations are intertwined and should be reviewed simultaneously.

Our jurisdiction includes the richest and most promising of all the oil shale deposits within the Green River Formation and it seems most likely, given the proportion of RDD leases being developed in our county, that commercial leasing interest will be focused here:

In the interest of developing sound public policy surrounding the future of this resource we respectfully request that the comment period for the 2012 OSTIS PEIS be extended for 90 days so as to allow time for us and our staff to properly review both documents together. We believe our request to be consistent with the goals of the NEPA process and will result in a better final product for each document.

Appendix to PEIS Written Comment Form:

<([#1 [6.3.1] Please consider by December,2012 publishing federal regulations and a call for a Research, Demonstration and Development Lease for exclusively underground mining seeking to extract 15 gallon per ton kerogen shale in the Piceance Basin, Colorado. The size below grade should be several surface sections.

NO strip mining in such an RD&D Lease.

NO in-situ retorting.

NO surface drilling or drilling rigs used for developing an in-situ retort system for liquid extractions.

NO surface water requirements. My plans are to dewater the oil shale underground leaving the local water on site.

NO surface protrusions except OSHA approved ventilations ducts and employee emergency exits. The 3% grade rail entrance will be the only indication of underground RD&D work.

Think Underground Mining of salt or potash.

These mines have evolved into large scale underground rooms with 20 foot ceilings suitable for large scale equipment and direct underground ore loading onto all-electric trains. Specifically, the plan is to load 220 railroad gondola cars underground with dewatered oil shale rock on standard rail tracks for an all-electric delivery to Utah with union labor. In Utah, a central 'special purpose' refinery produces only

high quality jet propulsion fuel, no gasoline. It also has ultra-low refinery carbon emissions.

The RD&D lessee is required to post with the US Treasury \$1.6 billion of AA rated bonds in exchange for a BLM supervised lease issued by the US Treasury. Here, the lessee needs to amortize its long term costs and furnish a \$1.6 billion performance fee.

Again, no surface drilling or surface modifications are needed nor any subsurface retorting. #1)>

<([#1 [9.8] The current re-do of the BLM's 2008 Programmatic Environmental Impact Statement regarding oil shale development, is a massive waste of tax-payer's dollars, and unreasonably restricts development of a resource that dwarfs the oil reserves of the middle east. The BLM's preferred land use alternative, in the 2012 re-do, cuts by nearly 80% the amount of land left available for oil shale companies to apply for commercial leases. This flies in the face of the three years of study and effort that went into preparing an oil shale plan in 2008. #1)>

<([#2 [2.1.1] The environmental lobby and their friends in the current White House seem intent on using our own tax dollars to make sure that oil shale forever remains unavailable to Americans, at the cost of jobs and energy security. For this reason, I support Alternative 1, as providing a more reasonable, forward-looking option. #2)>

<([#1 [2.2] The latest draft of the oil shale / Tar Sands Programmatic Environmental Impact Statement is a sad example of environmental obstructionism at its worst. The initial PEIS completed in 2008 was a very well-studied and forward looking document that opened 2,000,000 acres for application for commercial oil shale leasing. This put in place process for orderly expansion of oil shale into a commercial industry, while utilizing the processes in place to ensure proper environmental protections.

It did not, however, fit with the extreme anti-development lobby, who sued, and under a friendly settlement made sure a few more millions of our tax dollars were spent to totally re-do the PEIS. Despite using the exact same data, this latest version comes to a completely different outcome, as Alternative 2b (the Preferred Alternative) reduces the amount of land available for leasing to a few hundred thousand acres - roughly 20% of what the 2008 PEIS left available. #1])>

<([#2 [2.1.1] Alternative 1 would leave the results of the 2008 PEIS in place, and allow for commercial development to begin on the approximately 4 trillion barrels of oil from the oil shale deposits in our region. With gas prices constantly rising, and the international situation increasingly unstable, it only makes sense to permit a domestic energy industry of this magnitude.

As long-time residents, we do not wish to see harm come to the environment of this area. we love the natural beauty of western Colorado, and regularly take our kids hunting and camping in the area. We want as much as anyone to make sure that this will be available to them when they are grown.

At the same time, we realize that that does not mean that development cannot or should not occur. We are also keenly aware of the pain inflicted on communities when economic development is halted by groups with a very narrow agenda.

Please adopt Alternative 1 as being the only afforded option to balance the needs of environmental protection, and crucial economic development.

<([#1 [6.3.5] [6.2.2] [6.3.2.1] Opponents of oil shale development are dusting off some commonly used fallacies in an attempt to coerce your agency into adopting a land allocation plan that is overly restrictive and postpones commercial development of this valuable resource for years.

Among the falsehoods is the one that the technology is not available to produce oil shale on a profitable, commercial basis.

In fact, this technology is not only available, but is in use in several countries, including China and Estonia. This is the same

type of technology and process that could be used in the Utah portion of the vast oil shale lands.

Here in Colorado,

companies such as Shell have proven that their processes work, by actually managing to produce sizable quantities from

their RD&D projects. They now need to be able to expand those operations in order to be able to make the transition to

commercial-level production. Aside from Alternative 1, the current PEIS does not allow for this to take place.

Low energy efficiency is another anti-development myth. Oil shale is actually quite efficient, producing between 3 and 6 units

of energy to each unit that it uses in its extraction and processing.

Excessive water usage is also often claimed by the opponents, despite evidence to the contrary. Not only do most

companies currently involved in oil shale research already own the water rights they require, but the Federal Government's

own estimate, as compiled by the GAO, predict that there is more than sufficient water to sustain a 500,000 barrel a day

industry. Some oil shale extraction processes are being developed that actually use very little water. #1]>

<([#2 [2.1.1] These faulty assumptions, mainly derived from very loose interpretation, obsolete information, or political agendas, should not be the basis for formulating a land management plan that will have a huge impact on the regional and national economy. Alternative 1 , which was based on solid scientific information compiled between 2005 and 2008, should be the alternative chosen by the BLM to manage oil shale production in the near to long term.

I am a former small business owner who knows all to well the impacts that an arbitrary political decision can have on the economy. I am personally asking your group not to give in to the scare tactics of the environmental lobby; to decide for jobs and the economy of Western Colorado and Eastern Utah.

<([#1 [2.1.1] Thank you for this opportunity to offer input into the 2012 Oil Shale PEIS process. I support Alternative 1 (no action), and would urge the BLM to do the same. This alternative maintains the findings of the initial PEIS, completed in 2008, which made available what I believe to be a suitable amount of land to encourage and enable private, commercial oil shale development.

Businesses need options, flexibility and reasonable assurances of future growth potential in order to plan, forecast, and invest in a given venture or area The 2008 Record of Decision provided all of that, and in a way that ensured protection of the region's air, soil, water, and any fragile habitats and ecosystems. #1])>

<([#2 [2.2] This new PEIS, however, undid most of the hard work that went into the 2008 project, and made permanently unavailable almost 90% of the land (in Colorado) that was previously identified. The BLM's

preferred alternative, 2b, along with Alternative 4b, would also prohibit the issuance of commercial leases, until such time as the company applying for the lease demonstrated their production technology to the satisfaction of a government official. Not only does no other sector of any energy-related industry need to do such a thing, but the standards for ‘passing’ such technology are arbitrary and not published.

Finally, the lands excluded in this preferred alternative include land that was once considered for designation as an ACEC, but has since been determined not to be; lands the BLM designates as having “wilderness characteristics”, despite the fact that only Congress can make such a designation; and potential Sage Grouse habitat, even though the location of that habitat is still under review. #2]>

<([#3 [1.1.1] It is also worth noting that a new set of leasing regulations will be coming out on May 15, nearly 2 weeks after the public comment period ends. I would suggest strongly that the comment period be extended 30 days to accommodate for that release. #3]>

In closing, I wish to thank you and your office again, and once more urge you to select Alternative 1.

<([#1 [11.2] I am writing to express my disappointment over the BLM’s Preferred Alternative in the current PEIS. Reducing the land available for application for potential leasing to a few thousand acres, on small, widely dispersed parcels, is a clear signal to the oil shale industry that the BLM does not support commercial development- not apparently the

jobs and economic opportunity that comes with such development Oil shale is an extremely valuable and rich resource, and holds up to 4 trillion barrels of recoverable oil -and perhaps more. The United States government should be encouraging the production of this as a key to long-term American energy independence. Instead, the government seems to again be influenced by the extreme fringe of the environmental movement, and is promoting policies that would keep this resource from being developed for years, perhaps ever.

In addition to being a commodity of national importance, oil shale represents an incredible opportunity for the people of this region. Allowing commercial development, as called for in the 2005 Energy Policy Act, would bring jobs to the region that are sorely needed. It seems almost every day that we see another local business shut its doors or a family move to another state because there is such limited job growth here. The saddest part of that is that it is entirely unnecessary, given the amount of natural resource contained in the area. More often than not, it is government, doing the bidding of the “green” movement, which prevents the safe, responsible development of these resources. #1]>

<([#2 [2.1.1] We are not asking for any industry to receive handouts or subsidies; we do not want the government picking winners and losers. We simply ask that the roadblocks be removed, so that a viable oil shale industry can be allowed to proceed and bring with it the many benefits of a healthy, stable, long term industry. The only Alternative in the current PEIS that does this is Alternative 1, which I recommend to your office to be the final selection. #2])>

<([#1 [2.1.1] Thank you for this opportunity to provide comment on this PEIS.

I would like to support Alternative 1, and urge the BLM to do the same. This Alternative keeps a sufficient amount of land available for leasing to help foster a commercial oil shale industry.

Such an industry would provide increased employment in a region that has been struggling under 9- 10% unemployment rates for the past several years. In addition, oil shale is an important resource that can add significantly to the U.S. energy mix, help stabilize fuel prices, and wean us off of overseas oil.

Please adopt Alternative 1 as the final product of the 2012 Oil Shale PEIS. #1)>

<([#1 [2.1.1] [6.2.2] [6.3.2.1] [6.3.5] I am writing to offer my input on the 2012 Oil Shale PEIS. I would specifically like to address a number of fallacies that opponents to oil shale are putting out there, and that this PEIS seems to validate.

First, in terms of water usage, oil shale production will use far less than some would have us believe. There are, in fact, some processes that use little to almost no water at all. Further, the GAO estimates that there is sufficient water available to comfortably support a 500,000 barrel a day industry, far beyond what any accurate estimates predict the industry will actually use. Every company currently involved in oil shale says that their water consumption will be in the range of 1 to 3 barrels of water used per barrel of oil produced, an amount which can easily be accommodated.

Second, is the argument that oil from shale is not efficient. The fact is that oil shale development produces far more energy than it consumes, to the tune of 3:1 - 6:1.

Finally, is the fallacy that oil shale development technology remains years behind. In fact, oil shale is being produced commercially in several places around the world. Shell recently produced several thousand barrels of oil off one of its RD&D leases; the technology is clearly there, and improving every day.

And finally is the fallacy that oil shale development will destroy the environment. This is nonsense, and is reminiscent of similar arguments against natural gas drilling in the area. There are several in-situ processes that require no surface mining, and the industry has a proven track record, and vested economic interest, in being good stewards.

With this in mind, I recommend Alternative 1, which does by far the best job of permitting this industry to develop and create jobs and energy.

<([#1 [2.1.1] This letter is in response to the 2012 draft PEIS for oil shale. I wish to register my opposition to the BLM's Preferred Alternative, and the other Land Allocation Alternatives in the document, and express instead my support for Alternative 1, the No Action Alternative.

Our nation is experiencing ever increasing fuel prices and an energy policy that has us reliant on hostile foreign governments for a good deal of our oil. Meanwhile, this region holds as much as 4 trillion barrels of oil in place, according to the U.S. Geological Survey, and perhaps even more. This is more oil than in the entire Persian Gulf, right in our backyard.

#1]>

<([#2 [2.2] [9.2.1] So it was disappointing that the BLM chose as their Preferred Alternative, one that takes the acreage made available for oil shale commercial leasing in the original 2008 PEIS, and cuts it from 2,017, 714 acres, to a mere 461,965 acres- a reduction of 77%. Moreover, the

acreage that is left is spread out in small, isolated pockets. It would also specifically not allow the issuance of commercial leases, until such time as the applicant demonstrated a viable recovery technology- a requirement that no other segment of the energy sector is subjected to. This is in violation of the 2005 Energy Policy Act, which explicitly called for a separate and concurrent commercial development program for oil shale. Also, by excluding lands that exhibit “wilderness characteristics” from being available for leasing, the BLM appears to be in violation of a Congressional spending moratorium from April 21, 2011, that defunded the Secretary of the Interior’s Order 3310. #2]>

<([#3 [9.8] In addition, I feel the need to comment on the reason for redoing this PEIS in the first place; as part of a settlement over lawsuits directed at the Department of the Interior by certain extremist groups who were unhappy with the outcome of the three-year long 2008 PEIS. I think it sets a bad precedent for a particular interest group to be able to force the government to spend more money that it does not have to redo a major undertaking such as this, without any new information having been developed, just to appease that group. No unelected, unaccountable special interest organization should have that much power over critical national policy, and the national purse. This is another reason that the BLM should at least adopt the Alternative that reinforces the results of a lengthy, professionally done process that included thousands of hours of input from experts, scientists, local governments, and the people themselves. #3]>

Please adopt Alternative 1, and allow commercial oil shale development to take place responsibly in western Colorado.

<([#1 [2.1.1] I am supporting Alternative one in the current oil shale PEIS, that calls for no action from the original 2008 one. The

preferred alternative in this PEIS poses a couple of problems for me as a Western Slope resident. Most important is the apparent lack of concern over economic effects and job creation. The Preferred Alternative drastically cuts acreage available for oil shale leasing, and will greatly discourage and even actively prevent commercial development of oil shale. This development would create hundreds of jobs in the region, both directly and indirectly. The income generated from these jobs will help backfill the shortfalls in local and state funding of infrastructure, schools and other services, and spur further economic activity in a region experiencing over 10% unemployment.

The arguments against commercial oil shale development that led to this new PEIS are faulty; Leaving land open to be available for them to apply for leases and expand their operations does not automatically mean that the environment will be put at risk for the sake of these companies. The industry has a vested interest in looking after the land on which they operate, and in being good stewards of the environment. The energy industry in our area in fact has an excellent track record of doing so. The water issues that many opponents are so concerned about are also over-stated. Many of the industry's established production technologies use very little water, and for the ones that use more, most of the necessary water rights are already owned by companies seeking to commercially develop this resource, and are accounted for. In fact, the oil shale industry will use considerably less water than some 'renewable' energies, such as bio-mass from corn which requires irrigation.

The technology is available, and improves every day, to produce oil shale. They are already commercially developing it in Estonia, China, and elsewhere. Even here, Shell successfully produced several thousand barrels of oil just off one of its RD&D leases, and has done so with the utmost care being given to the environment. Each of the leases that would be allowed for under the Alternative 1 would be subject to NEP A analysis, providing a further level of protection. There is no excuse for the BLM to stand in the way of this industry from creating jobs and prosperity for western Colorado by adopting a more restrictive option.

<([#1 [2.1.1] In regards to this PEIS, I support Alternative 1 as being the most economically sensible option available. The socio-economic benefits of oil shale are too great to ignore. In terms of jobs alone, a commercial oil shale industry will directly create hundreds, in production operations, engineering, transport and logistics, directly-related construction, such as in-situ processing facilities, power plants and the like, hundreds more in operation of these facilities, and even more indirectly, through supporting industries, retail businesses, housing construction and so on. Much of the income from these jobs would be spent in the area, and some would go to local and state government in the form of taxes, providing money for schools, roads, and emergency services. Oil shale development would also provide a boost to non-related industries, such as tourism and recreation, and more people moved to the area, and more disposable income was generated to be able to pay for recreational activities.

On a national level, oil shale could scarcely be more important. With fuel costs rising on an almost daily basis, and the geo-political situation getting progressively worse in the Middle East, America is, or soon will be, desperate to find ways to increase domestic sources of energy. Oil shale has the potential to do that, and to meet America's demands for energy for the foreseeable future, without having to rely on oil from unstable and hostile foreign markets.

Alternative 1 will keep 2 million acres of prime oil shale rich land available to the industry for lease application. Various processes already in place will ensure that environmentally fragile areas are adequately protected, and having a plan established for commercial development will provide local communities and municipalities the chance to prepare for the growth to come. This balanced method of addressing the issue of oil shale is the only option that makes sense from all angles, and should be adopted by the BLM in the final draft. #1)>

<([#1 [1.1.1] I am writing to advocate for two things in regards to this oil shale PEIS; the first is to extend the public comment period at least 2 weeks beyond the date of the release of the new oil shale leasing regulations, which are due to come out May 15th.

It seems only proper that sufficient time be allowed for interested persons to review these regulations before offering comment on the PEIS and the various land allocation alternatives. #1])>

<([#2 [2.1.1] The second thing I ask is for the BLM to reconsider its Preferred Alternative, and instead select Alternative 1. The Preferred Alternative, 2b, eliminates commercial leasing altogether, and takes far too much land off the table for any kind of leasing. Alternative 1 would restore the findings of the 2008 PEIS, the information underlying it still being valid, which would make just over 2,000,000 acres available for application to commercial leasing. It is important to note, that not all of these acres would ever be developed; this simply allows companies a wider option of land from which to apply for a lease. Each application would be vetted by the BLM, EPA, and other agencies, and any fragile environmental features, terrain, or habitat would be duly protected. #2])>

In summary, please extend the public comment period sufficiently to allow review of all the pertinent information, and in the meantime, consider Alternative 1 as your Preferred Alternative.

<([#1 [11] I want to convey my frustration with the current Draft PEIS for oil shale, and the manner in which it dismisses the “people element” - the social and economic factors that should enter into any public policy decision of this magnitude.

Energy is the lifeblood of Colorado’s western slope, where much of the oil shale land is located. We not only understand the importance of these resources to a functioning modern society, and what their extraction means to the economic life of our local communities, we also know how to develop them in a way that is safe and respectful of our natural environment. Anyone who has been to Craig knows how closely we depend on coal mining, and how beautiful our landscape is, and how clean our air and water. There is no reason to suspect that we would deal with our other natural resources any differently.

The new 2012 OS/TS PEIS contains land allocation alternatives that would suggest otherwise. Instead approaching oil shale as the 2008 PEIS, and Alternative 1 that would implement it does, the BLM’s preferred alternative, 2b, takes a highly restrictive approach, cutting off over 1.5 million acres from potential leasing, that had previously been determined acceptable. Alternative 3 goes even farther, by not allowing any development beyond the existing RD&D leases.

The oil shale industry will never be able to establish itself and bring the job growth and economic development that it promises, if it is kept perpetually in the research phase by the government. If the technology truly is not there, the industry will not proceed; if it is there, then a process needs to be in place to allow orderly expansion and commercialization. Only Alternative 1 does that.

I would ask the BLM to place some trust and faith in the people who live, work and raise their families in the areas

you are determining land access policies for. We have more than proven that we know how to care for what we have been given, and simply ask the federal government to let us do it. #1)>

Thanks for the opportunity to offer comment on this important matter,

<([#1 [2.1.1] I would first like to thank the BLM for extending the opportunity for public input into this important matter. As a resident of the Western Slope, I would further like to take advantage of the opportunity to express my support for the commercial development of oil shale in general, and for Alternative 1, the no-action alternative, as described in the current 2012 Oil Shale PEIS.

The politics of oil shale development have been, and will continue to be debated for some time. However, the reality on the ground for the affected communities is that the socio-economic benefits, the job growth, the income, and tax revenue that the commercialization of oil shale will bring are the foremost concerns. It is a shame that the politicization of the process has had the effect of further delaying the establishment of an industry that bears such promise.

The PEIS completed in 2008 made available 2,000,000 acres for potential leasing; this is land that would not necessarily be developed, as much of the land may be unsuitable economically for leasing, and each lease would be subject to BLM assessment and approval prior to the lease actually being issued. This would, however, maximize the opportunity for careful expansion and commercial development, and the

benefits that come along with it.

The new proposals for land allocation in the current PEIS, undertaken only as a result of litigation by certain interest groups, would restrict the amount of land available for *application* for leasing, enough so that some companies with an interest in developing and producing oil shale and bringing good jobs to the region, would be forced to abandon their plans for Western Colorado and seek their success elsewhere.

We who live and raise our families in western Colorado are as much or more concerned than any over the conservation and stewardship of our natural environment, in conjunction with our economic health and future. We believe that the two goals are not mutually exclusive; we trust that the BLM can make wise decisions regarding the approval of individual leases- we only ask that the BLM trust us enough to keep in place the acreage deemed suitable for application 4 years ago.

<([#1 [2.1.1] I support Alternative 1 in the above referenced PEIS, and hope that the BLM will as well. The current Preferred Alternative Is far too restrictive, not only in the amount of land that is has placed off limits to any consideration for leasing potential, but also in the fact that it does not allow for commercial leases to be issued at all, Instead permitting only RD&D leases until a viable technology is demonstrated by the lease holder. Part of the problem with this is that the acreage that is not

excluded from leasing is so small and in such remote areas, that commercial expansion would prove impractical, if not impossible. Even commercial expansion of existing RD&D leases would be severely limited, since the Preferred Alternative puts most of the preference rights leasing areas around them off limits as well - in many cases, 100% of that area.

This obvious prevention of commercial development makes no sense from an environmental perspective; first, the larger acreage allowed for lease application under alternative 1 would not automatically be open for large scale development, each lease would first have to undergo a full NEPA environmental assessment. Secondly, the area deemed suitable under Alternative 1 had initially been determined to be following an extensive three-year environmental impact evaluation process - It was only after legal interference by environmental extremist organizations that vast swaths of additional land were also excluded. Finally, If the U.S. does not take the lead in oil shale development, we will cede the industry to places like Estonia and China, where oil shale development is already taking place on a commercial scale, and where environmental protections are considerably less stringent than they are here.

It certainly makes no sense from an economic standpoint; allowing a commercial oil shale industry to establish itself in this region would mean prosperity, growth, and opportunity for the people who live here. On a national scale, of course, it would mean a huge step towards energy independence, and a large, stable, long term domestic fuel source.

These are the reasons why I would urge the BLM to replace the current Preferred Alternative with Alternative 1. #1]>

I believe that the 2012 Oil Shale PEIS is not valid in that it violates federal statute.

<([#1 [9.2.1] By limiting leasing to RD&D and not allowing commercial leases until further requirements were met, the BLM's Preferred Alternative contravenes the 2005 Energy Policy Act, which explicitly mandates a commercial development track for oil shale alongside the RD&D track.

The 2012 oil shale PEIS also attempts to circumvent Congress by excluding huge swaths of land from any potential future leasing on the basis that they possess "wilderness characteristics". As you are well aware, only Congress can designate wilderness area. A Secretarial Order attempting to grant the BLM the power to designate land as having "wilderness characteristics", and subjecting it to the same restrictions as wilderness, was defunded last year by Congress. #1])>

<([#2 [1.1.1] Finally, excluding land from potential leasing due to the possibility of it containing Sage Grouse habitat before the details and boundaries of such habitat are released by the state Division of Wildlife disallows adequate assessment by the public. The BLM should extend the comment period at least until all such pertinent information (including the 2012 oil shale leasing regulations) is made available to the general public. #2])>

<([#3 [2.1.1] Placing thousands of acres forever off limits, and relegating the remaining available acreage to a few small, scattered outposts that make commercial leasing unviable is a roadblock, not a management plan. In addition to extending the public comment period, I call on the BLM to reconsider its support for Alternative 2b, and instead consider Alternative 1 as the most workable, prudent management alternative. #3])>

<([#1 [2.1] Opponents of oil shale development who launched the lawsuit that created this new PEIS are offering conflicting excuses to not allow commercial oil shale leasing, as provided for in the 2008 PEIS, and Alternative 1 of the current PEIS.

On one hand, they say that the technology is not there, that the industry is not ready for commercial development, and that the companies involved do not therefore really need or want the land at this time, and so there is no need to go ahead with any commercialization plan.

Paradoxically, opponents claim that the influx of people that a commercial oil shale project would bring to the region would overwhelm the local communities, and that therefore commercial development should be further delayed to allow time for these communities to plan for it.

So which is it? Is oil shale not viable, and therefore not ready to plan for commercial expansion, or will commercial leasing lead to such extensive and immediate economic development that it will quickly stress existing infrastructure and local services? Is commercial production an impossibility, or so likely that it is a “threat”?

The fact is that the technology has advanced to the point where oil shale is not only viable, but actually being produced in various places around the globe, including on certain RD&D leases here. And if the industry does not need access to the land for expansion to commercial-level production, and strategic planning purposes, then why is it asking for it?

As to the second contention, if the industry will lead to massive economic development, are they suggesting that it is better to not have a process in place to allow orderly commercial leasing, complete with NEPA processes being applied to each lease, and instead wait until such production is inevitable, or demanded in response to a crisis, and then approach it haphazardly?

#1])>

<([#2 [2.1.1] Alternative 1, the No-Action alternative, puts such a process in place, by allowing a maximum safe amount of land available for application for commercial leasing. This will both allow for a commercial program to get going, and ensure that it is done in a safe, responsible, orderly manner.

At any rate, if the introduction of an industry will create economic growth, isn't that a pretty good problem to have right now? #2])>

<([#1 [2.1.1] I support Alternative 1 in the 2012 Oil Shale PEIS, which would reopen land to potential commercial leasing, and provide a way forward for a commercial oil shale industry. I believe this industry is essential not only to our national energy security, but for the economy of western Colorado.

Many of the arguments currently being made against oil shale development are reminiscent of the arguments made against oil sands in Alberta, Canada, 30 years ago. Opponents then claimed that oil sand development would use too much water; would ruin the land; and that anyway, the technology was not there to do it, and was too expensive.

Now, 30 years later, we find that the water supply is more than adequate to support the industry; the apocalyptic environmental disasters did not come to pass; and that oil sand is being profitably produced on a large, commercial scale, in fact supplying the United States with the bulk of its imported oil. The town of Fort McMurray is thriving, Alberta's unemployment rate is low, and many smaller companies are investing and entering the industry, creating even more jobs and income. The Alberta government runs a surplus that they do not know what to do with, and there is still hunting, fishing and related activities going on in northeastern Alberta.

All of these benefits could be enjoyed by the people of western Colorado, and the tri-state area, if the government would just get out of the way, and let the industry establish itself. For that reason, I urge the BLM to adopt Alternative 1, which would allow this to happen.

<([#1 [1.1.1] CLUB 20 members are in the process of reviewing the recently published 2012 OSTIS PEIS in order to provide comments on that voluminous document. It is our understanding that the highly relevant commercial Draft BLM Oil Shale Regulation document is not expected to be published until May 15, 2012, well after comments are due on the 2012 OSTIS PEIS.

These two documents outlining impacted areas and development regulations are inextricably tied to one another and our members believe that making comments on one without the benefit of knowing the contents of the other may result in inconsistent and confusing responses, undermine the NEPA process, and interfere with the formation of well-considered public policy. It makes sense that comments should be considered simultaneously on these two important documents. In that light, CLUB 20 respectfully requests that the comment period on the 2012 OSTIS PEIS be extended to at least 90 days past the publication of the Draft BLM Oil Shale Regulations. Thank you for your consideration.

<([#1 [2.1.1] This PEIS poses some serious questions and concerns for me. I am primarily concerned with how much land the new PEIS places off limits to oil shale leasing, and what that might mean for both the industry and the economic future of the region. Western Colorado is facing sustained unemployment levels of 9% and more, and these jobs would be key to turning this region's economy around.

I would prefer to see a return to the land use plan agreed upon in the 2008 PEIS, which left available just over 2 million acres for potential oil shale leasing. This was not done *as* a blanket land give-away, but as part of a set process that included additional EIS's being done on each individual lease. This plan would in no way permit harm to the environment, but it would give companies the options they need to be able to plan for their own futures, and create jobs and wealth.

Allowing these companies to lease land and expand their operations would also help fill the holes in our education and infrastructure funding, as royalties and taxes paid by the companies acquiring the leases, and the income and property taxes paid by the additional workers would help replace revenue that has been lost over the past 3 years.

The best and only option available to allow all of this to happen is to not tinker with the plan agreed to in the 2008 study. Therefore, I support the no action alternative, Alternative 1, and urge the BLM to do the same. [#1]>

<([#1 [9.8] I would like to voice my objections to the current PEIS on the following grounds:

First, the 2012 PEIS is redundant, the process having already been completed back in

2008. That effort garnered the support and input of many different specialists, industry experts, county and local governments, development agencies, environmental interests, scientists, and more; it was a thorough, three year process, and resulted in a balanced management plan that encouraged commercial development of oil shale while protecting the environment. There has been nothing in terms of new evidence or information emerge since that time, that would begin to justify re-starting the whole process.

Second, the reason for redoing the PEIS is frankly appalling, and makes a mockery of the whole NEPA system. To restart such a major undertaking solely because a small, radical environmentalist group sues because they don't like the outcome, is not only ridiculous, but sets a terrible precedent; that each time the outcome of a government study, analysis or process is not to the liking of a particular special interest group, with no real legal claim, they can sue, under a more friendly administration, and have the entire process redone to fit their agenda. The current PEIS completely turns the findings of the original on its head, and reduces the amount of land available for potential commercial leasing by a huge margin, with disastrous effects on the outlook for future oil shale development. This is a tragic mistake.

Third, is the cost involved. An EIS costs millions to prepare, in man hours, government resources, research, travel, etc. At a time when governments, businesses and families are tightening their belts, it makes no sense to waste valuable public dollars on something that was already done. It would be comical, if the stakes were not so high. #1]>

<([#2 [2.1.1] As a veteran I understand full well what it means to bear responsibility to the people and resources of this great nation. I would therefore urge you to either A) scrap this nonsense and commit to the professional, non-politically motivated PEIS completed four years ago, or B) adopt the No Action Alternative, to achieve the same result. #2]>

<([#1 [9.8] The BLM should either scrap this PEIS now, or at least adopt Alternative 1, which calls for no action from the previous PEIS, finished only 4 years ago. Having environmental extremists mad at your agency is not sufficient reason to toss aside years of work, hours of public testimony, and exhaustive input from local governments, spend money that the government does not have, and re-write the entire PEIS. One can hardly blame our neighbors in Mesa County for refusing to participate this time around, after they already contributed extensively to the earlier one, noting that nothing substantial has changed.

In fact the only thing that did change was the BLM's conclusions. After analyzing the same data, and receiving the same input, your agency decided to reduce by hundreds of thousands of acres, the land to be made available for oil shale leasing, and to impose new requirements on companies seeking commercial leasing opportunities. Can you really tell me that your department could look at the same information a second time and come up with such a dramatically opposing conclusion, without there having been political factors involved? #1)>

<([#2 [2.1.1] We on the Western Slope are growing sick and tired of radical, left wing environmentalists constantly holding up development and job creation. It is obvious to most that energy development and nature can co-exist. We who actually live and try to make our livings out here full time not only know how to be good caretakers of the land, we want to.

So when we ask you to support Alternative 1, and to maximize the potential of the oil shale industry to grow and bring all of us up along with it, we are not asking you to allow some sort of pillage of the land - we are simply asking for a chance. #2)>

<([#1 [2.1.1] I am writing to express my opposition to the Preferred Alternative in the 2012 oil shale PEIS, and to recommend Alternative 1 as a replacement.

The Preferred Alternative, 2b, severely restricts commercial leasing opportunities by slashing the land available for application to leasing, relegating what is left to small isolated pieces, and issuing only RD&D leases, imposing unreasonable requirements on companies before they can upgrade to a commercial lease.

These provisions not only hamper and delay commercial development, and the regional and national economic benefits it would bring, but could even prove to be against the law, as the Energy policy Act of 2005 specifically called for a dual track for oil shale development, an RD&D program, and a concurrent, but separate, commercial program.

Alternative 1 retains in place the findings from her initial 2008 PEIS, which set aside roughly 2 million acres for potential commercial leasing, subject to individual EIS's. I recommend that the BLM adopt this as their final alternative. #1]>

<([#1 [2.2.] I support the Bureau of Land Management's preferred alternative in the draft plan for oil shale development.

The preferred alternative would close many valuable and important lands to oil shale, such as lands with wilderness characteristics, areas of critical environmental concern, and sage-grouse habitat. Maintaining wilderness values and ecological integrity on our wild public lands contributes to our way of life and to our economy.

The recreation industry in Colorado alone generates \$3 billion of economic activity every year. We should not risk our water, air, pristine lands, crucial species habitat and outstanding recreation opportunities for any energy development, much less one dependent on unproven technology.

For all the unknowns about oil shale, what is known is that it threatens water resources and clean air. To even attempt to generate a single barrel of oil from oil shale, 3-5 barrels of water are needed in the refining process alone.

Taking the oil shale out of the ground will waste more water on top of that. And since this development would be taking place in western states like Colorado, water is already a very precious commodity, often in short supply.

In addition to threatening our water, oil shale would also pollute our air. In order to create one million barrels of oil a day from oil shale, ten new coal-fired power plants would be needed, leading to the emission of 121 million tons of carbon dioxide.

Oil shale is the world's dirtiest fossil fuel. Please finalize the preferred alternative and ensure that wilderness, wildlife, clean air and precious water supplies are not sacrificed to oil shale.

Thank you for your help on behalf of America's irreplaceable lands, water and wildlife. #1)>

<([#1 [2.1.1] The Grand Junction Economic Partnership (GJEP) is the official economic development agency for Mesa County, Colorado. The mission of the organization is to enhance the economic vitality of our community creating a strong, diverse economy and an improved quality of life. GJEP focuses on five target industries, one of which is the energy industry.

The 2012 PEIS has the potential of impacting the energy industry in the region. For this reason GJEP supports the adoption of Alternative 1 (no-action) as outlined in the 2012 PEIS. Our reasons for supporting this alternative focus on the following areas; 1) the economic benefits that responsible commercial oil shale development will bring to our region; 2) the advantages to local communities to having a structured process for commercialization in place.

The development of the Western Slope's energy resources has a positive and significant impact on our local economy through increased tax revenues, payrolls, local vendor purchases and the creation of quality jobs. Allowing for the responsible commercial expansion of oil shale development to take place will bring hundreds of jobs to the region, both directly and indirectly, in construction, production operations, housing, and various support industries. Understanding there is a direct correlation between energy activity and jobs and living in a time of increasingly restricted state and Federal budgets, we must continue to promote business opportunities in the area.

Lastly, alternative 1 establishes an orderly system of commercialization, one that will accommodate the growth of the industry, while providing local entities the time and a stable framework under which to be able to appropriately plan for population growth, housing, and other impacts. Ultimately, GJEP supports responsible development of energy resources with consideration given to the strength and stability of local economies as well as the environment, health and public safety.

For these reasons, we support the adoption of Alternative one, and urge the BLM to do the same. #1])>

I wish to express my support for Alternative 1 in the referenced PEIS, and also my deep concern over the way aspects of this process have been handled.

<([#1 [9.8] Public policy for this nation should not be determined by a court settlement. This current PEIS is just that, the product of a settlement with opponents to oil shale development, unhappy with the outcome of the 2008 PEIS. As a result of this settlement, the BLM has disregarded 3 years of hard work and input from community leaders, local governments, scientific experts, and the public. Instead they have seen fit to mold their conclusions based on the questionable motives and agenda of a few.

It is unacceptable to allow environmental obstructionists to play the system for their own narrow and selfish agenda, at cost to the taxpayer. The cost of further delay in much needed economic development is also unacceptable. The people of the Western Slope do not want to see our tax dollars wasted on re-doing an Environmental Impact Statement for no other reason than to satisfy the environmental extremists' quest for a renewable utopia that is not economically viable, functional, or practical at this time in the United States. #1)>

<([#2 [2.1.1] Alternative 1, and the 2008 Record of Decision that it would be upholding, offers the best balance of conservation and energy development. Oil shale is a tremendous national resource that holds one of many keys to our energy independence, and long-term energy stability. A commercial oil shale industry will

create jobs, and help the Western Slope out of this recession. The biggest obstacle to this is no longer technological; it is the federal government's ill conceived and short sighted policies.

The people of the Western Slope will never sacrifice our environmental heritage, or the health and safety of future generations. As stewards of our region, we realize that protecting our land does not mean placing it under lock and key, and sacrificing our economic future instead. #2]>

<([#1 [2.1.1] Thank you for the opportunity to comment on the 2012 oil shale PEIS. I believe that Alternative 1 is the only Alternative that meets all the proper requirements for being accepted as a land management plan.

The initial PEIS, completed in 2008, allowed just over 2,000,000 acres to be available for consideration for commercial oil shale leasing. This new PEIS is simply a redo of the 2008 one, using the exact same information, yet arriving at a different Preferred Alternative. #1]>

<([#2 [2.2] The Preferred Alternative in this latest PEIS would reduce that available acreage by almost 80%, and locate what was left in widely scattered, tiny, parcels, too small and isolated to adequately support commercial development. It would also eliminate commercial leasing, until a "viable" technology was first demonstrated to the satisfaction of BLM officials - something that no other industry is subject to. #2]>

<([#3 [2.1.1] These land and leasing restrictions will have a further delaying effect on the industry, at a time when it is just getting started. The real tragedy of this is the denial of economic progress and prosperity to the people of the regions involved. Commercial oil shale development will bring much needed employment to this very hard-hit area. Also, the sheer size and potential of this resource dictates that it is in the national interest to produce it. With gas prices reaching all time highs, and increasing turmoil enveloping the Middle East, it would make

sense to encourage, not hinder, the development of such an extensive domestic energy supply.

For these reasons, I support Alternative 1, which restores the findings and land use plan agreed to in the 2008 PEIS, and I would urge this agency to do the same. #3]>

<([#1 [9.8] I object strongly to the manner in which this current PEIS came about. It is a do-over of an earlier version completed in 2008, using the exact same information. The only reason it is being re-done is because some environmental zealots sued the DOI over the outcome, which allowed lease application on 2 million acres of prime oil shale land in the west. Now, as part of the friendly settlement, the BLM is taking my tax dollars, looking at the exact same information again, but this time adopting a Preferred Alternative that reduces the previously allowed acreage by 80%, and eliminated commercial leasing.

What sort of message does this send, that every time a particular special interest group does not get their way, that they can sue for no solidly legal reason, and have the settlement reflect their agenda? This is a terrible precedent that is an affront to the way public policy decisions are supposed be made in America. #1]>

<([#2 [2.1.1] Allowing the free market the opportunity to develop oil shale on a commercial basis would have incredible benefits both for the nation and the local economy. Oil shale does represent a great technological challenge, but it is one that American industry is capable of meeting. Denying them the ability to take out commercial leases would only hinder and delay the establishment of this industry, and put off the job creation, royalty payments, energy independence, and other benefits for the indeterminate future.

For this reason, I support Alternative 1, which calls for no action against the 2008 PEIS, keeping the 2 million acres

available for commercial lease application and providing the same opportunities for oil shale developers as is afforded any other industry. #2]>

<([#1 [2] I am writing to object to the current 2012 Oil Shale Programmatic EIS, particularly in that it blocks commercial development of the resource.

Each of the Land Allocation Alternatives, excepting number 1 (the “No Action” alternative), fail to allow for commercial leasing as prescribed in the 2005 Energy Policy Act. Alternative 2 not only drastically reduces the amount of prospective land available for application for leasing from 2,017,714 acres to 461,965 acres over the tri-state area (or from 346,609 acres in Colorado to 35,308 acres, a cut of nearly 90%), but the acreage that remains is widely scattered in small, isolated pockets, the locations decided upon with no regard as to commercial suitability, access, or geological considerations. The potential lease lands are not contiguous, either with each other or existing RD&D leases. All of this serves as a serious barrier to future planning, commercial expansion, as well as to the decision to go commercial in the first place. It certainly makes the region unattractive to new oil shale development. Furthermore, Alt 2 places nearly all of the existing Preference Rights Leasing Areas, set aside currently to allow for commercial expansion from existing RD&D leases, off limits. So even minor expansion from the RD&D leases currently in place would be disallowed under this alternative. #1]>

<([#2 [9.6.1] The BLM's preferred alternative, 2b, goes even a step further, by requiring that a viable recovery technology first be demonstrated before a lease permit will be granted. This is a requirement unique to the oil shale industry- no other industry, including other energy industries, are subject to that test before they are allowed to secure leases. This will only deny companies the planning option of securing commercial land while they perfect their process. At any rate, no company would wish to risk their investment, and make lease payments, if they do not have a viable method for generating a return on their investment. There is also no defined standard for what constitutes "viable technology" in the BLM's eyes, which would be a further disincentive to invest in this resource.

#2])>

<([#3 [2.1.1] As for the remaining Alternatives, 3 makes absolutely no allowance for commercial development, limiting oil shale work to only the existing RD&D leases. 4b leaves a little more acreage available for leasing, but under the same restrictions as 2b, prohibiting commercial leases until a demonstration of viability.

All of this adds up to a program purposely designed to delay and hinder commercial development of oil shale, at a time when there can be no argument that the jobs are needed, and the energy source is needed. I therefore strongly request that the BLM adopt Alternative 1, and take no action deviating from the findings properly arrived at in the 2008 PEIS. #3])>

<([#1 [11.2] I wish to thank the BLM for this opportunity to offer input on the 2012 oil shale Programmatic Environmental Impact Statement. This region holds a tremendous amount of energy, and it is incumbent upon the federal government to allow its development to go forward. This will benefit us as both a nation and as western Coloradans; the amount of oil that could potentially be produced is sufficient to meet America's demands for petroleum and petroleum-based products for decades, and is also enough to replace the oil imports currently coming from places like the Middle East and Venezuela. On the regional side, the job growth that this industry would spur would generate enough wealth, income and revenue to lift the state out of the recession that has been holding us down for years now. #1])>

<([#2 [2.1.1] Alternative 1 is the only option presented in the 2012 OS/TS PEIS that will come close to adequately providing for such development, and I would ask the BLM to adopt it as the final Preferred Alternative. #2])>

<([#1 [2.1.1] I wholeheartedly recommend the adoption of Alternative 1 in this PEIS. Alternative 1 will pave the way to job growth and economic development stemming from a productive commercial oil shale industry, by providing that industry with the options it needs to get started. #1])>

<([#2 [2.2] The BLM's Preferred Alternative, on the other hand, severely limits the options available to the nascent industry by eliminating hundreds of thousands of acres of land from availability for leasing, and restricting what little bit is left to only RD&D leasing. This will make it next to impossible for smaller companies to enter the oil shale market, and make it all but impossible to establish a viable, profitable commercial oil shale industry in the United States. #2])>

<([#3 [2.1.1] This is just the kind of government interference, buoyed by an unaccountable, yet powerful, environmentalist lobby that prevents private sector job creation and

economic recovery. At stake is not the health of the environment- the NEPA process ensures that every lease applied for on federally controlled land is properly evaluated for potential environmental impacts; and at any rate, the people who live and raise their families on the Western Slope, and who would be the backbone of any commercial oil shale project, are not about to place their own environment or their children's health at risk.

Please select Alternative 1 , and place the future of this region into the hands of those who are most affected by the policies that govern it. #3]>

Concerning the oil shale PEIS, I would like to recommend:

<([#2 [1.1.1] 2. The period for public comment should be extended. #2])>

<([#1 [2.1.1] 1. Alternative #1 should be followed instead of #2b.

My reasoning includes the following points:

I have attended public seminars describing the technological improvements which have been made in recent years. I believe much of the delay we are seeing currently is due to foot-dragging on the part of government agencies and (to an even greater extent) red herrings from extreme environmental organizations. As long as reasonable (as opposed to totally obstructionist) environmental concerns are kept in mind, technology will continue to improve.

I am familiar with some of the tactics of the environmental groups trying to block this. These include abuse of the Equal Access to

Justice Act (for raiding the public treasury) and the Endangered Species Act (for justifying blind opposition to human activity) . #11)>

<([#1 [9.8] The U.S. Geological Survey estimates that as much as 4 Trillion barrels of oil are trapped in shale under this region. That is far more than the amount of oil in the vast Persian Gulf fields, more even than Canada's oil sands, which currently supplies the bulk of America's oil imports, and enough by far to supply America's energy needs well into the future, without needing to rely on oil from foreign, often hostile nations.

The 2008 Oil Shale PEIS seemed to recognize this, and produced a reasonable, balanced plan for harvesting this important national resource, identifying around 2 million acres of the most geologically prospective oil shale lands as being available for application for potential future leasing, pending environmental assessments of the individual leases. While it is recognized that not all of this acreage would actually end up being available, it still offered companies looking to invest in oil shale development the flexibility required to plan into the future.

That PEIS is now being re-done, at taxpayer expense, not because any new information has been discovered (none has), but instead, because of a lawsuit leveled at the government by a radical environmental lobby group. The BLM's new conclusion from this PEIS is that most of the land deemed fit for consideration just 4 years ago, is now off limits. This includes the Preferred Rights acreage around existing RD&D leases. These land restrictions make it virtually impossible to expand

commercially, and economically impractical to try. #1)]> <([#2 [9.6.I] Alternative 2b goes as far as not allowing any commercial leasing until a company demonstrates a viable recovery technology. This is something that no other industry is required to do. If this was demanded of the renewable energy industry, for example, there would not be even as much of a solar industry as there is today. #2)]>

<([#3 [2.1.I] Alternative 1 keeps in place the findings of the 2008 PEIS, and is therefore the only responsible, balanced, and economically viable alternative available to the BLM. I would urge you to do what is best for the people of the region, and for the country, and adopt Alternative 1 as management plan going forward. #3)]>

<([#1 [1] I am writing to express both my concerns over the 2012 Oil Shale PEIS, particularly the BLM's preferred alternative, 2b, as well as my support for the No-Action alternative. As a small business owner, I appreciate the positive impacts to the retail sector that the growth of a major industry can provide. Increased oil shale investment, development, and commercial production will bring employment opportunities to the region, and people to fill them. The resulting increase in both population and income will provide immediate benefits to businesses such as mine. We do not live in an economic vacuum, and the ripple effects of a successful and vibrant oil shale industry will reverberate throughout the region.

It is therefore somewhat distressing to see that the BLM, this time around, favors a plan that would all but stop commercial oil shale development before it even has a chance to get started. The draconian land restrictions, along with unreasonable demands on oil shale companies to prove to the satisfaction of government officials that their production technology is good enough before a commercial lease is even considered, essentially ensure that no commercial production will ever take place on federal lands in the tristate area. Alternative 3 goes even farther, not allowing any expansion at all beyond the currently held RE&D leases; and alternative 4, while not reducing acreage available for leasing by quite as much as 2 does, still comes attached with a sub-alternative, 4b, that would impose the same unreasonable requirements on companies as 2b.

What all of this means for business people such as myself, is yet another delay in the job growth and economic development we are all hoping for to salvage our livelihoods. I doubt very much that there is any one of us who would support anything that would truly pose a serious risk to the environment, but we are not willing to stand aside and watch our businesses and families suffer, while extreme environmental groups continue to hold up economic progress and development.

#1])>

<([#2 [2.1.1] I therefore ask two things of the BLM in this matter: First, please adopt Alternative 1, which would leave available sufficient land for possible commercial leasing, and set up a process by which a viable oil shale industry can emerge; #2])> and second, <([#3 [1.1.1] to please extend the public comment period, to allow for more input by the small business community in the region. #3])>

<([#1 [9.2.1] I am getting very sick and tired of hearing about radical environmentalists continually hijacking progress In this country. This latest PEIS is just the latest example. A perfectly well done PEIS was completed only four years ago, and simply because it dared to make enough land available for application for development to make it economically viable for the oil shale industry to expand and invest, the “greens” sued, and now we are spending who knows how many of our dollars to completely redo it to fit their anti-development views.

This is completely outrageous. We have unemployment in this region above 10%, and the options in this new PEIS, other than the no action alternative, place heavy land restrictions and requirements on the industry that will prevent it from creating jobs. We are facing crippling debt, due to out of control spending, and the federal government adds fuel to the fire by re-doing a major PEIS in response to a complaint by a fringe group.

Where will this end? [#1]> <([#2 [2.1.1] Put some trust in the people who really run this nation, and allow for the oil shale industry to develop and expand. Adopt Alternative 1, which keeps in place the 2008 PEIS, and provides for enough land to be available for application for leasing that the industry might be able to invest and create jobs and economic opportunity for our region, and our young people. Please have more consideration for the people and future of the regions that are impacted by your decisions, than on a noisy, but small, group of radicals that have no consideration for anything but their own narrow agenda. [#2]>

<([#1 [1] I would first like to thank the BLM for offering this opportunity to comment on this

important matter. Oil shale development will affect all of us on Colorado's Western Slope, and I appreciate the chance to let my voice be heard.

Oil shale is an enormous resource with incredible potential. The best estimates are that 4 Trillion barrels of recoverable oil are trapped in the shale that lies underneath federal land in those parts of Colorado, Wyoming and Utah, that you are considering. It should be a national priority to encourage the production of that oil for both economic and security reasons. With the international situation being what it is, and the price of fuel continually rising to the point where families are going to have to choose between gas to get the kids to school, and groceries to get through the weekend, it only makes sense that we would develop our own resources, especially if they are among the largest deposits in the world.

Forever cutting off the *vast* majority of those lands from *even* being considered for *application* for leasing, is not the best way to go about that. No one, especially those of us who live and raise our families in western Colorado wish to see harm come to the environment. But the fact is that the energy industry has many years of experience in how to develop resources responsibly, and to leave as little impact as possible. Shutting off all access to these areas makes little sense from any perspective.

What the Western Slope needs most right now is jobs. I have watched *over* the last few years many friends and neighbors move away, because the energy jobs had left. Tourism and recreation industries are great, but cannot sustain themselves; they need a vibrant, productive economy to produce the income to support them. #1]>

<([#2 [2.1.1] It is time to set political interests aside, and allow private industry to do what they do best, and create jobs and national prosperity. For this reason, I support Alternative 1, and ask the BLM to do the same. #2])>

<([#1 [9.8] I think it is an absolute shame that the taxpayer is paying for yet another Environmental Impact Statement, only four years after paying for one covering the exact same area, resource and issues. It is nothing less than insulting to consider why it is being done over in the first place. It is abhorrent that a federal government agency would allow itself to be used by any special interest, the way that the BLM has allowed its processes and procedures to be hijacked by the extreme environmentalists. By re-doing this PEIS, the BLM is in essence admitting that it screwed up the first time around, and that all of the work done by various agencies, institutions, and individuals was a waste of time and money.

I for do not believe that to be the case. I know that the many cooperating agencies, including Mesa County, put a Jot of effort into ensuring a quality product, and a management plan that balanced the need for critical energy development with environmental stewardship. And the product of that 2008 PEIS was a reasonable document that allowed opportunity for companies to expand their operations, and begin the long process of developing an energy resource that bears the potential to wean America off of foreign oil, and give out nation more control over fuel prices, all while providing an economic boon for the people of the Western Slope, and north eastern Utah.

Instead, in response to a frivolous lawsuit by some on the fringe of reasoned society, Our current administration chose to throw away all of that work, and abandon all of the important social and economic considerations, and go back to the drawing board with the extremists agenda as the driving principle. While we all foot the bill. #1]>

<([#2 [2.1.1] As a veteran, a business owner, a taxpayer, a local resident and a citizen, I urge, in the strongest terms, the BLM to put a stop to this nonsense before more money, time and opportunities are wasted. If it is too late for that, at the very least, the BLM needs to adopt Alternative 1, which will restore sanity to the situation, and return to the well thought out plan worked out in 2008. #2])>

Thank you for taking the time to read my comments,

<([#1 [9.8] We would like to register our opposition to the 2012 PEIS, both in terms of the overly restrictive and antidevelopment land allocation alternatives it offers, particularly the BLM's Preferred alternative, and in terms of how the process was handled.

This PEIS is a redo of one completed in 2008, which involved years of study and extensive input from many and varied sources, and arrived at the conclusion that just over 2 million acres of land in the richest oil shale region should be made available for potential commercial leasing by the industry. Following a lawsuit from extreme environmental interests, the new administration settled, resulting in the entire PEIS being redone, all at taxpayer's expense.

No new information is contained in this new PEIS, and yet the conclusion is dramatically different; the BLM's preferred Alternative cuts the available acreage down by 77% to a scant 461, 965 acres total. The total available acreage in Colorado is slashed by a stunning 90%, from 346,609 acres to a mere 35, 308, widely dispersed in small, isolated tracts that make even this little bit of acreage unattractive to commercial development. #1])>

<([#2 [9.6.1] The Preferred Alternative does not, in fact, even permit commercial leasing, limiting the small allotment to RD&D leasing only, and not permitting conversion to a commercial lease until the BLM bureaucrats are sufficiently happy that the lease applicants technology meets their unpublished requirements. NO other industry within the energy sector is required to do such a thing- not oil and gas, not mining, certainly not solar, wind, or geothermal, whose technologies are far more experimental than those related to oil shale development. #2])>

<([#3 [2.1.1] Considering this, we support Alternative 1, which would return land access back to what was properly decided in the 2008 PEIS, and best allows for private-sector job growth, wealth creation, and American energy independence. We would urge the BLM to be guided by the best available science, and the best interests of the nation and the region, rather than by the agenda of an ideological extremist lobby, and to adopt Alternative 1 in the final draft. #3])>

<([#1 [9.6] In commenting on the 2012 oil shale PEIS, I would like to point out a number of fallacies that are being put out there by oil shale opponents. The first revolves around the amount of acreage that the 2008 PEIS opens to development. The opponents would have you believe that all 2 million acres are to be handed over to the oil shale industry. This is not so; as you are aware, that acreage is only open for *application for leasing*; each lease would be individually evaluated by the BLM, using the criteria spelled out in the PEIS itself, which lists dozens of statutes that these lands would need to comply with before being granted a lease. Given such a strict protocol, it makes sense to leave as much land available as possible, in order to have a possibility of a viable commercial oil shale operation. #1])>

<([#2 [10.5] Second, is the issue of the oil shale royalty rate. The environmental lobby claims that the rates amount to a give-away to the industry. The fact is that the initial rates are indeed lower than conventional oil and gas, because oil shale is not conventional oil and gas; it is more expensive to produce, due to its geological characteristics, and therefore it is a sensible incentive to keep the governments take a bit lower during the industry's inaugural stage. The same system

was used in Canada for their oil sands industry- that industry is currently driving the Canadian economy, providing the U.S. with the bulk of our non-domestic oil, and is now paying a higher, more normalized rate. #2]>

<([#3 [6.3.2.1] The third fallacy involves water usage. Not only do other energy sources use more water to produce (i.e. irrigating corn for bio-fuels), but the most recent GAO estimates conclude that there is enough water to account for an oil shale industry that consumes as much as 500,000 barrels/day- an amount that is at the high end of any legitimate, scientific consumption estimate. Several companies involved in oil shale are promoting 'technologies for oil shale production use very little water whatsoever. In addition •. many oil shale companies already own the water rights they require to meet their long term needs. #3])>

<([#4 [6.2.2] Finally, Oil from shale is far more efficient than opponents incredulously claim. The energy production-to-consumption ratio is between 3:1 and 6:1 depending on the processing technology used. This is even higher than the Canadian oil sand oil that provides so much our fuel feedstock. #4])>

<([#5 [2.1.1] It is imperative that the BLM move forward with all the facts, and not be beguiled by the false claims of a few extremists. It is bad enough that the government is devoting taxpayer dollars to re-doing this entire EIS based on just that, the wild claims of a fringe movement, but it ought not compound the mistake by adopting a plan that is overly restrictive and hostile to a commercial oil shale industry. Please support the no action alternative, Alternative 1. #5])>

<([#1 [2.1.1] I feel that Alternative 1 as presented in the current Oil Shale PEIS represents the most balanced and reasonable approach to oil shale management on federal lands.

Western Colorado relies heavily on energy production for our economic survival. We have seen what happens when government gets in the way of energy development. Allowing companies to begin commercial leasing is the first step in establishing a viable, productive oil shale industry here that will create jobs, and keep the Western Slope economy from falling even further behind.

Tapping into the 4 Trillion barrels of oit under our feet in this region would go a long way towards increasing domestic production, freeing us from reliance on foreign oil, and keeping fuel prices reasonable. There is no good reason to prevent the commercial expansion of the oil shale industry, especially considering the many environmental safeguards and procedures in place to protect our air, water, and land.

Please help us preserve our economy, our communities, and our way of life by selecting Alternative 1 for this current PEIS. #1])>

<([#1 [2.1.1] This letter is to offer my support for the No Action alternative in the 2012 PEIS. I support oil shale development has a way to create jobs in our region, and to provide America with the energy needed to fuel her economic recovery and industrial might. There is an estimated 4 trillion barrels of oil in oil shale lands right outside our back door, and tapping this resource should be a national priority.

Instead, the BLM, egged on by extreme environmental groups, seems determined to obstruct the establishment of this industry in any way it can. The preferred alternative eliminates commercial leasing, allowing only leases for RD&D, which will inevitably delay commercial production, and the resulting economic benefits, for years to come.

This alternative also drastically reduces the amount of land made available for leasing, which will act as a further deterrent to commercial investment.

In contrast, Alternative 1 restores the findings of an earlier PEIS, which would allow companies to apply for commercial leases out of a pool of 2 million acres. While this may seem like a lot, the fact is that not all of this land would be developed. Since each lease would have to undergo a full environmental analysis, as per the protocols set in place for the BLM, EPA, and other agencies.

To me, this seems like the most honest, balanced approach to dealing with development on public lands, as opposed to simply shutting down large swaths. For this reason, I recommend that your office select Alternative 1 as the management plan for oil shale in this PEIS. #1])>

<([#1 [9.8] I think it is outrageous that your department would authorize a re-do of the 2008 Oil Shale PEIS,

simply because a handful of environmental extremists were unhappy over its outcome. What does

this say about the systems we have in place, that anytime some special interest group decides it didn't get exactly what it wants, it can sue and get a "do-over" at taxpayer's expense?

The three land allocation alternatives in the 2012 PEIS completely disregard science, economics, and the input of many people from many fields, and instead draw up plans from thin air to reduce acreage available for oil shale development, and impose restrictions on the industry. That this is being done not as a result of any new information, or new studies, but at the behest of a small, noisy bunch of extremists, is quite frankly disgusting. #1]>

<([#2 [2.1.1] Our government is not in place to cater to the whims of a loud minority who try to use the legal

system as a back-door way to push their agenda. I ask that you adopt Alternative 1, which keeps the findings of the original PEIS #2])>

<([#1 [2.2] I am deeply concerned with a number of Items In the new 2012 PEIS for oil shale,

especially as contained In Alternative 2b, the BLM's Preferred Alternative.

2b markedly decreases the amount of land available for application for commercial leasing, by nearly 80%, from 2,017,714 acres to a mere 461,965 acres. The acreage that is left is distributed in portions too small and isolated to support a large-scale commercial industry. These locations were also not selected on any economic or geological basis.

2b goes even further by not allowing for commercial leasing on these properties in the first place. Leasing would be restricted to RD&D only until the lease demonstrated a viable recovery technology.

It should be left to the individual companies to make these sorts of management decisions. If a company wants to secure a lease without yet possessing the ability to develop it, it is on that company to decide for itself if the long term strategic planning interests of having the lease outweigh the costs of paying for it every year. That is NOT a decision for government to make. #1)>

<([#2 [9.3] The 2,000,000 acres allowed for in the 2008 PEIS, and in Alternative one which would retain its findings, would not automatically be given up for development; each lease applied for would have to undergo a full NEPA analysis, including at least one EIS, which would ensure that truly fragile eco-systems are granted any protection they warrant #2])>

<([#3 [2.1.1] Alternative 1 is the most prudent, balanced, and economically sound model, and I recommend its adoption. #3])>

<([#1 [2.1.1] The purpose of this letter is to offer our comments and recommendation on the 2012 Oil Shale Programmatic Environmental Impact Statement (PEIS). The Board of Directors of the Western Colorado Contractors Association voted to support the selection of Alternative No. 1 as the option to be adopted by the Bureau of Land Management (BLM). We have made this recommendation based on the following comments:

The current PEIS outlines in its Socio-Economic Impacts section, Alternative No. 1 will result in a substantial amount of construction and corresponding job growth. The PEIS estimates that adoption of Alternative No. 1 will create roughly 10,000 commercial jobs in the region and hundreds more in residential housing construction. The projected income associated with housing construction for oil shale workers and their families alone is in the range of \$10 to \$15 million. This figure does not include incomes for housing construction associated with ancillary projects such as a power plant for in-situ processing which would generate hundreds more construction jobs and millions more in income.

In contrast, the implementation of Alternative 3 is projected to result in a reduction in housing construction jobs by over 2/3 and that commercial construction jobs created would be approximately one quarter of the jobs created by Alternative No. 1. #1]>

<([#2 [3.10.3] The BLM's preferred Alternative 2b, does not include an actual estimate of the economic impacts but only comments that the jobs and income generated would be "lesser in scale" due to the drastically reduced acreage available from the original project parameters. #2])>

<([#3 [2.1.1] The wider economic benefits of oil shale development will not only benefit our membership but the community at large as well. Continuing with these development operations under Alternate No. 1 is critical to developing a reliable method of harvesting this immense natural resource which will contribute to the reduction of our nation's dependence on foreign sources of energy production. Dictating a reduction in the land being made available for these projects by nearly 90% from the originally approved PEIS disrupts the process and potentially jeopardizes the feasibility of the projects for the participants. #3])>

<([#4 [1.1.1] For these reasons and in light of the positive effects that Alternative 1 will have on the local economy, we fully support the adoption of this Alternative. In addition, it is our understanding that the comment period for the 2012 Oil Shale PEIS expires on May 4, 2012, with implementation of the new Alternative scheduled for May 15, 2012. We would respectfully request the extension of this period to allow a reasonable amount of time for other members of the business community to comment on the PEIS. #4])>

<([#1 [9.8] Alternative 1 is the only responsible alternative for the BLM to select as you re-complete this PEIS process for oil shale. The efforts by a few highly ill-informed individuals and groups should not be the basis for making major decisions that have national economic and security implications. The 2008 PEIS identified just over 2 million acres within the most geologically prospective oil shale area as being suitable for application for leasing. This would, among other things, maximize the opportunity for oil shale development, and ensure that sensitive areas were protected by conducting a full EIS analysis on each applied lease.

There is little if anything of substance for opponents of oil shale development to intelligently debate about; the technology has made great strides since the much-ballyhooed “Black Sunday” crash back in 1980, as evidenced by successful operations in other parts of the world, and exciting recent developments on Shell’s oil shale RD&D lease in Colorado. [#1]> <([#2 [6.3.2.1] Properly estimated water usage is far less than the unscientific and fear-mongering claims of the opponents - in fact some surface retort processes use little to no water. [#2]> <([#3 [6.2.2] Oil shale is highly efficient, in that it produces far more energy than it uses to produce it, at a ratio of between 3:1 and 6:1, depending on processing method used. Leaving the maximum amount of acreage available for potential commercial leasing puts in place an orderly process for such commercial expansion, allowing local towns and counties to prepare for greater economic development. The income and sales tax produced by greater employment would have immediate beneficial impacts on local and state coffers. And these projects are being funded by private investment, not taxpayer subsidies.

#3])>

<([#4 [11.2] The benefits of oil shale are many and varied. Obviously, the economic activity and job growth would be a boon to the Western Slope. Making use of the processes in place to ensure environmental protection, establishing an orderly program for commercial development, and producing this resource here, rather than ceding it to less environmentally-conscious countries, are all of enormous benefit to the environment. And being able to replace the oil America purchases from mostly hostile regions of the earth, with a domestic product, is the lynchpin of an effective strategic, national energy program. #4])>

<([#5 [2.1.1] It is therefore in the best interests of the region, the environment, and the nation to adopt the least restrictive option on the table, Alternative 1. #5])>

<([#1 [12] A few years ago we marked the bicentennial of the Lewis and Clark expedition. About the same time, we heard that the furthest you could get from a road in the Lower 48 was 27 miles. And we said, "If we had the bodies and the horses we had in 1965, we could probably cover that in one day." We find that appalling. We accept that some of what's left will have to be sacrificed for energy exploration, but it is beyond us that we are asked to gamble on a form of energy that required large amounts of our scarce water and more energy that it will produce to make use of it. And yes, we've been in Rangely for 36 years and we remember 1982. #1])>

<([#1 [9.8] Thank you for this opportunity to voice key concerns on the draft 2012 Oil Shale/Tar Sands Programmatic Environmental Impact Statement. Oil shale has an important impact on our nation's economy, security and future of our country especially in my home state of Colorado.

As a taxpayer, I am very displeased by the reason behind this new PEIS. The final outcome of the 2008 PEIS, and the no action alternative in the current one which retains this outcome, allows for the delicate balance between environmental conservation and economic growth. Both the 2008 and 2012 PIES have nearly identical information but completely different conclusions. Little evidence has been discovered since the initial 2008 PIES to warrant redoing the report. In reality, the only reason for this new PEIS is to please extremist environmental lobbying groups who have sued the Department of Interior in order to set their own agenda.

It is unreasonable to waste taxpayer money, at a time when our national debt is nearly \$15 trillion, when the initial PEIS 2008 study was professionally done. Wasting taxpayer dollars to produce a new PEIS sets a dangerous precedent of manipulating the courts to dictate public policy. #1)>

<([#2 [2.2] Oil shale exploration will help the United States reach 4 trillion barrels of oil lying below

our soil. Not only will oil shale exploration allow our nation to become self reliant but will lead us towards an energy independent future. The 2008 PIES identified over 2 million acres of prospective oil shale lands in three western states. The preferred 28 alternative under the 2012 PIES would cut the previously recommended exploration by 90 percent in Colorado - and only permit exploration of small pockets in the area. If Alternative 28 passes, it would be too limited and expensive for companies to even consider oil shale expiration in Colorado. #2)>

<([#3 [2.1.1] It is important for us to consider the impact of such a dangerous policy in Colorado.

As a

native Coloradan, and someone with strong ties to the Western Slope, I have seen the impact of job losses in the oil industry due to overzealous regulations. As federal and

state-regulations against oil-exploration have tightened, I have-watched hundreds of Coloradans lose their jobs and homes and struggle to survive. With a 10 percent unemployment rate on the Western Slope and gas prices at \$4 per gallon, the time is now to find a balance between economic development and environmental protections.

As a native Colorado taxpayer, and former resident of the Western Slope, I stand firmly against these strangling regulations that have setback oil exploration, extracted jobs, harmed communities and thwarted our quest for oil independence. I strongly urge you to select Alternative 1 in the final 2012 PEIS report. #3]>

<([#1 [9.8] In regards to the most recent PEIS on oil shale development in Colorado, Utah and Wyoming, I find it appalling that we are even going through this again. This issue was studied, analyzed, and worked through only a few short years ago, and it is a waste of taxpayer's money, not to mention an unjustifiable delay in progress towards commercial oil shale development, to redo the PEIS based solely on a lawsuit brought against the Department of the Interior by a handful of individuals discontented with the outcome of the first one. What does this say about the systems we have in place, and the EIS process? That every time the outcome of the long, expensive process is disputed, some group can sue until it receives a decision they like? Where does this end?

There has been nothing, aside from a change in administration, happen between when the first PEIS was completed and this new one started, that would justify redoing the whole thing. As a taxpaying citizen, I am frankly outraged that our federal government would be so flippant with my money. #1]>

<([#2 [2.1.1] Oil shale development is crucial to the nation and the region, and is ready to take the next steps forward. It should not have to be held hostage by a process that seems intent on delaying it to death.

With that said, the BLM should choose Alternative 1, the “no action alternative” and leave things the way they were after we went through this the first time in 2008. Anything else is just a political game. #2]>

<([#1 [2.1.1] This letter is in response to the 2012 draft PEIS for oil shale. I wish to state my opposition to the BLM’s Preferred Alternative, and other Land Allocation Alternatives in the document and express instead my support for Alternate 1, the No Action Alternative. #1])>

<([#2 [10.6.3] Our nation is experiencing ever increasing fuel prices and an energy policy that has us dependant on foreign governments who are not our friends for a large percentage of our oil. Meanwhile, this region holds as much as 4 trillion barrels of oil in place, according to the U.S. Geological Survey and perhaps even more. This is more oil than in the entire Persian Gulf, right in our own backyard. #2])>

<([#3 [9.8] It is rather ridiculous to reduce the amount of acreage by 77% and then to spread them out in small isolated pockets. I expect this will cost the Oil Shale Companies more money to extract the oil. This is a violation of the 2005 Energy Policy Act, which explicitly called for a separate and concurrent commercial development program for oil shale. Putting limitations on oil shale development in this way points to a much larger problem. The larger problem I am referring to is the bullying being done by various environmental groups who brought a lawsuit against the outcome of the three-year long 2008 PEIS. The intent of these groups is to make it impossible to drill for oil because of their ideological belief that the use

of this substance causes damage to our earth's atmosphere. As long as they are able, they will continue to hamper any form of oil shale development. It is about time that someone or some entity stood up to them and said "ENOUGH!"

Just think what these environmentalists would have had to say about the expansion and growth of our country, the industrial revolution, the inventions of the automobile, airplanes, space rockets. We would still be a small but very crowded area located on the eastern seaboard and the rest of the country belonging to Mexico or Canada. I don't think we would have the type of power plants that have efficiently powered our cities with many many daily electric conveniences. Their idea is to make everything so expensive that we as consumers cannot afford it. Just another thought- we would never have been able to travel to the moon. They seem to wish to move us backwards in time. Isn't it time to say no to them and yes to a future based upon sound common sense. I think that the BLM should at least adopt the Alternative that reinforces the results of a lengthy, professionally done process that included thousands of hours of input from experts, scientists, local governments, and the people, who are the taxpayers and you are supposed to work for them.

Please adopt Alternative 1, put a stop to the nonsense, and allow commercial oil shale development to take place responsibly in western Colorado.

#3])>

<([#1 [2.1.1] Thank you for extending this opportunity to express our views and concerns over this most recent PEIS involving oil shale. This is a resource that can be developed and produced in an environmentally responsible manner, and that can create enough jobs and economic activity to return prosperity and growth to the region. The tax revenue generated by a healthy and vibrant commercial oil shale industry will also ease the strain on local, state, and federal budgets, and help fund schools, roads, emergency personnel, and other key local government functions. Furthermore, it goes without saying that having the ability to produce energy here at home will help relieve pressure on fuel prices, and enable the United States to scale back its reliance on foreign sources of oil. The 2008 PEIS, and the first, “No-Action” Alternative in the 2012 version that retains the recommendations of that thoroughly prepared document, is the best, most responsible and most legally acceptable approach to seeing these benefits come to fruition. I encourage you to adopt Alternative I. #1])>

<([#1 [2.2] This latest PEIS for oil shale is disappointing on many levels. First is the sheer amount of land that is placed off limits to any oil shale leasing. The 2008 PEIS identified about 2 million acres that could be made available to the oil shale industry to apply for commercial leases, and the Preferred Alternative in the new PEIS cuts that down to a mere 346,000, a fraction of the land allowed for in 2008. Shutting all of this land off forever will delay the commercial development of oil shale, and the economic benefits to the region that such development would bring. #1])>

<([#2 [6.3] This PEIS seems to buy into the many falsehoods spread about oil shale by its opponents; that the technology is not there to develop it, that it is a ‘dirty’ industry,

that it will use all of the water, that it will destroy the land through extensive strip mining == none of these insinuations are true, based on scientific data that industry, academia, and even the federal government has compiled over the years, and yet the current PEIS, especially Alternatives 4b, 3, 2, and the Preferred Alternative, 2b, all seem to accept these allegations in prohibiting commercial leasing, and imposing extreme restrictions to land access.

#2])>

<([#3 [2.1.1] It is mostly disappointing that the BLM would let the environmental lobby bully it into

making these restrictive recommendations. A lot of work, time and money went into the 2008 PEIS, just to be dismissed at the behest of a couple environmentalist organizations.

The BLM should start looking out for the people who live and work in and around the land they manage, not for their friends in the ‘green’ lobby, and they should start by selecting Alternative 1 as their new Preferred Alternative. #3])>

<([#1 [9.8] There is no valid reason for the federal government to have restarted the Programmatic EIS on oil shale, just a few years after completing one in 2008. There has been virtually nothing change between then and now, except for the conclusions, which all of a sudden severely restrict oil shale development.

Mesa County was entirely correct in not participating as a cooperating agency this time around, as they participated fully in the 2008 PEIS, and their input would not have changed one iota. Participating in this latest round, would have been a waste of time and money that we don't have.

#1])>

<([#2 [2.2] With this PEIS, and the BLM's stated preferred alternative which cuts land available for commercial oil shale lease application down from just over 2 million acres to just *over* 460,000 acres, unreasonably prohibits commercial leasing, and *even* disallows commercial

expansion off existing RD&D leases, the BLM is placing itself directly at odds with the people of the region, who are tired of rehashing old arguments, and simply want to see the industry establish itself, and bring in jobs and economic opportunity. #2]>

<([#3 [2.1.1] Despite what some misinformed opponents might say, this is not a choice between economic development and the environment. Both development and conservation can work hand in hand, as they have for many years in this very region. The land made available in the 2008 PEIS is not ‘open for development’ but ‘available for application for leasing’, meaning that each individual lease would be subject to vigorous environmental evaluation prior to a lease permit being issued. So the claims of environmental catastrophe by oil shale’s opponents are really just claims that your agency cannot do its job, something that we know is no more true than their many other claims regarding oil shale.

The fact of the matter is that oil shale is a resource that has been proven feasible economically and technologically, and the only major impediment to commercial development in the United States is arbitrary government action, as determined by small but vocal extremist groups. Please do not let a special interest group determine our future; please select alternative 1 as your preferred alternative for oil shale management. #3]>

<([#1 [9.8] The BLM is redoing an Oil Shale Programmatic EIS simply on the basis of a lawsuit brought against the

Department of the Interior over the findings of the first one, completed in 2008. There has been absolutely no new information develop over the course of the few short years between that PEIS and

the current one, and yet the BLM has adopted as its preferred alternative one that recklessly slashes

the amount of land found under the 2008 PEIS to be suitable for application for oil shale leasing by

90% in Colorado, and eliminated commercial leasing.

If nothing has changed in terms of science, environmental analysis, economics, or any other factor, why such a drastic change in the BLM's conclusions? The only possible reason for this is that the BLM is allowing itself to be held hostage by environmental extremists with an agenda that cares nothing for the economic and social well being of the people of the Western Slope. #1)>

<([#2 [2.1.1] The 2008 PEIS was a very thoroughly done project that involved all the local governments, the public, and experts in many fields, and resulted in a preferred alternative that provided for a reasonable amount of land to be made available for potential future commercial leasing, while excluding truly sensitive ecological areas from any development.

This approach would maximize the economic potential of recovering some of the 4 trillion barrels of oil that is under this region (according to the U.S. Geological Survey), and provide hundreds or more of long-term, well-paying jobs. As a college student, this is vitally important to me, as I contemplate graduation facing student loan debt and a bleak job market.

Alternative 1 of the current re-done PEIS preserves the findings of the 2008 PEIS, and should be the route chosen by the BLM. #2)>

This letter pertains to the BLM's "draft programmatic environmental impact statement" for oil-shale and tar-sand development in Colorado, Utah and Wyoming.

<([#1 [11] I am fully supportive of the BLM initiating a commercial leasing program for oil-shale and tar-sands development in this area. It would provide much needed, domestically developed energy for our country, as well as providing gainful employment for thousands of people.

Although there are those who claim that carbon dioxide has a significant impact on the earth's climate, there has been significant recent research that clearly links changes in the sun's activity level as the true driver of the earth's climate. Therefore, there is no reason to not proceed with oil-shale and tar-sand development.

I therefore fully support any action by the BLM to continue or to authorize any new oilshale or tar-sand development on public land, or create or continue land-use allocations that would allow for such uses in the future. The draft programmatic environmental impact statement properly endorses additional public-land use for oil shale extraction.

#1])>

<([#2 [8.1] The land overlying oil-shale resources in Utah, Colorado and Wyoming is some of the

best open land in the West, and outdoor recreation and tourism are huge economic drivers for the region. Based on the economic activity in the deserts of the southwest to develop solar plants, and on my own experience as a frequent visitor to the area, I have observed how recreation successfully co-exists with tar sands development, since the area developed is only a small percentage of the land in the region. In other words, there is enough land for everyone, and I think that striking a balance between recreation and oil shale development is readily achievable. #2])>

<([#3 [11] I ask that you approve oil shale and tar sand development for these areas. It is essential for our nation to continue to prosper and remain independent. #3])>

<([#1 [2.2] I would like to express and explain my objections to the land allocation alternatives as described in the PEIS referenced above.

Alternative 2, and the BLM's preferred Alternative 2b, both reduce the amount of land available for commercial lease application to such an extent, and into such small and widely dispersed tracts, that commercialization becomes all but impossible. Most of the tiny, isolated pockets that are not placed forever off limits to even consideration for leasing are far too small to support a commercial operation. In the meantime, the alternative also places the current Preferred Acreage Leases, designed to allow commercial expansion of existing research and development leases, mostly or, in some cases, completely off limits as well. #1]>

<([#2 [9.6] 2b, the "preferred Alternative", also eliminates commercial leasing by only allowing RD&D leases until the applicant can demonstrate to the government its technology for producing the oil from shale. It should be none of the governments business to pass arbitrary judgment on a company's tools and processes before it grants a lease. If a company wishes to take the risk of renting a lease before its technology has caught completely up, that is the business of that company; if they want to make the lease payments while perfecting their systems, let them. It is their call whether or not the reward is worth the risk, and laws of economics dictate that only companies that think they will be able to turn a profit relatively quickly off their investment will go ahead and bear the risk. But to deny them the flexibility of being able to secure those leases in the interim is an unconscionable intrusion on their rights as businesses, and a strong disincentive to investment.

#2]>

<([#3 [2.3] Alternative 3 restricts leasing to existing RD&D leases only, without even pretending to be open to the possible of expansion. This is totally unacceptable.

#3]>

<([#4 [2.4] Alternative 4 may be similar to the best Alternative, Alternative 1, but 4b places the same restrictions on commerddalleasing as does 2b. #4]>

<([#5 [2.1.1] Alternative 1 will keep available the 2,000,000 acres found in the 2008 PEIS to be suitable for commercial lease application, and as such is the only reasonable alternative to consider. #5])>

<([#1 [2.1.1] This letter is intended as part of the public comment period for the above referenced PEIS. I would like to express my support for Alternative 1, no-action.

As a business owner in western Colorado, I understand the importance of energy development to the economy of the region. As a resident, I also understand the importance of conserving our rich natural areas. Alternative 1 is the only alternative in the 2012 PEIS, in my opinion, that manages to accomplish both.

Unlike the Preferred Alternative, 2b, Alternative 1 leaves available for potential commercial leasing enough land to make it economical and practical for energy companies to invest and expand into the region. 2b, by leaving only a small fraction of that land available, locating it in widely separated parcels, and limiting leasing to only RD&D, deters both the establishment of a commercial-scale industry, and the long-range planning and investment that a commercial oil shale program would require ..

This would not only hurt companies which might want to pursue oil shale extraction, but would deny the people of this region the opportunity to make a bright, more prosperous future for themselves and their children. Many families and businesses have already moved out of the area, and without a

solid industry to sustain the local economy, many more will.

Alternative one goes back to the land allocation plan that was decided upon in the 2008 PEIS, which collected years of data, and hours of testimony and input from the people and businesses in the region, and concluded that just over 2,000,000 acres of prime oil shale land was suitable to be made available for commercial leasing. This ensured that a process would be in place to evaluate each lease for environmental hazards, while also allowing industry the flexibility needed to plan commercial expansion.

I would ask your office not to throw aside all the work done by various parties in developing a sound oil shale management plan that accommodates commercial development, in favor of the agenda of a handful of environmental obstructionists. Please make the right decision for our region's economy, and our nation's energy future, and adopt Alternative 1. #1)>

<([#1 [1.1.1] In regards to the 2012 oil Shale PEIS, I would first like to request that the comment period be extended for 30 days for to allow the public to offer comments on the current PEIS in light of the release of the 2012 Oil Shale Leasing Regulations. #1])>

<([#2 [9.6.1] I also take issue with certain provisions in the preferred Alternative, 2b, and 4b. The requirement for companies to demonstrate their recovery technology is an unreasonable request that does not apply to any other industry to my knowledge, certainly not to any

other energy sub-sector including oil and gas, solar or wind. There does not appear a reason for oil shale to be held to a different standard than any other form of energy other than a desire to prevent oil shale from becoming a viable commercial industry.

This requirement added to the land restrictions imposed by alternatives 2, 2b, and 3, combine to serve as a disincentive for commercial development. This contributes to an indefinite delay in the economic benefits that could be reaped by the communities in the area by allowing a structured commercialization of the industry. Not just in terms of jobs not being created but in the loss of lease bonus payments and other taxes that would otherwise be going to the federal government.

#2])>

<([#3 [2.1.1] The oil shale industry is not asking for special treatment or for the subsidies being granted

other energy industries - most notably renewable energy. They simply want an equal opportunity to grow their businesses that every other industry enjoys. For this reason I support Alternative 1, the no-action alternative, for the current PEIS, which will preserve the more reasonable, pro-growth plan of the 2008 PEIS. #3])>

<([#1 [9.6] The Land Allocation Alternatives in this PEIS contain restrictions on commercial leasing that are in violation of federal statutes and congressional orders.

Most importantly, the Alternatives 2b (the Preferred Alternative) and 4b, both prohibit commercial leasing until such time as a developer demonstrates a “viable technology” for harvesting oil shale. This is in contravention of the 2005 Energy Policy Act, which explicitly calls for allowing a separate commercial leasing program, as distinct from the RD&D track. The BLM needs, therefore, to allow issuance of commercial leases alongside RD&D ones. Limiting leasing to only RD&D is not only in violation of the statute, but serves as a major disincentive to commercial investment and resulting growth. #1])>

<([#2 [9.2.1] Similarly, excluding lands from lease availability on the basis of having

“wilderness characteristics”, is A) an attempted endrun around Congress, which alone has the authority to designate wilderness, and B) a violation of a Congressional spending moratorium issued last year to defund any activity related to Secretarial Order 3310, which would have permitted the DOI to label lands as having Wilderness characteristics”. #2])>

<([#3 [2.1.1] Unlike the specious claims of the environmentalist lobby that initiated the lawsuit that brought about the costly re-do of the 2008 PEIS, these are real violations that will most likely result in substantive lawsuits, should these provisions be enacted. It makes no sense for the BLM to continue on the path it is on, and willfully back an alternative that clearly breaks the law. Alternative 1 is the only real, legal option, and should be selected. #3])>

<([#1 [1.5] The current oil shale PEIS is unacceptable. It is the result of a settlement stemming from a lawsuit over the 2008 version, and not the result of fresh analysis or empirical evidence. Drastically reducing the amount of land available for leasing from just over 2 million acres to a few hundred thousand widely scattered acres is not conducive to cultivating a healthy regional industry, and will only serve to prolong the economic hardship of the northwest Colorado region. #1])>

<([#2 [9.2.3] Also, by limiting leasing to only RD&D, the preferred alternative in the 2012 document may be a violation of federal statute. The Energy Policy Act of 2005 explicitly mandated a commercial oil shale program be permitted, separate and distinct from the RD&D program. #2])>

<([#3 [2.1.1] I urge you to reconsider this PEIS and return to the land allocation plan decided upon in the 2008 PEIS, as provided for by Alternative 1. #3])>

<([#1 [9.8] It is my opinion that this most recent PEIS for oil shale is ill-founded in general, and the Preferred Alternative is unsound technically.

The fact that the only reason for this latest version to have been drafted is as part of a settlement with an environmental extremist group, who disputed the amount of land left available for potential leasing in the 2008 PEIS, is outrageous. The land allocation plan in the 2008 document was determined after three years of intensive study, and hours of community, government and scientific input. It makes no sense that the BLM would arrive at such a dramatically different conclusion, cutting the available acreage by well over 70%, without them being any new information develop since the original PEIS was drafted. #1])>

<([#2 [9.6.1] The Preferred Alternative (2b) does not only eliminate hundreds of thousands of acres from availability for potential leasing, but distributes the little remaining land into tiny, segregated tracts with no consideration given as to commercial viability or access. It limits leasing to RD&D only. and requires that in order to upgrade to a commercial lease, the operating company must demonstrate its technology to the satisfaction of the BLM. This is a requirement that is unique to the oil shale industry, and is very arbitrary, as there are no published guidelines for what constitutes a “viable” technology in the BLM’s eyes. Like the rest of this current process, this requirement seems extremely vulnerable to political whim. #2])>

<([#3 [9.2.1] Finally, the selection of which land to exclude in Alternative 2b is, at best, ill thought out. In excluding lands with what the BLM determines as having “wilderness characteristics”, seems to be an attempt to implement Secretarial Order 3310, in contravention of a Congressional spending moratorium passed last year which specifically prohibited doing so. It also excludes from any possibility for future leasing, potential Sage Grouse habitat, ahead of the Forest Service releasing details of where that habitat is located.

#3])>

<([#4 [2.1.1] With all of this in mind, I call on the BLM to implement Alternative 1, which restores the findings of the 2008 PEIS. #4])> <([#5 [1.1.1] I would also ask that the public comment period be extended by at least 30 days, to allow for all the relevant information to be released and examined. #5])>

<([#1 [2.1.1] I would like to express my support for Alternative 1 as described in the 2012 Oil Shale Programmatic EIS.

Alternative 1 offers the best opportunity for industry to expand commercially, and to bring jobs and

prosperity to the region, while still ensuring that our environmental heritage is protected.

Alternative 1 restores the findings of the initial PEIS done in 2008, and leaves 2 million acres available for

potential commercial leasing, pending environmental analysis of each lease. This is an adequate amount

of land to make commercial expansion attractive to oil shale companies, and to provide for a stable,

long term industry. The industry will never take off if it is relegated by government to forever be stuck in

research and development mode. Should that happen, the entire region will be denied the enormous

economic benefits of a major industry, our local, state and federal governments will be denied a wider

tax base, and our nation will be denied the energy security that we have been seeking for decades.

As a veteran of this nation, I care deeply about its future, in terms of security, economics, and, yes, its

environment. Putting a process in place now to provide for orderly commercial development of oil shale

will help meet the requirements for each of these terms. Alternative 1 does this best, and I urge you to

adopt it as your final position on this PEIS. #1])>

<([#1 [2.1.1] As business owners in Grand Junction, CO, we wholeheartedly support oil shale development, and accordingly, alternative 1 in the current PEIS. This is the only alternative presented that makes an honest attempt at encouraging commercial development of this massive resource. In restoring the actions taken in the original 2008 PEIS, which set aside just over 2 million acres of federal land for commercial lease application, this alternative removes unnecessary obstacles from the path towards commercial development. #1])>

<([#2 [2.2] In contrast, the BLM's preferred alternative, 2b, places the vast majority of this land off limits, and restricts what is left to only more RD&D leasing. This will do nothing to help the industry get itself up off the ground, and bring jobs, people, and dollars back into the region. This preferred alternative will in fact be a disincentive to commercial development, and even to more research, as few companies will want to enter into a market that they know will not be made available to them for commercial production for many years - or indefinitely. #2])>

<([#3 [2.1.1] Business owners on the Western Slope have for long enough been at the mercy of extreme environmentalist groups and their anti-business agenda. We are asking you, as agents of our elected federal government, to stand up for us and to allow reasonable, environmentally responsible oil shale leasing and development take place, as provided adequately for under Alternative 1. #3])>

<([#1 [9.8] I would like to voice my objection to the implication in the current, 2012 Programmatic EIS for oil shale and tar sands, that the findings from the 2008 PEIS would somehow lead to wholesale damage to the environment.

The 2008 document did indeed identify just over 2,000,000 acres for prime oil shale land as being available for application for commercial leasing, but that does not translate into 2,000,000 acres actually being leased, much less developed. In the first place, those acres *available* for leasing would be subject to a full NEPA analysis prior to actually being leased and developed. Also the BLM is taking upon itself to decide where the industry should take out leases and conduct its business. This is on top of its granting itself the power to determine if a company's technology is sufficient in the eyes of the government to be allowed to proceed. Combined with the proposed policy of only granting RD&D leases until it approves of a particular technology, this represents an egregious intrusion of government into private business decisions, and blesses the government with the sole, Caesar-like discretion of which companies and which technological processes succeed and which fail.

The BLM should limit its role to analyzing the land in question, identifying which areas are truly in need of special protection, and opening up lands for commercial access based on that criteria, combined with an evaluation of the socioeconomic factors. The BLM did in fact sufficiently and thoroughly do this, resulting in a PEIS in 2008 which nicely balanced the needs for conservation with the economic development. #1])> <([#2 [2.1.1] I therefore recommend, and wholeheartedly support the adoption of Alternative 1, which maintains these findings. #2])>

<([#3 [1.1.1] I would also recommend that the public comment period be extended, in order to allow time for study of the new oil shale regulations coming out on May 15th. #3])>

<([#1 [3] I am writing about the BLM's "draft programmatic environmental impact statement" for oil-shale and tarsand development in Colorado, Utah and Wyoming. Oil-shale and tar-sands development are two of the filthiest ways to produce energy.

I am deeply concerned about the potential environmental effects if the BLM initiates a commercial leasing program for oil-shale and tar-sands development. It would pollute our land, air and water and exacerbate climate change. Endemic, threatened and endangered species would be lost.

Between global warming, rampant extinction and a quickly drying Colorado River-- problems that oil-shale and tar-sand development would only worsen -- it's hard to imagine a less prudent use of our public lands. #1])>

<([#2 [12.3] I oppose any action by the BLM to continue or to authorize any new oil-shale or tar-sand development on public land, or create or continue land-use allocations that would allow for such uses in the future. #2])> <([#3 [2.5] The draft programmatic environmental impact statement should have included an alternative that does not in any way endorse additional public-land use for this unproven industry. #3])>

<([#4 [3.10.3] Oil shale is currently producing no jobs and no revenue; the Congressional Budget Office confirmed that it is not expected to produce significant revenues through 2022.

The land overlying oil-shale resources in Utah, Colorado and Wyoming is some of the best wildlife habitat in the West, and outdoor recreation and tourism are huge economic drivers for the region. We must protect this sustainable economy by making smart decisions based on sound information.

<([#5 [6.2.3] Oil shale requires a huge amount of electricity to heat it enough to extract liquid from the rock. The BLM estimates that producing one million barrels per day would require ten new coal-fired power plants, each with a capacity to power a city of 500,000 people.

#5])>

<([#6 [3] During fracking millions of litres of water, sand and numerous chemicals most of which are toxic, carcinogenic as well as teratogenic (they include benzene, toluene, ethyl benzene, xylene, ethylene glycol [antifreeze], diesel fuel, naphthalene [moth ball] compounds boric acid arsenic poly nuclear organic hydrocarbons, only to name a few of 600-odd chemicals used), are pumped into boreholes at high pressure to release natural gas (called shale gas) trapped in layers of underground rock.

The toxic chemicals used in fracking have had devastating consequences across the country-contaminating lakes and streams, and sickening and killing wildlife. Fracking creates many problems for wildlife besides increased mortality from toxic chemicals: increase of edge habitats, altered microclimates, increased traffic -noise -lighting- well flares.

We cannot develop this resource without putting the health and safety of our citizens at risk. The research increasingly shows that fracking has contaminated groundwater resources from Wyoming to Pennsylvania.

I urgently ask that you evaluate carefully and disclose fully the serious impacts of all new energy required for oil-shale and tar-sand production and its potentially devastating impact to our climate, as well as the threat it poses to wildlife, special-status, threatened and endangered species, and to our water air and communities.

Re: Draft Programmatic Environmental Impact Statement for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah, and Wyoming

<([#1 [2.1.1] The United States has 1 trillion recoverable barrels of oil in taxpayer-owned oil shale deposits, but the federal government is standing in the way of the production of this oil.

I write to ask that the Department of Interior (DOI) reject the “preferred alternative” in the oil shale Programmatic Environmental Impact Statement (PEIS) and instead adopt the “no action” alternative allowing America’s vast, game-changing oil shale energy resources to be developed, consistent with federal law and our nation’s best interests.

President Obama claims he favors an “all-the-above” energy strategy, but DOI’s preferred alternative locks up billions of barrels of oil. This is consistent with Interior Secretary Ken Salazar’s long anti-oil shale history. DOI’s preferred alternative is directly at odds with the President’s professed energy plan. If President Obama truly believes in an “all-the-above” energy policy, DOI would open more land for oil shale permitting. The fact that DOI’s preferred alternative locks up more oil and land shows that the administration is not serious about domestic oil production.

It is notable that many of the most affected counties in Colorado have adopted positions that reject Secretary Salazar’s proposed plan and instead supporting commercial leasing with proper safeguards and the inclusion of more lands in the plan. I stand with those local counties in favor of oil shale development jobs, investment and national security and against the embargo of our own energy resources represented by the preferred alternative. I stand with those who want to produce energy domestically.

I support the Bureau of Land Management's preferred alternative in the draft plan for oil shale development.

<([#1 [3] [3.10.4] The preferred alternative would close many valuable and important lands to oil shale, such as lands with wilderness characteristics, areas of critical environmental concern, and sage-grouse habitat. Maintaining wilderness values and ecological integrity on our wild public lands contributes to our way of life and to our economy. The recreation industry in Colorado alone generates \$3 billion of economic activity every year. We shouldn't risk our water, air, pristine lands, crucial species habitat and outstanding recreation opportunities for any energy development, much less one dependent on unproven technology.

#1])>

<([#2 [6.3.2.2] For all the unknowns about oil shale, what is known is that it threatens our water resources and clean air. To even attempt to generate a single barrel of oil from oil shale, 3-5 barrels of water are needed in the refining process alone. Taking the oil shale out of the ground will waste more water on top of that. And since this development would be taking place in western states like Colorado, water is already a very precious commodity, often in short supply.

#2])> <([#3 [6.2.3] [3.5.3] In addition to threatening our water, oil shale would also pollute our air. In order to create 1 million barrels of oil a day from oil shale, 10 new coal-fired power plants would be needed, leading to the emission of 121 million tons of carbon dioxide.

#3])>

<([#4 [2.2.1] Therefore, I hope you will finalize the preferred alternative and ensure that wilderness, wildlife, clean air and precious water supplies are not sacrificed to oil shale.

#4])>

<([#1 [3] I am deeply concerned about the potential effects to our water, wildlife, communities and public lands if the BLM initiates a commercial leasing program. The two million acres in UT, WY and CO previously allocated for commercial leasing is a massive amount of public, taxpayer land that would be sacrificed for a singular use of the landscape.

Oil shale is currently producing no jobs and no revenue the Congressional Budget Office confirmed that it is not expected to produce significant revenues through 2022. So we have the time to assess the impacts of development to our water, wildlife, and communities.

I recommend that you carefully consider the serious impacts of new energy required for oil shale production and the potential devastating impacts to our wildlife, water, air, and communities as you take another look at oil shale development.

Subject: Re: Draft Programmatic Environmental Impacts State for Oil Shale and Tar Sands Development --Please Choose Alternative 3

<([#1 [2.3.1] Thank you for this opportunity to comment on the Draft Programmatic Environmental Impacts State for Oil Shale and Tar Sands development on our nation's public lands. As a citizen concerned about the increasing impacts of climate change on our nation's health and welfare, I am appalled by the notion of allowing oil companies to develop tar sands and oil shale projects on public lands. I thank the Obama administration for your work to roll back dangerous provisions enacted by the Bush administration, and I urge you and your agency to select Alternative 3 in the Final EIS.

#1])>

<([#2 [12.3] The magnitude of potential impacts to the West's delicate public lands and shrinking water resources is simply too great to grant unfettered access to the oil industry in these areas. It is foolhardy and irresponsible to open up public lands to these industries-- particularly before we even understand the magnitude their footprint. Public lands should be held in trust for American citizens, not for private profits #2])> .

<([#3 [3.5.1.6] At a time of record-breaking temperatures, debilitating droughts, devastating floods, and increasingly severe weather, we simply cannot afford to increase our reliance on higher-carbon fuels. Producing oil from both tar sands and oil shale generates significantly more carbon pollution than production of conventional petroleum. Granting the oil industry access to our public lands to lock-in production of these types of fuels is simply incompatible with a sustainable energy future that will mitigate the impacts of climate change.

#3])>

<([#4 [3] Large-scale development of oil shale and tar sands on our public lands would also come at a major cost to the West's land, wildlife, air quality, and water resources. Already subject to significant oil and gas developments, some of the areas assessed in the DPEIS suffer extremely poor air quality. And although very little is known about the impacts of oil shale production, even the low-end of the estimates of how much water it would consume is significant: a 2010 study by the Government Accountability Office demonstrated the range of estimated water impacts from 5-25 barrels of water consumed for every barrel of oil produced-- a toll the West simply cannot afford.

#4])>

<([#5 [12.3] For all these reasons, I am strongly opposed to opening up our public lands to oil shale or tar sands development #5])> .

<([#1 [2.2.1] Thank you for the opportunity to comment on the Bureau of Land Management's 2012 Oil Shale and Tar Sands Draft Programmatic Environmental Impact Statement. I urge you to choose Alternative 2(b) of the Programmatic Environmental Impact Statement. I support this proposal to limit leasing to research and development projects and to exclude vital fish and wildlife habitats from all development activities for oil shale. It is the prudent way forward to safeguard wildlife and to investigate whether we can avoid impacts on our air and water. In addition to this, I urge the BLM to wait for the results from current research before permitting the use of any additional public lands. #1])>

<([#2 [3] The federal public land overlying oil shale resources in Utah, Colorado and Wyoming is some of the best fish and wildlife habitat in the West. It is home to the largest remaining big game migration in the lower 48 states. It is the "mule deer factory." It provides important habitat for sage-grouse, a species that is on the brink. All of the proposed extraction methods for oil shale will have devastating impacts on wildlife and on other values of these public lands, including clean air and water.

Good Sirs: <([#1 [3.5.1.6] My knowledge is limited to that which Others-Cause Media-Covered. I'm confident BLM-Awareness is Detailed—as necessary for Protecting-Public-Interest; that my-writing of aspects Already-Existing in Public-Concern, will be Accepted/ Recorded; I contend Obama/ Interior/ BLM Erred-Severely in Omitting-Concern about CO2 V Global-

Warming.

I've read the Mesa County Resolution 2012-034, Objecting BLM 's 2012 OSTs Programmatic Environmental Impact Statement (which I've Not-read), and apparently this latter failed to mention Global-Warming/ Storm-Magnification/ Sea-Rise—Horrific-Specie-Suffering—because the Mesa Commissioners' MCM-034, above-link, also so failed to Discuss-Such-Consequences.

I suspect EISes rarely focus the Rising-Sea, when-expectedly more-germane-Issues are of Immediate-Consequence; however, this-aspect of disputed-Warming-Criticality—the 'Tipping/ Too-Late-Problem', accepted by most-Scientists—IS-They-Believe of-Immediacy; thus-Here.

https://www.google.com/#hl=en&gs_nf=1&gs_mss=the%20'too-&tok=3-tkEVwiEBaO7No7qEokdQ&cp=39&gs_id=4k&xhr=t&q=the+'toolate'+timing+of+global-warming&pf=p&rlz=1C2GGGE_enUS452US455&sclient=psyab&oq=the+'too-late'+timing+of+globalwarming&aq=f&aqi=&aql=&gs_l=&pbx=1&bav=on.2,or.r_gc.r_pw.r_qf.,cf.osb&fp=be21acf9a25b1028&biw=1280&bih=812

I recall-constructively that Interior Failed to exercise it's MMS/ EIS-Prerogative against BP's Deepwater-Horizon drill-rig—NOT-suggesting a blast-stack, often-installed elsewhere, and-which if present—because-Environmentally, rig-blasts are Not-Uncommon, and Blast-Stacks ARE-Effective-Historically—would likely have limited damage to 'Repairable'.

The Essence-of-Safety IS-Prevention; that Warming is THE Premier-Application;

BY FAR the Most-Expansive/ Permanent-Catastrophe Humans-Will-Have-Caused; NOT Presently to be Ignored in ANY-EIS, particularly when Billion?-Tons-CO2 is this(Mesa)-Object Outcome; and when You-at-BLM ARE(these-Leases) the Last-Regulatory-Influence.

#1])>

<([#2 [6.3.2] Other Environmental Comments: P4/par1 asserts 'little/ no-water-consumption' for the

entire oil-shale oil-production-process, contradicting-'myths by prior-Objectors'. This does not-compare to my personal underground-experience, where stream-to-pond diversion and large-water-trucks were constantly-engaged in road/ floor-wetting, together with mixing-graders; I urge You contact several(for comparison) Miningschools(Nevada/ Colorado/ Missouri) with the specifics for shale-removal; also, to Schools-Knowledgeable(TX?) about subsequent-processing oil-refineries; also, Waste-Disposition Experts: TVA-Kingston. I've read the Canadian-Tar Sands are quite-'dirty', and that processing requires considerable-water; surely some correspondence would reward-specific-Awareness. ALL-about Water.

If-indeed, no-significant-water is required, then only Lakewood-sized-piping/ meters

need-be-installed. I think Integrity Ought-Be Expected-Throughout these-Subject-
Leases.

#2]>

<([#3 [9] P2/par7 refers to some 2.5million acres in(perhaps-not-'of') Colorado set-aside for the
Permanent-Use(Possession) of Business—not-unlike Railroad-Incentive—and probably
'near-free', in Unlimited-Freedom, together-with-Water Rights. This Fed Land Ought be
Overseen by an Agency(short-leash) of Colorado-Legislature; Oil-Turmoil will absolutely be
Adverse to-Colorado-Law/ Citizens(imagine in-DC); Colorado-Legislature Ought-Be
Continuum-Cognizant, with NO-Need to Ask-Permission/ Discuss-BLM.

#3]>

<([#4 [3.10.3] Also, Colorado is Hurting-Financially. I think-Reasonable, that-NO Governing-
Entity
sustain-ANY-Cost, Ever. Not, for-Example, the Additional-Schooling/ Police/ Sheriff/
Administration/ Fire-required; HealthCare-Complete ought-be Company-Provided, to
assure the Medical-Part of No Cost-Concept. I'm sure Mesa(Others) County will be Selfly-
Concerned.

Lease-Documents Ought-Require Zero-Pollution/ Damage; because, as has-occurred
with-livestock, fracking/ other-wells/ roads/ streams/ etc, there WILL Otherwise-
Develop a Cost/ Consequence-To-State/ Citizens; the 'Mineral-Fee' will be State-Utilized
for Whatever-Issues, and will-NEVER get-to Individual-Citizens-Adversed;

Examples-of-Which are in the Alleghany Coal Deposits: Poverty-Stricken-
Families(You've-seen the media.), Uneducated, Working-Unsafe; essentially-Company-
Serfs. BLM/ Colorado Can/ Ought-Preclude That-Destiny for This-State, since BLM/ CO-
HAVE-Now Sufficient-Control. Have I made a mistake in-Addressing my-CO/Fed-
Politicians??

#4]>

<([#5 [9.6] With Mine-Caused/ Acid-Discharges into WV/ CO-Streams, Alleghany-
Demonstrated
Collapsed-Ground(underground-openings failing), and Environmental-Problems occur—
CO has Drill/ Fracking-problems, so Those-Lease-Contracts ARE-Failures—what kind
Lease-Language will CO-Politicians(State/ Fed) Expect of BLM/ Interior. Has Salazar
'Gone-DC'?? Are Your-Speeches About-Environment for-naive School-Kid-Listening?? I AM-
Insistent; Environment-Failure, NOT-Success, IS-Oil(Coal-too)-History!!; plausible-Reason
most-Citizens have Quite-Lost Political-Respect; here,
UnDemonstrated-Integrity About-Citizen-Protection(Environment/ Budget); Mesa-
Resolution displaying scant Office-Concern-About Oil-Activity-Consequence; only Angst-
About That-Reduction.

A CO-Lease-Complaint, is-that Leases Aren't-Being-Pumped: just-'Held', which-
Speculative-Behavior does-zero to reduce-fuel-price(Second-After-Jobs, US-Economy-
Bane.); ShaleOil-Ownership, by/for Rapid-Depreciation, without-Production, =NO-Jobs/
Fuel.

BLM Ought-Write a Lease-Contract that, Besides-Protection, Benefits-US(reducing-gasprice),

by Requiring-Prompt/ Continued Oil-Production; common-in-Construction, so Court-Proof; nor-can fundamental-Need(pump-price), of such-Lease-Terms be Successfully-Objected.

Interior/ BLM's-Reduced-Acreage(Go-Slow) Dissipates-'Rush'; sensible when a Different-Type-Refinery is 'Proto'(Change-Anticipated). Nothing is Best first-time; a 3-x-larger 'Mesa-Rush' will produce 'scaled-errors/ costs/ bids that-are 3-x-greater(risk/ profit/ pump-price)'; larger-unit-cost for Rush-Mistakes, regardless-Issues, but especially where Oil-Controls-Policies—Intrinsically-For Self-Benefit—while Citizens-Engage Transferred-Responsibility for Expenses, and Oil-Collects-Profit. Citizens ALWAYS Lose (Gain-Less) confronting-Corporations'-Lawyers. Writing-Leases is when Near-Equality in Law is Available; Going-Slow—sequenced-Leases—reduces-Mistakes; Good/ Better/ Best-for BLM/ Citizens, which BLM-Realized.

<([#1 [3.1.7] Page 3-34, Line 39: After the sentence ending" . . . overlaps 50,025 acres of the oil shale basin"

insert «The WEQC ruling through EQC Docket No. 07-1101 at number 38 states, the designation protects the area from non-surface coal mining only. The designation would prevent surface mining for oil shale and uranium, as well as gravel pit mining. The designation does not limit oil and gas leasing, exploration, drilling, production or related construction. The designation does not limit or curtail any type of access to private in-holdings or for purposes other than non-coal surface mining on public lands, including livestock grazing.”

#1])>

<([#2 [3.1.7] Page 3-34, Lines 39-41: Delete the sentence that reads “Finally, these areas are located within a

much larger area of land that has been identified as having wilderness characteristics.”

#2])>

<([#3 [3.1.7] Page 3-34, Lines 41 & 42: After the sentence “Table 3.1.1-7 presents the acreage

overlapping

the oil shale resource within the Adobe Town specially designated areas and identified lands with wilderness characteristics” add the following: As depicted in Figure 3.1.1-13, certain portions of the Adobe Town/Kinney Rim area have been determined to contain lands with wilderness characteristics; whereas other areas did not meet the size criteria or were determined to not have wilderness characteristics. Based on the proliferation of existing oil and gas leases in the Adobe Town areas outside the WSA, the Rawlins RMP determined these areas would not be managed for those wilderness characteristics, but rather, would remain available for multiple-use management with emphasis on reclamation. Specifically the RMP at page 1-3 states, “*The BLM’s analysis of wilderness characteristics is consistent with the agency’s policy and guidance. BLM IM-2003-275 states that considering wilderness characteristics in the land use planning process may result in several outcomes, including, but not limited to: 1) emphasizing other multiple uses as a priority over protecting wilderness characteristics; 2) emphasizing other multiple uses while applying management restrictions (e.g., conditions of use, mitigation measures) to reduce impacts to some or all of the wilderness characteristics. As a result, the BLM is not required to manage for wilderness characteristics just because they may exist. The BLM chose not to carry the analysis of wilderness characteristics into the Proposed RMP/Final EIS because valid existing lease rights prohibit implementation of management actions to protect the wilderness characteristics identified. The BLM Approved RMP was selected from an alternative in the Proposed RMP/Final EIS that did not include management for wilderness characteristics.*”

Text on page 2-11 of the Proposed RMP/Final EIS is clarified to read as follows: “Because the BLM found the lands to be unmanageable for wilderness character because of preexisting oil and gas leases, the BLM elected to manage lands with wilderness character for multiple use and not for protection of wilderness character. Accordingly, measures to provide protection for any wilderness characteristics of lands (outside of previously established WSAs) will not be considered in the alternatives in this RMP. This is consistent with BLM policy as presented in BLM IM 2003-275.”

The approved RMP at Management Objective 4 and Management Action 6 on page 2-25, as well as through Maps 2-17, 2-58, 2-59, and Appendix 37 designates the area within the Rawlins Field Office that surrounds the Adobe Town WSA as the Adobe Town Dispersed Recreation Use Area (DRUA).

#3])>

<([**#4** [3.1.7] Page 3-34, Lines 43-45: Delete this sentence “During the process of developing the Rawlins

RMP, the BLM chose not to carry the analysis of wilderness characteristics into the Proposed RMP/Final EIS because valid existing lease rights prohibit management actions to protect the identified wilderness characteristics.”

#4])>

This letter pertains to the BLM's "draft programmatic environmental impact statement" for oil-shale and tar-sand development in Colorado, Utah and Wyoming.

<([#1 [3] I am deeply concerned about the potential environmental effects if the BLM initiates a commercial leasing program for oil-shale and tar-sands development. It would pollute our land, air and water and exacerbate climate change. Endemic, threatened and endangered species would be lost.

Between global warming, rampant extinction and a quickly drying Colorado River -problems that oil-shale and tar-sand development would only worsen -- it's hard to imagine a less prudent use of our public lands. #1])>

<([#2 [12.3] I therefore oppose any action by the BLM to continue or to authorize any new oil-shale

or tar-sand development on public land, or create or continue land-use allocations that would allow for such uses in the future. The draft programmatic environmental impact statement should have included an alternative that does not in any way endorse additional public-land use for this unproven industry. #2])>

<([#3 [3.10.3] Oil shale is currently producing no jobs and no revenue -- the Congressional Budget

Office confirmed that it is not expected to produce significant revenues through 2022.

The land overlying oil-shale resources in Utah, Colorado and Wyoming is some of the

best wildlife habitat in the West, and outdoor recreation and tourism are huge economic drivers for the region. We must protect this sustainable economy by making smart decisions based on sound information.

#3])>

<([#4 [3] I ask that you evaluate carefully and disclose fully the serious impacts of all new energy required for oil-shale and tar-sand production and its potentially devastating impacts to our climate, as well as the threat it poses to wildlife, special-status, threatened and endangered species, and to our water, air and communities. #4])>

Thank you for your time and consideration regarding my comments.

Summary

As a result of the settlement by the U.S. Department of the Interior (DOI) in regards to lawsuits brought against the 2008 Oil Shale and Tar Sand Programmatic Environmental Impact Statement(PEIS) and Commercial Oil Shale Leasing Regulations (Regulations), the Bureau of Land

Management (BLM) has solicited comments on a new draft PEIS. <([#1 [2.1.1] The Industrial Energy Consumers of

America (IECA) urges BLM to reaffirm the 2008 PEIS and supports Alternative 1, Oil Shale No Action

Alternative in the new draft PEIS.

Commercial oil shale and tar sands leasing programs are in the best interest of the nation in helping

to meet the country's energy needs. Premature and precautionary removal of access to the vast majority of land with this resource potential will put the viability of continued research and development at risk by making commerciality of development far less likely. The proposed

removal

of 90 percent of lands in Colorado and three-quarters of currently available land in the three-state area will discourage continued Research, Development and Demonstration (RD&D) expenditure by drastically shrinking the size of, and introducing major uncertainty for, potential resource recovery.

#1])>

Comments

The Industrial Energy Consumers of America is a nonpartisan association of leading manufacturing companies with \$700 billion in annual sales and with more than 650,000 employees nationwide. IECA member companies are substantial consumers of natural gas, natural gas and coal fired power generation and refined crude oil products. The cost of energy can often determine competitiveness with offshore competitors. IECA membership represents a diverse set of industries including: chemicals, plastics, cement, paper, food processing, brick, fertilizer, steel, glass, industrial gases, pharmaceutical, aluminum and brewing.

<([#2 [11] [3.10.3] IECA member companies have good reason to be concerned about access to Federal lands and the associated oil and natural gas resources. In the period from 2000 to 2005 natural gas prices doubled and tripled because demand exceeded supply. We recall that the Bureau of Land Management's (BLM) permitting system, heavy with increased bureaucracy and inadequate staffing, resulted in thousands of drilling permit backlogs. Wells did not get drilled, oil and natural gas did not get produced, and the manufacturing sector and the economy as a whole suffered. There were plenty of oil and natural gas reserves and the Federal Government was directly responsible for the failure to allow producers access to the oil and natural gas in order to produce it for us, the consumer.

The manufacturing sector lost 3.0 million jobs from 2000 to 2005 and a great number of these jobs were directly related to the high price of oil and natural gas. Thousands of chemical, plastics, fertilizer, steel, paper, glass and aluminum manufacturing plants shut down. We cannot and should not let this happen again. #2])>

<([#3 [2.1.1] The 2012 draft PEIS contains largely the same information as the 2008 final PEIS. There is little, if any, new information to be considered. However, the BLM has chosen a different preferred alternative 2(b) that substantially reduces the acreage available for oil shale leasing, eliminates the issuance of commercial *leases*, and restricts leasing to RD&D leases only.

Alternative 1, Oil Shale No Action Alternative, in the new PEIS, preserves the actions taken in the 2008 PEIS, and is the alternative favored by IECA.

The 2008 PEIS was recent, and substantively and procedurally thorough. The preferred alternative provided a reasonable amount of acreage for potential commercial leasing, while still designating environmentally sensitive and other areas deemed unsuitable for leasing. #3)>

<([#4 [2.2] BLM's preferred alternative 2(b) in the new PEIS restricts leasing to RD&D leases only and defers decisions on commercial leasing for years. This disaggregation of RD&D from commercial leasing simply discourages companies with commercially viable technology with delay, uncertainty and disincentive for resource development.

Commercial leasing for oil shale development is merely a first step. The BLM and other government agencies require additional environmental reviews and permitting activities with public oversight before a project can begin. Two or three Environmental Impact Statements would be required, in addition to this PEIS, before a developer could break ground on a commercial venture.

In the 2008 PEIS, 2,000,000 acres were made available for leasing, but the amount of land that would be leased or developed would likely be far less. Industry would choose the acreage that it believes can be profitably developed. Under the new PEIS, BLM appears to be choosing the lands that hold commercial potential.

#4)>

<([#5 [9.8] Western U.S. oil shale resources- 4 trillion barrels according to the USGS- are an important

domestic energy asset that should be developed for the benefit of the American people.

Revisiting

the PEIS and regulations completed in 2008 is at best delaying and at worst destroying, the responsible development of the oil shale resource. #5)>

Dear The Bureau of Land Management,

<([#1 [2.1.1] Thank you for this opportunity to provide comment on the Draft 2012 Oil Shale/Tar Sands Programmatic Environmental Impact Statement. Oil shale is a vitally important national resource, and policies involving its management on federally controlled lands will have profound impacts on our nation's economy, national security, and energy independence.

I urge the The Bureau of Land Management (BLM) to adopt Alternative 1, the no-action alternative, in the current PEIS, which would restore the findings of the 2008 PEIS. Like most Americans, I recognize the need to balance the twin objectives of environmental conservation, and economic development. I do not believe the two are mutually exclusive. The Record of Decision from the 2008 Oil Shale PEIS reflected this reality, and established a reasonable and balanced plan for going forward with development of our nation's oil shale resources. This ROD protected sensitive areas and habitats, while providing private industry the opportunity and flexibility required to take the next step towards commercial production. It would have also provided much-needed employment and economic growth in one of the hardest hit regions of the nation. #1]>

<([#2 [9.8] I find it shocking that your agency would casually disregard the hours of input by scientists, experts, local government leaders and the public, and spend precious government resources to completely re-do this PEIS, in the absence of any new information or evidence. I further believe it sets a negative precedent to allow a special interest group to dictate public policy simply by suing when the outcome of a public process does not fit their agenda. #2]>

<([#3 [2.1.1] Oil shale is an abundant national resource that has the potential to meet America's energy needs well into the future, cut our reliance on oil imports from unstable, often hostile, regions of the world and provide thousands of private-sector jobs and economic growth. The BLM should not be in the business of putting up obstacles to development and prosperity in response to a noisy fringe element of society.

For these reasons I again urge the BLM to adopt Alternative 1 in the final PEIS.

#3]>

Sincerely,

<([#1 [3] Just read an article by an environmental group about a push by an oil shale group wanting large acres of land in Colorado for oil shale development. I had heard that there has been some oil shale work or testing done in Pennsylvania - my childhood state and it had caused much damage to the land of farmers there. I realize it may be useful in some places. I hope you might be able to test it on a small scale before you approve of thousands of acres. It may be harmful to our water, clean air, and wildlife. I understand that the technology has not been proven yet.

#1])>

I know you must have a difficult job to do there. I'm trying to help.

OSTS_235**Organization:** Colorado Environmental Coalition campaign**Received:** 7/27/2012 12:00:00 AM**Commenter1:** - , Colorado (United States)**Organization1:** Colorado Environmental Coalition campaign**Commenter Type:** Environmental Organization**Classification:** none**Submission Category:** Campaign Letter**Submitted As:** E-Mail**Form Letter Category:****Form Letter Master:****Current Task:** Issues Entered **Assigned/Due:** klett**Attachments:** OST2012D00237.htm (OSTS_235-59462.htm Size = 1 KB)

<([#1 [3] I am deeply concerned about the potential effects to our water, wildlife, communities and public lands if the BLM initiates a commercial leasing program. The two million acres in UT, WY and CO previously allocated for commercial leasing is a massive amount of public, taxpayer land that would be sacrificed for a singular use of the landscape.

#1])>

<([#2 [2.2] [12.3] While the preferred alternative (Alternative 2) is a step in the right direction, I would like to have seen a draft document that does not give away hundreds of thousands of taxpayer lands to a failed industry to tinker with. I would have liked to have seen an alternative that does not endorse giveaways of even more public lands to this unproven industry.

#2])>

<([#3 [3] Oil shale is currently producing no jobs and no revenue the Congressional Budget Office confirmed that it is not expected to produce significant revenues through 2022. So we have the time to assess the impacts of development to our water, wildlife, and communities.

#3])>

<([#4 [3.10.4] The land overlying oil shale resources in Utah, Colorado and Wyoming is some of the best wildlife habitat in the West, outdoor recreation and tourism are huge economic drivers in the West. We must protect these jobs by making smart about how we allow oil companies to move forward with oil shale speculation.

#4])>

<([#5 [3] Finally, I recommend that you carefully consider the serious impacts of new energy required for oil shale production and the potential devastating impacts to our wildlife, water, air, and communities as you take another look at oil shale development.

#5])>

Although I or the firm I work for (A Canadian design firm headquartered in Toronto) are not in the Oil business we do get involved with the design of facilities and infrastructure related to the economic impacts of the oil development. Currently our Edmonton, Alberta office, along with one of my associates here in our Salt Lake City Office, is providing design services for new subdivisions in Edmonton and Fort McMurray, Alberta. The economic impact of the oil rich Alberta oil sands is far reaching. However, the US economy has caused much of the design professions to see heavy layoffs. I was recently told that fully 1/2 of licensed architects in Oregon were unemployed. I personally have had to work extensively in our Edmonton office and now in our Vancouver office because of diminished work in our Salt Lake City Office. It all

started with the downturn in 2008. I am very concerned about world political issues, our dependence on oil (not to change anytime soon despite alternate energy options simply due to population growth worldwide as well as domestically), and the current economy sluggish to recover. I have managed to keep my job (I am nearly 63 and cannot retire under these conditions) by being willing to work extensively in our Canada offices away from my wife and family. <([#1 [2.1.1] I do not believe this BLM strategy is conducive to improving the current economic struggle. There are more than adequate environmental protections in current lay and plenty of opportunity for proponents and opponents to be heard. We must become less dependent on Middle Eastern oil and more self sufficient to make a more stable domestic economy. That will help my procession as a licensed architect and the construction industry as well. We cannot let politics dictate good thinking. I am not in favor of this lease are a reduction on BLM land. Opinions aside, technology will eventually make these resources and the vast oil reserve economically feasible. We must encourage this with all the protections needed to ensure minimizing environmental impacts, but restricting lease area is not the way. Thank you for this opportunity. I hope my firm and others in the design arena will not have to suffer further due the bureaucratic mismanagement of our public natural resources. #1])> Thank you. Larry Steinbach, AIA Architect

Industrial Systems Inc.,(ISI) was founded in 1991. ISI is: A Service Disabled Veteran Owned Small Business employing about 35 employees full time. ISI has employed as many as 200 employees depending on larger projects. ISI is currently completing a Pilot Shale Oil project in Pieance Creek area of western CO. This project has generated full time work for over 100 full time employees for the most part of the last two years. The above mentioned employees are not into account for the various companies who manufactured pipe, pumps, other pieces of equipment too numerous to list Other firms, such as freight company, equipment dealers such as Catapillar, Ford, Chevy trucks,etc. co on and on. Many millions of dollars have went through ISI's payroll and accounting systems. <([#1 [11.2] Failure to list theshale oil lands for lease would have of course, not allowed this important project [a Pilot Shale Oil project in Pieance Creek area of western CO] to proceed. The shale oil leases must continue to insure America has a chance to not be dependent on foreign countries for our energy. This work is being done without adverse enviromental stress or damage to the BLM lands. I strongly urge BLM support of continued leasing of BLM land to private companies to push forward with pilot programs ti insure

America's independence of other countries who may not have our best interests at heart regarding our energy future. #1)> Thank you Thank you

Abstract. We describe scenarios that define how rapidly fossil fuel emissions must be phased down to restore Earth's energy balance and stabilize global climate. A scenario that stabilizes climate and preserves nature is technically possible and it is essential for the future of humanity. Despite overwhelming evidence, governments and the fossil fuel industry continue to propose that all fossil fuels must be exploited before the world turns predominantly to clean energies. If governments fail to adopt policies that cause rapid phase-down of fossil fuel emissions, today's children, future generations, and nature will bear the consequences through no fault of their own. Governments must act immediately to significantly reduce fossil fuel emissions to protect our children's future and avoid loss of crucial ecosystem services, or else be complicit in this loss and its consequences.

1. Background

Humanity is now the dominant force driving changes of Earth's atmospheric composition and thus future climate on the planet. Carbon dioxide (CO₂) emitted in burning of fossil fuels is, according to best available science, the main cause of global warming in the past century. It is also well-understood that most of the CO₂ produced by burning fossil fuels will remain in the climate system for millennia. The risk of deleterious or even catastrophic effects of climate change driven by increasing CO₂ is now widely recognized by the relevant scientific community.

The climate system has great inertia because it contains a 4-kilometer deep ocean and 2-kilometer thick ice sheets. As a result, global climate responds only slowly, at least initially, to natural and human-made forcings of the system. Consequently, today's changes of atmospheric composition will be felt most by today's young people and the unborn, in other words, by people who have no possibility of protecting their own rights and their future well-being, and who currently depend on others who make decisions today that have consequences over future decades and centuries.

Governments have recognized the need to stabilize atmospheric composition at a level

that avoids dangerous anthropogenic climate change, as formalized in the Framework Convention on Climate Change in 1992. Yet the resulting 1997 Kyoto Protocol was so ineffective that global fossil fuel emissions have since accelerated by 2.5% per year, compared to 1.5% per year in the preceding two decades.

Governments and businesses have learned to make assurances that they are working on clean energies and reduced emissions, but in view of the documented emissions pathway it is not inappropriate to describe their rhetoric as being basically ‘greenwash’. The reality is that most governments¹³, strongly influenced by the fossil fuel industry, continue to allow and even subsidize development of fossil fuel deposits. This situation was aptly described in a special energy supplement in the New York Times entitled ‘There Will Be Fuel’ (Krauss, 2010), which described massive efforts to expand fossil fuel extraction. These efforts include expansion of oil drilling to increasing depths of the global ocean, into the Arctic, and onto environmentally fragile public lands; squeezing of oil from tar sands; hydro-fracking to expand extraction of natural gas; and increased mining of coal via mechanized longwall mining and mountain-top removal. The true costs of fossil fuels to human well-being and the biosphere is not imbedded in their price. Fossil fuels are the cheapest energy source today only if they are not made to pay for their damage to human health, to the environment, and to the future well-being of young people who will inherit on-going climate changes that are largely out of their control. Even a moderate but steadily rising price on carbon emissions would be sufficient to move the world toward clean energies, but such an approach has been effectively resisted by the fossil fuel industry.

The so-called ‘north-south’ injustice of climate disruption has been emphasized in international discussions, and payment of \$100B per year to developing countries has been proposed. Focus on this injustice, as developed countries reap the economic benefits of fossil fuels while developing countries are among the most vulnerable to the impacts of climate change, is appropriate. Payments, if used as intended, will support adaptation to climate change and mitigation of emissions from developing countries. We must be concerned, however, about the degree to which such payment, from adults in the North to adults in the South, are a modern form of indulgences, allowing fossil fuel emissions to continue with only marginal reductions or even increase.

The greatest injustice of continued fossil fuel dominance of energy is the heaping of climate and environmental damages onto the heads of young people and those yet to be born in both developing and developed countries. The tragedy of this situation is that a pathway to a clean energy future is not only possible, but even economically sensible.

Fossil fuels today power engines of economic development and thus raise the standards of living throughout most of the world. But air and water pollution due to extraction and burning of fossil fuels kills more than 1,000,000 people per year and affects the health of billions of people (Cohen et al., 2005). Burning all fossil fuels would have a climate impact that literally produces a different planet than the one on which civilization developed. The consequences for young people, future generations, and other species would continue to mount over years and centuries. Ice sheet disintegration would cause continual shoreline adjustments with massive civil engineering cost implications as well as widespread heritage loss in the nearly uncountable number of coastal cities. Shifting of climatic zones and repeated climate disruptions would have

enormous economic and social costs, especially in the developing world.

These consequences can be avoided via prompt transition to a clean energy future. The benefits would include a healthy environment with clean air and water, preservation of the shorelines and climatic zones that civilization is adapted to, and retention of the many benefits humanity derives from the remarkable diversity of species with which we share this planet. 13 Some nations are working hard to reduce their emissions, some with notable success. But there is not global recognition that most of the remaining fossil fuel carbon cannot be emitted to the atmosphere without great damage to the future of young people.

It is appropriate that governments, instituted for the protection of all citizens, should be required to safeguard the future of young people and the unborn. Specific policies cannot be imposed by courts, but courts can require governments to present realistic plans to protect the rights of the young. These plans should be consistent with the scientifically-established rate at which emissions must be reduced to stabilize climate.

Science can also make clear that rapid transition to improved energy efficiency and clean energies is not only feasible but economically sensible, and that rapid transition requires a steadily rising price on undesirable emissions. Other actions by governments are needed, such as enforcement of energy efficiency standards and investment in technology development. However, without the underlying incentive of a price on carbon emissions, such actions, as well as voluntary actions by concerned citizens, are only marginally effective. This is because such actions reduce the demand for fossil fuels, lower their price, and thus encourage fossil fuel use elsewhere. The price on carbon emissions, to be most effective, must be transparent and across-the-board, for the sake of public acceptance, for guidance of consumer decisions, and for guidance of business decisions including technology investments.

Here we summarize the emission reductions required to restore Earth's energy balance, limit CO₂ change to a level that avoids dangerous human-made interference with climate, assure a bright future for young people and future generations, and provide a planet on which both humans and our fellow species can continue to survive and thrive.

Figure 1. Global surface temperature anomalies relative to 1951-1980 mean for (a) annual and 5-year running means through 2010, and (b) 60-month and 132-month running means through March 2011.

Green bars are 2-s error estimates, i.e., 95% confidence intervals (data from Hansen et al., 2010).

2. Global Temperature

Global surface temperature fluctuates chaotically within a limited range and it also responds to natural and human-made climate forcings. Climate forcings are imposed perturbations of Earth's energy balance. Examples of climate forcings are changes in the

luminosity of the sun, volcanic eruptions that inject aerosols (fine particles) into Earth's stratosphere, and human-caused alterations of atmospheric composition, most notably the increase of atmospheric carbon dioxide (CO₂) due to burning of fossil fuels.

2.1. Modern Temperature

Figure 1(a) shows annual-mean global temperature change over the past century. The year-to-year variability is partly unforced chaotic variability and partly forced climate change. For example, the global warmth of 1998 was a consequence of the strongest El Niño of the century, a natural warming of the tropical Pacific Ocean surface associated with a fluctuation of ocean dynamics. The strong cooling in 1992 was caused by stratospheric aerosols from the Mount Pinatubo volcanic eruption, which temporarily reduced sunlight reaching Earth's surface by as much as 2 percent.

Figure 1(b) shows global temperature change averaged over 5 years (60 months) and 11 years (132 months), for the purpose of minimizing year-to-year variability. The rapid warming during the past three decades is a forced climate change that has been shown to be a consequence of the simultaneous rapid growth of human-made atmospheric greenhouse gases, predominately CO₂ from fossil fuel burning (IPCC, 2007).

The basic physics underlying this global warming, the greenhouse effect, is simple. An increase of gases such as CO₂ makes the atmosphere more opaque at infrared wavelengths. This added opacity causes the planet's heat radiation to space to arise from higher, colder levels in the atmosphere, thus reducing emission of heat energy to space. The temporary imbalance between the energy absorbed from the sun and heat emission to space, causes the planet to warm until planetary energy balance is restored.

The great thermal inertia of Earth, primarily a consequence of the 4-kilometer (2½ mile) deep ocean, causes the global temperature response to a climate forcing to be slow. Because

atmospheric CO₂ is continuing to increase, Earth is significantly out of energy balance – the solar energy being absorbed by the planet exceeds heat radiation to space. Measurement of Earth's energy imbalance provides the most precise quantitative evaluation of how much CO₂ must be reduced to stabilize climate, as discussed in Section 2.

However, we should first discuss global temperature, because most efforts to assess the level of climate change that would be 'dangerous' for humanity have focused on estimating a permissible level of global warming. Broad-based assessments, represented by the 'burning embers' diagram in IPCC (2001, 2007), suggested that major problems begin with global warming of 2-3°C relative to global temperature in year 2000. Sophisticated probabilistic analyses (Schneider and Mastrandrea, 2005) found a median 'dangerous' threshold of 2.85°C above global temperature in 2000, with the 90 percent confidence range being 1.45-4.65°C. The conclusion that humanity could readily tolerate global warming up to a few degrees Celsius seemed to mesh with common sense. After all, people readily tolerate much larger regional and seasonal climate variations.

The fallacy of this logic became widely apparent only in recent years. (1) Summer sea ice cover in the Arctic plummeted in 2007 to an area 30 percent less than a few decades earlier. Continued growth of greenhouse gases will likely cause the loss of all summer sea ice within the next few decades, with large effects on wildlife and indigenous people, increased heat absorption at high latitudes, and potentially the release of massive amounts of methane, a powerful greenhouse gas, presently frozen in Arctic sediments on both land and sea floor. (2) The great continental ice sheets of Greenland and Antarctic have begun to shed ice at a rate, now several hundred cubic kilometers per year, which is continuing to accelerate. With the loss of protective sea ice and buttressing ice shelves, there is a danger that ice sheet mass loss will reach a level that causes catastrophic, and for all practical purposes irreversible, sea level rise. (3) Mountain glaciers are receding rapidly all around the world. Summer glacier melt provides fresh water to major world rivers during the dry season, so loss of the glaciers would be highly detrimental to billions of people. (4) The hot dry subtropical climate belts have expanded, affecting climate most notably in the southern United States, the Mediterranean and Middle East regions, and Australia, contributing to more intense droughts, summer heat waves, and devastating wildfires. (5) Coral reef ecosystems are already being impacted by a combination of ocean warming and acidification (a direct consequence of rising atmospheric CO₂), resulting in a 1-2% per year decline in geographic extent. Coral reef ecosystems will be eliminated with continued increase of atmospheric CO₂, with huge consequences for an estimated 500 million people that depend on the ecosystem services of coral reefs (Bruno and Selig, 2007; Hoegh-guldberg et al., 2007; Veron et al., 2009). (6) So-called mega-heatwaves have become noticeably more frequent, for example the 2003 and 2010 heatwaves over Europe and large parts of Russia, each with heatdeath tolls in the range of 55,000 to 70,000 (Barriopedro et al., 2011). Reassessment of the dangerous level of global warming has been spurred by realization that large climate effects are already beginning while global warming is less than 1°C above preindustrial levels. The best tool for assessment is provided by paleoclimate, the history of ancient climates on Earth.

Figure 2. Global temperature relative to peak Holocene temperature (Hansen and Sato, 2011).
2.2. Paleoclimate Temperature

Hansen and Sato (2011) illustrate Earth's temperature on a broad range of time scales. Figure 2(a) shows estimated global mean temperature during the Pliocene and Pleistocene, approximately the past five million years. Figure 2(b) shows higher temporal resolution, so that the more recent glacial to interglacial climate oscillations are more apparent.

Climate variations summarized in Figure 2 are huge. During the last ice age, 20,000 years ago, global mean temperature was about 5°C lower than today. But regional changes on land were larger. Most of Canada was under an ice sheet. New York City was buried under that ice sheet, as were Minneapolis and Seattle. On average the ice sheet was more than a mile (1.6 km) thick. Although thinner near its southern boundary, its thickness at the location of the above cities dwarfs the tallest buildings in today's world. Another ice sheet covered northwest Europe.

These huge climate changes were instigated by minor perturbations of Earth's orbit about

the sun and the tilt of Earth's spin axis relative to the orbital plane. By altering the seasonal and geographical distribution of sunlight, the orbital perturbations cause small temperature change. Temperature change then drives two powerful amplifying feedbacks: higher temperature melts ice globally, thus exposing darker surfaces that absorb more sunlight; higher temperature also causes the ocean and soil to release CO₂ and other greenhouse gases. These amplifying feedbacks are responsible for practically the entire glacial-to-interglacial temperature change.

In these slow natural climate changes the amplifying feedbacks (ice area and CO₂ amount) acted as slaves to weak orbital forcings. But today CO₂, global temperature, and ice area are under the command of humanity: CO₂ has increased to levels not seen for at least 3 million years, global temperature is rising, and ice is melting rapidly all over the planet. Another ice age will never occur, unless humans go extinct. A single chlorofluorocarbon factory can produce gases with a climate forcing that exceeds the forcing due to Earth orbital perturbations.

[14 This estimate of global mean temperature is obtained from ocean sediments at many locations around the world (Zachos et al., 2001; Hansen et al., 2008). The composition of the shells of deep-sea-dwelling microscopic animals (foraminifera), preserved in ocean sediments, carry a record of ocean temperature. Deep ocean temperature change is about two-thirds as large as global mean surface temperature change for the range of climates from the last ice age to the present interglacial period; that proportionality factor is included in Figure 2.]

During the climate oscillations summarized in Figure 2, Earth's climate remained in near equilibrium with its changing boundary conditions, i.e., with changing ice sheet area and changing atmospheric CO₂. These natural boundary conditions changed slowly, over millennia, because the principal Earth orbital perturbations occur on time scales predominately in the range of 20,000 to 100,000 years.

Human-made changes of atmospheric composition are occurring much faster, on time scales of decades and centuries. The paleoclimate record does not tell us how rapidly the climate system will respond to the high-speed human-made change of climate forcings – our best guide will be observations of what is beginning to happen now. But the paleoclimate record does provide an indication of the eventual consequences of a given level of global warming. The Eemian and Hosteinian interglacial periods, also known as marine isotope stages 5e and 11, respectively about 130,000 and 400,000 years ago, were warmer than the Holocene, but global mean temperature in those periods was probably less than 1°C warmer than peak Holocene temperature (Figure 2b). Yet it was warm enough for sea level to reach mean levels 4-6 meters higher than today.

Global mean temperature 2°C higher than peak Holocene temperature has not existed since at least the Pliocene, a few million years ago. Sea level at that time was estimated to have been 15-25 meters higher than today (Dowsett et al., 1999). Changes of regional climate during these warm periods were much greater than the global mean changes.

How does today's global temperature, given the warming of the past century, compare with prior peak Holocene temperature? Holocene climate has been highly variable on a regional basis (Mayewski et al., 2004). However, Hansen and Sato (2011) show from records at several places around the globe that mean temperature has been remarkably constant during the Holocene. They estimate that the warming between the 1800s and the period 1951-1980 (a warming of $\sim 0.25^{\circ}\text{C}$ in the Goddard Institute for Space Studies analysis, Hansen et al., 2010) brought global temperatures back to approximately the peak Holocene level.

If the 1951-1980 global mean temperature approximates peak Holocene temperature, this implies that global temperature in 2000 (5-year running mean) was already 0.45°C above the peak Holocene temperature. The uncertainty in the peak Holocene temperature is a least several tenths of a degree Celsius. However, strong empirical evidence that global temperature has already risen above the prior peak Holocene temperature is provided by the ongoing mass loss of the Greenland and West Antarctic ice sheets, which began within the last few decades. Sea level was relatively stable for the past five to six thousand years, indicating that these ice sheets were in near mass balance. Now, however, both Greenland and West Antarctica are shedding ice at accelerating rates. This is strong evidence that today's global temperature has reached a level higher than prior Holocene temperatures.

The conclusion is that global warming of 1°C relative to 1880-1920 mean temperature (i.e., 0.75°C above the 1951-1980 temperature or 0.3°C above the 5-year running mean temperature in 2000), if maintained for long, is already close to or into the 'dangerous' zone. The suggestion that 2°C global warming may be a 'safe' target is extremely unwise based on critical evidence accumulated over the past three decades. Global warming of this amount would be putting Earth on a path toward Pliocene-like conditions, i.e., a very different world marked by massive and continual disruptions to both society and ecosystems. It would be a world in which the world's species and ecosystems will have had no recent evolutionary experience, surely with consequences and disruptions to the ecosystem services that maintain human communities today. There are no credible arguments that such rapid change would not have catastrophic circumstances for human well-being.

Figure 3. (a) Estimated planetary energy imbalance in 1993-2008, and (b) in 2005-2010. Data sources are given by Hansen et al. (2011).

3. Earth's Energy Imbalance

Earth's energy balance is the ultimate measure of the status of Earth's climate. In a period of climate stability, Earth radiates the same amount of energy to space that it absorbs from incident sunlight. Today it is anticipated that Earth is out of balance because of increasing atmospheric CO_2 . Greenhouse gases such as CO_2 reduce Earth's heat radiation to space, thus causing a temporary energy imbalance, more energy coming in than going out. This imbalance causes Earth to warm until energy balance is restored.

The immediate planetary energy imbalance due to an increase of CO_2 can be calculated precisely. It does not require a climate model. The radiation physics is rigorously understood.

However, the current planetary energy imbalance is complicated by the fact that increasing CO₂ is only one of the factors affecting Earth's energy balance, and Earth has already partly responded to the net climate forcing by warming 0.8°C in the past century.

Thus authoritative determination of the state of the climate system requires measuring the planet's current energy imbalance. This is a technical challenge, because the magnitude of the imbalance is expected to be only about 1 W/m² or less, so measurements must have an accuracy that approaches 0.1 W/m². The most promising approach to achieve this accuracy is to measure ongoing changes of the heat content of the ocean, atmosphere, land, and ice on the planet. The vast global ocean is the primary reservoir for changes of Earth's heat content. Because of the importance of this measurement, nations of the world launched a cooperative Argo float program, which has distributed more than 3000 floats around the world ocean (Roemmich and Gilson, 2009). Each float repeatedly yoyos an instrument package to a depth of two kilometers and satellite-communicates the data to shore.

The Argo program did not attain planned distribution of floats until late 2007, but coverage reached 90% by 2005, allowing good accuracy provided that systematic measurement errors are kept sufficiently small. Prior experience showed how difficult it is to eliminate all measurement biases, but the exposure of the difficulties over the past decade leads to expectation that the data for the 6-year period 2005-2010 are the most precise achieved so far. The estimated standard error for that period, necessarily partly subjective, is 0.15 W/m².¹⁵ Barker et al. (2011) describe a remaining bias due to sensor drift in pressure measurements. That bias is reduced in the analysis of von Schuckmann and Le Traon by excluding data from floats on a pressure-bias black list and data from profiles that fail climatology checks, but errors remain and require further analysis.

Smaller contributions to the planetary energy imbalance, from changes in the heat content of the land, ice and atmosphere, are also known more accurately in recent years. A key improvement during the past decade has been provided by the GRACE satellite that measures Earth's gravitational field with a precision that allows the rate of ice loss by Greenland and Antarctica to be monitored accurately.

Figure 3 summarizes the results of analyses of Earth's energy imbalance averaged over the periods 1993-2008 and 2005-2010. In the period 1993-2008 the planetary energy imbalance ranges from 0.57 W/m² to 0.80 W/m² among different analyses, with the lower value based on upper ocean heat content analysis of Levitus et al. (2009) and the higher value based on Lyman et al. (2010). For the period 2005-2010 the upper ocean heat content change is based on analysis of the Argo data by von Schuckmann and Le Traon (2011), which yields a planetary energy imbalance of 0.59 ± 0.15 W/m² (Hansen et al., 2011).

The energy imbalance in 2005-2010 is particularly important, because that period coincides with the lowest level of solar irradiance in the period since satellites began measuring the brightness of the sun in the late 1970s. Changes of solar irradiance are often hypothesized as being the one natural climate forcing with the potential to compete with human-made climate forcings, so measurements during the strongest solar minimum on record provide a conclusive

evaluation of the sun's potential to reduce the planet's energy imbalance.

The conclusion is that Earth is out of energy balance by at least ~ 0.5 W/m². Our measured 0.59 W/m² for 2005-2010 suggests that the average imbalance over the 11-year solar cycle may be closer to 0.75 W/m².

This planetary energy imbalance is substantial, with implications for future climate change. It means that global warming will continue on decadal time scales, as the 0.8°C global warming so far is the response to only about half of the net human-made climate forcing. Knowledge of Earth's energy imbalance allows us to specify accurately how much CO₂ must be reduced to restore energy balance and stabilize climate. CO₂ must be reduced from the current level of 390 ppm to 360 ppm to increase Earth's heat radiation to space by 0.5 W/m², or to 345 ppm to increase heat radiation to space by 0.75 W/m², thus restoring Earth's energy balance and stabilizing climate.

Earth's energy imbalance thus provides accurate affirmation of a conclusion reached earlier (Hansen et al., 2008), that the appropriate initial target level of atmospheric CO₂ to stabilize climate is " <350 ppm". This target level may need to be adjusted as it is approached, but, considering the time required to achieve a reversal of atmospheric CO₂ growth, more precise knowledge of the ultimate target for CO₂ will be available by the time CO₂ has been restored to a level approaching 350 ppm.

One reason that more precise specification than " <350 ppm" is inadvisable now is the uncertainty about the net effect of changes of other human-made climate forcings such as methane, other trace gases, reflecting aerosols, black soot, and the surface reflectivity. These forcings are smaller than that by CO₂, but not negligible.

Indeed, there is a concern that expected future reductions of particulate air pollution will exacerbate global warming via reduction of reflective aerosols. It has been suggested (Hansen et al., 2000) that a concerted effort to reduce methane, tropospheric ozone, other trace gases and black soot could substantially reduce the human-made climate forcing, possibly enough to counteract the warming effect of a decline in reflective aerosols. Our calculations of future global temperature in section 5 assume that a major effort will be made to reduce the non-CO₂ forcings sufficient to obviate warming due to a decline of reflective aerosols. To the degree that this goal is not achieved, future warming could exceed that which we calculate.

Figure 4. (a) Decay of instantaneous (pulse) injection and extraction of atmospheric CO₂, (b) atmospheric CO₂ if fossil fuel emissions terminated at end of 2011, 2030, 2050.

The important point is that CO₂ is the dominant climate forcing agent and it will be all the more so in the future. The CO₂ injected into the climate system by burning fossil fuels will continue to affect our climate for millennia. We cannot burn all of the fossil fuels without producing a different planet, with changes occurring with a rapidity that will make Earth far less hospitable for young people, future generations, and most other species.

4. Carbon Cycle and Atmospheric CO₂

The ‘carbon cycle’ that defines the fate of fossil fuel carbon injected into the climate system is well understood. This knowledge allows accurate estimation of the amount of fossil fuels that can be burned consistent with stabilization of climate this century.

Atmospheric CO₂ is already about 390 ppm. Is it possible to return to 350 ppm or less within this century? Yes. Atmospheric CO₂ would decrease if we phased out fossil fuels. The CO₂ injected into the air by burning fossil fuels becomes distributed, over years, decades, and centuries, among the surface carbon reservoirs: the atmosphere, ocean, soil, and biosphere. Carbon cycle models simulate how the CO₂ injected into the atmosphere becomes distributed among the carbon reservoirs. We use the well-tested Bern carbon cycle model (Joos et al., 1996)¹⁶ to illustrate how rapidly atmospheric CO₂ can decrease.

Figure 4 (a) shows the decay of a pulse of CO₂ injected into the air. The atmospheric amount is reduced by half in about 25 years. However, after 500 years about one-fifth of the CO₂ is still in the atmosphere. Eventually, via weathering of rocks, this excess CO₂ will be deposited on the ocean floor as carbonate sediments. However, that process requires millennia. It is informative, for later policy considerations, to note that a negative CO₂ pulse decays at about the same rate as positive pulse. Thus if we decide to suck CO₂ from the air, taking CO₂ out of the carbon cycle, for example by storing it in carbonate bricks, the magnitude of the CO₂ change will decline as the negative increment becomes spread among the carbon reservoirs. It is also informative to examine how fast atmospheric CO₂ would decline if fossil fuel use were halted today, or in 20 years, or in 40 years. Results are shown in Figure 4 (b). If emissions were halted in 2011, CO₂ would decline to 350 ppm at mid-century. With a 20 year delay in halting emissions, CO₂ returns to 350 ppm at about 2250. With a 40 year delay, CO₂ does not return to 350 ppm until after year 3000.

[¹⁶ Specifically, we use the dynamic-sink pulse-response function representation of the Bern carbon cycle model (Joos et al., 1996), as described by Kharecha and Hansen (2008) and Hansen et al. (2008).]

The scenarios in Figure 4 (b) assume that emissions continue to increase at the ‘business-as-usual’ (BAU) rate of the past decade (increasing by just over 2% per year) until they are suddenly halted. The results are indicative of how difficult it will be to get back to 350 ppm, if fossil fuel emissions continue to accelerate.

Do these results imply that it is implausible to get back to 350 ppm in a way that is essentially ‘natural’, i.e., in a way other than a ‘geo-engineering’ approach that sucks CO₂ from the air? Not necessarily. There is one other major factor, in addition to fossil fuel use, that affects atmospheric CO₂ amount: deforestation/reforestation.

Fossil fuel emissions account for about 80 percent of the increase of atmospheric CO₂ from 275 ppm in the preindustrial atmosphere to 390 ppm today. The other 20 percent is from net deforestation (here net deforestation accounts for any forest regrowth in that period). We take net deforestation over the industrial era to be about 100 GtC (gigatons of carbon), with an

uncertainty of at least 50 percent (Stocker et al., 2011)17.

[17 Net historical deforestation of 100 GtC and historical fossil fuel use yield good agreement with historical growth of atmospheric CO₂ (Figure S16 of Hansen et al., 2008), based on simulations with the Bern carbon cycle model.]

There is considerable potential for extracting CO₂ from the atmosphere via reforestation and improved forestry and agricultural practices. The largest practical extraction is probably about 100 GtC (IPCC, 2001), i.e., equivalent to restoration of deforested land. Complete restoration of deforested areas is unrealistic, yet a 100 GtC drawdown seems feasible for the following reasons: (1) the current human-enhanced atmospheric CO₂ level leads to an increase of carbon uptake by vegetation and soils, (2) improved agricultural practices can convert agriculture from being a large CO₂ source into a carbon sink, as discussed in the following paragraph, (3) part of this CO₂ drawdown can be achieved by burning biomass at powerplants and capturing the CO₂, with the provision that the feedstock for this bioenergy is residues and wastes, unlike most current-generation bioenergy sources, thus avoiding loss of natural ecosystems and cropland (Tilman et al., 2006; Fargione et al., 2008; Searchinger et al., 2008). Competing uses for land – primarily expansion of agriculture to supply a growing world population – could complicate reforestation efforts. A decrease in the use of animal products would substantially decrease the demand for agricultural land, as more than half of all crops are currently fed to livestock (Stehfest et al., 2009; UNEP, 2010).

The 100 GtC ‘reforestation’ thus is a major task, but it is needed to get CO₂ back to 350 ppm and it is an opportunity to achieve other major benefits. Present agricultural practices, based on plowing and chemical fertilizers, are dependent on fossil fuels and contribute to loss of carbon from soil via land degradation. World agriculture could sequester 0.4-1.2 GtC per year by adopting minimum tillage and biological nutrient recycling (Lal, 2004). Such a strategy can also increase water conservation in soils, build agricultural resilience to climate change, and increase productivity especially in smallholder rain-fed agriculture, thereby reducing expansion of agriculture into forested ecosystems (Rockstrom et al., 2009).

We thus assume a 100 GtC drawdown (biospheric C uptake) in our reforestation scenarios, with this obtained via a sinusoidal drawdown over the period 2031-2080. Alternative timings for this reforestation drawdown of CO₂ would have no qualitative effect on our conclusions about the potential for achieving a given CO₂ level such as 350 ppm.

Figure 5. (a) Atmospheric CO₂ if fossil fuel emissions are cut 6% per year beginning in 2012 and 100

GtC reforestation drawdown occurs in the 2031-2080 period, (b) Atmospheric CO₂ with BAU emission

increases until 2020, 2030, 2045, and 2060, followed by 5% per year emission reductions.

Figure 5 (a) shows that 100 GtC reforestation results in atmospheric CO₂ declining to 350 ppm by the end of this century, provided that fossil fuel emissions decline by 6% per year beginning in 2013. Figure 5 (b) shows the effect of continued BAU fossil fuel emission (just over 2% per year) until 2020, 2030, 2045 and 2060 with 100 GtC reforestation in 2031-2080.

The scenario with emission cuts beginning in 2020 has atmospheric CO₂ return to 350 ppm at about 2300. If the initiation of emissions reduction is delayed to 2030 or later, then atmospheric CO₂ does not return to the 350 ppm level even by 2500.

The conclusion is that a major reforestation program does permit the possibility of returning CO₂ to the 350 ppm level within this century, but only if fossil fuel emission reductions begin promptly.

What about artificially drawing down atmospheric CO₂? Some people may argue that, given the practical difficulty of overcoming fossil fuel lobbyists and persuading governments to move rapidly toward post-fossil-fuel clean energy economies, 'geo-engineering' is the only hope.

At present there are no large-scale technologies for air capture of CO₂. It has been suggested that with strong research and development support and industrial scale pilot projects sustained over decades, it may be possible to achieve costs of about ~\$200/tC (Keith et al., 2006). At this rate, the cost of removing 50 ppm of CO₂ is ~\$20 trillion. However, as shown by Figure 4 (a), the resulting atmospheric CO₂ reduction is only ~15 ppm after 100 years, because most of the extraction will have leaked into other surface carbon reservoirs. The cost of CO₂ extraction needed to maintain a 50 ppm reduction on the century time scale is thus better estimated as ~\$60 trillion.

In section 7 we note the economic and social benefits of rapidly phasing over to clean energies and increased energy efficiency, as opposed to continued and expanded extraction of fossil fuels. For the moment, we simply note that the present generation will be passing the CO₂ clean-up costs on to today's young people and future generations.

5. Future Global Temperature Change

Future global temperature change will depend primarily upon atmospheric CO₂ amount. Although other greenhouse gases, such as methane and chlorofluorocarbons, contributed almost 18% to the total human-caused climate forcings over the past century, CO₂ now accounts for more than 80 percent of the growth of greenhouse gas climate forcing (over the past 15 years). Natural climate forcings, such as changes of solar irradiance and volcanic aerosols, can cause global temperature variations, but their effect on the long-term global temperature trend is small compared with the effect of CO₂.

A simple climate response function can provide a realistic estimate of expected global temperature change for a given scenario of future atmospheric CO₂. Indeed, Hansen et al. (2011) show that such a function accurately replicates the results from sophisticated global climate models. In the simulations here we use the 'intermediate' response function of Hansen et al. (2011), which accurately replicates observed ocean heat uptake and observed temperature change over the past century, and we assume that the net change of other human-made climate forcings is small in comparison with the effect of CO₂.

One important caveat must be stressed. These calculations, as with most global climate

models, incorporate only the effect of the so-called ‘fast feedbacks’ in the climate system, such as water vapor, clouds, aerosols, and sea ice. Slow feedbacks, such as ice sheet disintegration and climate-induced changes of greenhouse gases, as may occur with the melting of tundra and warming of continental shelves, are not included.

Exclusion of slow feedbacks is appropriate for the past century, because we know the ice sheets were stable and our climate simulations employ observed greenhouse gas amounts. The observed greenhouse gas amount includes any contribution from slow feedbacks. Exclusion of slow feedbacks in the 21st century is a dubious assumption, used in our illustrative computations only because the rate at which slow feedbacks come into play is poorly understood. However, we must bear in mind the potential for slow feedbacks to fundamentally alter the nature of future climate change, specifically the possibility of creating a situation in which continued climate change is largely out of humanity’s control.

Slow feedbacks are thus one important consideration that helps to crystallize the need to keep maximum warming from significantly exceeding 1°C. With the current global warming of ~0.8°C evidence of slow feedbacks is beginning to appear, e.g., melting of tundra with release of methane (Walter et al., 2006), submarine methane release from dissociation of sea-bed gas hydrates in association with sea water temperature increase (Westbrook et al., 2009), and increasing ice mass loss from Greenland and Antarctica (Velicogna, 2009). The fact that observed effects so far are small suggests that these feedbacks may not be a major factor if maximum global warming is only ~1°C and then recedes.

On the other hand, if BAU CO₂ emissions continue for many decades there is little doubt that these slow feedbacks will come into play in major ways. Because the CO₂ injected into the air stays in the surface carbon reservoirs for millennia, the slow feedbacks surely will occur. It is only a question of how fast they will come into play, and thus which generations will suffer the greatest consequences.

There is thus strong indication that we face a dichotomy. Either we achieve a scenario with declining global CO₂ emissions, thus preserving a planetary climate resembling that of the Holocene or we set in motion a dynamic transition to a very different planet.

Figure 6. Simulated future global temperature for the CO₂ scenarios of Figure 5. Observed temperature record is from Hansen et al. (2010). Temperature is relative to the 1880-1920 mean. Subtract 0.26°C to use 1951-1980 as zero-point. Subtract 0.70°C to use 5-year running mean in 2000 as zero point. Can we define the level of global warming that would necessarily push us into such a dynamic transition? Given present understanding of slow feedbacks, we cannot be precise. However, consider the case in Figure 6 in which BAU emissions continue to 2030. In that case, even though CO₂ emissions are phased out rapidly (5% per year emission reductions) after 2030 and 100 GtC reforestation occurs in 2031-2080, the (fast-feedback) human-caused global temperature rise reaches 1.5°C and stays above 1°C until after 2500. It is highly unlikely that the major ice sheets could remain stable at their present size with such long-lasting warmth. Even if

BAU is continued only until 2020, the temperature rise exceeds 1°C for about 100 years. In contrast to scenarios with continued BAU emissions, Figure 6 (a) shows the scenario with 6% per year decrease of fossil fuel CO₂ emissions and 100 GtC reforestation in the period 2031-2080. This scenario yields additional global warming of ~0.3°C. Global temperature relative to the 1880-1920 mean would barely exceed 1°C and would remain above 1°C for only about 3 decades. Thus this scenario provides the prospect that young people, future generations, and other life on the planet would have a chance of residing in a world similar to the one in which civilization developed.

The precise consequences if BAU emissions continue several decades are difficult to define, because such rapid growth of climate forcing would take the world into uncharted territory. Earth has experienced a huge range of climate states during its history, but there has never been such a large rapid increase of climate forcings as would occur with burning of most fossil fuels this century. The closest analogy in Earth's history is probably the PETM (Paleocene-Eocene Thermal Maximum) in which rapid global warming of at least 5°C occurred (Zachos et al., 2001), probably as a consequence of melting methane hydrates (Zeebe et al., 2009). The PETM is instructive because it occurred during a 10-million year period of global warming, and thus the methane release was probably a feedback effect magnifying the warming. Global warming that occurred over the period from 60 Mya (million years ago) to 50 Mya can be confidently ascribed to increasing atmospheric CO₂. That was the period in which the Indian subcontinent was moving rapidly through the Indian Ocean, just prior to its collision with Asia, when it began to push up the Himalayan Mountains and Tibetan Plateau. Continental

drift over carbonate-rich ocean crust is the principal source of CO₂ from the solid Earth to the surface reservoirs of carbon.¹⁹

[¹⁹ The principal sink of CO₂, i.e., the mechanism that returns carbon to the solid Earth on long time scales, is the weathering process. Chemical reactions associated with weathering of rocks results in rivers carrying carbonate sediments that are deposited on the ocean floor.]

The global warming between 60 Mya and 50 Mya was about 5°C, thus at a rate less than 1°C per million years. Approximately 55 Mya there was, by paleoclimae standards, a very rapid release of 3000-5000 GtC into the surface climate system, presumably from melting of methane hydrates based on the absence of any other known source of that magnitude. This injection of carbon and rapid additional warming of about 5°C occurred over a period of about 10,000 years, with most of the carbon injection during two 1-2 thousand year intervals. The PETM witnessed the extinction of almost half of the deep ocean foraminifera (microscopic shelled animals, which serve as a biological indicator for ocean life in general), but, unlike several other large warming events in Earth's history, there was little extinction of land plants and animals.

The important point is that the rapid PETM carbon injection was comparable to what will occur if humanity burns most of the fossil fuels, but the PETM occurred over a period that was 10-100 times longer. The ability of life on Earth today to sustain a climate shock comparable to the PETM but occurring 10-100 times faster is highly problematic, at best. Climate zones would

be shifting at a speed far faster than species have ever faced. Thus if humanity continues to burn most of the fossil fuels, Earth, and all of the species residing on it, will be pushed into uncharted climate change territory, with consequences that are practically impossible to foresee.

6. Consequences of Continued Global Warming

The unparalleled rapidity of the human-made increase of global climate forcing implies that there are no close paleoclimate analogies to the current situation. However, the combination of paleoclimate data and observations of ongoing climate change provide useful insight. Paleoclimate data serve mainly as an indication of likely long-term responses to changed boundary conditions. Observations of ongoing climate change provide information relevant to the rate at which changes may occur.

Yet we must bear in mind that some important processes, such as ice sheet disintegration and species extermination, have the potential to be highly non-linear. That means changes can be slow until a tipping point is reached (Lenton et al., 2008) and more rapid change occurs. Sea level. If most fossil fuels are burned global temperatures will rise at least several degrees Celsius. The eventual sea level change in response to the global warming will be many meters and global coast lines will be transfigured. We do not know how rapidly ice sheets can disintegrate, because Earth has never experienced such rapid global warming. However, even moderate sea level rise will create millions of global warming refugees from highly-populated low-lying areas, who must migrate from the coastline, throwing existing global demographics into chaos.

During the most recent prior interglacial period, the Eemian, global temperature was at most of the order of 1°C warmer than the Holocene (Figure 2). Sea level reached heights several meters above today's level and there were instances of sea level change by 1-2 meters per century (Rohling et al., 2008; Muhs et al., 2011). Hearty and Neumann (2001) and Hearty et al. (2007) interpret geologic shoreline evidence as indicating a rapid sea level rise to a peak 6-9 meters above present late in the Eemian followed by a precipitous sea level fall, but there is not unanimity in the research community about this specific history. The important point is that the high sea level excursions in the Eemian imply rapid partial melting of Antarctic and/or Greenland ice when the world was little warmer than today. During the Pliocene, when global mean temperature may have been 2°C warmer than the Holocene (Figure 2), sea level was probably 15-25 meters higher than today (Dowsett et al., 1999, 2009; Naish et al., 2009). Expected sea level rise due to human-caused climate change has been controversial partly because the discussion and the predictions of IPCC (2001, 2007) have focused on sea level rise at a specific date, 2100. Recent estimates of likely sea level rise by 2100 are of the order of 1 m (Vermeer and Rahmstorf, 2009; Grinsted et al., 2010). Ice-dynamics studies estimate that rates of sea-level rise of 0.8 to 2 m per century are feasible (Pfeffer et al., 2008) and Antarctica alone may contribute up to 1.5 m per century (Turner et al., 2009). Hansen (2005, 2007) has argued that BAU CO₂ emissions produce a climate forcing so much larger than any experienced in prior interglacial periods that a non-linear ice sheet response with multi-meter sea level rise may occur this century.

The best warning of an imminent period of sustained nonlinear ice sheet loss will be provided by accurate measurements of ice sheet mass. The GRACE satellite, which has been measuring Earth's gravitational field since 2003 reveals that the Greenland ice sheet is losing mass at an accelerating rate, now more than 200 cubic kilometers per year, and Antarctica is losing more than 100 cubic kilometers per year (Sorensen and Forsberg, 2010; Rignot et al., 2011). However, the present rate of sea level rise, 3 cm per decade, is moderate, and the ice sheet mass balance record is too short to determine whether we have entered a period of continually accelerating ice loss.

Satellite observations of Greenland show that the surface area with summer melting has increased over the period of record, which extends back to the late 1970s (Steffen et al., 2004; Tedesco et al., 2011). Yet the destabilizing mechanism of greatest concern is melting of ice shelves, tongues of ice that extend from the ice sheets into the oceans and buttress the ice sheets, limiting the rate of discharge of ice to the ocean. Ocean warming is causing shrinkage of ice shelves around Greenland and Antarctica (Rignot and Jacobs, 2002).

Loss of ice shelves can open a pathway to the ocean for portions of the ice sheets that rest on bedrock below sea level. Most of the West Antarctic ice sheet, which alone could raise sea level by 6 meters, is on bedrock below sea level, so it is the ice sheet most vulnerable to rapid change. However, parts of the larger East Antarctic ice sheet are also vulnerable. Indeed, satellite gravity and radar altimetry reveal that the Totten Glacier of East Antarctica, fronting a large ice mass grounded below sea level, is already beginning to lose mass (Rignot et al., 2008). The important point is that uncertainties about sea level rise mainly concern the timing of large sea level rise if BAU emissions continue, not whether it will occur. If all or most fossil fuels are burned, the carbon will be in the climate system for many centuries, in which case multi-meter sea level rise should be expected (e.g., Rohling et al., 2009).

Children born today can expect to live most of this century. If BAU emissions continue, will they suffer large sea level rise, or will it be their children, or their grandchildren? Shifting climate zones. Theory and climate models indicate that subtropical regions will expand poleward with global warming (Held and Soden, 2006; IPCC, 2007). Observations reveal that a 4-degree poleward expansion of the subtropics has occurred already on average (Seidel and Randel, 2006), yielding increased aridity in southern United States (Barnett et al., 2008; Levi, 2008), the Mediterranean region, and Australia. Increased aridity and temperatures have contributed to increased forest fires that burn hotter and are more destructive in all of these regions (Westerling et al., 2006).

Although there is large year-to-year variability of seasonal temperature, decadal averages reveal that isotherms (lines of a given average temperature) having been moving poleward at a rate of about 100 km per decade during the past three decades (Hansen et al., 2006). This rate of shifting of climatic zones exceeds natural rates of change. The direction of movement has been monotonic (poleward) since about 1975. Wild species have responded to this climatic shift, with at least 52 percent of species having shifted their ranges poleward (and upward) by as much as 600 km in terrestrial systems and 1000 km in marine systems (Parmesan and Yohe, 2003). As long as the planet is as far out of energy balance as at present, that trend necessarily will continue, a conclusion based on comparison of the observed trend with interdecadal variability in

climate simulations (Hansen et al., 2007).

Humans may be better able to adapt to shifting of climate zones, compared with many other species. However, political borders can interfere with migration, and indigenous ways of life have already been adversely affected. Impacts are apparent in the Arctic, with melting tundra, reduced sea ice, and increased shoreline erosion. Effects of shifting climate zones may also be important for native Americans who possess specific designated land areas, as well as other cultures with long-standing traditions in South America, Africa, Asia and Australia.

Loss of Species. Explosion of the human population and its presence on the landscape in the past few centuries is having a profound influence on the well being of all the other species. As recently as two decades ago biologists were more concerned with effects on biodiversity other than climate change, such as land use changes, nitrogen fertilization, and direct effects of increased atmospheric CO₂ on plant ecophysiology (Parmesan, 2006). However, easily discernible impacts on animals, plants, and insects of the nearly monotonic global warming during the past three decades (Figure 1) has sharply altered perceptions of the greatest threats. A dramatic awakening was provided by sudden widespread decline of frogs, with extinction of entire mountain-restricted species attributed to global warming (Pounds et al., 1999, 2006). Although there are somewhat different interpretations of detailed processes involved in global amphibian declines and extinctions (Alford et al., 2007; Fagotti and Pascolini, 2007), there is agreement that global warming is a main contributor to a global amphibian crisis: “The losses portend a planetary-scale mass extinction in the making. Unless humanity takes immediate action to stabilize the climate, while also fighting biodiversity’s other threats, a multitude of species is likely to vanish” (Pounds et al., 2007).

Mountain-restricted species in general are particularly vulnerable to global warming. As warming causes isotherms to move up the mountainside so does the specific climate zone in which a given specific species can survive. If global warming continues unabated, i.e., if all fossil fuels are burned, many mountain-dwelling species will be driven to extinction. The same is true for species living in polar regions. There is documented evidence of reductions in the population and health of Arctic species living in the southern parts of the Arctic and Antarctic species in the more northern parts of the Antarctic.

A critical factor for survival of some Arctic species will be retention of all-year sea ice. Continued BAU fossil fuel use will result in loss of all Arctic summer sea ice within the next several decades. In contrast, the scenario in Figure 5a, with global warming peaking just over 1°C and then declining slowly, should allow some summer sea ice to survive and then gradually increase to levels representative of recent decades.

The threat to species survival is not limited to mountain and polar species. Plant and animal distributions are a reflection of the regional climates to which they are adapted. Although species attempt to migrate in response to climate change, their paths may be blocked by humanconstructed obstacles or natural barriers such as coast lines. As the shift of climate zones

Figure 7. Extant reefs used as analogs (Hoegh-Guldberg et al., 2007) for ecological structures anticipated

for scenarios A (375 ppm CO₂, +1°C), B (450-500 ppm CO₂, +2°C), C (>500 ppm CO₂, >+3°C)

becomes comparable to the range of some species, the less mobile species will be driven to extinction. Because of extensive species interdependencies, this can lead to mass extinctions. The IPCC Working Group II assessment (IPCC WG-II, 2007) reviews studies relevant to estimating the eventual extinction rate for different magnitudes of global warming. If global warming relative to the pre-industrial level exceeds 1.5°C, they estimate that 9-31 percent of species will be committed to extinction. With global warming of 2.7°C, an estimated 21-52 percent of species will be committed to extinction.

Mass extinctions have occurred in conjunction with rapid climate change during Earth's long history, and new species evolved over hundreds of thousands and millions of years. But such time scales are almost beyond human comprehension. If we drive many species to extinction we will leave a more desolate planet for our children, grandchildren, and as many generations as we can imagine.

Coral reef ecosystems. Coral reef ecosystems are the most biologically diverse marine ecosystem, often described as the rainforests of the ocean. An estimated 1-9 million species (most of which have not yet been described; Reaka-Kudla 1997) populate coral reef ecosystems generating ecosystem services that are crucial to the well-being of at least 500 million people that populate tropical coastal areas. These coral reef ecosystems are vulnerable to current and future warming and acidification of tropical oceans. Acidification arises due to the production of carbonic acid as increasing amounts of CO₂ enter the world's oceans. Comparison of current changes with those seen in the palaeontological record indicate that ocean pH is already outside where it has been for several million years (Raven et al. 2005; Pelejero et al. 2010). Mass coral bleaching and a slowing of coral calcification are already disrupting coral reef ecosystem health (Hoegh-Guldberg et al 2007; De'Ath et al. 2009). The decreased viability of reef-building corals have led to mass mortalities, increasing coral disease, and slowing of reef carbonate accretion. Together with more local stressors, the impacts of global climate change and ocean acidification are driving a rapid contraction (1-2% per year, Bruno and Selig 2007) in the extent of coral reef ecosystems.

Figure 7 shows extant reefs that are analogs for ecological structures anticipated by Hoegh-Guldberg et al. (2007) to be representative of ocean warming and acidification expected to accompany CO₂ levels of 375 ppm with +1°C, 450-500 ppm with +2°C, and >500 ppm with >+3°C. Loss of the three-dimensional framework that typifies coral reefs today has consequences for the millions of species that depend on this coral reef framework for their existence. The loss of these three-dimensional frameworks also has consequences for other important roles coral reefs play in supporting fisheries and protecting coastlines from wave stress. The consequences of losing coral reefs are likely to be substantial and economically devastating for multiple nations across the planet when combined with other impacts such as sea level rise.

The situation with coral reefs is summarized by Schuttenberg and Hoegh-Guldberg (2007) thus: "Although the current greenhouse trajectory is disastrous for coral reefs and the millions of people who depend on them for survival, we should not be lulled into accepting a world without corals. Only by imagining a world with corals will we build the resolve to solve

the challenges ahead. We must avoid the “game over” syndrome and marshal the financial, political, and technical resources to stabilize the climate and implement effective reef management with unprecedented urgency.”

Hydrologic extremes and storms. The extremes of the hydrologic cycle are intensified as Earth becomes warmer. A warmer atmosphere holds more moisture, so heavy rains become more intense and increase flooding. Higher temperatures, on the other hand, cause an intensification of droughts, as does expansion of the subtropics with global warming. The most recent IPCC (2007) report confirms existence of expected trends, e.g., precipitation has generally increased over land north of 30°N and decreased in more tropical latitudes. Heavy precipitation events have increased substantially. Droughts are more common, especially in the tropics and subtropics. Tropospheric water vapor has increased.

Mountain glaciers. Mountain glaciers are in near-global retreat (IPCC, 2007). After a one-time added flush of fresh water, glacier demise will yield summers and autumns of frequently dry rivers originating in the Himalayas, Andes, and Rocky Mountains (Barnett et al., 2008) that now supply water to hundreds of millions of people. Present glacier retreat, and warming in the pipeline, indicate that 390 ppm of CO₂ is already a threat for future fresh water security.

Human health. Children are especially vulnerable to the health impacts of climate change. Principal effects are categorized in Table 1 under the headings: (1) heat waves, (2) asthma and allergies, (3) infectious disease spread, (4) pests and disease spread across taxa: forests, crops and marine life, (5) winter weather anomalies, (6) drought, (7) food insecurity. Climate change poses a threat to child health through many pathways, especially by placing additional stress on the availability of food, clean air, clean water, and potentially expanding the burden of disease from vector-borne diseases (Bernstein and Myers, 2011).

World health experts have concluded with “very high confidence” that climate change already contributes to the global burden of disease and premature death (IPCC WG-II, 2007). At this point the effects are small but are projected to progressively increase in all countries and regions. IPCC (WG-II, 2007) describes evidence that climate change has already altered the distribution of some infectious disease vectors, altered the seasonal distribution of some allergenic pollen species, and increased heat-related deaths.

Table 1. Climate Change Impacts on Human Health

Heatwaves.

Heatwaves are not only increasing in frequency, intensity and duration, but their nature is changing. Warmer nighttime temps [double the increase of average temperature since 1970 (Karl et al.)] and higher humidity (7% more for each 1°C warming) that raises heat indices and makes heat-waves all the more lethal. Asthma and allergies.

Asthma prevalence has more than doubled in the U.S. since 1980 and several exacerbating

factors stem from
burning fossil fuels.

Increased CO₂ and warming boost pollen production from fast growing trees in the spring and ragweed in the fall (the allergenic proteins also increase). Particulates help deliver pollen and mold spores deep into the lung sacs.

Ground-level ozone primes the allergic response (and O₃ increases in heat-waves). Climate change has extended the allergy and asthma season two-four weeks in the Northern Hemisphere (depending on latitude) since 1970.

Increased CO₂ stimulates growth of poison ivy and a chemical in it (urushiol) that causes contact dermatitis.

Infectious disease spread.

The spread of infectious diseases is influenced by climate change in two ways: warming expands the geographic and temporal conditions conducive to transmission of vector-borne diseases (VBDs), while floods can leave “clusters” of mosquito-, water – and rodent-borne diseases (and spread toxins). With the ocean the repository for global warming and the atmosphere holding more water vapor, rain is increasing in intensity - 7% overall in the U.S. since 1970, 2”/day rains 14%, 4”/day rains 20%, and 6”/day rains 27% since 1970 (Groisman et al., 2005), with multiple implications for health, crops and nutrition.

Tick-borne Lyme disease (LD) is the most important VBD in the U.S. LD case reports rose 8-fold in New Hampshire in the past decade and 10-fold (and now include all of its 16 counties). Warmer winters and disproportionate warming toward the poles mean that the changes in range are occurring faster than models based on changes in average temperatures project. Biological responses of vectors (and plants) to warming are, in general, underestimated and may be seen as leading indicators of warming due to the disproportionate winter (T_{minimum} or T_{min}) and high latitude warming.

Pests and disease

spread across taxa:
forests, crops and
marine life.

Pests and diseases of forests, crops and marine life are favored in a warming world. Bark beetles are overwintering (absent sustained killing frosts) and expanding their range, and getting in more generations, while droughts in the West dry the resin that drowns the beetles as they try to drive through the bark. (Warming emboldens the pests while extremes weaken the hosts.) Forest health is also threatened in the Northeast U.S. (Asian Long-horned beetle and woolly adelgid of hemlock trees), setting the stage for increased wildfires with injury, death and air pollution, loss of carbon stores, and damage to oxygen and water supplies. In sum, forest pests threaten basic life support systems that underlie human health.

Crop pests and diseases are also encouraged by warming and extremes. Warming increases their potential range, while floods foster fungal growth and droughts favor whiteflies, aphid and locust. Higher CO₂ also stimulates growth of agricultural weeds. More pesticides, herbicides and fungicides (where available) pose other threats to human health. Crop pests take up to 40% of yield annually, totaling ~\$300 billion in losses (Pimentel) Marine diseases (e.g., coral, sea urchin die-offs, and others), harmful algal blooms (from excess nutrients, loss of filtering wetlands, warmer seas and extreme weather events that trigger HABs by flushing nutrients into estuaries and coastal waters), plus the over 350 “dead zones” globally affect fisheries, thus nutrition and health.

Winter weather anomalies.

Increasing winter weather anomalies is a trend to be monitored. More winter precipitation is falling as rain rather than snow in the Northern Hemisphere, increasing the chances for ice storms, while greater atmospheric moisture increases the chances of heavy snowfalls. Both affect ambulatory health (orthopedics), motor vehicle accidents, cardiac disease and power outages with accompanying health effects.

Drought.

Droughts are increasing in frequency, intensity, duration, and geographic extent. Drought and water stress are major killers in developing nations, are associated with disease outbreaks (water-borne cholera, mosquito-borne dengue fever (mosquitoes breed in stored water containers)), and drought and higher CO₂

increase the cyanide content of cassava, a staple food in Africa, leading to neurological disabilities and death.

Food insecurity.

Food insecurity is a major problem worldwide. Demand for meat, fuel prices, displacement of food crops with those grown for biofuels all contribute. But extreme weather events today are the acute driver. Russia's extensive 2010 summer heat-wave (over six standard deviations from the norm, killing over 50,000) reduced wheat production ~40%; Pakistan and Australian floods in 2010 also affected wheat and other grains; and drought in China and the U.S. Southwest are boosting grain prices and causing shortages in many nations. Food riots are occurring in Uganda and Burkino Faso, and the food and fuel hikes may be contributing to the uprisings in North Africa and the Middle East. Food shortages and price hikes contribute to malnutrition that underlies much of poor health and vulnerability to infectious diseases. Food insecurity also leads to political instability, conflict and war.

If global warming increases IPCC (WG-II, 2007) projects the following trends, where we include only those that are assigned either high confidence or very high confidence: (1) increased malnutrition and consequent disorders, including those related to child growth and development, (2) increased death, disease and injuries from heat waves, floods, storms, fires and droughts, (3) increased cardio-respiratory morbidity and mortality associated with ground-level ozone, (4) some benefits to health, including fewer deaths from cold, although it is expected that these would be outweighed by the negative effects.

7. Societal Implications

The science is clear. Human-made climate forcing agents, principally CO₂ from burning of fossil fuels, have driven planet Earth out of energy balance – more energy coming in than going out. The human-made climate forcing agents are the principal cause of the global warming of 0.8°C in the past century, most of which occurred in the past few decades. Earth's energy imbalance today is the fundamental quantity defining the state of the planet. With the completion of the near-global distribution of Argo floats and reduction of calibration problems, it is confirmed that the planet's energy imbalance averaged over several years, is at least 0.5 W/m². The imbalance averaged over the past solar cycle is probably closer to 0.75 W/m². An imbalance of this magnitude assures that continued global warming is in the pipeline, and thus so are increasing climate impacts.

Global climate effects are already apparent. Arctic warm season sea ice has decreased more than 30 percent over the past few decades. Mountain glaciers are receding rapidly all over the world. The Greenland and Antarctic ice sheets are shedding mass at an accelerating rate,

already several hundred cubic kilometers per year. Climate zones are shifting poleward. The subtropics are expanding. Climate extremes are increasing. Summer heat of a degree that occurred only 2-3 percent of the time in the period 1950-1980, or, equivalently, in a typical summer covered 2-3 percent of the globe, now occurs over 20-40 percent of Earth's surface each summer (http://www.columbia.edu/~jeh1/mailings/2011/20110327_Perceptions.pdf). Within these expanded areas smaller regions of more extreme anomalies, such as the European heat wave of 2003 and the Moscow and Pakistan heat waves of 2010.

Global climate anomalies and climate impacts will continue to increase if fossil fuel use continues at current levels or increases. Earth's history provides our best measure of the ultimate climate response to a given level of climate forcing and global temperature change. Continuation of business-as-usual fossil fuel emissions for even a few decades would guarantee that global warming would pass well beyond the warmest interglacial periods in the past million years, implying transition to literally a different planet than the one that humanity has experienced. Today's young people and following generations would be faced with continuing climate change and climate impacts that would be out of their control.

Yet governments are taking no actions¹³ to substantially alter business-as-usual fossil fuel emissions. Rhetoric about a 'planet in peril' abounds. But actions speak louder than words. Continued investments in infrastructure to expand the scope and nature of fossil fuel extraction expose reality.

The matter is urgent. CO₂ injected into the atmosphere by burning fossil fuels remains in the surface climate system for millennia. The practicality of any scheme to extract CO₂ from the air is dubious. Potentially huge costs would be left to young people and future generations. The apparent solution is to phase out fossil fuel emissions in favor of clean energies and energy efficiency. Governments have taken steps to promote renewable energies and encourage energy efficiency. But renewable energies total only a few percent of all energy sources, and

improved efficiency only slows the growth of energy use. The transition to a post-fossil fuel world of clean energies is blocked by a fundamental fact, as certain as the law of gravity: as long as fossil fuels are the cheapest energy, they will be burned.

However, fossil fuels are cheapest only because they are subsidized directly and indirectly, and because they are not made to pay their costs to society – the costs of air and water pollution on human health and costs of present and future climate disruption and change. Those people who prefer to continue business-as-usual assert that transition to fossil fuel alternatives would be economically harmful, and they implicitly assume that fossil fuel use can continue indefinitely. In reality, it will be necessary to move to clean energies eventually, and most economists believe that it would be economically beneficial to move in an orderly way to the post fossil fuel era via a steadily increasing price on carbon emissions.

A comprehensive assessment of the economics, the arguments for and against a rising carbon price, is provided in the book *The Case for a Carbon Tax* (Hsu, 2011). An across-theboard

price on all fossil fuel CO₂ emissions emerges as the simplest, easiest, fastest and most effective way to phase down carbon emissions, and this approach presents fewer obstacles to

international agreement.

The chief obstacles to a carbon price are often said to be the political difficulty, given the enormous resources that interest groups opposing it can bring to bear, and the difficulty of getting the public to understand arcane economic issues. On the other hand, a simple, transparent, gradually rising fee on carbon emissions collected, with the proceeds distributed to the public, can be described succinctly, as it has by Jim DiPeso, Policy Director of Republicans for Environmental Protection <http://www.rep.org/opinions/weblog/weblog10-10-11.html>

A gradually rising carbon price is the sine qua non, but it must be combined with a portfolio of other actions: energy research and development with demonstration programs; public investment in complementary infrastructure such as improved electric grids; global monitoring systems; energy efficiency regulations; public education and awareness; support for climate change mitigation and adaptation in undeveloped countries. In economic theory, within a nation or a common block of nations, a carbon trading system may be useful, but given the need for rapid global emissions reduction, a simple across-the-board carbon tax is the preferred approach from the standpoint of conservative economics (Mankiw, 2007).

The basic matter, however, is not one of economics. It is a matter of morality – a matter of intergenerational justice. The blame, if we fail to stand up and demand a change of course, will fall on us, the current generation of adults. Our parents honestly did not know that their actions could harm future generations. We, the current generation, can only pretend that we did not know.

<([#1 [2.2] I am very disappointed with the BLM preference fore Alternative 2. It sounds like the BLM has taken a firm stance agains any Oil Shale Research and development programs. The BLM has obviously not asked for input from the industry, because this alternative does not provide incentive for industry to invest their monies into this resource. If it is the BLM responsiblity to manage our resources, I would say your progress so far has failed miserably. The BLM will be effectively shutting down the potential for long term job creation and sending a very bad message to the industry. What about national security? Is production of U.S. Oil reserves not part of the big picture? Alternative energies are a great mix to the energy spectrum, but you can't walk around blind expecting them to take the place of fossil fuels in the near future. #1)>

See Attachment.

Mr. Ken Salazar

Secretary

Department of the Interior

1849 C Street NW

Washington DC 20240

February 29, 2012

Dear Secretary Salazar,

<([#1 [2.2.1] As faith based organizations and religious institutions, we write to express our gratitude for recent decisions made by the Department of the Interior, regarding uranium mining in the Grand Canyon, as well as removing two million acres of public land from oil shale development. As people of faith, we are called to serve as stewards of God's great Creation and we believe that lands serve as a place for reflection, prayer, and time with God. Each of these actions taken by the Department of the Interior will ensure more places and spaces are available, while limiting the amount of large scale development that can cause detrimental impacts to the lands and all those that depend on them. #1])>

Mining for uranium in the Grand Canyon has long been a controversial issue. Though we, as communities of faith, do not share a collective position on the use of nuclear power as an energy source, we do share the belief that mining for uranium is not appropriate in fragile places such as the Grand Canyon. The beauty of this place is irreplaceable and surface mining of this nature would have a devastating long-term impact on the health of the Grand Canyon and the areas that surround it.

In addition to protecting the beauty of the Grand Canyon, we stand in solidarity with the tribal communities that oppose mining in the Grand Canyon and have cultural and spiritual ties to the Canyon. The Hopi, Navajo, and Havasupai, along with other tribal entities, oppose expanded mining and have suffered from historical mining in the region that has contaminated the local water and air.

<([#2 [2.2.1] Finally, your decision to withdraw more than two million acres from proposed oil shale development is appropriate for this time and the place. Designating any public lands for energy development that is not yet commercially viable is not a wise use of the lands that have been given to us. Stewardship in our traditions addresses stewardship of all our gifts – including money and Creation.

Within the territory withdrawn from oil shale development lies Adobe Town a unique formation in the heart of Wyoming's Red Desert. Adobe Town represents those parts of God's Creation that are worthy of permanent protection. While we believe that energy development is appropriate for certain parts of God's Creation, there are places and spaces that should remain untouched so that future generations can enjoy the beauty of Creation while also having a place to pray and reflect as Christ, Moses, and Abraham did in Biblical times.

Thank you for recognizing that using God's Creation wisely and protecting unique and valuable parts of Creation should be central in our development of land use practices and policy. We look forward to working with you in the future as you continue to plan for the use of public lands all across the United States. #2])>

<([#1 [12.2] I oppose the plans to open two million acres of public land to commercial leases for oil shale exploration and exploitation. Oil shale currently produces no jobs and no revenue. The Congressional Budget Office confirmed no significant revenues through 2022. Oil shale mining will destroy some of the best wild life habitat in Colorado, Utah and Wyoming. Outdoor recreation, tourism and agriculture are huge economic drivers in the West. The price of undisturbed wilderness is incalculable Already the West faces significant water shortages. Estimates range from 3 to 12 barrels of water are needed for every one barrel of oil produced from oil shales. Entire aquifers and watersheds could be polluted with heavy metal and chemical runoff. Thank you for your attention to this serious environmental decision. #1])> Cynthia Patterson

<([#1 [12] While domestic energy is important, tar sands and oil shale go against common sense good practices and the prevailing science. Tar sands and oil shale extraction is energy intensive, which means more expense and more CO2 released. Local air pollution and water pollution is a great concern, and the science has not been adequate to show that extraction can be accomplished without significant pollution side effects. Additionally, too much water is used in the extraction process, particularly in areas where water is scarce (consider availability in severe to extreme droughts which are inevitable). #1])> <([#2 [10.6.1] BLM should be prioritizing solar, wind and geothermal sources of energy. #2])>

Submission Text

<([#1 [12.2] Oil shale rock found in the Green river basin contains solid bituminous materials called kerogen. With great difficulty, expense, heat and water the rock can yield oil. After billions of government dollars spent over 86 years, all attempts to develop oil shale have failed. The BLM estimates that it takes 1 to 4 barrels of water to produce a barrel of oil. Water is scarce in Utah and oil shale demand will harm agriculture and future populations. Even with in-situ processes, water pollution is virtually inevitable and CO2 emissions are estimated to be 25 to 75% higher than conventional oil. We live on a finite planet and must greatly reduce use of fossil fuels in the near future if the planet is to sustain our children. Scientists that study climate are nearly unanimous that global warming is serious and human caused. However, propaganda from the fossil fuel industry, has 60% of the general public in doubt. Clean solar and wind energy with electric vehicles are much better choices for Utah and the US. I strongly urge the BLM to end or greatly limit any oil shale development.

Submission Text

<([#1 [4.3] The area being considered for oil shale development has already seen energy development that has negatively impacted wildlife and air quality. Before the BLM leases any new projects, the downward trends need to be addressed. #1])> <([#2 [5] [10.4] In addition, oil shale development under current technology uses too much water, and produces high levels of emissions. Any new development in this region needs to be held to a higher standard. The posting of bonds, a detailed plan to reduce impacts, and mitigation that should leave the environment better than before are minimal steps that need to be taken to ensure the long term sustainability of this ecoregion. The BLM could go a long way to rehabilitate this region by returning bison, whose beneficial influence has long been missing. The most important thing about this region is the open space, the lack of noise and people, clean air and water, and

abundant wildlife. The whole is greater than the sum of the parts. All of these things need protected. #2])> Thank you.

Submission Text

<([#1 [12] Living in a pristine environment where tourism is our number one source of income, I am strongly opposed to oil shale and tar sands exploration and extraction. Not only are these activities dirty, dangerous and environmentally unsound, but the economic base of our rural lifestyle is completely undermined. A tremendous amount of water is lost and the time to “recharge” is unknown. Surely this is madness. Fracking needs to be stopped, now, for the health of our forests, rivers air and land. Pity the poor ranchers that will go bankrupt when their properties are destroyed by the degradation attendant upon this type of drilling. Let adjacent communities decide the best use of BLM land, e.g. grazing, hiking, fishing, hunting. We need to protect our health and safety, and that of domestic and wild animals, not enrich foreign oil and gas interests. #1])>

Dear sirs: <([#1 [12.3] I strongly feel that the whole oil shale and tar sands issue is a total waste of our resources; especially our limited water supplies. This technology is unproven and devastating to the areas where it is done and will greatly degrade our environment and outdoor recreation in our state of Utah. I feel that no federal land should be leased to these companies until more renewable forms of energy are supported and explored. #1])> Sincerely, Larry Hardebeck

Comments on PEIS

by Roger E. Moore, P.E. Chemical Engineer

<([#1 [2] [3.15] The draft PEIS encourages surface mining in Utah and Wyoming and precludes surface mining

in Colorado. The draft spells out the criteria for surface mining, < 500 ft of over burden and beds >25 ft thick, yet ignores the Donnell (1987) paper that the PEIS references. The Donnell paper identifies a large area in the northwest corner of the Piceance Basin which satisfy the selection criteria. Estimates of the surface mineable acreage are larger than the total proposed for new leasing in Alternative 2(b). (page 2-20). The maps in the various figure need section lines so they

can be compared to previous work by others such as Donnell

#1])> <([#2 [6.3.6] The retorting technology discussion does not mention the Brazilian oil shale surface retorting process, Petrosix. This technology has operated a large commercial retort since the 1980's. (page 2-19)

The use of surface mining and surface retorting is probably the least expensive combination for producing shale oil commercially and is the most logical first step. Environmentally, it probably has the least long term impact, ie Unocal's project, and avoids the unanswered questions of cleaning up in-situ retorts.

#2])> <([#3 [2.2] The Alternative 2(b) identifies 35,000 acres to lease which is about 7% of the Picaence Basin resource. This PEIS is not encouraging development of the United States resources. (page 2-43) The leasing program does not need to be an RD&D lease first. If a company believes they can do a commercial project, they will have to meet all the regulations for emissions and cleanup. The PEIS seems to ignore what was done in the 1980's. Shale mining and retorting was proven technically by Unocal but development stopped when the oil prices dropped from \$30-35/bbl to \$12-15/Bbl. We are certainly above those oil price levels now and those prices will never be seen again.(ES-7)

Personally, this plan reflects Secretary Salazar's "no development in Colorado" attitude.

<([#1 [12] What saddens me more than anything is that to date billions of dollars have been spent and decades have been lost to oil shale exploration. Years and dollars that could have gone to alternative, renewable energy resources. If the BLM truly cared about our natural resources they would protect them, rather than exploit them. If the "energy" companies were truly about "energy" they would put their valuable time and money into energy sources that don't obliterate the environment and make people sick. **#1])>**

<([#1 [2.3.1] In the recently-released Draft PEIS, the BLM's preferred alternative (Alternative 2b) proposes to make 252,181 acres available for shale leasing in Utah and 91,045 acres available for tar sands leasing. BLM's proposal would leave these lands open for speculative development that could foul public lands, air and water quality, and result in large quantities of greenhouse gasses. I support the alternative that prohibits new oil shale leasing and most tar sands development. Under this alternative, only existing oil shale research, development, and design leases would remain on public lands. One commercial tar sands project just outside of Vernal could continue to undergo environmental reviews and permitting. #1])>

<([#1 [12.2] Given the current technology, I oppose oil shale development for the following reasons: Oil shale would foul our air and water, soak up enormous amounts of water, and disrupt local economies. Annual commercial oil shale production could require one-and-a-half times the water needs of all 1.3 million Denver Water customers. Where would that water come from? Oil and gas companies are abandoning oil shale research independently, yet the State of Utah is still preparing to turn over public resources for speculative development. That's like building a factory before you know how to make the widget. It doesn't economic, environmental, or social sense. #1])>

<([#1 [I2] Extraction requires high temperatures, enormous supplies of water and huge amounts of energy with not much bang for the buck. I agree that land use much be restricted especially

since the technology is questionable at best. If there is a spill (and there will be), tar sands oil sinks to the bottom of rivers/streams and cleanup is almost impossible. I want my public lands clean, my water clear and safe and my wildlife protected. Fracking and tar sands extraction are a dangerous mess with no proven method of clean-up or protection for those in its path. Finally, much of our current oil is sold to other countries. The US takes the risk and other countries and 'big oil' benefit. #1)>

March 19, 2012

Comments on the BLM's Programmed Environmental Impact Statement [PEIS] for Oil Shale and Tar Sands in Colorado, Utah and Wyoming,

March 19, 2012 Mark Hilberman

<([#1 [3.1.2] A group of worried ranchers attended the presentation of the draft document in western Colorado on March 12, 2012. None of the BLM maps in the PEIS show where and how existing land use will be disrupted by any of the proposed plans. Nevertheless, it is clear that fossil fuel extraction in these areas will disrupt existing ranching and recreational uses in these dry western lands. This arid portion of the country is projected to become dryer still. Furthermore, scars upon the land heal slowly: witness still evident 150 year old Pony Express and immigrant trails.

#1])>

<([#2 [3.4.1] Water consumption and potential contamination is of great concern: the Colorado River no longer drains into the ocean as existing human and agricultural usage already consumes all its water. #2])> <([#3 [10.6.1] Moreover, DOE Secretary Chu's recent statement to Congress that our priority goal should be to develop alternative energy sources is correct.

#3])>

<([#4 [2.2.1] [2.3.1] With this in mind [land use change, water quality & quantity, and alternative energy goals] alternatives 2 or 3 make the most sense. Alternative 2b which requires and RD&D phase first is presently preferred by the BLM allows for the gathering of additional essential information for rational future decision making.

· However, there is no evidence in this document that the BLM intends to gather new information beyond simple technical extraction issues. A significant part of the BLM's responsibility to the American public is to determine the feasibility, environmental cost and impacts of using these resources at this time. Therefore, this information should be obtained if RD&D leasing proceeds and such leasing should proceed slowly to facilitate the data gathering needed to decide upon more extensive commercial exploitation. #4])>

<([#5 [3.5.1.1] · In the past several decades the climate science community has become much more concerned about the future adverse impact of global warming:

“Finally, we are close to dead certain, from the Greenland ice cores and other climate records, that abrupt climate changes did actually occur during the Ice Age, . . . The existence of abrupt climate change is by now more of an observational fact than a theory. . . . [A furry stuffed toy snake hangs in the window of Broecker’s office with a sign around its neck:] “I am the Climate Beast and I am Hungry.”[1]

· In February of 2012 the USDA released it’s reclassification of the climate zone of Aspen from Zone 3 to the significantly warmer Zone 5, based upon minimal winter temperature measurements – this after only 22 years since the prior 1990 classification. We have just had one of the warmest winters on record, an unusual early spring and unusually early and violent tornados in the Midwest. Increases in greenhouse gas concentrations which have risen more steeply since ~1960 and record rising temperatures suggest these are harbingers of climate change rather than simply weather phenomena. It is clear that global climate change issues must be considered in the RD&D analysis. Moreover, the potential cost of climate change dwarfs the cost of working fast to minimize and then reduce greenhouse gas production.

#5)>

<([#6 [6.3.4] · I asked George Richardson, a friend who knows energy business intimately to comment on my note. He referenced his group’s website www.usenergypolicycoalition.org and stated:

“From my perspective, **the scarcity of water**, already an issue in the west, coupled with **the dramatic amount of energy needed to produce these resources** (EROEI, or energy return on energy invested) are enough to take them off the list of future energy choices without a viable method of CCS (Carbon Capture and Storage). From my 20 odd years in the oil and gas business, seldom did anyone ever deal with much more than “financial costs” and rates of return on a field or individual wells. . . . Oil shales, and tar sands, are “bottom of the barrel” choices in that they are heavier oils that are sticky bitumens that contain little or no of the high octane lighter hydrocarbons that combust at lower temperatures. . . . if one considers the true total “economic” cost per barrel, as compared to coal gasification or liquified natural gas, we will probably never develop these resources, especially if they are in competition with farmers who need lots of water to irrigate their crops. The normal game played by the petroleum industry is to try to garner subsidies that will help develop a profitable business model for oil shale development and then the subsidies never go away and the business flounders if the subsidies are withdrawn because the economics require perpetual subsidies by the government.”

#6)>

<([#7 [9.7] · Given the land use, environmental, water, global climate, socioeconomic and other issues involved in progressing to full scale commercial development it is *derelict* for the BLM not to have specified an ongoing collaborative research endeavor in the PEIS. The high energy consuming forms of proposed fossil fuel extraction from rock and sand need to be evaluated critically and quantitatively in view of their apparent unnecessary and excessive contributions to climate change, compared to fluid oil and gas fossil fuels. Yet there is no clear statement of the goals and parameters to be evaluated by the government in the R&D phases of the project. #7)>

<([#8 [10.4] · Finally, I live around the corner from Coal Creek in Redstone, Colorado where the effluvia from an unrestored, abandoned coal mine site continues to pollute. Bonds may cover the RD&D phase, but once commercial exploitation is permitted a significant revenue stream, sufficient to cover worst case reclamation costs needs to be secured and set aside. If all the funds are not needed to reclaim the site from which they were derived they can be used to restore a multitude of sites such as Coal Creek and the abandoned Mid-Continent coal mine. #8])>

<([#9 [9.3] · p 62 [1-16]: The purely technical issues are likely to be solved an RD&D phase focused upon the technical feasibility of producing “commercial quantities of shale oil from the lease.”

o On p 66, there is a provision for “site-specific analysis . . . prior to issuance of . . . leases, the environmental consequences to specific resource values and uses within areas . . . would be analyzed.” This vague hand waving should be replaced by a clear definition of comprehensive research objectives and decisional parameters. These obvious data requirements are nowhere specified, indeed in some sections it sounds as if they will not be obtained [see appendix J 3.1.3]. #9])>

<([#10 [9] · pp77-78: There should be specific acknowledgement of the excess energy, water use and possible contamination issues related to fracking or similar technologies used for *in-situ* extraction of oil and gas from tar sands and shales. How will they be monitored during RD&D and or prevented or detected presuming leases are granted? #10])>

<([#11 [9.3] · p. 92. States BLM plan to do a NEPA analysis. At the risk of boring: what additional data will be collected prospectively upon which to base this decision? #11])>

<([#12 [3.15] · p 209 ff. A great deal of information about present, past and possible future uses of valuable fossil fuel deposits, recreational, farm and ranch use and other material. However, the maps presented completely fail to adequately depict present farm, ranch and recreational uses in the region. There is a great deal of land here that could be abused by little justified, poorly planned, overzealous use for poor grade fuel. #12])>

<([#13 [9] · Volume 2.

This volume reviews the multiple impacts of the proposed technologies in detail. There is no plan for adequate measurement of adverse impacts which occur during the RD&D or initial commercial exploitation phases, nor does it specify how such measurement would be used in the final decision processes for proceeding with commercial exploitation of these valuable fossil fuel resources.

#13])>

- <([#14 [3.4.1] The proposed explorations are in an arid part of the country. Therefore, it is essential that the BLM measure the effect of the oil and gas research and commercial use phases on river water and underground water quality, especially in the RD&D phase. #14])> <([#15 [6.2.3] page 79 [4-55] It is a truism that localized GHG production will

have a minimal impact on global GHG production. Nevertheless, the extra GHG produced extracting oil and gas from shale and sand make these dirty sources of energy compared to the use of fluid oil or gas. This extra impact should be quantified by the BLM with the EPA and DOE. #15)>

<([#16 [1] · Volume 3.

The impacts are time broken down by the different proposed alternatives. **Review of the BLM proposals would be facilitated by combining volumes 2 and 3. #16)>**

· Volume 4:

<([#17 [1] Reviews the comments made after the initial public presentations. What is not clear is why issues were considered outside the scope of the PEIS. As an example, the BLM rejected baseline environmental studies as involving too great an area to be practical [J.3.1.3, pp J-19 ff, or V.4, 425 ff]. However, the BLM does not appear to contemplate an essential step for future decision making: conducting a relevant set of measurements in each of the RD&D lease areas. Absent this information it is difficult to understand how final decisions can be properly made.

#17)>

<([#18 [3.5.1.6] The comment that green plants mitigate CO2 release [V4 - p423 (J-17), line 46] is a truism and false: – green plants have not been able to keep up with the Anthropocene’s fossil fuel consumption and release of CO2 and this will not change. Available climate science data indicate that CO2 production needs to be slowed, then decreased and sooner rather than later.

#18)>

Submission Text

<([#1 [12.3] There should be NO extraction or “development” of fossil fuels on public lands. It is imperative for the safety of all people that we solve our energy crisis by rapidly ratcheting down our consumption of fossil fuels and rapidly ratcheting up development and utilization of carbon-neutral energy sources such as wind and solar energy. The use of public lands to pursue fossil fuels is a disgrace to our country and to humanity and makes me ashamed to be an American. We are tinkering with our climate, a system on which being alive depends. Our food

crops, including staples such as rice and wheat, cannot produce a sufficient yield in a hotter climate, to feed us. It is unthinkable and unconscionable to even so much as RISK a disastrously hotter climate, yet you would have us blithely stay on track to guarantee this ugly outcome. We, the public, know that you all take bribes from oil companies to allow this. SHAME on you for even considering using our public lands in this way. #1)>

Submission Text

<([#1 [1] We need energy and no one chooses to freeze in the dark rather than use available resources. Blocking technological development out of fear rather than guiding it brings only poverty and want and war. Hydraulic fracturing in deep shale has now given us a 100 year supply of natural gas but we still need to import oil. In-situ heating and production of oil shale can make us energy independent in oil for 100 years if we embrace it. Then we will no longer be

manipulated by other oil producing nations. If we let environmental fear dominate our thinking instead of innovation, then we will continue to offer tribute to foreign kings and tyrants begging their indulgence and compromising our ethical standards for foreign oil. The price of energy will continue to increase causing suffering for all the world's poor. #1)> <([#2 [9.2.6] [6] Sound primary cementing techniques for wells and proper safe design and recycling of fracturing fluids are needed for safe shale gas production. So also we will need proper perimeter barriers such as wax sealant or grout walls and freeze walls to isolate the oil shale producing areas from groundwater. We need techniques to prevent pollution of water aquifers. The good news is that we can have anything we need if we place wise regulations and requirements in place instead of silly fear-based moratoriums and bans on a method rather than the outcome of a method. There is always some "environmental impact" but what we have to ask is "is it really significant compared to feeding the poor, preventing war, and improving the standard of living for all our people. Simply specify what is to be protected, define permissible impact and let the engineers do the rest. Show some leadership! Specify the recycling of the required water resources. Specify the levels of certainty and environmental foot print, place tax incentives on doing it better, and let private enterprise find the optimal solution without micro-managing it. New slot drilling techniques and underground electric heating allow efficient heating of subterranean areas to convert shale kerogen into liquid hydrocarbons in in-situ reservoirs a mile square. Vast quantities of oil and gas may be produced so that the world price of energy will be held in check. Depleted oil shale wells will make great carbon dioxide sequestration reservoirs if this is found significant to climate change. The rest of the world is going to produce oil shale whether we do or not. We have the chance right now to show them the most environmentally responsible way to do it. Or we can sit on our hands whining that "something may go wrong" and refuse to take responsibility for proper stewardship of the resources we are given. Throughout the world, children starve for lack of government economic leadership a thousand times more often than they are harmed by all kinds of energy production combined. #2)> <([#3 [11.2] Like every other kind of energy, oil shale conversion takes energy and water to produce energy. We will always need liquid hydrocarbons for plastics and chemicals even if we could invent batteries good enough to run electric cars. You will never be able to collect energy from sun or wind as cheaply as exploiting a source of energy that has already been concentrated for you. If you want to be greener, just spend the money to design safer nuclear power systems instead of using 70 year old technology that was never intended to be a long term plan. In addition to safety issues these old reactors waste 90 percent of the energy into waste. Fifth generation nuclear reactor designs can remain inherently safe with automatic shutdown even if cracked open by an earthquake or a terrorist bomb. Newer designs could actually burn the spent fuel from old reactors. Thorium based reactors generate no radioactive waste at all and stop instantly when you shut off the neutron generator. They could be used to safely generate the heat to harvest the oil shale if the government would be responsible and spend the money to develop them. If global warming was really an important issue we would have already been doing this research. Ignorance and environmental fear have made it too expensive for private industry to develop the clean nuclear energy we need. If we are not careful and wise, fear will also rob us of the wonderful resource represented by oil shale.

Submission Text

Dear Sir or Madam, Please consider these comments regarding the 2012 Oil Shale and Tar Sands Draft PEIS, which will determine what areas Utah, Colorado, and Wyoming should be available for oil shale or tar sands leasing and development. <([#1 [2.3.1] I urge you to select Alternative 3. Alternative 3 allows only existing oil shale research, development, and design leases on public lands. The commercial tar sands project near Vernal could continue to undergo environmental reviews and permitting. Three barrels of water are required to extract one barrel of oil. Ninety percent of this polluted water is dumped into tailing ponds. The discharge water is polluted with heavy metals, cyanide and ammonia. Tar sands are the fastest growing source of global warming in Canada. Tar sands extraction destroyed large areas of Canadian boreal forest, polluted water and poisoned the air. As gasoline prices inch upwards, there is pressure to drill and extract more. I urge you to protect our American West from the short-sighted destruction we see in Canada.

Colorado Department Of Public Health & Environment
Air Pollution Control Division
Technical Services Program
Modeling, Meteorology, and Emission Inventory Unit

Technical Memorandum

To: Jim Dileo

From: Kevin Briggs

CC: Chuck Machovec, Daniel Bon, Dale Wells

Date: April 4, 2012

Subject: Comments on : Draft Programmatic Environmental Impact Statement and Possible Land Use Plan Amendments for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah, and Wyoming- January 2012

<([#1 [9.3] [3.5.4] In Volume 2, Chapters 4 and 5, page 4-52, lines 32-38, the Draft PEIS states that

“It is not possible to predict site-specific air quality impacts until actual oil shale projects are proposed and designed. Once such a proposal is presented, impacts on these resources would be further considered in project-specific NEPA evaluations and through consultations with the BLM prior to actual development. As additional NEPA analysis is done for leasing and site specific development, it may be necessary as part of the air quality analysis to conduct air quality modeling. The types of modeling that may be performed, when warranted, include near-field modeling, far-field modeling, and photo-chemical grid modeling.”

Comment:

As the RD&D projects are expanded from 160-acres to commercial leases, it is expected that local and cumulative air quality resources will be effected as stated throughout the documents. Prior to doing any NEPA analysis, an air quality modeling protocol needs to be submitted to reviewing agencies, including CDPHE, describing how near-field, far-field transport modeling and photochemical grid modeling will be performed for oil shale/tar sand development in order to reach an understanding of how the air quality impact analysis will be conducted.

In addition, given the uncertainty in actual oil shale projects that may be proposed, the magnitude of development and how those projects might be designed, it is imperative that base line air quality be determined through a robust monitoring network prior to construction. The monitoring network should be constructed in a way to provide year-round characterization of existing air quality levels, improve the accuracy of modeling, and to improve the ability of CDPHE to issue air quality advisories to the general public if warranted by monitored conditions. It is recommended that BLM work with the State of Colorado to establish an air quality monitoring fund (or another method) to expand the existing air quality monitoring networks as deemed appropriate by CDPHE to gather meteorological and air quality data at micro, local, and regional scales for these projects. Funding levels should be sufficient to include AQRV/visibility monitoring at potentially affected mandatory federal Class I areas such as the Rocky Mountain National Park and the Flat Tops Wilderness Area. Funding should also be sufficient in order to provide and establish long term air quality monitoring throughout the project's lifetime. CDPHE also recommends that such a funding source be flexible enough to allow for future monitoring to include HAPS (such as carbonyl compounds), speciated VOCs (especially BTEX) and greenhouse gases (especially methane). Monitoring of these types of emissions are notably absent in the oil and gas development areas of western Colorado. It is recommended that the private sector proponents of oil and gas development fund the regulatory monitoring network enhancements.

Comments on Draft Programmatic Environmental Impact Statement (PEIS) and Possible Land Use Plan Amendments for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah and Wyoming

<([#1 [9.3] General: There are very few conclusions reached in the PEIS and minimal technical data because of the speculative nature of this document. There are multiple references throughout the document to the effect that it is not possible to predict specific air quality impacts until actual oil shale projects are proposed and designed. Once a project is proposed, prior to a lease being approved a site-specific NEPA analysis must be submitted and approved. At this point, the Division's technical expertise will be best used. #1])>

Specific Comments:

<([#2 [3.5.5] Chapter 3.5.2 Existing Emissions, lines 39-41 of page 3-105 states that, "...annual emission inventory data for criteria pollutants and volatile organic compounds (VOC) for 2002 for counties within and around the study are in Colorado..."

Comment: There has been significant oil and gas expansion in the Piceance region, where the Oil Shale exploration will take place, since 2002. As a result the emission inventory is outdated. A more recent data set should be obtained and used. #2])>

<([#3 [6.3] Chapter 4.1.3 In Situ Retort Projects, lines 12-14 of page 4-12 states that, "100% of combustible gases recovered from the formation would be dewatered, filtered of suspended solids, and consumed on site as supplemental fuel in external combustion sources."

Comment: During an APCD inspection of the Shell Mahogany project, gases recovered from the formation were flared, not used as supplemental fuel. Suggested revision is to include possibility of flaring gases. #3])>

<([#4 [9.3] Chapter 4.6.1 Common Impacts, lines 20-21 of page 4-53 states that, "Before oil shale development could occur, additional project-specific NEPA analyses would be performed, subject to public and agency review and comment."

Comment: Given the limited information provided in the PEIS, it's at this site- and project-specific level that the technical expertise of the O&G Team can be best used. #4])>

<([#5 [3.5.3] Chapter 6.1.1.5 Air Quality (of Alternative 1), line 26 of page 6-11

Chapter 6.1.2.5 Air Quality (of Alternative 2), line 1 of page 6-73

Chapter 6.1.4.5 Air Quality (of Alternative 4), line 21 of page 6-176 all chapters state that, “If development of oil shale requires expansion of capacity of existing electric power plants...”

Comment: It is believed that the development of shale *will* require additional power capacity. Suggested revision is to strengthen this language to reflect that commercial development will more than likely require additional power capacity. #5)>

<([#6 [9.3] **Chapter 6.1.5.5 Air Quality, lines 30-35 of page 6-229** states that, “...impacts would be considered in project-specific NEPA analyses that would be conducted at the lease (including conversion from any RD&D to a commercial lease) and development phases of projects.”

Comment: It is unclear if BLM expects companies to halt production and expansion of a project from the RD&D phase to the commercial production phase or if this analysis will take place while a facility is expanding. Suggested revision: please clarify what is expected of a company and when the public and agencies have an opportunity to analyze additional impacts. #6)>

OSTS2012D50073**Organization:****Received:** 4/4/2012 10:51:17 PM**Commenter1:** - , (United States)**Organization1:****Commenter Type:** Member of the Public**Classification:****Submission Category:** Standard Web Form**Submitted As:** Web Form**Form Letter Category:****Form Letter Master:****Current Task:** Issues Entered **Assigned/Due:** mMcHugh 4/13/2012 12:00:00 AM**Attachments:** OSTS2012D50073.htm (OSTS2012D50073-58318.htm Size = 1 KB)**Submission Text**

<([#1 [1.1] [2.2] I am relieved to see BLM taking a more sound approach to development of oil shale and tar sands on our public lands, and hope the agency will continue to close inappropriate places to leasing based on information received during the public comment period. #1)>

Our comments are attached. <([#1 [1.1.1] Recommend extending the comment period to 60-days after the draft Oil Shale Leasing Regulations are issued. Both are linked, and have to be reviewed together. #1])> See Attachment.

Comments on the

Draft Environmental Impact Statement and Possible Land Use Plan Amendments for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land

Management in Colorado, Utah and Wyoming January 2012 – Volumes 1 through 4 – DES 12-01

by

National Oil Shale Association – P.O. Box 3080, Glenwood Springs, CO 81602

natos@comcast.net – www.oilshaleassoc.org

April 2012

- BLM has decided to redo the Oil Shale and Tar Sand Programmatic Environmental Impact Statement.... (PEIS) and Commercial Oil Shale Leasing Regulations (Regulations) completed in 2008. BLM's actions resulted from a settlement by the Department of Interior of law suits brought against the 2008 PEIS and Regulations. There is little, if any, new information to be considered, and the 2012 draft PEIS contains largely the same information as the 2008 final PEIS. However, the BLM has chosen a different preferred alternative 2(b) that significantly reduces the acreage available for oil shale leasing, eliminates the issuance of commercial leases, and restricts leasing to Research, Development and Demonstration (R,D&D) leases only.

<([#2 [2.1] • Alternative 1, Oil Shale No Action Alternative, in the new PEIS, preserves the actions taken in the 2008 PEIS, and is the alternative favored by NOSA.

- The 2008 PEIS was very professionally done, received thousands of comments, involved the public and resulted in a preferred alternative that provided a reasonable amount of acreage for potential commercial leasing, while still designating environmentally sensitive and other areas deemed unsuitable for leasing.

#2])> <([#3 [9.6] • BLM's preferred alternative (2b) in the new PEIS restricts leasing to R,D&D leases only and defers decisions on commercial leasing for years. This is a disincentive for companies that have access to technologies that are commercially viable. Going through the R,D&D process will delay bringing oil shale into production. Also, unknown lease terms for

future R,D&D leases is yet another disincentive for companies interested in producing shale oil (e.g. 2nd round R,D&D leases offered insufficient Preference Right acreage to support a commercial project in the opinion of many companies), and other terms of the leases are more restrictive than those in the 1st round R,D&D leases. Only three companies sought 2nd round R,D&D leases, whereas about 20 companies sought 1st round R,D&D leases).

#3])> <([#4 [9.6] • Eliminating commercial leasing closes the door to some companies that could responsibly develop the resource, provide jobs, and produce tax revenues to local communities. Leasing oil shale is only the first step towards a commercial project. The BLM, Federal, State and local government agencies require a developer to go through additional environmental reviews and permitting activities that include public oversight before a project can go into production. It is estimated that two or three Environmental Impact Statements would be required, in addition to this PEIS, before a developer could break ground on a commercial venture. This PEIS and the 2008 final PEIS, only designate where oil shale leasing may occur and directs BLM field offices to change their planning documents accordingly.

#4])> <([#5 [1.1.1] • The draft 2012 oil shale leasing regulations have not yet been issued. It is difficult to comment intelligently upon the PEIS since the two are integrally linked. The BLM should consider extending the deadline for the comment period beyond May 4, 2012 to allow time for BLM to issue the regulations.

#5])> <([#6 [9.6.1] • Under Federal mineral leasing laws industry is allowed to lease oil & gas and minerals from BLM without a prior demonstration of the technology to be used to recover the resource. BLM for some reason has a different standard for oil shale. Developers decide whether to risk the cost of leasing a resource. They pay bonus payments to the Federal Government (shared with local communities) to acquire the lease. And lease rental payments are made to keep the lease during the time the developer is deciding whether to pursue a commercial venture. During that period, jobs are created and local communities receive sales, and other tax revenues.

#6])> <([#7 [2.2] • PEIS Alternative 2 reduces the acreage available for leasing to a level that most tracts in Colorado are too small and too dispersed to support a commercial project. The situation in Utah is somewhat better. Wyoming is similar to Colorado.

#7])> <([#8 [2.3] • Alternative 3 restricts leasing to the current 1st and 2nd round R,D&D lessees.

#8])> <([#9 [2.4] • Alternative 4(a) is very similar in acreage to Alternative 1, the No Action Alternative, but Alternative 4 (b) restricts leasing to R,D&D first leases only.

#9])> <([#10 [3.15] • Maps are in error in all three states

1. The oil shale cut-off grade was not consistently applied across the three states (e.g. 15 gpt in Wyoming and 25 gpt in Utah and Colorado). Assumptions about mining are over generalized (e.g. 500 ft. maximum overburden for surface mining in Utah and Wyoming , no surface mining in Colorado, and no consideration of underground mining in Colorado); thus the Most Geologically Prospective Oil Shale Resource areas should be corrected in each state map.
2. Preference Right acreage for the 1st Round R,D&D leases is smaller than already agreed upon between BLM and lessees (Figures 2.3.3-4 and 2.3.3-5 show portions of Preference Right areas are not available for leasing). If maps are the legal description of the actions BLM plans to take, then the maps should be changed.

#10])> <([#11 [9.6] • The fact that 2,000,000 acres were made available for leasing in the 2008 PEIS does not mean that amount of land would be leased or developed. Generally, industry chooses the acreage that it believes can be profitably developed. In the new PEIS, BLM has

assumed industry's role by choosing the lands it believes should be leased. Whereas the mineral leasing laws provide for leases of 5, 120 acres BLM is limiting the acreage to be leased, and deciding upon technological strategies to be employed by restricting leasing to an R,D&D first approach. So it seems BLM is choosing winners and losers, a role usually left up to industry. BLM has the authority to control development after leases are issued through environmental analyses and approval of development plans.

#11)> <(**#12** [10.5] • The current royalty rate for oil shale in the 2008 regulations is not a give-away. Oil shale is not oil and gas. Oil shale is more expensive to produce than conventional oil and gas. Thus the rates should be much lower initially during the pioneering phase of the industry.

#12)> <(**#13** [10.5] • In Canada the royalty rates for oil sands were set low initially in recognition of the pioneering nature of the industry. The Canadian government recently raised the royalty rates because the industry matured and could afford to pay higher rates. Canadians benefited from that strategy, and, as it works out, so did we in the United States, because today over a million barrels per day of oil from Canadian oil sands comes to U.S. refineries.

#13)> <(**#14** [3.4.3] [6.3.2] • Water used in oil shale processing is reasonable compared with many other energy sources (e.g. much lower than water consumed producing bio fuels from irrigated corn). There is a wealth of information on water usage and quality. A recent GAO report indicates there is enough water for a 500,000 b/d shale oil industry. The water consumption estimates used by GAO are conservative. They assumed the use of electric power generated from coal fired – water cooled power plants would be used to liberate shale oil via insitu heating. This approach does not reflect a consensus of industry thinking at this time. Low water usage has been recently publicized by developers of new and improved technologies (e.g. AMSO, Red Leaf and Enefit). Many companies have water rights to meet their long term needs.

#14)> <(**#15** [3.4.3] • A recent independent study sponsored by the Colorado River Conservation District showed that 120,000 acre feet per year of water would be required for a 1.55 million barrel per day shale oil industry. This is about 2-3 % of the water that flows from the Colorado River into Lake Powell annually. This study also used some liberal water usage assumptions. Much more water flows from Western Colorado to Front Range cities to meet their growing water needs.

#15)> <(**#16** [6.3.2.1] • Oil shale production produces more energy than it consumes. The range is 3:1 to 6:1. A huge drop in oil prices and political reasons caused oil shale development to stop in the 1980's. It had nothing to do with its energy content or energy recovery efficiency. A similar resource, the oil sands of Canada, proceeded after the drop in oil prices, because of industry-government cooperation. That industry is producing 1.6 million barrels per day of crude oil and sending over 1-million barrels per day of it to the U.S. The energy content of Canadian oil sands is less than the average Western U.S. oil shale.

#16)> <(**#17** [3.1.4] • The Piceance and Uinta Basins – where most of the oil shale resource is concentrated - are not pristine primitive areas. The cultural, wildlife, environmental, and recreational assets can be managed along with oil shale development as has been demonstrated by existing oil and gas operations in the region. The BLM appropriately designated certain sensitive areas inappropriate for leasing in the 2008 EIS. For some reason the preferred alternative in the 2012 PEIS designates substantially more acreage unavailable for leasing while relying on the same data. It also leaves a great deal of discretion to the BLM field offices to designate more sensitive areas in the future.

#17)> <(**#18** [3.1.7] • The concentrated nature of the oil shale resource (e.g. 1 to 1-1/2 million

barrels per acre in the middle of the Piceance Basin of Colorado) reduces the land use effects over similar energy recovery operations.

#18])> <(**#19** [9.8] • Re-visiting the PEIS and leasing regulations is delaying the time oil shale can provide more jobs and economic development in the three-state region and nationwide.

#19])> <(**#20** [9.8] • Western U.S. oil shale resources – now estimated by U.S.G.S. at 4-trillion barrels - are an important domestic energy asset that should be developed for the benefit of the American people. Re-visiting the PEIS and regulations completed in 2008 is delaying the development of the oil shale resource. The time required to develop an oil shale project is long, and the work should not be further delayed.

<(**#1** [3] I am deeply concerned about the potential effects to our water, wildlife, communities and public lands if the BLM initiates a commercial leasing program. The two million acres in UT, WY and CO previously allocated for commercial leasing is a massive amount of public, taxpayer land that would be sacrificed for a singular use of the landscape. I recommend that you carefully consider the serious impacts of new energy required for oil shale production and the potential devastating impacts to our wildlife, water, air, and communities as you take another look at oil shale development.

<([#1 [2.3.1] I would prefer that lands are only used for RDandD and that no commercial leasing be allowed until oil shale and tar sands technologies are made both safe to the environment and truly economical. I would prefer Alternative 3 (RDandD) although I realize it may not allow much RDandD for tar sands. Once we open up this land, it may truly be destroyed and may not go back to “public/wildlife” usage. Oil shale may be very harmful to our water supplies. This likely will effect rivers, outdoor recreation (economy) and wildlife. #1])> <([#2 [10.6.1] We should be putting our resources towards cleaner more sustainable energy sources, not opening up large areas of public lands/water to a potentially harmful and economically unsustainable industry. #2])> Thank You

<([#1 [12] Oil shale and tar sands development is one of the filthiest ways to produce energy, and extracting oil from our public lands in this way would deal a disastrous blow to any hope of reducing atmospheric CO2 levels to below 350 parts per million — the level we need to reach soon to stabilize Earth’s climate. Besides helping push us toward global warming catastrophe, oil shale and tar sands development would destroy species habitat, waste enormous volumes of

water, pollute air and water, and degrade and defile vast swaths of land. And since it's so wasteful, it's not even commercially viable yet. Don't do it. #1])>

<([#1 [12] We can not afford to have oil shale development in our country. All the water required is coming from where? Clean water sources. What about sensitive wildlife habitats? What about the few remaining horses that are wild? What about treasures such as ancient tribal lands? Ancient ruins? Beautiful rock art? What about recreational opportunities? If none of this matters to you, what about the fact that it takes just about equal amounts of energy to create the energy received? We're scraping the bottom of the barrel for this energy and once it's gone, then what? I say no to this whole idea. I do not live in an expendable area of the country. We treasure the beauty of everything we have here. #1])>

Comments Regarding the US DOI-BLM

Draft Environmental Impact Statement and Possible Land Use Plan Amendments for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah and Wyoming

<([#1 [9.8] 1. Why has the Federal Government decided to take a “fresh look” at the land use plan allocation decisions made in the 2008 PEIS? The 2008 PEIS was and still is a good document that adequately considers the land use plan. #1])>

<([#2 [9.8] 2. Why does the Federal Government need to “reconsider” which lands should be open to future oil shale leasing when a perfectly good plan was already in place? #2])>

<([#3 [9.8] 3. Why did the Federal Government waste tax payers dollars on an unnecessary and expensive process to recreate yet another PEIS when the 2008 PEIS was acceptable? How much did this 2012 PEIS cost the American taxpayers? They have a right to know. #3])>

<([#4 [1.3] 4. Why did the Federal Government not directly solicit input and consideration from the County of Mesa and the City of Grand Junction, Colorado, the county and city with the largest population base in the region? #4])>

<([#5 [2.2] 5. Why has the Federal Government chosen a different preferred alternative (2(b)) that significantly reduces the acreage available for oil shale leasing, eliminates the issuance of commercial leases, and is far too restrictive? #5])>

<([#6 [9.7] 6. Why does the Federal Government want to restrict oil shale to Research, Development and Demonstration (RD&D) leases only? Industry will not be encouraged by these restrictions and is an open indication that the current administration does not want nor encourages oil shale development in a time when it could be developed and would help secure our energy independence. The bottom line is that, by developing an oil shale industry, the US could keep jobs here in the US, develop a road map to energy independence, help reduce our dependence upon unreliable foreign oil imports, reduce our trade deficit and potentially become a net oil exporter. Why does our Federal Government NOT want this to happen? #6])>

<([#7 [2.1.1] 7. We believe that alternative 1, Oil Shale No Action Alternative, in the 2012 PEIS, is similar to the actions taken in the 2008 PEIS, and is the alternative that should be implemented and would best promote the United States energy independence. #7])>

<([#8 [6.1.1] 8. Why and how can the Federal Government mandate what is a minable oil shale resource grade and thickness? This should be left for industry to determine because it is technology and resource dependent. #8])>

<([#9 [3.10.3] 9. The Federal Government continues to make it more difficult for industry to make oil shale commercially viable and as a result have lost good paying jobs and those companies have taken their technologies and oil shale interests to foreign countries. What does the Federal Government plan to do about this situation? The 2012 PEIS has promoted this ideology. #9])>

<([#10 [2.2] 10. BLM's preferred alternative (2b) in the 2012 PEIS is far too restrictive and allows for only scattered lands that are not contiguous in the Piceance Creek Basin to be considered for future RD&D oil shale leasing. Why is this the case when the Piceance Creek Basin in Northwestern Colorado has the world's richest and thickest oil shale deposits? #10])>

<([#11 [2.2] 11. The fact that alternative 2b only allows for scattered, non-contiguous parcels for potential RD&D oil shale leasing in the Piceance Creek Basin is unattractive to industry, why does the Federal Government want to promote this nonsensical approach? #11])>

<([#12 [10.3] 12. When will the draft 2012 oil shale leasing regulations be available for public review and determine how they can be integrated with the 2012 PEIS? #12])>

<([#13 [9.6.1] 13. Why does the Federal Government have a double standard by allowing industry to lease oil, gas and minerals from BLM without a prior demonstration of the technology to be used to recover the resource, but require a governmental mandated RD&D effort for oil shale? #13])>

<([#14 [2.4] 14. In the 2012 PEIS alternative 4(a) is very similar in acreage to Alternative 1, the No Action Alternative, but Alternative 4 (b) restricts leasing to the first round RD&D leases

only, why? #14)>

<([#15 [9.6] 15. The Piceance Creek and Uinta Basins, where most of the significant US oil shale resources are concentrated, are not pristine, environmentally sensitive or primitive areas. The fact that 2,000,000 acres were made available for leasing in the 2008 PEIS does not mean that amount of land would be leased or developed. The oil shale industry should decide where their technology and process is best suited for development of the oil shale resource, NOT the Federal Government. #15])>

<([#16 [10.3] 16. Why doesn't the Federal Government use other countries that have developed their oil shale resources (which are much less rich and thick) as examples and develop a similar US oil shale industry that will help the US economy? This 2012 PEIS does NOT do that. #16])>

<([#17 [3.4.3] 17. A recent GAO report noted the water requirements for a half a million barrel per day oil shale industry is available. Water is not the issue impeding oil shale development but is commonly used as a deterrent to the development of oil shale by people not knowledgeable about the subject. A recent independent study sponsored by the Colorado River Conservation District showed that 120,000 acre feet per year of water would be required for a 1.55 million barrel per day shale oil industry. This is about 2-3 % of the water that flows from the Colorado River into Lake Powell annually.

#17])>

<([#18 [9.8] 18. Colorado, Utah and Wyoming oil shale resources have recently been estimated by the USGS at four trillion barrels. This is the United States' most important domestic energy asset that should be developed for the benefit of the American people. Reconsidering the 2008 PEIS and regulations completed in 2008 is delaying the development of the oil shale resource. The lead-time required to develop an oil shale project is significant, and the work should not be further delayed or burdened by unnecessary rules, regulations or roadblocks.

#18])>

<([#1 [2.3.1] With the current price of natural gas, there will be no investors for oil shale in the near future. I support the alternatives that minimize the land available for commercial development until research and development can be completed on a smaller scale. Resources other than oil are present in oil shale, and long term recovery of those resources should also be a consideration. Please be advised that the resolution passed by Colorado's Mesa County Commissioners on April 16 does not represent the opinion of many citizens of Mesa County. There were far more people testifying against that resolution, which appears to have been crafted by the oil and gas industry at a meeting in Vernal, Utah. This was a closed door meeting, which is in violation of Colorado's Sunshine laws, and involved elected officials who are closely tied to the oil and gas industry. They don't represent me, nor do they represent most of the citizens of this valley. Please consider the genesis of these resolutions against any of the proposed options, and reject them in your deliberations. #1])>

Comments on the Draft PEIS on Oil Shale and Tar Sands

#1. <([#1 [9.8] The introductory letter states that the BLM has decided to take a fresh look at land use in the

2008 PEIS to reassess the appropriate mix of allowable uses with respect to oil shale and tar sands. On page 1-4, it is stated that the PEIS is a result of the settlement of a lawsuit. On what basis did the Department of the Interior decide such a settlement was in the best interest of the United States instead of taking the case to court? Was such a settlement merely a convenient excuse to change the PEIS for political purposes unrelated to any technical basis? What documents exist in the Department of the Interior that provide the basis for accepting this settlement? Since having land potentially available for leasing does not mean that the land must or will be leased, and since any activity will have to address any pertinent environmental issue currently identified or identified in the future, the relatively trivial new information that has come to light since 2008 is not a viable excuse for the massive change in the commercial leasing program. Is the Department of the Interior aware that there have been no directives from Congress to change that time period or reopen the PEIS process, and indeed there have been actions to the contrary, so that the Department of Interior is in violation of the spirit if not the letter of 2005 Energy Act?

#1)> #2. <([#2 [2] An EIS is supposed to create the document facts and analyses that will enable an informed

decision. The current document does not satisfy all the required NEPA criteria. Consequently, we think any decision based on this EIS is flawed.

The only alternatives studied are various levels of leasing. The alternative of having no commercial leasing program is not considered. The adverse effects of not doing anything can include stunted economic growth due to a high balance-of-payments deficit, the need for a large military force to assure a safe source of petroleum, and periodic wars to enforce that security. Alternatively, it could compare shale oil to biofuels in terms of cost and water use. Or it could compare shale oil to the impacts of gasoline rationing. There are negative impacts to not developing oil shale. So the PEIS is not adequate to compare both the benefits of oil shale and the negative impacts of alternative.

#2)> <([#3 [2.2] The preferred alternative 2b purports to provide a leasing program in Colorado, but the

conditions are so onerous that it might effectively be considered a ban of commercial leasing in Colorado. Much of the land is on parcels too small or too gerrymandered to attract commercial interest. Industry comments about what would be needed have been ignored completely, so this alternative is effectively a no-leasing option, and therefore the implications of no one responding should be analyzed (see previous paragraph). The fact that best resource, in the center of the

Piceance basin, is almost absent from the leasing plan is neither rational nor in conformity with the required cost-benefit analysis.

#3)> 2

<([#4 [3.10.3] The EIS discusses possible adverse effects of oil shale development on low income people but

does not acknowledge the obvious and powerful advantages of oil shale development for low income people including job opportunities and a better standard of living. There are numerous statements about possible negative effects of oil shale development but essentially no discussion of the benefits. Consequently, the EIS fails to provide the information needed for an informed choice. #4)>

<([#5 [3.10.3] In the end, oil shale development, like many of the choices in life, is all about tradeoffs.

Agriculture is the biggest user of water and destroyer of natural habitat, and it creates a bigger dead zone every year in the Gulf of Mexico than the Macondo blowout. But we all like to eat, so agriculture exists. This PEIS describes virtually every negative environmental impact imaginable, but it does not discuss the potential economic and environmental benefits. So there can be no rationale balancing of benefits and interests as required by the NEPA.

Most egregiously, the PEIS does not acknowledge that the center of the Piceance Basin contains oil shale so rich in energy that the amount of energy produced per the amount of land disturbance per would rank it near the top of all energy sources. Nevertheless, this land has been all but taken out of the leasing program. Nor does it acknowledge that in any oil shale activity, the possibility exists to reconstruct the land in any desired manner to optimize habitat for desired species. #5)>

#3. <([#6 [9.1] Page ES-1 states that the BLM intends to take a hard look at whether it is appropriate for

approximately 2,000,000 acres to remain available for potential development of oil shale. Why does this refer to the future? One could posit that the BLM made a decision on which alternative to pick without taking a hard look—facts are not important if the decision maker has a prejudicial commitment to a specific outcome. #6)>

#4. <([#7 [3.4.1] Page ES-9 states that the BLM looks forward to gaining a clearer understanding of the

implications of developing oil shale. For water quality and quantity, for example, industry has provided much information on updated estimates of water needs for oil shale, and that information is used in Section 4. What else is needed? There are a variety of laws in existence that protect water quality, and any lessee would have to go through a NEPA process to demonstrate that their proposed activities will not violate existing laws and regulations. Further, if there is a compelling public need to limit water consumption by an oil shale company or industry to less than industry currently estimates, no further information is needed from industry—industry would simply be required to stay within that bound. That said, does the BLM have the position that water rights are not true property rights and can be revoked for political purposes? All industry analyses indicate that enough water rights are in place to support oil shale production in excess of 1 million barrels per day. #7)> <([#8 [4.2] Or if the issue is CO2 emissions, they are

outside the proper consideration of the PEIS as stated on pages 1-13 and 2-78, and the BLM does not have the authority to generate regulations of such not authorized by Congress. Further, CO2 mitigation is primarily a financial issue, not a technology issue, and it can be addressed

straightforwardly if and when regulations are implemented, for example via sequestration or sale.
#8)> 3

#5. <([#9 [1.3] On page 1-15, the PEIS lists governmental agencies that cooperated in the PEIS. What was

their position on the amount of acreage that should be available for development, and is the PEIS consistent with the desires of the local governments?

#9)> #6. <([#10 [6.3] On page 1-17, the footnotes say that EGL has been renamed “since the preparation of this

PEIS”. To what PEIS does “this” refer? EGL was renamed AMSO in early 2008, well before the start of the current draft PEIS. OSEC was changed to Enefit in 2011 prior to the issuance of the current draft PEIS.

#10)> #7. <([#11 [6.1.1] On page 2-13, on what basis did the BLM decide that commercial viability requires 25 ft of

oil shale >25 gal/ton in Utah and Colorado but only 15 ft of 15 gal/ton in Wyoming?

Economically recoverable depends on both depth and technology in a complicated way. The oil shale industry is in a much better position to decide what resource it can recover economically and where it will risk its capital. The BLM has is not in a position to make a similar calculations.

#11)> <([#12 [9.6] And just because an area is open for commercial lease applications does not mean that any

company will actually try to lease it if it does not see commercial viability. Concerns about land speculation are more appropriately addressed by performance clauses in the lease rather than taking them off the potentially leasable area.

#12)> #8. <([#13 [6.1] There are technically incorrect statements about oil shale on page 2-15. Not all oil shale in

the Green River formation is a marlstone. The Garden Gulch member is clay rich and does not fall within the marlstone field. The temperature required to generate shale oil varies with time. For timescales of human activity, temperature for significant shale oil generation is as low as 500 oF, as that temperature for a few years will convert a substantial amount of kerogen. The processes being pursued by Shell and by AMSO will generate shale oil at temperatures primarily between 600 and 700 oF. While some people have recently misused the term “shale oil” to denote shale-hosted natural crude oil, the term “shale oil” has meant the product formed from destructive distillation of oil shale for hundreds of years.

#13)> #9. <([#14 [9.6] On page 2-30, the statement is made that six existing RD&D leases have terms that could

allow commercial development on up to 5120 acres each. The most obvious interpretation of this statement is that even though the option 2 acreage largely excludes the preference right lease area from commercial leasing (see, for example, Table 2.3.2-2), it would be allowed for commercial leasing to the RD&D lease holder by virtue of an existing contract, and this interpretation is supported by words on page 2-54. However, if it is suitable for commercial leasing, it should be included in the area available for commercial leasing.

#14)> #10. <([#15 [9.6] On page 2-26, the statement is made that if an RD&D lease holder relinquishes its lease,

the area may be leased to another operator with the decisions in the RMP at the time of application. Which application? The original RD&D lease application or a subsequent application after the original lease is terminated? Does that mean that if Alternative 2b is adopted, essentially all of that acreage would be removed from commercial leasing? What

would occur if the lease is transferred to another entity rather than terminated? Would the new entity be required to pursue the same process originally proposed, or could the entity modify the process consistent with the old or a new environmental assessment?

#15])> 4

#11. <(**#16** [9.6] The statement is made that MMTA would be excluded from oil shale leasing until

technology or other factors exist to develop oil shale without jeopardizing trona mines. Does that mean that if a company demonstrates that it is possible, the land would be available for leasing? If so, a lease stipulation would be a more appropriate way to enforce that requirement. Multi-mineral extraction requirements are already in force for nahcolite and oil shale.

#16])> #12. <(**#17** [9.2.3] The first paragraph mentions geologically prospective areas not being excluded for any

specific could be considered at a later time. Which areas are those, specifically, and for what reason did the Department of Interior not consider them at this time? This appears to be a violation of the intent of Congress in the 2005 Energy Act. The subsequent discussion on that page appears to describe the intent of the Department of the Interior to frustrate rather than facilitate oil shale development for the good of the American people, in direct violation of both the 2005 Energy Act and the Department's own charter.

#17])> #13. <(**#18** [2.2] It is stated on page 2-35, in effect, that Alternative 2b was not conceived until the PEIS was

in draft form and is not even properly discussed in the rest of the document. An obvious question, therefore, is what specific technical discoveries of the PEIS process motivated the creation of this alternative and its eventual adoption? If no technical discoveries were the cause, what specific meetings or actions precipitated the idea after the analysis of alternatives had been completed? It appears that the alternative was motivated by political forces completely separate from legitimate PEIS considerations and therefore with the spirit of the 2005 Energy Act.

#18])> #14. <(**#19** [2.2] Figure 2.3.3-1 on page 2-37 demonstrates that the preferred alternative directly contradicts

the BLM's stated rationale for the PEIS and leaves no doubt that this alternative was designed specifically to prevent commercial development of oil shale in Colorado in direct violation of the 2005 Energy Act.

Almost the entire Piceance Basin is excluded from commercial leasing applications even though it has not been identified as either Sage-Grouse Core or Priority Habitat or Lands with Wilderness Characteristics. Absurdly, part of the land proposed for commercial leasing applications is identified as Sage-Grouse critical! Finally, most of the land made available is in such small, isolated parcels that it would effectively prevent significant commercial development. **#19])>**

#15. <(**#20** [2.4] As much Figure 2.3.3-1 is a farce, Alternative 4 shows a lack of thought concerning the

definition of "moderate" in moderate development. Land proposed for commercial leasing includes Sage-Grouse critical habitat. Even though it is arguable that oil shale development could occur without adversely affecting the Sage Grouse and there is a paragraph outlining the responsibility of the field office in that regard, the amount of acreage so designated is so small that it could easily be eliminated without significant impact on the oil shale industry this century. The PEIS itself says the probability of leasing is low, so why not just take it off the table and save a lot of wasted effort? Similarly, there is a portion of the Cathedral Bluffs designated as

Lands With Wilderness Characteristics that could easily be eliminated from leases without adversely affecting the oil shale industry.

#20)> 5

#16.<([#21 [2.2] In discussing a comment about limiting leases to those in process, the PEIS states that it is not consistent with the Secretary's and Director's emphasis on developing and maintaining a robust RD&D process. The preferred alternative has so little land available in such isolated parcels that it is not conducive to either R&D or commercial activity. The clearest evidence for this is that the number of proposals dropped from 20 to 3 when the preference right lease area was dropped from 5120 to 640 acres. While it may be profitable to perform multi-mineral extraction on a 640 lease tract, oil shale production alone is probably not feasible on such a small plot given the 500-ft restriction of activity from the border of the lease, which potentially reduces the available resource by one third. Further it is clear that a significant portion of the land made available will not even support a 640-acre lease. There is no rational justification for dividing the available acreage into tiny tracts other than to block commercial development without overtly abrogating existing RD&D lease contracts.

#21)> #17. <([#22 [6.3.5] The statement is made that "Despite the absence of a commercially viable processing technology" is not intrinsically correct. Commercially viable depends on the market price for oil, so this statement presupposes some market price for crude oil. The assumptions circa 1980 were that the price would be \$90/bbl by 1990 and increasing thereafter. If that price prediction was correct, the processes at the time would have been commercially viable, and the statement here would be demonstrated to be false. In fact, the price of crude oil dropped dramatically in the early 1980s and fell to historic lows in the 1990s (<20/bbl), so the failure of oil shale to take off was simply due to a glut of inexpensive conventional crude oil, driven by discoveries and production in Alaska and the North Sea, among others, and not a failure of the technology of the time. In fact, the process being proposed by Enefit today is very similar to that pursued by Chevron and ExxonMobil. Of course, automation has improved in the past 30 years, so the process now will take fewer people to operate, but it is basically the same. And the reason that it is commercially viable now is that the oil price is at the \$100+ dollar per barrel range considered in economic analyses of the late 1970s. So the correct statement would be "Under the incorrect assumption of \$90-\$100/bbl oil late in the 20th century,"

#22)> #18. <([#23 [3.10.3] The statement of adverse impact of the oil shale bust in the early 1980s is correct, but reading it in the absence of other economic history would suggest it is unique in the history of the United States. It is not. Speculative house building in many locations around the country based on the assumption of continued price escalation and economic growth has resulted in the foreclosure of millions of homes as a result of the real estate bust of 2008. This is just one of hundreds of stories of boom and bust that are characteristic of economic development across industries. While prudent action can and should be taken to minimize the probability, no human endeavor is without risk, and the oil shale industry should not be paralyzed due to a lack of 100% certainty in the economic and energy predictions for the next century. If this tack were taken for all proposed economic activity, all investment would cease. In fact, most proposed oil shale growth would occur at a measured pace using fewer workers per unit of production. Establishing a sound and gradually growing industry in the absence of national energy panic is the best way to avoid the catastrophes of the past.

#23])> #19. <(**#24** [3.10.3] The discussion on pages 3-241 through 244 is incongruous.

Statements are made about

rapid growth and employment due to the oil and gas industry and having to import skilled labor from afar, and statements are made that wages are increasing due to the oil and gas industry as if that is a bad thing. Now, the unemployment rates are about 10% in regions that would be affected by oil shale development, and foreclosures are common. Since it is doubtful that natural gas activities will reach the levels of 4 years ago in the coming decades due to established infrastructure and low natural gas prices, what is going to pull the economy of western Colorado out of its malaise?

#24])> #20. <(**#25** [3.10.1] [3.10.3] On pages 3.11.2.2.4, the PEIS states that rental housing in the Rifle area is all taken and

there are no hotels available. That may have been true 3 years ago, but it is not true now. Rental housing is easy to find, and rents are dropping. Hotel rooms are plentiful, and construction of one hotel was stopped a few years ago because of the drop in demand. Foreclosures on houses are common, just like other parts of the country. There are several partially built apartment units in foreclosure. If the PEIS is supposed to give a basis for economic status on which to make decisions about oil shale, it must be up to date. Otherwise, it is giving a completely mistaken view of why economic development, including oil shale, is needed to maintain a healthy economy in the Rifle area in the long run. In other words, if it was worth redoing the PEIS, it is worth doing it right and not using data that is 3 years old as if it were current. Again, the way to avoid booms and bust is to have steady growth, and waiting to develop oil shale during a national crisis is exactly opposite to what the country should do. It should have leasing policy that enables enough high-quality resource to be available for leasing so that the industry can learn, mature, and grow gradually over the next 20-30 years. Alternative 2b, on the other hand, will prevent commercial oil shale development entirely, except possibly for a few small operations.

#25])> #21. <(**#26** [6.4] The statement on page 4-6 that spent shale volume would increase by 30% over the volume

of raw shale introduced into the retort is incorrect. The 30% increase in volume occurs during mining, and the volume of shale is basically unchanged during the retorting process. It would be correct if the statement were that the spent shale volume increases by 30% over its volume in the earth before mining. The same is true of the overburden for surface mining operations.

#26])> #22. <(**#27** [6.2.1] On page 4-13, the BLM has projected that the new electricity capacity needed for in-situ oil

shale would be generated by coal as a worst case. That may be true if the electricity is generated in Utah and transmitted to Colorado, and of course, that changes the Colorado impact. If the electricity is generated nearer, it will probably be generated from a combination of co-produced gases and natural gas. This is an active choice that could be made to minimize impacts, and the PEIS ignores that possibility. In fact, no company is currently considering using coal-generated electricity as its preferred power source for major operations. The PEIS acknowledges that some proposed in-situ processes do not plan to use electrical heaters, but it does not reflect this in its subsequent analysis. It seems that if the PEIS would be better served by making a range of estimates of water usage, because the fact that this is a worst case will get lost in public discussions.

#27])> #23. <(**#28** [6.3.2.1] Section 4.5.1.2 grossly over-estimates water needs. Enenefit claims lower water usage than

2.6-4.0 bbl water per bbl oil—their web site says 1-3 tonne per tonne of shale oil. Also, the

correct range for in-situ projects is zero to 3 bbls water/bbl of oil. Zero might come from working out of the aquifers (Garden Gulch member) and using the cleaned-up co-produced water for cooling needs. Also not mentioned is the possibility of using reverse osmosis or distillation of deep brackish water to supply the water needs for oil shale production. The economics appear tolerable, particularly if waste heat is used for a distillation method, but this has not been actively studied because of the availability of plentiful water at low cost—ironic due to the near hysteria about water availability. The point here is that shale oil production is such a high-value operation and its water needs sufficiently modest that it probably could get along with no significant draw on fresh-water supplies if the government insists upon confiscating current water rights—estimates are that more than a million barrels of oil per day could be produced with existing water rights.

#28])> #24. <([#29 [6.3.2.1] It is likely that a 100,000 bbl/day oil shale industry would use less than 1% of the upper

Colorado Basin remaining available surface water. Tables 4.5.2-1 and 3.4.1-2 indicate a water surplus of about 300,000 ac-ft/yr, and a generous estimate of water consumption by an in-situ industry would be only 10,000 ac-ft/yr according to Table 4.5.2-1 if it did not use electrical heating. So why is the Department of Interior ignoring this in their analysis of water use vs. water availability?

#29])> #25. <([#30 [3.5.1.2] On page 4-54, the PEIS employs the phrases “at best, professional judgment” and “at worst

would be speculation.” The PEIS should not be using speculative numbers from non-experts in its consideration. There are numerous good professional judgment numbers in the literature that agree reasonably well that one does not have to use the derogatory qualifier “at best”. The point here is that there will be a range of emission estimates for various candidate technologies, and establishment of regulations on CO2 emissions would affect the ultimate outcome. If the public has a compelling interest to establish a performance standard, and then it will be industry’s responsibility to figure out how to meet it. We don’t need national policy based on the “bring me another rock until I see one I like” principle.

#30])> #26. <([#31 [6.3.1] [3.8.3] Figures 4.9.1-1 and 4.9.1-2 show pictures of a UMATAC industrial process. No one in the

United States is considering using this technology, so why show pictures of it? It would seem more reasonable to show pictures from the new Enefit plants in Estonia and even a Petrosix plant in Brazil, as the latter is similar to the Paraho process favored by several US companies.

#31])> #27. <([#32 [5] Nowhere in the vicinity of page 4-154 did I see a discussion of the fact that the oil shale

activities in the 1980s generated a substantial experience on how to reclaim surface disturbance. It would seem to an uneducated reader that everything for the oil shale industry would have to be learned from scratch. In fact, photos of reclaimed areas would add more to the intelligent discussion of this issue than much of what is in the PEIS.

#32])> #28.<([#33 [3.4.3] In the introductory sentence of 4.12.1.4, it is stated that “it is likely that oil shale

technologies will require large amounts of water.” Compared to what? Has the BLM compared it to biofuels? In the arid west, typically 85-90% of the water is used for agriculture, and an oil shale industry will have only a minor effect on that number. So from one perspective, nothing but agriculture uses large quantities of water. Now if one uses a metric of economic value generated per unit of water consumption, how does oil shale compare to other industries. The

Department of Interior should not repeat common misstatements about water crippling agriculture—it should undertake an honest in-depth analysis, using the technologies currently being contemplated and not those last used in the 1970’s. This is likely to lead to a conclusion that a significant oil shale industry would divert only a few percent of agricultural water, and that could easily be made up by more efficient use of water by agriculture.

#33])> #29. <([#34 [3.10.3] The implicit attitude of section 4.13.1.3 is that the best thing we can do for poor people is

to leave them alone so they can continue to be poor. Grand Junction and Carbondale are so far away from the oil shale development that any direct impact is clearly a stretch. An equivalent statement is that the skiing industry is hurting the poor people in Carbondale because skiing is a rich-person’s hobby and drives up real estate values, and therefore we should kill the ski industry. Instead, the oil shale industry will provide high-quality jobs and economic growth that will create many opportunities for people to escape poverty. The biggest threat to the health and well-being of poor people is an economy that cannot provide decent employment opportunities for all. A robust oil shale industry can help sustain long term economic growth in western Colorado. Early indications from ongoing RD&D activities fully support this conclusion.

#34])> #30. <([#35 [3.12.2] It appears that the writer of this section [no section specified, but prior comment addresses section 4.13.1.3] was unaware of what all was discussed about oil shale and retorting in the preceding hundreds of pages. I recommend that the first two sentences be stricken as redundant and useless.

#35])> #31. <([#36 [9.6] The bottom paragraph on page 6-1 states that making land available for lease applications

has no impact on environmental or socioeconomic setting. It is the subsequent development work on the land that would have an impact, and it must be analyzed by the NEPA process. So what is the justification for removing essentially all the land in Colorado from the lease application process? It has been stated by many people many times that having land available for leases does not mean that it will be leased. If oil shale’s detractors are correct, few or no leases will ever be pursued because oil shale is fool’s gold and won’t ever be developed. The real truth was stated by Utah Senator Bennett, “What are you afraid of?... You are afraid it might work.” If the concern is merely companies tying up land on a speculation basis, as is sometimes said, that could easily be prevented by lease performance terms.

#36])> #32. <([#37 [6.3] The information about AMSO LLC in section A.5.3.2 is extremely outdated. An

Addendum to the original Plan of Operations was submitted in July 2008 and approved by the BLM in October 2008, and a Plan of Operations was submitted in May 2009 and approved by the BLM in September 2009. The stated reason for the update of the PEIS is to incorporate more recent information, and here is a case where the BLM has not incorporated relevant information contained within its own regulatory approval process.

ECCOS Environmentally Conscious Consumers for Oil Shale

April 9, 2012

BLM Oil Shale and Tar Sands Draft Programmatic EIS

Argonne National Laboratory 9700 S. Cass Ave. Argonne IL 60439

Ken Salazar, Secretary

U.S. Department of the Interior 1849 C Street, N.W. Washington DC 20240

Bob Abbey, Director

Bureau of Land Management 1849 C Street, N.W., Room 5665 Washington DC 20240

RE: 2012 OSTs PEIS Comment Period

Dear Secretary Salazar, Director Abbey, et al:

<([#1 [I.I.] Currently members of Environmentally Conscious Consumers for Oil Shale (ECCOS) are in the process of reviewing the extremely comprehensive 2012 OSTs PEIS in order to provide comments. However, it has come to our attention that the Draft BLM Oil Shale Regulation document is not expected to be published until May 15, 2012. The comment period on the 2012 OSTs PEIS closes on May 4, 2012 and obviously does not allow time for review of the Draft BLM Oil Shale Regulation document prior to submitting comments. It seems logical that these two documents are inevitably tied to one another. These two documents outline impacted areas and regulations on development. Having both documents to review simultaneously will behoove those wishing to make relevant comments and help to avoid comments that may tend to be inconsistent and confusing without all the information available. Therefore, ECCOS requests that the comment period on the 2012 OSTs PEIS be extended to no less than 90 days past the publication of the Draft BLM Oil Shale Regulations. #1])> Thank you for your time and consideration.

Respectfully,

Brad McCloud Executive Director Environmentally Conscious Consumers for Oil Shale (ECCOS)

See Attachment.

<([#1 [6.1] The extensive deposits of Oil Shale located in the United States offer key advantages. The Oil Shale deposits located not only in the United States, but in Utah and Colorado are extensive, and very well defined. This would all but eliminate exploratory costs. The research field of Oil Shale is extensive and very active in local communities, universities and government facilities which would also eliminate the need for outside resources for development. #1])> <([#2 [10.3] Producing the Oil Shale does raise many environmental concerns, but the environmental policies being enforced are too strict and are choking the productivity and profitability of this massive natural resource we have on our own soil. #2])> <([#3 [6.3.5] Production is already close to the finished product market, and these markets are substantial enough to support development of the industry. #3])> <([#4 [10.6.3] [11] The refining process, though different, is markedly less than crude oil that we rely upon from foreign sources. Successful development of oil shale can greatly enhance the energy supply, economy and security of this local area which has been hit hard by the decline of the oil and gas production - as well as that of the entire country. Lessening our dependency on foreign commodities and foreign companies is a valid concern we need to face, and the production of United States Oil Shale is a huge step and advantage we should utilize. #4])>

Comments on the

Draft Environmental Impact Statement and Possible Land Use Plan Amendments for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah and Wyoming January 2012 – Volumes 1 through 4 – DES 12-01

By

Edward R. Hawley

<([#1 [10.6.3] As a Native American, (member of The Choctaw Tribe of Oklahoma), with significant European ancestry, I have a deep-seated respect for the environment. That said I also realize that there are situations that require individuals to remove their blinders, (political affiliations and/or personal agendas), and focus on what will provide the greatest benefits for America and Americans. It is the time to accept the reality that there is no substitute for oil. Not today or in the foreseeable future. Concerns as for what might be must be weighed with what is today's reality. America cannot afford to delay the development of any of its oil resources; specifically its 4 trillion barrels of oil contained in the oil shale regions of Colorado, Utah and Wyoming. America must end its reliance on other countries for the oil required to fuel its economy.

Oil's importance to modern society is comparable to the importance of the buffalo to early Native Americans. When the buffalo were virtually exterminated, America's Native American way of life vanished. The buffalo were more than a source of food. Shelter, clothing, weapons and many other necessities for Native Americans came from the buffalo. As with the buffalo, oil is more than just a source of energy. Oil is component of virtually every product important to modern society.

As an American, I strongly support America's free enterprise economy. But anyone that considers the oil industry as free enterprise is ignoring the reality of oil. America has gone to war to protect its oil supplies. America currently maintains a significant military presence in the oil

producing regions of the world. Is it necessary for America to continue to provide international security at such a tremendous financial drain on our nation? (As a Navy veteran, I cannot fail to also draw attention to the irreplaceable American lives lost in multiple wars protecting oil resources of other nations.) The answer is clear: America cannot continue to support the world. It's time for America's leaders to place the needs of America and Americans first.

What other country blessed with the natural resources that America has, would allow its people and economy to be held hostage by other, less than friendly oil producing countries? The answer is obvious: None! Not one! It is time for America to confront the reality of the fact that without an affordable, reliable and sustainable supply of oil, America's way of life will follow our predecessors, the early Native Americans, with the loss of the buffalo.

#1)>

<(#2 [10.5] Fossil fuels are a problem for the world's environment. The significance of oil's impact on the World's environment is debatable. But what is not debatable is the fact that America will continue to rely on oil as its primary transportation fuel regardless of advances in green, renewable energy technology. Why not develop America's oil resources contained within public regions and allocate a portion of the royalty and/or tax revenue to the development of cleaner energy technology? Environmentalists have achieved their objective and ingrained into American society the fundamental belief that Americans need to protect the environment for the benefit of future generations. But, it is important for America's leaders and environmentalists to accept the fact that America needs a secure, reliable and affordable supply of oil to survive the transition to cleaner, more environmentally friendly energy sources and technology.

#2)>

<(#3 [11] [10.6.3] The members of this BLM committee cannot undo the mistakes of the past. Without a doubt, there are obstacles that must be overcome to economically develop America's oil shale. But unless efforts to develop America's oil shale are not only allowed but encouraged, there is no chance that the challenges to the development of oil shale will ever be resolved. Rather than focus on ways to suppress the development of America's oil shale, this BLM committee, as well as America's leaders, need to be concentrating on how to maximize the economic benefits that could be derived from the development of America's oil shale.

I hope that the members of the BLM committee accept the seriousness of the task that they have been given. Decisions made by this committee will impact America's security and economy for generations to come. America needs oil. There is no substitute for oil.

Although the President and his administration make no secret as to their objectives, everyone needs set aside their political beliefs and personal agendas, (blindness), and do whatever is necessary to secure America's oil supplies for today and tomorrow. The decisions made by this BLM committee will determine the future of America far beyond the time of the current political regime. Americans cannot continue to allow the lifestyle that has been created by our parents and their parents to continue to deteriorate. America can no longer afford to ignore its enormous oil resources, specifically, America's oil shale.

Submission Text

Refer to attachment. See Attachment.

There are many points in this environmental impact statement that I find particularly disturbing and would like to comment on.

<([#1 [3.7.4.1] First, after reviewing the endangered species section in chapter three, I could not help but notice how many areas dedicated to endangered species overlap with the oil shale and tar sand proposals. All 227 species listed rely heavily on BLM land for their survival. I also found it interesting that four out of twelve native species of fish are endangered and will go extinct due to decreased stream flow and stream warming. #1])> <([#2 [3.4.1] I would like to see what kind of research has been done to asses water sources with close proximity to the existing

oil shale and tar sand sites and what kind of health those streams are in. what effect does run off from oil leaks have on the streams and rivers? I would also like to see what chemicals exist in fracking fluid and what effect they have one rivers and streams. #2]>

<([#3 [3.5.7] Secondly, The section on air quality in chapter three had many tables that clearly showed that the emissions in oil shale and tar sand counties were higher, sometimes much higher, than counties with no sites. Garfield County, the county I grew up in, has most of the highest emissions numbers in the state and has a large number of oil shale sites. #3])>

<([#4 [3.10.3] Thirdly, it saddened me to read about peoples' relationships in towns disappearing due to transient oil field workers. On page 3-239 the Rifle Tribune was cited as saying that local relationships fizzled out with the influx of oil workers, as did the local economies that were replaced with goods preferable to the oil workers rather than the farmers and ranchers who are permanent residents of the area. It also said that the city found it increasingly difficult to find people to employ in public resource departments. Oil shale and tar sands might create thousands of jobs, but they are jobs given to migrant workers from out of state and those jobs are clearly detrimental to important community ties and employment. #4])>

<([#5 [3.14] Lastly, I would like to see a section on human health impacts. There was no evidence regarding if people living near the sites suffered from environment related health problems nor was there any remark as to whether that research had been done. I personally know people in my county who have suffered greatly since oil shale sites have moved onto their properties. Again I think that having access to a list of chemicals in fracking fluid would be appropriate. #5])>

Thank you for your time.

the total of of my PEIS is 10 pgs... but was unable to send all pages in one form so it will be submitted i 10 This # 1 See Attachment.

Listed below, for your consideration, are several comments/concerns that apply to the hydrology assessment of the northern Piceance basin as presented in the SUBJECT REPORT.

<([#1 [3.4.6] 1. P3-12; Hydrographs of springflow show that several springs in the vicinity of the nuclear blasts in the early 1970s were significantly impacted after detonation.

#1])>

<([#2 [3.2] 2. P3-43; Extreme valley floor erosion in the Yellow C basin has occurred during large runoff events. #2])>

<([#3 [3.4.5] 3. P3-76; Introduced in the Geologic setting, the hydrologic characteristics of the

Wasatch fm were not included in the aquifer descriptions of the Tertiary-Cretaceous rocks in Piceance basin. #3]>

<[#4 [3.4.1] 4. The near surface hydrology in the basin (streams, and the numerous springs that flow from the fractured Uinta fm and valley alluvia) is an important source of good quality water. Are comprehensive data assessments for this important source included in EA and EIS presentations for the basin? #4]>

<[#5 [3.4.6] 5. The concentration range for dissolved solids in the major groundwater aquifers presented in this report is nebulous. A key USGS report (Welder and Saulnier, 1978), in which Saulnier describes the water characteristics in the two principal bedrock aquifers, is not referenced, and appears unused for evaluation purposes. Dissolved solids data from the Welder and Saulnier report and other wells are compiled and presented for your information in the attached figure 1. Similar data compiled from the USGS database for the basin are provided for streams (figs. 2-4) and springs (figs. 5-8). Water quality data for many of the constituents sampled in the basin, when compiled and analyzed, are informative for determining both water source and movement, and would be useful for assessing general water conditions in the basin. [See figures in Comment #50097, 98, 100, 101, 102, 103, 104, 105, 106, 107, 108, 109] #5]>

<[#6 [3.4.5] 6. Important supplemental data useful in the assessment of water quality along the White River mainstem can be found in the USGS report, Tobin, 1993. Water quality characteristics and dissolved solids loads in the White River are qualified and quantified for a period of 15 years that included record high and low flow annual discharges. #6]>

In addition to the enclosed figures 1-8, selected references (attachment 1) are included.

Submission Text

<([#1 [3.10.2] The City Council of the City of Rifle greatly appreciates the Department of the Interior, Bureau of Land Management's review of past decisions regarding oil shale leasing and development and offers the following comments: The City of Rifle, Colorado (population 9,500) sits at the base of the oil-shale rich Roan Plateau in the Piceance Basin. When commercial development of oil shale occurs, our community and region will again be the likely epicenter of oil shale development as it was in the late 1970s and early 1980s. Unfortunately, in 1982, our community was also the epicenter of the oil shale bust that resulted in an economic depression in our region that spanned close to two decades. In recent years our community and region was heavily impacted by natural gas exploration and production occurring in nearby private and public lands. Natural gas development brought significant growth to our community and placed

considerable demands upon our municipal infrastructure, resulted in a shortage of affordable housing and essential community workforce, caused material and labor costs to skyrocket and strained social services and law enforcement capacities. Full-blown commercial development of oil shale may have similar impacts to our community and region. Although we are supportive of the current Oil Shale research and development activities, given oil shale's history in our region, the City wants to ensure that we understand the impacts that may result from commercial production and from each company's technologies on our community and region. Such questions as: What will development mean for our economy – both positive and negative aspects? How much water will be used, for what, and how will local watersheds be affected? How will our infrastructure, community services and facilities be impacted, including roads, water, sewer, housing, law enforcement, etc.? How will production activities be powered? How will the environment and wildlife be affected? What will be the impacts relating to hunting, fishing and recreation in the oil shale development areas? Often we hear anecdotal responses to these questions, but like the industry, we need factual data on which to base our planning and infrastructure investment decisions. We want to ensure that communities expected to be impacted by commercial development of oil shale have the appropriate and necessary financial resources to address and cope with the effects of production. Our community has learned from past energy development "booms" that investment in community services, facilities, and infrastructure is needed many years in advance of commercial production and the associated tax revenue. Additionally, as municipalities and counties in Colorado have experienced in recent years, energy tax revenues that have historically flowed to local governments to respond to energy development impacts have been usurped by the State Legislature to balance their budget in this down economy. As in past comments on Oil Shale Development, the Rifle City Council strongly supports action by the federal government to develop an oil shale cumulative community impacts study for the anticipated commercial production regions and dedicate funding to address the identified local impacts prior to approval of commercial production. #1]> <([#3 [10.5] Additionally, the federal government should develop an incentive program for oil shale companies to provide meaningful up-front and on-going investment in local communities and to local governments directly affected by oil shale development and production. #3]> <([#4 [2] Instead of selecting one of the alternatives put forward by BLM, the Rifle City Council requests that whatever alternative selected requires RDandD first. Additionally, we implore Secretary Salazar, BLM officials and our Congressmen and Senators to address the above mentioned issues through the federal regulatory or legislative processes to ensure that our community and region are prepared and have the necessary assistance in place prior to the commercial development of oil shale. #4]> Thank you for your consideration of our concerns. Respectfully submitted on behalf of the City Council of the City of Rifle, Colorado.

<([#1 [2.3.1] Would like to see the BLM minimize the amount of oil shale and tar sands development, until some good hard environmental data is obtained through Environmental Impact assessments. Very disappointed with our local Mesa County, Colorado decision on this topic which I feel does not represent the majority view here. #1])> Thanks, Walt Speirs

OSTS2012D50113**Organization:** Mary Wolfe**Received:** 4/23/2012 4:36:14 PM**Commenter1:** Mary Wolfe - Durango , Colorado 81301 (United States)**Organization1:****Commenter Type:** Member of the Public**Classification:****Submission Category:** Standard Web Form**Submitted As:** Web Form**Form Letter Category:****Form Letter Master:****Current Task:** Issues Entered **Assigned/Due:** mMcHugh 4/25/2012 12:00:00 AM**Attachments:** OST2012D50113.htm (OST2012D50113-58538.htm Size = 1 KB)**Submission Text**

<([#1 [2.3.1] [12] In regard to the development of tar sands and oil shale in this area, I ask that the BLM choose Alternative 1; the No Action Alternative [I believe commenter is confused and supports Alt 3]. Tar sands oil is one of the dirtiest and most corrosive forms of oil. The extraction process completely devastates land; removing the oil and leaving the land unusable. Production of tar sands oil “generates three times the global warming pollution of conventional crude

production”. Extraction of tar sands oil is also very energy-intensive and costly and the refining process also uses obscene amounts of energy and water. Increasing the production of such dirty, energy inefficient oil would be outrageous. If the devastation that tar sands extraction will have on the environment isn’t enough, the lack of knowledge that we have about oil shale should be reason not to pursue this request. We know very little about the environmental impacts of oil shale production. As this PEIS states repeatedly, there are still many fundamental questions about the environmental implications that remain unanswered. There is not enough information available about the impact that extraction will have on “water quality and quantity”. Allowing this land to become available for leasing would not only have devastating, irreversible impacts on the land, but there is not enough known about oil shale production to reasonably allow this type of project. #1)>

<([#1 [3.10.3] Ensuring our limited open spaces in the United States are utilized, we must take the time to study the land and the impact of what drilling would do to it. Is drilling really the best LONG TERM economical, environmental, energy producing option? Would it benefit our economy more than the current jobs in that area? If the answer to those questions is yes, then we should consider drilling. However, Utah has enough ghost mining towns as it is. Most mining is not sustainable long term. It is a superficial way to bring money to a community. If we are going to completely disrupt the ecosystem and economy to a region, it is imperative we study the effects, using NON-BIAS, NON-POLITICAL methods and agencies. This is not the time for our government to use our land and our heritage to leave their legacy behind. It is the time for us as American citizens to use our God and country-given rights to ensure our lands, our history, and our futures are protected. #1])>

<([#1 [4.2] [3.4.1] [3.10.2] The Water Quality Control Division (Division) of the Colorado Department of Public Health and Environment continues to be concerned that the Draft PEIS inadequately addresses the cumulative impacts of the development of the oil shale and tar sands on water quality in Colorado. Specifically, the Division is concerned with the socioeconomic impacts related to public water systems and wastewater systems with respect to increased populations that will occur with development of oil shale resources in Colorado. While the PEIS discusses water withdrawals that will occur from the extraction activities, it does not take into account the additional stress upon water and wastewater infrastructure in nearby communities from both population growth and potentially reduced surface water flows due to extraction activities. In order to address this issue, the Draft PEIS should incorporate the projected population growth due to the extractive industries in communities near the leases. #1])> <([#2 [3.4.5] The water withdrawals discussed in the Draft PEIS do not take into account the effect that reduced instream water flow could have upon NPDES permits. For example, the PEIS does not address the potential impact to wastewater facilities from water withdrawals upstream of a wastewater facility and the concomitant reduction in NPDES permit limits that result. #2])> <([#3 [3.4.6] In Section 3.4.1.2, the Draft PEIS focuses on salinity as the key parameter for potential water quality impairment in the Colorado River Basin. The Division agrees that salinity is a significant concern in the Colorado River Basin, but is concerned that the Draft PEIS does not significantly discuss the potential contribution of other contaminants to area waters from the proposed extraction activities. The Division is especially concerned about the potential of increased selenium loading to area waters from the proposed extraction activities. #3])> <([#4 [3.4.5] In Section 3.4.1.3, the 303(d) list of impaired water bodies needs to be updated to the current 2012 303(d) List. The current 2012 303(d) List for Colorado can be found in the Water Quality Control Commission Regulation No. 93 ([http://www.cdph.e.state.co.us/regulations/wqccregs/93_2012\(03\).pdf](http://www.cdph.e.state.co.us/regulations/wqccregs/93_2012(03).pdf)). #4])> <([#5 [3.4.5] In Section 4.5.1, the Draft PEIS indicates that runoff from surface disturbances related to oil shale operations would be non-point sources. In fact, disturbances of one acre or more during construction would require a point source stormwater permit. This error is repeated in section 4.5.1.1. #5])>

Mr. Michael Nedd, BLM Assistant Director

Minerals, Realty and Resource Protection

1849 "C" Street NW

Washington, DC 20240

Dear Mr Nedd:

Thank you for this opportunity to comment on the Draft Programmatic Environmental Impact Statement for Oil Shale and Tar Sands Development in Wyoming. Please consider these the formal comments of the Alliance for Historic Wyoming (AHW), a statewide nonprofit organization dedicated to preserving our historic and cultural resources. We work with citizens around the state and across the country who are concerned about ensuring Wyoming's

irreplaceable historic resources exist for future generations.

<([#1 [1.1] [3.9.2] As this project goes forward, we ask that AHW be considered an interested party at every stage of this process for all consultations under Section 106 of the National Historic Preservation Act (NHPA) as amended, and implementing regulations 36 CFR 800.2(c)(5) and 800.3(f)(3). You may use the above listed address, phone number and email address to contact us as part of the Section 106 consultations. As you know, NHPA’s Section 106 process recognizes that “the views of the public are essential to informed Federal decision making” and agencies are required to “seek and consider the views of the public in a manner that reflects the nature and complexity of the undertaking and its effects on historic properties, [and] the likely interest of the public in the effects on historic properties.” 36 CFR § 800.2(d)(1) Likewise, the Historic Sites Act of 1935 states that: “It is a national policy to preserve for public use historic sites, buildings, and objects of national significance for their inspiration and benefit of the people of the United States.” In the case of this project, we expect that interest could be especially high because of the nature of the potentially affected resources – the National Historic Trails, in particular – as well as the dramatically different nature of this potential undertaking from any that has previously been done in Wyoming. Therefore, we encourage you to reach out to the various nonprofit organizations dedicated to working on historic and prehistoric resources in this area, including the county historical societies, the certified local government organizations, TRACKS Across Wyoming, the Lincoln Highway Association and the local museums and tourism offices. Each of these groups will have valuable input to add to the Section 106 process.

#1])>

<([#2 [1.2] [3.9.3] We also want to encourage you to ensure that extensive and effective outreach be made to the affected tribes as early as possible in this process so that they might have the opportunity to do extensive on-the-ground surveys to identify landscape-wide cultural sites of importance to them. As you may be aware, it is often the case that the prehistoric and cultural features identified by SHPOs do not come close to being as inclusive as the sites identified by THPOs and tribal elders. Tribes often have not had the opportunity to do extensive ground surveys for decades or longer. Only through this kind of examination can they adequately contribute to the process of protecting their sacred sites in accordance with Executive Order 13007. We would also remind you that EO 13007 defines a “sacred site” as “any specific, discrete, narrowly delineated location” that is “identified by an Indian tribe, or **Indian individual determined to be an appropriately authoritative representative of an Indian religion...**” (emphasis added) This secondary requirement of seeking identification by authoritative Indian **individuals** places a heavy responsibility on federal agencies to cast a wide net among the affected tribes to ensure that all potential sacred sites are identified. While we understand and appreciate that this level of consultation can be time-consuming and complicated, we believe that the need to protect these irreplaceable resources makes this process more than worthwhile. #2])>

<([#3 [1.1] As a representative of the Alliance for Historic Wyoming, I did have the opportunity to speak with Sherri Thompson about this project and appreciated her sensitivity towards our concerns and her willingness to reach out and offer us additional consultation opportunities. It is clear that the BLM has taken a very cautious approach to the potential for oil shale/tar sands development and we very much appreciate this go slow attitude since none of us have ever

before dealt with an oil shale project and the technology itself remains experimental, with no proven track record of success. #3)>

<([#4 [3.4.1] Our concerns, in general, are concerns that I am sure you will hear from many others. In particular, the “dirty” nature of oil shale gives us great pause about this project. In addition, we are deeply concerned about how development of oil shale would affect the water resources in Wyoming, which I am sure you know is a high desert. Thanks to that high desert climate, we are blessed with the best remaining remnants of the historic emigrant trails – the Oregon, California, Mormon and Pony Express National Historic Trails. But the lack of water in our state is always a concern when development is proposed and with the changing climate patterns and our recent history of drought, it is doubtful that we can afford to use the quantities of water that would be necessary to make oil shale a viable commodity without seriously diminishing the water available for our communities. #4])>

<([#5 [3.9.7] Our specific cultural resource concerns center on the degradation of the historic trails and other cultural sites, including rock art and archaeology sites, which are being heavily impacted by the increasing industrialization of the I-80 corridor through southern WY. While many people look at this area and see only a heavily impacted transportation corridor, the Alliance for Historic Wyoming recognizes that this transportation corridor in fact tells the whole story of America’s development into a nation “from sea to shining sea.” It is along this corridor that one can experience the original historic emigrant trails, the shift in usage of the trails to a freighting operation (the Overland Trail), the connecting of the continent through the transcontinental railroad, the communications revolution that began with the Pony Express and continued with the telegraph lines, the first national roadway (the Lincoln Highway), the Eisenhower interstate road system and, more recently, the development of industrial wind energy. All of these advancements have helped to bind our nation together and southern Wyoming offers unique opportunities for interpretation and appreciation of these resources.

When you look at these areas and the historic and cultural resources in them, we strongly encourage you to take this broader view. In particular, we believe that the BLM has done a generally poor job of evaluating Wyoming’s landscapes in terms of their potential for listing on the National Register of Historic Places as Rural Historic Landscapes or Traditional Cultural Properties. Very little consideration has also been given as to whether any of these areas might qualify as National Heritage Areas. Wyoming’s most iconic cultural feature is its wide-open spaces. Unfortunately, however, these vistas and their importance to our communities are rarely considered by the BLM when looking at the impacts of these large-scale projects. In our experience, the Section 106 process as outlined by the National Historic Preservation Act is often incapable of addressing these concerns. The Section 106 process requires that the participants define an area of potential effect (APE) and then address the potential adverse effects within those boundaries. But when you are talking about open vistas, it is impossible to draw boundaries around the space.

#5)>

<([#6 [4.1] [5] [3.9.1] Additionally, we find the Section 106 approach increasingly inadequate when it comes to dealing with the National Historic Trails. The trails, by their very nature, are a single, contiguous resource that extends for hundreds of miles from their point of origin to their termination. When we are forced to confine our analyses to the impacts that occur within an

APE, we are artificially segmenting these trails and doing irreparable harm to them in the process. In our experience, the Section 106 process is simply incapable of adequately addressing these cumulative effects. As a result of this recognition, we are now requesting that a mechanism be established to provide off-site compensatory mitigation for cumulative effects through the NEPA process. This not only provides an opportunity to deal with these difficult to address cumulative effects but has the added bonus of making it possible to provide grants to organizations that, for any number of reasons, might not be able to take part in the Section 106 process, but which may well have new and innovative ideas about how to address the adverse effects. Should this project go forward, we hope that the NEPA documents will address this issue. #6)>

<([#7 [3.10.4] Our concerns about this project are not just limited to the environmental and cultural issues already addressed. We also recognize that cultural and historic resources are closely tied to recreational values and the socio-economic vitality of our small cities and towns. Wyomingites, by nature, are closely tied to their lands. We rely on our public lands for recreational opportunities. This extends very directly to the huge impact that tourism has on our state. As you may or may not know, tourism is Wyoming's second largest industry, right behind energy development. And the fastest growing sector of the tourism industry is heritage tourism. Wyoming is blessed with a robust heritage tourism sector. People come from all over the world to experience "the West" in Wyoming. They are looking not only for our open vistas but also our historic ranches, our ghost towns, our unique little museums, our abandoned railroad spurs, our isolated cemeteries, our historic trails, our rock art and tipi rings, our forts and battlefields, and our natural landmarks. If they arrive in Wyoming and do not feel transported to another time and place, if all they see around them are the signs of industrialization that they can find in any other state, they will quickly move on. To lose this source of income would be devastating to our small communities, especially. As a state, we have experienced and absorbed and survived untold cycles of the boom and bust energy economy. What brings us through is our pristine landscapes and cultural assets which bring in the tourists with their tourism dollars. If energy booms are allowed to wipe out those assets, it is highly uncertain how we would weather the bust.

Google some of our smaller towns along the I-80 corridor and you will see why we are concerned about giving the wandering heritage tourist the impression that there is little to see or do that cannot be found in a more densely populated and developed location. Take Superior, WY, for example. The website they maintain <superiorwyoming.net> explains their allure this way:

We invite you to enjoy a modern day voyage into yesteryear to a town forgotten by time. Superior remains a diamond in the rough for those seeking real adventure in authentic old west sightseeing. In its heyday, Superior was a bustling town of over 3,000, lured by underground coal mines. Today, only 336 hearty souls keep this isolated "Ghost Town" alive.

This is precisely the kind of description that calls the heritage tourist away from the interstate and invites them to explore. But if they are already discouraged by what they have seen while driving, they are likely to pass Superior by. Nearby Reliance, WY, depends on its historic tipple to create the same kind of draw. Built in 1936, the tipple was touted as being "the most modern all-steel tipple in the Union Pacific Coal Company's extensive coal holdings" with "a capacity of

500 tons of coal per hour.” Without the heritage tourists who stop to learn about a tipple, Reliance would certainly suffer. I would encourage you to visit the TRACKS Across Wyoming <tracksacrosswyoming.com> website and see all the fascinating little pieces of history that continue to thrive because heritage tourism is alive and well along the I-80 corridor. No NEPA analysis would be complete or adequate for energy development in this area if it doesn’t thoroughly examine the impacts such a project, especially a “dirty energy” project, would have on recreational tourism and the resulting potential for socio-economic loss.

#7])>

<([#8 [3.9.5] As I am sure you know, Congress declared in NHPA that “the historical and cultural foundations of the Nation should be preserved as a living part of our community life and development in order to give a sense of orientation to the American people; [and] the preservation of this irreplaceable heritage is in the public interest so that its vital legacy of cultural, educational, aesthetic, inspirational, economic, and energy benefits will be maintained and enriched for future generations of Americans.” 16 U.S.C. 470(b)(2) and (b)(4) Moreover, NHPA states that: “It shall be the policy of the Federal Government...to foster conditions under which our modern society and our prehistoric and historic resources can exist in productive harmony and fulfill the social, economic, and other requirements of present and future generations; [and] encourage the public and private preservation and utilization of all usable elements of the Nation’s historic built environment.” 16 U.S.C. 470-1 (1) and (5) These findings place a high burden on our country’s land management agencies to ensure that all possible steps be taken to ensure the protection of our historic and cultural resources for future generations. AHW believes that no NEPA analysis can be complete or adequate if it doesn’t thoroughly examine the impacts that the proposed project, especially if it is a “dirty energy” project, would have on recreational opportunities, including the ability and desire to wander and discover the nation’s historic roots, heritage tourism and the potential socio-economic loss if such opportunities are sacrificed.

#8])>

Thank you for your consideration of these comments. Should you have any questions about our concerns, please feel free to contact us. AHW looks forward to working with you as this project proceeds.

Sincerely,

Lesley Wischmann
Founding Board Member
Alliance for Historic Wyoming

<([#1 [2.3.1] I am writing to urge caution in moving forward with oil shale and tar sand development. Although I am tentatively in favor of almost all ways to improve and expand Utah's economy, I am concerned that this form of development is not the best way to use our lands and resources, nor the best way to improve the lives of our native citizens economically or otherwise. Although I am not an expert, cursory research suggests oil shale and tar sand development dubious propositions, which require a large quantity of water in an already dry region, and that long term environmental costs may not be worth the relatively short term benefits. I would favor continued research and development to immediately opening up lands for commercial exploitation. Contributing to my skepticism is also the unconvincing and overzealous rhetoric of the "drill baby drill" faction, who have yet to impress or sway me to their side. Until I can be given convincing evidence that this is a good idea, I certainly perceive the negatives to outweigh the positives of opening up vast scales of land to commercial shale and tar development. #1])>

To: BLM RE: Proposed Oil and Gas Leases <([#1 [3] I am not a geologist or scientist and I have never considered myself an environmentalist. Never the less, a few things have become painfully obvious to me. The current state of oil and gas exploration and the State of Colorado, are no longer a good match.I was recently in Paonia, visiting a friend, and attended a meeting at the local high school, down the road in Hotchkiss.What was presented at that meeting was so disturbing, I will never forget it.Towns large and small, across the country, have been so adversely effected by the practice of fracking, they will never recover. Air pollution compared to that of Los Angeles, tap water not only undrinkable,but flammable and livestock and wildlife dying in the fields and on the banks of streams and rivers.Grasslands once productive, now laid waste. The organic farming community in the North Fork Valley is facing extinction secondary to the proposed leasing of 30,00 acres of BLM, otherwise known as public lands, on the edge of fruit orchards and vegetable farms. The town of Erie, only 40 miles north of Denver, as the winds blow, facing air pollution so severe that the NOAA (Boulder) report, requested by that community, could not soften the facts in front of their City Council on 2/21/12. Rifle, and its environs a total gasland. Scenic beauty gone and air that made me cough even as we stopped to briefly stretch our legs.Have we learned nothing from N.Y.,Penn.,Ohio and Wy. to mention a few?Rural residents there, in need of money, and unaware that there could be any secondary effects from fracking, have learned a disheartening lesson for us all. Plagued by respiratory ailments, reproductive changes and neurologic symptoms, including previously healthy children suffering the effects of Asthma, have found no redress from the drilling companies or from the state government sworn to protect their welfare. Is this the fate we want for Colorado? #1])>
<([#2 [12] The EPA is currently undertaking an extensive study of fracking. At the very least, there should be a moratorium on all drilling and all leases to drill, until this study is made public in 2014. Only than, can an informed public decide the fate of the State of Colorado and its citizens. #2])> Respectfully, Eleanor J. Jefferson, Lakewood,CO.

<([#1 [12] There are very few wilderness places left in the US with such beauty resonant with wildlife and and expansiveness. Some things should just be left alone....and this is one area. The land belongs to all of us, not the government, not commercial enterprises of this world.....but the people who share this land. To turn this land over to be pillaged is poor stewardship and has great potential to affect other necessary and natural resources of more value than oil.....water, not to mention the habitat that lives there and the millions of people who enjoy the wilderness. Please (if that word means anything to you) don't do this. I am part Native American Indian and watch, with deep sadness, the exploitation and raping of our land. Haven't we done enough? #1])> <([#2 [3] I am deeply concerned about the potential effects to our water, wildlife, communities and public lands if the BLM initiates a commercial oil shale leasing program. Submission Text

To Whom It may Concern,

I have several concerns about use of public lands for oil production from tar sands and oil shale. The concerns are expressed below.

<([#1 [9.3] 1) Modify the information on page 1-6 and justify the statement that oil production is “mature.” Oil shale and tar sands oil has never been produced in these areas. NEPA before leasing is needed. #1])>

<([#2 [10.5] 2) How much will the US taxpayer get for the leases? The lands should not be given away. Royalties should be at least as high if not higher than for conventional. The US taxpayer should get at least 16%. The information about leasing and royalties on page 1-2 should be clarified. #2])>

<([#3 [3.4.1] 3)How will tar and shale oil development impact existing oil and other activities and water use in the Pariette area as shown in Figure 1.2-2. Newfield Oil is already using a significant amount of water for a water flood project in this area? Change page 1-10 as needed. #3])>

<([#4 [3.1.1] 4) Tar sand and oil shale should be off the table in areas adjacent to national parks and monuments. The reasons seem obvious (recreation, encroachment, air pollution and water pollution, wildlife wandering etc.). #4])>

<([#5 [3.5.7] 5) Text indicates climate is a factor.. As you know the Uintah Basin is already a non-attainment area for air quality. It seems oil and tar oil development will make things worse. #5])>

<([#6 [3.5.1.1] 6) Text indicates climate change is not considered. The impacts to climate change from development of tar sands are well known, with very large amounts of CO2 being emitted. The same will be true of oil shale - if not worse. Climate change is a valid issue to consider in terms of this document and in terms of future water availability and should be added as an item to consider in planning land use. The Nasa climate scientist James Hansen has said full development of the tar sands would mean it was “game over” for the climate. #6])>

<([#7 [3] 7) Modify the text and add a section that describes the environmental impacts from tar sands production in Canada. This has led to a very large environmental problems and the same

problems would occur as a result of these activities in Utah, Wyo and Colorado. #7)>
 <([#8 [3.9.7] 8) The beautiful lands on the south side of the Uintahs near Whiterocks will be highly impacted if tar sand is produced here. There are likely lots of archeological indian sites in this and other areas proposed for leasing or use that have not been identified. How will these areas be protected?

#8)>

<([#9 [3.3.1] 9) Have all important fossil localities been identified in the proposed areas? #9)>

<([#10 [3.10.3] 10) Will the EU and other foreign governments buy tar and shale oil? How will this impact production? It seems that production of oil from tar and shale will be a big gain for a few and huge loss for many Americans. It will also lead to large environmental problems and consume large amounts of water in the very dry (and getting drier) west. #10)>

Dave Larsen

Submission Text

See Attachment.

The Routt County Commissioners greatly appreciate the Department of the Interior, Bureau of Land Management's review of past decisions regarding oil shale leasing and development and offers the following comments:

<([#1 [3.10.3] Routt County, Colorado is a neighboring county of the oil-shale rich Roan Plateau in the Piceance Basin. When commercial development of oil shale occurs, our region will again be the likely epicenter of oil shale development as it was in the late 1970s and early 1980s.

In recent years our region was heavily impacted by natural gas exploration and production occurring in nearby private and public lands. Natural gas development brought significant growth to our region and placed considerable demands upon municipal infrastructure, resulted in a shortage of affordable housing and essential community workforce, caused material and labor costs to skyrocket and strained social services and law enforcement capacities. Full-blown commercial development of oil shale may have similar impacts to our region.

Although we are supportive of the current Oil Shale research and development activities, given oil shale's history in our region, the Routt County Commissioners want to ensure that we understand the impacts that may result from commercial production and from each company's technologies on our region. Such questions as: What will development mean for our economy- both positive and negative aspects? #1)> <(#2 [3.4.1] How much water will be used, for what, and how will local watersheds be affected? #2)> <(#3 [3.10.2] How will our infrastructure, community services and facilities be impacted, including roads, water, sewer, housing, law enforcement, etc.? #3)> <(#4 [6.2.1] How will production activities be powered? #4)> <(#5 [3] How will the environment and wildlife be affected? #5)> <(#6 [3.1.2] What will be the impacts relating to hunting, fishing and recreation in the oil shale development areas? Often we hear anecdotal responses to these questions, but like the industry, we need factual data on which to base our planning and infrastructure investment decisions. #6)>

<(#7 [3.10.2] We want to ensure that communities expected to be impacted by commercial development of oil shale have the appropriate and necessary financial resources to address and cope with the effects of production. Our region has learned from past energy development "booms" that investment in community services, facilities, and infrastructure is needed many years in advance of commercial production and the associated tax revenue. Additionally, as governmental entities in Colorado have experienced increasing energy impacts in recent years, energy tax revenues that have historically flowed to local governments to respond to energy development impacts have been usurped by the State Legislature to balance their budget in this down economy.

Routt County strongly supports action by the federal government to develop an oil shale cumulative community impacts study for the anticipated commercial production regions and dedicate funding to address the identified local impacts prior to approval of commercial production. Additionally, the federal government should develop an incentive program for oil shale companies to provide meaningful up-front and on-going investment in local communities and to local governments directly affected by oil shale development and production.

#7)> <(#8 [2] Instead of selecting one of the alternatives put forward by BLM, the Routt County

Commissioners request that whatever alternative selected requires R&D first. Additionally, we implore Secretary Salazar, BLM officials and our Congressmen and Senators to address the above mentioned issues through the federal regulatory or legislative processes to ensure that our region is prepared and will have the necessary assistance in place prior to the commercial development of oil shale. #8)>

Organization:**Received:** 4/25/2012 12:59:52 PM**Commenter1:** - , (United States)**Organization1:****Commenter Type:** Member of the Public**Classification:****Submission Category:** Standard Web Form**Submitted As:** Web Form**Form Letter Category:****Form Letter Master:****Current Task:** Issues Entered **Assigned/Due:** mMcHugh 5/1/2012 12:00:00 AM**Attachments:** OSTIS2012D50145.htm (OSTIS2012D50145-58605.htm Size = 1 KB)**Submission Text**

<([#1 [2.1.1] We vote for alternative 1-allow commercial leases. You have enough rules and guidelines in place to assure protection of the environment, and to insure renewing the landscape. You can close off specific areas for protection. #1])>

OSTIS2012D50146**Organization:** Cynthia Cannon**Received:** 4/25/2012 1:01:12 PM**Commenter1:** Cynthia Cannon - , (United States)**Organization1:****Commenter Type:** Member of the Public**Classification:****Submission Category:** 035a_Campaign**Submitted As:** Web Form**Form Letter Category:****Form Letter Master:****Current Task:** Issues Entered **Assigned/Due:** mMcHugh 5/1/2012 12:00:00 AM**Attachments:** OSTIS2012D50146.htm (OSTIS2012D50146-58607.htm Size = 2 KB)**Submission Text**

<([#1 [3] I am deeply concerned about the potential effects to our water, wildlife, communities and public lands if the BLM initiates a commercial oil shale leasing program. The two million acres in UT, WY and CO previously allocated for commercial leasing is a massive amount of public, taxpayer land that would be sacrificed for a singular use of the landscape. #1])> <([#2 [2.2] [12.3] While the preferred alternative (Alternative 2) is a step in the right direction, BLM should consider an alternative that does not endorse giveaways of public lands to this unproven industry. #2])> <([#3 [3] Oil shale is currently producing no jobs and no revenue. The Congressional Budget Office confirmed that it is not expected to produce significant revenues through 2022. This means we have time to thoroughly assess the impacts of development to our water, wildlife and communities, and should not rush now to give away public lands. #3])> <([#4 [3.10.3] The land overlying oil shale resources in Utah, Colorado and Wyoming is some of the best wildlife habitat in the West. Outdoor recreation and tourism are huge economic drivers that depend on this habitat. The farming and ranching sectors require reliable access to water resources, which may be depleted by extensive commercial oil shale development. We must protect these jobs by making smart decisions about how we allow oil companies to move forward with oil shale speculation. #4])> <([#5 [3] I recommend that you carefully consider the

impact analysis to support future leasing decisions within these allocated lands.”¹ We concur that more information must be obtained about the technological requirements for development of the oil shale resource, as well as associated environmental, cultural and economic implications, before committing any more public lands to broad scale commercial oil shale development. While we recognize that demand for fossil fuels is directly related to consumption, and that there is a need to produce oil and natural gas domestically as a matter of national security and the health of our economy, we don’t believe that energy resource development should be at the expense of irreplaceable natural resources like clean air, clean water and an adequate water supply. Furthermore, new and existing energy development must be considered and analyzed in the context of cumulative impacts to wildlife habitat, human health, local economies and social cost/benefit. Based on the nascent character of the technology for development of oil shale and lack of definitive research and conclusions regarding cumulative impacts associated with development, we strongly recommend that the BLM adopt Alternative 3 in the Final PEIS. Alternative 3 will help to ensure that commercial development will not be initiated until a full understanding and evaluation of impacts is completed to a specified standard.

¹ 2012 Draft PEIS for Allocation of Oil Shale & Tar Sands Resources, at 1-2

#1])> 1

<([#2 [3.4.1] Furthermore, we recommend that the Final PEIS provide direction that result in oil shale lessees

evaluating/addressing the following issues in subsequent NEPA analysis:

Water Quality and Quantity Oil shale production will likely utilize vast amounts of water from the Colorado River basin which is life-sustaining for all of the Colorado River Compact states; providing water for drinking by humans, livestock and wildlife, for irrigating agricultural lands and

for outdoor recreation; all of which are critical to a resort economy upon which Colorado and particularly rural mountain communities depend. To assess oil shale production impacts to water quality and quantity, the Final PEIS should require that subsequent NEPA analysis determine the following:

1. Quantity of water required for production annually; and resulting impacts to the health and livelihood of other downstream and junior users; Impacts to fisheries (including Colorado River Cutthroat Trout fisheries), riparian and wetland areas and wildlife resulting from potential changes to stream and river flows;
2. Level of toxins including but not limited to hydrocarbons, salts, trace metals that may be released and/or leached into streams, fisheries and groundwater as a result of production; and resulting impacts to fisheries, riparian and wetland areas and wildlife; and whether technologies are presently available to prevent salt loading and the introduction of other contaminants into the Colorado River;
3. Secondary impacts of large scale oil shale development (such as population growth; and use of power generation to extract oil from shale) on demand for limited water resources in the West;
4. Impacts to recharge of deep-water aquifers in the event that in-situ extraction techniques result in new areas of porous rock that function as shallow aquifers.

While we support BLM’s coordinated work with the U.S. Geologic Survey to analyze baseline water conditions in areas where oil shale might be developed, we believe that it is premature to lease lands for such development before the impacts to water are determined. #2])>

<([#3 [3.7.3.1] [4.2] [3.7.3.6] Wildlife In addition to potential impacts to fisheries and streams that sustain all species of wildlife, the roads, pipelines compressors, tanks, drill rigs and general infrastructure associated with oil shale extraction and production will most likely result in overall loss of habitat and fragmentation of contiguous wildlands necessary to sustain wildlife. The cumulative impact of resource development infrastructure on habitat and wildlands contiguity must be evaluated. #3])>

<([#4 [3.5.9] [3.5.3] [3.5.4] Air Quality Evaluate the impacts associated with the following aspects of oil shale production as it relates to air quality:

1. Health and climate change impacts of dust created as a result of surface mining and associated truck traffic on roads; impacts of dust on snow as it relates to resort economies that rely upon snow for recreation-based tourism;
2. Health and climate change impacts associated with power plant activity required for resource production; including but not limited to increases in ozone and nitrogen deposition;
3. Impaired visibility on a regional level; and resulting impacts to tourism as one consideration;

#4])> 2

<([#5 [3.14] Overall Human Health Impact Evaluate all health issues and potential mitigations. Incorporate a health impact assessment which is a systematic, comprehensive methodology for assessing human health impacts.

#5])> <([#6 [3.10.4] [3.10.2] Local Economy As a headwater area, Pitkin County has been diligent at a local, regional and State level, in protecting watersheds as a means of maintaining water quality and quantity to sustain wildlife, agriculture and our tourist economy. Rural resort communities such as ours and throughout the West are dependent upon the economic benefits of tourism, which is to a great extent reliant upon characteristics associated with clean water, clean air, healthy, intact ecosystems and vital wildlife populations on public lands. Additional NEP A analysis must weigh the impacts of oil shale development on rural and tourist-based economies against the economic benefits accrued to industry. #6])>

<([#7 [6.2] Social Cost/Benefit Finally, as a general matter in ultimately determining whether or not leases

for commercial production of oil shale is appropriate, BLM should consider whether the amount of energy spent in oil shale production, as it compares to the amount of energy produced, is worth the potential impact to public health and public lands in the form of air and water quality, the overall health of ecosystems and wildlife populations; and tourism dependent economies of rural western Colorado. #7])> <([#8 [10.6] Also consider to what extent the production of oil shale will prolong our

ability to use fossil fuels, and whether the impacts associated with the extended timeframe are at a reasonable cost. In the event that public lands in western Colorado are to be sacrificed to produce domestic fuels, it would be prudent to stipulate that such fuels be used domestically, rather than sold on the world-wide market. #8])> <([#9 [10.6.1] Finally, as there is clearly a finite supply of fossil

fuels, it is critical to ensure that the use of public lands for domestic fossil fuel production be tied

to concurrent fuel consumption conservation measures - and that oil shale leasing, if found to be viable, is ultimately part of a long term energy outlook and economy that also incorporates renewable energy resources.

#9) **<([#10 [2.3.]** In closing, we emphatically endorse Alternative 3, as this is the only Alternative that ensures that no additional public land will be available for leasing of any kind until and unless technology for resource development and associated development impacts can be assessed and a determination made, that environmental impacts can be eliminated. Furthermore, we recommend that the Final PEIS require subsequent public review of standards that may be developed for commercial leasing as the direct result of data assessed from RD&D projects- prior to issuance of any commercial leases. We cannot stress enough our concern about potential impacts of oil shale development (on air quality and implications for climate change, and ramifications of oil shale development on water availability that is already severely restricted in western states.

#10) Thank you again for the opportunity to provide comments. Please direct any questions to Ellen

Sassano at 970-920-5098 or at ellens@co.pitkin.co.us

Re: Draft 2012 Oil Shale and Tar Sand (OSTS) Programmatic Environmental Impact Statement (PEIS)

Via <http://ostseis.anl.gov/involve/comments/index.cfm>

Dear Comment Compiler,

The City of Grand Junction (“City”) by and through the Mayor and City Council offers the following comments on the Department of Interior, Bureau of Land Management (“BLM”) 2012 OSTs PEIS. Please incorporate these comments into the official record of decision on that matter.

<([#1 [3.10.2] Grand Junction and the Grand Valley of the Colorado River are filled with abundant natural beauty and natural resources. The City serves as the hub of commerce, social activity and health care for the Western slope of Colorado and Eastern Utah. We proudly serve, near and far, our sister communities and because of our regional importance we are both positively and negatively affected by the development in and around those communities and the greater region.

Recently the City has been both benefitted and burdened by the exploration for and development of natural gas in the Colorado and Gunnison River basins near us. The exploration for and development of gas, some oil and other mineral resources has been an important economic engine for our community but it has also caused impacts to roads, schools, social services and virtually all publicly funded endeavors. Additionally, the gas exploration and development

industry has created a shortage in housing and has strained already needy public programs and resources.

The City experienced an oil shale boom once before and the aftermath of those events was to say the least not good. Because of that historical experience and because of the more recent experiences we have had with the gas and oil industry, we implore those that are deciding among the OSTs PEIS alternatives to step back and remember as is stated in the preamble to the National Environmental Policy Act (“NEPA”) that the purpose of an environmental review is:

“To declare national policy which will encourage productive and enjoyable harmony between man and his environment; to promote efforts which will prevent or eliminate damage to the environment and biosphere and stimulate the health and welfare of man; to enrich the understanding of the ecological systems and natural resources important to the Nation...”

2012 DRAFT OSTs PEIS – City of Grand Junction Comments

By our comments on the OSTs PEIS alternatives we hope to encourage productive and enjoyable harmony between man and his environment and to stimulate our collective health and welfare. #1)> To that end we state the following regarding the 2012 OSTs PEIS:

1) <([#2 [11] We are supportive of oil shale and tar sand research, development and demonstration (“RD&D”) projects. We conclude that additional RD&D is necessary and appropriate and that as a matter of Federal, State and local policy, public lands should be made available in

sufficient quantity and with a reasonable regulatory structure that recognizes the importance of and presents an opportunity for responsible growth of the industry. #2)>

2) <([#3 [2] We recognize that reasonable alternatives are presented in the 2012 OSTs PEIS and that we do not possess the expertise to recommend one alternative over the other. What we are supportive of and would expect is that industry and the federal land administrators will come to a consensus position on an alternative that will allow the industry to grow but will not, absent a demonstration of the viability of the industry, to develop without regard to impacts and/or mitigation of those impacts. #3)>

3) <([#4 [9.3] Which alternative is chosen is not as important to the City as the development of a policy (whether applied via lease stipulations or as a matter of amendments to the BLM Resource Management Plan(s)) that requires a cumulative, regional impact study of any and all commercial activity as a pre-condition to and as a result of OSTs exploration and/or production and/or development. #4)>

4) <([#5 [3.10.2] A study(ies) must be performed before the impacts occur and must address the changes to the quality of life that will be/are visited on communities such as ours by the introduction of the commercialization of a new and valuable resource. From the silver and gold rush days to the first oil shale boom to the recent experience with gas exploration and development, the needs, the shortages and the aftermath of insufficient planning and more importantly the failure to invest before the full brunt of the impacts occur, is highly predictable. Because many of those impacts are predictable they are also preventable. We would ask that you

help to prevent or at a minimum reduce the impacts from exploration and development of oil shale and tar sand resources. #5)>

5) <([#6 [10.5] The analysis and ultimate selection of an alternative must acknowledge that funding is crucial to the planning and mitigation of impacts. A pre-development, industry funded trust or other similar financing vehicle for the use and benefit of the communities ought to be advanced as a condition of all leasing. #6)>

6) <([#7 [10.6] The City Council strongly urges that the BLM, Secretary Salazar and our legislative delegation build a national energy policy that recognizes the importance of developing our oil shale, coal and natural gas resources and in turn reducing dependence on foreign oil. Likewise we encourage solar, wind, geothermal and hydro electric power development. As important as development of a comprehensive policy is, it must be written and enforced in light of and with the understanding of the impacts on communities and the environment that are associated with large scale development of any resource. #7)>

<([#8 [9] Please work to meaningfully develop and implement protections for our community. #8)> Should you have any questions or if we may otherwise be of assistance to you as the matter proceeds to a record of decision, please let us know.

<([#1 [2.3.1] As a supporter of Defenders of Wildlife and someone who cares about America's wildlife and wild places, I am writing today to urge the Bureau of Land Management to protect millions of acres of public lands from oil shale development by selecting "Alternative 3" in the oil shale Draft Environmental Impact Statement, the alternative most protective of our public lands. I am pleased that BLM is taking clear and measured steps to restore order to the federal oil shale and tar sands policy. While the agency's preferred alternative (2(b)) is a step in the right direction, a stronger approach is needed to protect our public lands. Alternative 3 in the Draft Environmental Impact Statement would not allow for commercial development of oil shale extraction until further research is done for a clearer understanding of its impacts on our public lands and the wildlife that live there. This alternative places important environmental and ecological areas off-limits to development and requires companies to prove their technologies and evaluate their impacts on communities, human health and the environment. The two million acres of land in Utah, Wyoming and Colorado being considered for oil shale development is a massive amount of America's public land to be sacrificed for the development of a destructive and unproven energy source. #1)> <([#2 [3.7.4.10] These vast expanses of public lands are home to the iconic pronghorn, sage grouse, prairie dogs, golden eagles and other wildlife. They are also habitat that is key to the survival and recovery of the highly endangered black-footed ferret. #2)> <([#3 [3.10.5] Oil shale production is a dirty business that is not economically viable. The BLM itself estimates that its development would consume large amounts of water, cause significant air pollution and destroy thousands of acres of wildlife habitat. Oil shale is currently producing no jobs and no revenue. The Congressional Budget Office confirmed that it is not expected to produce significant revenues through 2022. The industry already has access to thousands of acres of public and private lands for research and development. We shouldn't sacrifice even more western public lands for such a destructive and unproven energy source. #3)> <([#4 [3.10.4] These millions of acres of western public lands are vital to economies that rely on tourism and wildlife-related recreation. In Colorado alone these activities generate \$3 billion in economic activity. Protecting jobs and related revenue from these sustainable economies must be prioritized over the speculative investment in oil shale production on public lands. America's wildlife and wild places are too valuable to squander on the destructive and unproven practice of oil shale development. #4)> Thank you for the opportunity to comment on this matter.

Comments Regarding:

BLM Oil Shale and Tar Sands Draft PEIS

<([#1 [2.1.1] The BLM should select Alternative 1 as their Preferred Alternative.

Selecting Alternatives that reduce lands available for leasing (Alternative 2) or that require research, development and demonstration (RD&D) first (Alternatives 2b, 3 and 4) would likely eliminate the potential for sound development of certain projects. At this time, it is premature for the BLM to remove lands for potential leasing when techniques being developed or that may be developed are suited for specific geologic and/or surface conditions on lands removed from leasing. Further, requiring RD&D to be conducted on a specific lease first would preclude using a recovery technique proven acceptable and economical by one of the existing RD&D projects or by operations in another country. The fact that BLM administered lands would be available for potential leasing has no bearing on potential impacts from oil shale or tar sands development. More projects could lead to more impacts, but, as documented repeatedly in the Draft PEIS, each project would be subjected to rigorous reviews by local, state, and federal agencies. Potential impacts - in particular cumulative impacts - would be avoided, minimized, or mitigated and held below specific levels allowed by existing federal, state, and local regulations.

#1]> <([#2 [1] This Draft PEIS is comprehensive and thorough with disclosure of the existing environment and the potential impacts from oil shale development. #2]>

<([#3 [9.2] This Draft PEIS also discloses regulatory agencies and regulations that are in place to reduce or prevent environmental impacts (Section 2.2.1 and Appendix D). However, with few exceptions (perhaps for the sake of brevity), little discussion exists concerning the role that most of these agencies have in approving oil shale development projects and the prevention of environmental impacts. Many readers may not realize the permitting requirements that every oil shale project would undergo. The Final PEIS should elaborate on these requirements.

One of the exceptions can be found in a brief discussion beginning on page 4-52 that presents the state agencies that would regulate impacts to air quality and the reviews that each project would undergo. Impacts to air quality would be limited by these agencies.

No oil shale project could operate without a permit that restricts air pollution. Currently, some of the RD&D projects are limited in scope to prevent impacts to air quality. However, other regulatory agencies and their permitting approvals are not discussed. For example:

- The Colorado Division of Water Resources (DWR) regulates the use of water in Colorado. Water rights, types of uses, points of transfer, and points of use are all regulated by the DWR. Many of the decisions by the DWR, and by various water courts in Colorado, are open for public review. The regulation of water use in Colorado reduces the impact on all users of water in the state, and potential impacts to water from oil shale development would be mitigated by decisions of the DWR. However, the DWR is not mentioned in the Draft PEIS.
- The Colorado Division of Reclamation, Mining and Safety (DRMS) was mentioned, but their role in preventing impacts to land surface, habitat, and water resources was not presented. Before any operation can proceed in Colorado, full disclosure of the operation, the methods to prevent impacts, and also the specific measures to reclaim the mining disturbances must be approved through a permitting process with full public disclosure. Each project must also post a bond sufficient to insure that the state could reclaim the disturbances should the mining company not. The DRMS operates under the Colorado Mined Land Reclamation Act, which is mentioned under eight of the categories in Table D.1 “Regulatory Citations and Statutory Authorities.” It would seem that the role of an agency that regulates a significant portion of oil shale development activities and ensures no long term environmental impacts would be described in the Draft PEIS.
- County regulations are listed in Appendix D. However, the requirements those regulations place on development are not. For example, Rio Blanco County, Colorado, assesses an impact fee on new capital facilities in the county as part of their land use permit process. This fee is based on the size of the operation and lessens potential impact to county infrastructure. Thus, the county collects fees at project initiation to insure, for instance, road maintenance.

The concerned public should realize that any oil shale development will undergo exhaustive permitting at local, state, and federal levels; with most of the permit processes open to public input. The amount of BLM administered land available for oil shale leasing has no bearing on the outcome of the permitting processes. However, restricting the amount of land open to leasing would likely eliminate the potential for sound projects and the refinement of recovery technologies. #3]>

Thank you for this opportunity to comment.

Sincerely,

/_<~

Comments By Brad Klafehn, Denver, Colorado on 2012 Oil Shale and Tar Sands Programmatic EIS, April 27, 2012

Thank you for the opportunity to comment on the 2012 Oil Shale and Tar Sands Programmatic EIS. My name is Brad Klafehn from Denver, Colorado. I attended the May 4, 2011 Denver, Colorado Scoping Session on this EIS and testified publicly there. I am retired from the City and County of Denver Finance Office, and am the holder of a Master of Public Administration from the University of Colorado, with an emphasis on Policy Analysis. In the 1970's, I was active in the oil shale leasing and regulatory arena as a staff member of the Colorado Open Space Council Mining Workshop. As such, I and others brought suit against the Department of Interior and the oil company lessees over the Programmatic EIS which was then being prepared as being inadequate. I also testified before Congress regarding oil shale leasing and toured the Piceance Basin lease sites numerous times. I was not involved in the 2008 lawsuit which forced preparation of this revision to the Programmatic EIS.

<([#1 [2.2] While BLM is moving in the right direction by recommending that the over 2 million acres currently authorized for leasing be reduced, its preference for Alternative 2, making 830,000 acres available for commercial development, is still too aggressive for an industry which has shown little ability to produce oil from shale and when data from the current R&D leases are so scarce. 830,000 acres represents 1,300 square miles of land. This is an obscene amount of public land to be tied up for potential commercial leasing, with all the uncertainties this creates for local governments and land administrators. #1])> <([#2 [2.3.1] It makes more sense from a public policy standpoint to adopt Alternative 3, restricting further leasing at this point to the areas surrounding the current six, and possibly nine, R&D tracts, if and when it can be shown that they can be developed profitably and environmentally. Alternative 3 would make available one-twenty-seventh of the land to be made available under Alternative 2. This is a sensible, precautionary alternative to Alternative 2, given that there is so little actual operating experience from the R&D tracts. Adopting Alternative 3 would let further leasing decisions be fully informed by the results of the R&D process, and would free the Bureau Field Offices from having to revise a bevy of land use plans for a commercial industry which may never occur. In the meantime, the industry owns sizeable quantities of private oil shale land which they can develop without federal leasing approvals.

For the last 35 years that I have been observing the industry, the constant drumbeat from potential oil shale producers has been to grab as much land as soon as possible while conjuring visions of an immanently mature industry which would be ready to spring into existence were it not for governmental interference and restriction in the leasing and regulatory areas, given that the environmental impacts of full-scale, commercial oil shale development are said to be acceptable and manageable. As I noted in my Scoping Comments, this is the fairyland version of events. In reality, none of these assertions have come to pass during the last four decades, and in many ways, the current debate rehashes the same issues in the same manner from 35 years ago.

#2])>

<([#3 [1.5] In my opinion, the Bureau has done a better job than previously in providing citations to the relevant literature, but the analysis of that research data is superficial, the document has not incorporated much of this data into the discussion, and it still fails to present essential, critical real-life data. For example, in Appendix A, BLM seeks to describe the current research tracts, their technology, and impacts. But an examination shows that the only information presented comes from the 2006-2007 EAs and from operator-submitted Operation Plans. NO operational data is presented! Absurdly, the EIS contains statements like this one:

“The next phase of the research was scheduled to occur in the spring of 2006 and was to involve a 30-day continuous operation of the retort using the Mahogany Ridge shale that is still at the research site. Over this period, additional data will be collected that will be essential for optimizing operating parameters for the retort, establishing reaction kinetics and thermodynamics to optimize yields, and more precisely evaluating the environmental impacts of the operation, including disposal of spent shale. (p. A-56, lines 8-13.)

One has to wonder when this statement was actually written. “The next phase of research was scheduled to occur” 6 years ago? There haven’t been any developments since then that BLM can report to inform decision-making and the public? If this were a school paper, one would be tempted to give it an ‘incomplete’ and send it back for further work. If there have been no developments and no data generated in the last six years, then this speaks volumes about the unreadiness of operators to proceed in developing the resource, and thus, their lack of need for additional public land. If there have been developments since then, failure to present that further information is an indication of the failure of the EIS to present a reasonably accurate description of the known data and issues. In either case, the EIS’s justification for leasing 830,000 additional acres fails.

However, the EIS indicates that this failure is a feature not a bug. Specifically, page J-6, in the analysis of Scoping Comments, states that the comment that “deferment of decisions [should be made] until RD&D results are available” is outside the scope of the PEIS. Surely, knowledge of specific impacts is exactly within the scope of the EIS and essential to a judgment on the desirability of proceeding with further leasing. By defining this issue away, BLM shows the bankruptcy of this process.

#3])>

<([#4 [1.1] Likewise, at the scoping meeting, I recommended the formation of a technical advisory committee, such as the one that BLM had in the 1970’s, to keep the public and local governments involved and aware of technical developments. Speaking from personal experience, this was very useful in the past for me, as a member of the public, and others. However, here again, the Bureau has decided that this is ‘outside the scope’ of the EIS. This is ridiculous. BLM could easily commit to creating this group as part of the mitigation and stakeholder involvement processes, and it should do so as part of the final EIS.

#4])>

<([#5 [4.1] In general, BLM has avoided addressing most of the cumulative impacts of its leasing decision by saying they are outside the scope of the analysis. However, if they are not

addressed now as potentially setting an upper limit for development, when would they ever be addressed? What is a programmatic EIS for, if not for addressing programmatic impacts?

#5)>

In what follows, I have specific comments on the impact analysis portion of the document.

<([#6 [6.3.2] - P. 4-4, line 45: The water uses listed – dust suppression and ‘moisturizing’ spent shale (does the spent shale have dry skin?) are obviously consumptive uses, not ‘nonconsumptive,’ as the water thus used will be lost to evaporation. This mistake repeats itself on p. 4-9, lines 32-35. #6)>

<([#7 [6] - P. 4-6, line 436ff: Does syncrude from oil shale have similar characteristics with the dilbit produced from oil sands in Canada, or Utah? What are the differences, as concerning viscosity and corrosivity? The Kalamazoo River pipeline leak seems to have been caused by corrosion due to dilbit. Will this be an issue for Colorado and Utah oil shale or tar sands transportation? #7)>

<([#8 [3.4.1] - P. 4-9, line 32-35: How much water is expected to be dewatered from underground mining operations? What are the exact water quality considerations and standards which must be met in order to apply this water in these ways? #8)>

<([#9 [6] - P. 4-12, lines 33-40: There is no analysis of pipelines required other than ‘feeder’ pipelines. If an attempt is not made to quantify these cumulative impacts now, when will they be quantified? #9)>

<([#10 [3.2] - P. 4-25, line 38: Pipeline breaks of any kind would affect water and soils – not just breaks due to ‘flood events.’ This is particularly true if the syncrude or dilbit is corrosive, a subject that the EIS does not address. #10)>

<([#11 [3.2] - P. 4-27, line 43: Toxic metals are subject to be being leached, as well. The text should be modified to reflect this. #11)>

<([#12 [5] - PP. 4-27 through 4-28, Mitigation Measures: This section should include a discussion of the BLM’s and the States’ requirements for reclamation performance bonds as one of the main mitigation measures for soil and geologic resources. #12)>

<([#13 [3.3.2] - P. 4-29: The discussion of the protection of paleontological resources totally ignores the role of the SHPOs – the State Historic Preservation Officers. #13)>

<([#14 [3.4.6] - P. 4-34, lines 1-2: Merely saying that “water may be obtained from major streams, groundwater, or reservoirs” is a tautology with no definable content. This programmatic EIS should include a programmatic analysis of the possible sources of water for commercial oil shale operations on the 830,000 acres it proposes to make available for leasing and development. Is water availability a limiting factor for development on this scale or not? The EIS cannot just punt this question into the future, as it tries to do by again claiming that the analysis is ‘outside the scope’ of the EIS (P. J-20, lines 26-38). #14)>

<([#15 [3.4.6] - P. 4-38, line 2: The EIS should acknowledge that injection wells not only have the potential to degrade water quality, but also to cause earthquakes, as stated by the USGS at a panel entitled “Are Seismicity Rate Changes in the Midcontinent Natural or Manmade?” presented to the Seismological Society of America’s 2012 Annual Meeting. #15])>

<([#16 [1.5] - P. A-61: This table needs to explain why ‘simulated in situ retorts’ are described, when actual data stemming from in situ retorting are available. For example, I have personally seen data from Anvil Points which indicated that in situ retort water contained arsenic in excess of 1,000 times the safe drinking water standard. This was obtained in our 1970’s lawsuit against DOI, but the data was placed under seal by the Court, and thus unavailable to those who were not counsel of record. In my scoping comments, I asked BLM to dig out that data and present it as part of this EIS, as it obviously has great significance for this analysis. This has not been done, calling into question whether this document is truly a scientific study or merely a political statement. (A schedule for the EIS handed out at the scoping meeting in Denver showed a final decision on the EIS was timed to coincide with a possible exit from power by the Obama Administration in January 2013. This information is nowhere to be found in this Draft EIS. This decision on future leasing is too important for its schedule to be dictated by re-election politics. The changes required to be made to this EIS may well push the schedule out past what appears to be an arbitrary deadline selected for political purposes.)

In sum, this is a supposed programmatic EIS which resolutely refuses to conduct its analysis at a programmatic scale. BLM needs to re-examine its decisions as to which subjects are ‘outside the scope’ of the programmatic EIS and include them in the final EIS.

BLM also needs to identify and analyze real data from oil shale operations from all available sources, and incorporate them into its analysis.

Lacking this, this EIS will go down in the history books as so many have before it – as an effort to justify politically-motivated decisions without reaching the essential scientific and policy issues which must be addressed before undertaking a federal action of this magnitude. #16])>

BLM Oil Shale and Tar Sand PEIS

Argonne National Laboratory

EVS Division, Building 240

9700 Cass Avenue

Argonne, Illinois 60439

April 25, 2012

Re: OSLI Project #2012-004

Matthew H. Mead

Governor

Ryan M. Lance

Director

Draft Resource Management Plan Amendments and Draft PEIS for

Allocation of Oil Shale and Tar Sands

To Whom It May Concern:

The staff of the Office of State Lands and Investments (OSLI) has reviewed the captioned document (PEIS) and offers the following comments relative to the proposed action insofar as it pertains to the mission of this office.

The Office of State Lands and Investments (OSLI) manages significant surface and mineral acreage within the proposed oil shale project areas located in Wyoming. The Wyoming Constitution and statutes mandate that OSLI and the Board of Land Commissioners manage these trust assets for both short- and long-term returns to the public schools and other designated beneficiaries. Accordingly, we view cautiously all federal land use allocations and actions that could directly or indirectly impede our ability to protect the underlying value of, or derive revenue from, those trust assets. OSLI manages state trust assets for two key purposes consistent with traditional trust principles: (1) long term growth in value, and (2) optimum, sustainable revenue production. That said, we are quite interested in any actions of the Bureau of Land Management (BLM) that could impact state trust resources.

As stated in the document, the fact that commercial oil shale development technologies are still primarily in the research and development phase, and details regarding the specific technologies that may be used in a given area are unknown, it is difficult for us to provide the BLM Oil Shale and Tar Sand PEIS

April 25, 2012

Page 2

BLM with specific concerns relative to the direct/indirect impacts that our trust assets could encounter as a result of oil shale development and production. <([#1 [9.2] Aside from NEP A and other

federal approvals, all oil shale project proponents are required to comply with the Rules and Regulations adopted by the Board of Land Commissioners in accordance with W.S. §36-2-1 07 and W. S. §36-9-118, in the event that development occurs on, or it is necessary to traverse, state trust lands.

#1)> <([#2 [9.2.4] Although the BLM's management prescriptions for sage grouse core area protection are not

consistent with the provisions of the Governor's Executive Order 2011-5, the Board of Land Commissioners and OSLI will comply with all provisions of the Executive Order to ensure that all land use/management activities on lands under the jurisdiction of the Board of Land Commissioners provide for the maintenance and enhancement of sage grouse habitats and populations within the defined core areas.

#2)> At this time, we would encourage the BLM to carefully and critically evaluate the nature and

extent of the proposed alternatives. My Office will look forward to providing more substantive comments during the course of any project-specific NEPA analysis, at which time we will be better informed/prepared to determine how those projects will impact our ability to fulfill our fiduciary duty to our beneficiaries.

We appreciate this opportunity to comment. If we may be of further assistance, please do not hesitate to contact this office.

Submission Text

Hello, <([#1 [2.3.1] I am writing to ask the BLM to support Alternative 3 as the smartest option to ensure our public land and parks are protected while still offering an option to continue research and development on oil shale and tar sands as an energy resource. #1)> <([#2 [3.1.1] I currently live in Northern Colorado and frequent our National Parks and Recreation Areas. They are national treasures. Though I understand our desire to access more fossil fuels, I worry tremendously about the short-sightedness in not protecting our parks for future generations.

#2)> <([#3 [3.4.1] Perhaps even more worrisome is the amount of water needed for these

activities. Water in the West is scarce and one of our most precious resources. Let's use it as wisely as we can. #3]> Thank you for your consideration. Sincerely, Sarah Waterson

Draft OSTs PEIS
Argonne National Laboratory
9700 S. Cass Ave.
EVS/240
Argonne, IL 60439

Subject: Please Choose Alternative 3: Don't Use Public Lands for Oil-Shale or Tar-Sand Development -- Draft Programmatic Environmental Impacts State for Oil Shale and Tar Sands Development

Dear Secretary Salazar,

Thank you for this opportunity to comment on the Bureau of Land Management's (BLM) 2012 Draft Programmatic Environmental Impacts Statement (PEIS) for Oil Shale and Tar Sands development on our nation's public lands. <([#1 [2.3.1] As a citizen concerned about the increasing impacts of climate change on our nation's health and welfare, I am appalled by the notion of allowing oil companies to develop tar sands and oil shale projects on public lands. It would pollute our land, air, and water, and exacerbate climate change. Endemic, threatened, and endangered species would be lost. I urge you and your agency to select Alternative 3 in the Final EIS.

“Our duty to the whole, including to the unborn generations, bids us to restrain an unprincipled present-day minority from wasting the heritage of these unborn generations. The movement for the conservation of wildlife and the larger movement for the conservation of all our natural

resources are essentially democratic in spirit, purpose and method.”

-- Theodore Roosevelt

#1])>

<([#2 [9.8] I thank the Obama administration for its work to roll back dangerous provisions enacted by the corrupt Bush administration that would have opened 670,558 acres of public land for oil shale leasing and 430,686 acres for tar sands leasing in Utah alone, including some of the state’s most iconic wilderness-quality lands such as White Canyon and Fiddler Butte. #2])>

<([#3 [2.2] In the recently-released Draft PEIS, the BLM’s preferred alternative (Alternative 2b) proposes to make 252,181 acres available for shale leasing in Utah and 91,045 acres available for tar sands leasing. This is still too much! The BLM’s proposal would leave these lands open for speculative development that could foul public lands, air and water quality, and result in large quantities of greenhouse gasses.

“Our government is like a rich and foolish spendthrift who has inherited a magnificent estate in perfect order, and then has left his fields and meadows, forests and parks to be sold and plundered and wasted.”

-- John Muir

#3])>

<([#4 [12.3] Between global warming, rampant extinction, and a quickly drying Colorado River—problems that oil-shale and tar-sand development would only worsen—it’s hard to imagine a less prudent use of our public lands. I therefore oppose any action by the BLM to continue or to authorize any new oil-shale or tar-sand development on public land, or create or continue land-use allocations that would allow for such uses in the future. I am very disappointed that the Draft PEIS did not include an alternative that does not in any way endorse additional public-land use for this unproven industry.

“Wilderness is a resource that can shrink but not grow—the creation of new wilderness in the full sense of the word is impossible.”

-- Aldo Leopold

The magnitude of potential impacts to the West’s delicate public lands and shrinking water resources is simply too great to grant unfettered access to the oil industry in these areas. It is foolhardy and irresponsible to open up public lands to these industries—particularly before we even understand the magnitude their footprint. Public lands should be held in trust for American citizens, not for private profits.

“As we peer into society’s future, we—you and I, and our government—must avoid the impulse to live only for today, plundering for our own ease and convenience the precious resources of tomorrow. We cannot mortgage the material assets of our grandchildren without risking the loss also of their political and spiritual heritage. We want democracy to survive for all generations to come, not to become the insolvent phantom of tomorrow.”

-- Dwight D. Eisenhower

#4])>

<([#5 [10.6.1] At a time of record-breaking temperatures, debilitating droughts, devastating floods, and increasingly severe weather, we simply cannot afford to increase our reliance on higher-carbon fuels. Producing oil from both tar sands and oil shale generates significantly more

carbon pollution than production of conventional petroleum. Granting the oil industry access to our public lands to lock-in production of these types of fuels is simply incompatible with a sustainable energy future that will mitigate the impacts of climate change.

“I think America will have come to maturity when it will be possible to erect somewhere in the United States a great bronze marker which will read:

“Beneath these lands which surround you there lies enormous mineral wealth. However, it is the judgment of the American people, who locked up this area, that these lands shall not be disturbed, because we wish posterity to know that somewhere in our country, in gratitude to nature, there was at least one material resource that we could let alone.”

-- Freeman Tilden

#5]>

<([#6 [3.5.7] Large-scale development of oil shale and tar sands on our public lands would also come at a major cost to the West’s land, wildlife, air quality, and water resources. Already subject to significant oil and gas developments, some of the areas assessed in the Draft PEIS suffer extremely poor air quality. #6]> <([#7 [6.3.2.2] And although very little is known about the impacts of oil shale production, even the low-end of the estimates of how much water it would consume is significant: a 2010 study by the Government Accountability Office demonstrated the range of estimated water impacts from 5 to 25 barrels of water consumed for every barrel of oil produced—a toll the West simply cannot afford.

“Every man who appreciates the majesty and beauty of the wilderness and of wild life, should strike hands with the farsighted men who wish to preserve our material resources, in the effort to keep our forests and our game beasts, game-birds, and game-fish--indeed, all the living creatures of prairie and woodland and seashore--from wanton destruction. Above all, we should realize that the effort toward this end is essentially a democratic movement.”

-- Theodore Roosevelt

#7]>

<([#8 [3.7.3.12] [3.10.3] [3.10.5] The federal public land overlying oil shale resources in Utah, Colorado, and Wyoming is also some of the best fish and wildlife habitat in the West, and outdoor recreation and tourism are huge economic drivers for the region, whereas oil shale is currently producing no jobs and no revenue, and the Congressional Budget Office confirmed that it is not expected to produce significant revenues through 2022. These federal public lands are also home to the largest remaining big game migration in the lower 48 states. It is the “mule deer factory.” It provides important habitat for sage-grouse, a species that is on the brink. All of the proposed extraction methods for oil shale will have devastating impacts on wildlife and on other values of these public lands, including clean air and water. We must protect this sustainable economy by making smart decisions based on sound information.

“Then I say the Earth belongs to each generation during its course, fully and in its own right, no generation can contract debts greater than may be paid during the course of its own existence.”

-- Thomas Jefferson #8]>

<([#9 [12.3] I ask that you carefully evaluate and fully disclose the serious impacts of all new energy required for oil-shale and tar-sand production and its potentially devastating impacts to our climate, as well as the threat it poses to wildlife, special-status, threatened, and endangered

species, and to our water, air, and communities. For all the reasons stated above, I am strongly opposed to opening up our public lands to oil shale or tar sands development.

“A thing is right when it tends to preserve the integrity, stability, and beauty of the biotic community. It is wrong when it tends otherwise.”

-- Aldo Leopold

#9]>

Thank you for your consideration of my comments. Please do NOT add my name to your mailing list. I will learn about future developments on this issue from other sources.

Sincerely,
Christopher Lish

If You Build it They Will Come “If you build it, they will come,” the adage from “Field of Dreams,” has a parallel in the petroleum industry. “If we find it, they will buy it.” The public seems unaware of the environmental cost and the finiteness of oil. Extraction continues on almost an exponential curve. The first oil was easy. The Drake well near a tar spring at Titusville, Pennsylvania in 1859 was seventy feet deep. The first exploration was just to find a tar seepage and drill. Near the La Brea Tar Pits, now within Los Angeles, a huge field came in. The first Wyoming well was near a tar pit south of Lander. Early on oil was near where it was used. A well in front of the Oklahoma state capitol is nicknamed “Petunia #1”. Drilling began in the middle of a flowerbed. Where are the extremes today in keeping up with the demand? Two hundred miles off the coasts the largest companies build platforms that are the size of the Eiffel Tower, so large and expensive the major petroleum companies, the richest industrial organizations ever, must pool their funds. The platforms cost billions and the sub sea wells may be 7,000 feet just to the well hole. We know their danger. Operations bring billions in profits. With drill stems ready, the industry waits for an opening into the Artic National Wildlife Refuge. Tar sands come from beneath Canada’s boreal forest and fragile ecosystems are devastated. Google “Sixty Minutes,” “The Tar Sands of Alberta.” In a land where the winter temperature sometimes zooms up to zero degrees, twenty-four hours a day monster trucks move across the artic transporting sands to be processed into crude and sent out in pipelines. The largest, the

Keystone XL, is intended to cross seven US states. Meanwhile, much of the public asks, Why not? What is the use of undeveloped Canada? <([#1 [6.2.3] The ultimate extreme would be to bake oil from shale in the Colorado Plateau region of Colorado, Utah and Wyoming. The BLM is planning to assist oil shale production like Canada does in Alberta. It would require enormous amounts of energy to make energy. Jim Bridger Power Plant, Wyoming's largest, produces 2,000 megawatts. Each day it uses 15,000 tons of coal. In coal cars that extends a mile and a half on the railroad track. Colorado Plateau oil shale averages one barrel of oil per three tons of shale. A Rand Corporation study indicates that a commercial-scale industry of a million barrels daily, one twentieth of the nation's consumption of oil each day, would require ten 1,200 megawatts plants. Wyoming has eight main power plants. Ten plants would produce 100 million tons of greenhouse gasses annually. The requirement would be 60 million tons of shale for a single US day of oil. In 100-ton rail cars that much ore would reach across the US two times! #1])> <([#2 [3.5.1.6] The most urgent threat by far, even beyond the use of precious, already appropriated water, will be harm to our atmosphere. Oil produced from oil shale will end up where the other fossil fuels end up, as carbon dioxide in the atmosphere. Nearly all organizations of scientists affirm the atmosphere and the earth's surface is warming and climate change is the result (http://en.wikipedia.org/wiki/Scientific_opinion_on_climate_change). A recent study conducted by the National Academy of Sciences (<http://www.pnas.org/content/107/27/12107.full>) polled 1,372 active atmospheric scientists. 97–98% of active climate researchers support the tenets of anthropogenic caused climate change outlined by the Intergovernmental Panel on Climate Change. The ongoing study by the IPCC is the most exhaustive study ever on climate change. With two thousand other scientists, in 2007, Dr. Gabor Vali and Dr. Jason Shogren of the University of Wyoming received the Nobel Peace Prize for their research with the IPCC. #2])> <([#3 [12] Conservation gets smothered in Wyoming. Eighty percent of the employment is tied to production of fossil fuels. We're first in coal production among the states, second in natural gas, and seventh in oil. Wyoming produces more carbon to be released into the atmosphere as carbon dioxide than any of the U.S. states and most nations. In 1997 Wyoming was the first state to produce 200 million tons of coal in one year. It remains the only state to mine that much coal in one year. In 2008, a decade later, production more than doubled to 462 tons, more coal than the other three top coal-producing states, Pennsylvania, West Virginia and Kentucky, combined. #3])> Duane Keown, Professor Emeritus, Science Education, University of Wyoming (dkeown@uwyo.edu)

To: BLM 4/30/2012

Subject: 2012 Oil Shale and Tar Sands PEIS

I am a resident of Garfield County, Colorado. For many years I lived in Parachute, Colorado and am very familiar with the dubious oil shale legacy including the various pilot projects currently underway.

<([#1 [9.8] The 2008 PEIS was fundamentally flawed. The adverse impacts of dedicating nearly 2 million acres of our Public Lands for industrial use at bargain basement prices, without a proven extraction technology and without having scientific data to measure impacts on the water, soil, air, wildlife resources and public health and safety was egregious. I commend the BLM for conducting this second stage PEIS to increase transparency and scientific rigor on this most import project.

#1)> <([#2 [2.2.1] I support the BLM's Preferred Alternative of allocating 462,000 acres for potential oil shale and tar sands leases as a measured response to enable the oil shale industry to conduct robust RD & D activities to identify viable extraction processes including cost/ benefit ratio, energy requirements, water requirements, resource environmental impacts, impacts on wildlife, social-economic impacts, and health – life safety concerns.

As a registered professional engineer, I view the Preferred Alternative as a logical incremental progression in the decision matrix for oil shale development whereas the 2008 proposal was a political imperative to benefit the industry without transparency and scientific support. There are still groups (various County Commissions) with the misguided belief that the 2008 proposal is still preferred. The 2008 proposal was nothing more than an industry land grab that was not in the best interests for the citizens of the United States both economically and environmentally.

#2)> <([#3 [3.10.2] The citizens of Western Colorado have been through several oil shale busts over the past years; the latest being 30 years ago. Today, industry proponents tout that another oil shale bust is impossible now or in the future. In the early 2000's, the natural gas industry made similar claims that there "could never be an economic bust in natural gas like there was in oil shale". The current economically depressed natural gas industry disproves the bravado claimed in the early 2000's. #3)>

Thank you for the opportunity to comment.

Sincerely,

Douglas DeNio, PE.

<([#1 [3] I am deeply concerned about the potential effects to our water, wildlife, communities and public lands if the BLM initiates a commercial oil shale leasing program. The two million acres in UT, WY and CO previously allocated for commercial leasing is a massive amount of public, taxpayer land that would be sacrificed for a singular use of the landscape. #1])> <([#2 [2.2] [12.3] While the preferred alternative (Alternative 2) is a step in the right direction, BLM should consider an alternative that does not endorse giveaways of public lands to this unproven industry. #2])> <([#3 [3] Oil shale is currently producing no jobs and no revenue. The Congressional Budget Office confirmed that it is not expected to produce significant revenues through 2022. This means we have time to thoroughly assess the impacts of development to our water, wildlife and communities, and should not rush now to give away public lands. #3])> <([#4 [3.10.3] The land overlying oil shale resources in Utah, Colorado and Wyoming is some of the best wildlife habitat in the West. Outdoor recreation and tourism are huge economic drivers that depend on this habitat. The farming and ranching sectors require reliable access to water resources, which may be depleted by extensive commercial oil shale development. We must protect these jobs by making smart decisions about how we allow oil companies to move forward with oil shale speculation. #4])> <([#5 [3] I recommend that you carefully consider the serious impacts of oil shale production to our wildlife, water, air, and communities as you take another look at oil shale development. #5])>

<([#1 [12] I will reiterate what I put in a letter to the editor in the Laramie “Boomerang” but I have attached it below. This is an unproven, so far unproductive process that will not affect our dependence on foreign oil (only we will!), will destroy the landscape, use too much water, pollute the air, endanger recreation- and tourism-related jobs, and disrupt wildlife. The damage

and any potential yield are absolutely not worth allowing exploration and drilling.

I recently read literature and a website's FAQs about oil shale. It reminded me of the commercial: "It's not nice to fool Mother Nature." Why? Because producing oil from oil shale involves using other natural resources and energy-consuming processes to convert fossilized organic matter embedded between layers of shale into conventional crude oil instead of letting Mother Nature do it for us!

Scientists and experts can always be found to defend or refute a theory or a prediction; all that proves to me is that if that happens, it's an issue serious enough to be thus debated.

But various sources tell me that a 2020 industry prediction of 59,500 barrels/day is 0.3% of our daily oil consumption so oil shale production won't reduce our foreign oil dependence; that up to 5 barrels of water are needed to produce each barrel of oil from oil shale; that conventional crude oil is twenty times more efficient; that all of the energy consumed to do Mother Nature's work will result in anywhere from 23%-75% more greenhouse gases.

Why care? No matter your position on climate change, we're experiencing drier, hotter weather and water-availability issues that affect tourism, recreation, agriculture and threaten associated "bird in the hand" jobs. Do we want to divert water to an unproven process that after 100 years hasn't yielded one commercially-produced barrel? BLM proposals involve approximately 175K to over 1M acres in Wyoming - mostly in the Green River Basin - plus more in Utah and Colorado; that's a whole lot of land to be given over to commercial leases without evidence of feasibility or an understanding of the impacts on wildlife, water, and people; Google the "Gillette Syndrome" to be reminded of what happens to small communities when temporary workers inundate a town, strain resources and infrastructure and change its life-style.

I will participate in the BLM's 90-day comment period on the oil shale - and tar sands - draft proposals opting probably for a restrictive alternative, but you should read more on oil shale; consult with experts; go to the BLM's Information Center at <http://ostseis.anl.gov> and take a stand one way or the other. #1)>

<([#1 [3.1.2] My name is Jason Stevenson. I am a resident of Salt Lake City, Utah. I am concerned that allowing oil shale and tar sands leases in the proposed areas would cause harm to nearby national parks and recreational areas. I enjoy hiking, car-camping, and driving in southern Utah with my family. We moved to Utah from Pennsylvania specifically because of the state's outdoor amenities. In fact, we are planning a car camping trip with friends this June to visit Canyonlands, Arches, Grand-Staircase, and Zion. My job as an outdoors writer is directly connected to the availability and preservation of Utah's world-famous recreation lands and activities. I worry that the untested and unknown technologies to extract oil shale and tar sands will harm the air quality, wildlife, roads, water quality and flow, and visitor experience at national parks and recreation lands in Utah where I live. Creating energy from oil shale and tar sands is the "cold fusion" of the petroleum industry. Maybe one day it will be possible, but we aren't there yet. #1])> <([#2 [2.3.1] Oil shale and tar sands companies have been experimenting on state, private, and some public lands for decades--trying to figure out how to make oil shale and tar sands economical. After decades of hard work, they are closer to making it work, but they aren't to the point where they should be given hundreds of thousands of acres of public lands to continue their experiments. Therefore, I think the BLM should choose the research-only Alternative #3, which allows only research development, and demonstrate leases on existing parcels. I believe these leases will give companies enough public lands to demonstrate the feasibility of their projects. The other options that allow more leases could create another boom-to-bust energy grab, which would not only harm the public lands where the mining and processing takes place, but also whiplash the economy like it did on Black Sunday in May 1982. In summary, as a Utah resident, as someone whose livelihood depends on the preservation of this state's national parks and public lands, and as a father who wants his son to enjoy the same access and enjoyment from public lands that I had as a child, I urge the BLM to choose the research-only Alternative #3. Thank you for reading my comments. #2])> -Jason Stevenson

RE: Colorado Parks and Wildlife Comments for the Draft Programmatic Environmental Impact Statement and Possible Land Use Plan Amendments for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah, and Wyoming (January 2012).

Dear Ms. Thompson:

Colorado Parks and Wildlife (CPW) appreciates the opportunity to work with BLM by providing comments and recommendations for the Draft Programmatic Environmental Impact Statement and Possible Land Use Plan Amendments for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah, and Wyoming (OSTS DPEIS). In December 2007 and May, 2008, Colorado Division of Wildlife, (now Colorado Parks and Wildlife) provided comments on the impacts to wildlife that would likely to occur as a result of land-use allocations and policy direction as presented in the BLMs Resource Management Plan Amendments for Oil Shale.

<([#1 [3.7.3.1] [3.7.4.1] CPW s concerns and recommendations expressed in the 2007 and 2008 OSTS PEIS

comment letters remain valid for this OSTS DPEIS. (See Attachments) CPW respectfully restates that the Piceance Basin is home to the largest migratory mule deer herd in North America, a large migratory elk population, one of only six greater sagegrouse populations in Colorado, conservation and core conservation populations of Colorado River cutthroat trout, and a host of other wildlife species. These resources are of statewide economic, ecological, recreational, and aesthetic importance. Impacts to these wildlife resources from oil shale development will have local, regional, statewide, and even national implications to sportsmen and other wildlife enthusiasts. #1])>

<([#2 [3.7.3.1] [3.7.4.3] CPWs primary concern for wildlife due to commercial oil shale development is the overall loss and fragmentation of crucial wildlife habitat, the feasibility of reclamation of disturbed areas, and the damage that would accrue to wildlife populations. Due to the

lack of available information, the detail provided in the OSTs DPEIS is insufficient to allow for an accurate or complete assessment of the cumulative impacts to wildlife habitats and populations that will occur from oil shale development.

BLM identifies, generally, potential impacts to Colorado wildlife species, such as cutthroat trout and the greater sage-grouse; CPW recommends that the most current assessments, habitat maps, Resource Management Plans, or potential listing reviews be included for updates and assessments in the process as it moves forward. #2)>

<([#3 [3.7.5.1] Concurrent with the most recent mapping efforts, there is a heightened interest and sense

of urgency to define sufficient protective measures for greater sage-grouse at the state and national levels and methods for incorporating those measures in RMPs. For instance, CPW in cooperation with BLM has developed revised priority habitat maps that differ from maps previously outlined in the Colorado Greater Sage-grouse Conservation Plan (2008). Results of the greater sage-grouse EIS should be incorporated into this OSTs DPEIS. CPW expects that the BLM will manage greater sage-grouse and their habitats wherever they occur in a manner that avoids the need to list the species under the Endangered Species Act. CPW is unclear how the process and outcomes of this OSTs EIS, especially leasing, will be merged with BLMs parallel process under the National Sage-Grouse Strategy to protect the greater sage-grouse.

CPW points out that new (Spring 2012) greater sage-grouse habitat and population distribution information (map) is available and that this new information has the potential to influence the process and outcome of the OSTs DPEIS. #3)>

<([#4 [3.7.3.8] The BLM is offering four leasing alternatives with four sub alternatives (Alternative 2a, 2b, 4a, and 4b). Each of the alternatives designates a specified amount of acreage that would be made available for lease; acreage amounts range from 32,640 to over 2 million acres with numerous permutations for partial and full lease exclusions.

CPWs review of the leasing alternatives identified many crucial unknowns and variability in estimates concerning leasing scenarios, technologies that would be used, production output variability, and potential impacts to wildlife. The generalizations and lack of specific information presented in the document make it extremely difficult if not impossible to analyze the alternatives and provide meaningful review and feedback with respect to impacts to wildlife and wildlife habitats as well as to provide strategies and methods for avoidance and minimization of those impacts. On page 2-83 BLM states that “The magnitude of these potential impacts cannot be quantified at this time because key information about the location of commercial projects, the technologies that maybe employed, the project size or production level, development time lines, and mitigation measures that would be applied, are unknown.” CPW agrees.

Further, it appears that past and on-going RD&D projects have not produced substantive information to make informed decisions regarding impacts to wildlife resources that will result from oil shale development. Many of BLMs references to technologies refer to

2005 research and not on-going efforts or recent findings. CPW believes that it would be unwise to move forward with the aggressive leasing alternatives #1 and #4 which have the most potential to impact Colorado's wildlife. #4)>

<([#5 [6.3.1] CPW is intrigued by the Red Leaf R&D Resources EcoShale TM In-Capsule Technology

claims of being self-sufficient power wise, its anticipated energy return on investment of 10, and that it would not require Process Water. This approach appears to be the least intrusive to wildlife and reduces the negative effects of Oil Shale development. If these claims are proven to be true, this type of Oil Shale development technology should be required for oil shale leases across the region. #5)>

<([#6 [2.3.1] CPW firmly believes that until less detrimental methods for Oil Shale Development is

proven; leasing is premature other than the 6 existing R&D Pilot Plots plus the 3 pending R&D Pilot studies (totaling 32,640 acres of public land - 26,880 in Colorado). The existing and planned R&D studies should be allowed to run their course, derive meaningful results (real data that can be used to develop accurate impact assessments), and attempt to establish an environmentally friendly cost effective extraction process. When such technologies are found and proven, appropriate oil shale extraction and mitigation regulations can be developed and implemented for all proposed BLM land allocations and leasing opportunities. #6)>

Thank you for this opportunity to comment. CPW looks forward to working cooperatively with BLM to ensure that impacts to wildlife and habitats associated with oil shale development are addressed in a careful and protective manner.

Sincerely,

/s/ Ron D. Velarde

BLM Oil Shale & Tar Sands PEIS

Argonne National Laboratory

EVS Division, Building 240

9700 South Cass Avenue

Argonne, IL 60439

RE: Comments on Draft BLM Oil Shale & Tar Sands PEIS

Dear Reader:

<([#1 [9.8] Duchesne County, Utah, a cooperating agency in this environmental review process, has summarized its comments in Resolution #12-08, attached hereto and incorporated herein. Rural counties in Utah, Wyoming and Colorado containing these vast and important energy resources will not stand idly by while the Obama Administration continues to wage war on energy production in the West.

This so-called “fresh look” at lands available for oil shale and tar sands leasing is a colossal waste of the taxpayer’s dollars, which practice has become all too frequent during the Obama Administration. The 2008 PEIS, which Duchesne County spent significant staff hours reviewing and commenting on, as a cooperating agency, was consistent with the Energy Policy Act of 2005, the state and local land use plans in the region (such as the Uintah Basin Utah Energy Zone designation) and the multiple use mandate of FLPMA. The draft 2012 PEIS violates all of these and makes no attempt to explain why greater consistency cannot be achieved. A copy of the Uintah Basin Utah Energy Zone Resolution #12-06, approved by Duchesne County, is attached hereto and incorporated herein by reference. #1])>

<([#2 [9.1] [9.2.1] This DPEIS contains a flawed purpose and need statement based on the infamous Secretarial Order 3310, which Congress de-funded as stated in the Resolution enclosed. #2])> <([#3 [1.5] The DPEIS, given the substantial numbers of errors and omissions therein, shows an obvious attempt to rush this PEIS to approval before the end of the Obama Administration. #3])>

<([#4 [2.2] The BLM preferred Alternative, Alternative 2b, is not adequately analyzed in the DPEIS. #4])> <([#5 [2.1.1] Alternative 1 is the only alternative that can be legally justified. #5])>

<([#6 [6.3] [9.2.5] The DPEIS fails to deliver the promised “fresh look” as it relies on basically the same data as the 2008 PEIS and fails to incorporate new data that has become available since 2008; especially the important data associated with new oil shale and tar sands technologies being employed on non-federal lands in the region. This failure to utilize the best available data constitutes a violation of the Federal Data Quality Act. #6])>

<([#7 [9.5] Duchesne County, pursuant to our Cooperating Agency Memorandum of Understanding, Section V (E) hereby informs the BLM that we disagree on substantive elements of the DPEIS. These disagreements have not been resolved through the comment period to our satisfaction. We request, in accordance with the MOU, that the BLM describe the many substantial inconsistencies between its proposed action and the objectives of Duchesne County’s land use plans and policies and include a summary of Duchesne County’s views (as stated in this letter and in the enclosed Resolution) in the Final PEIS. #7])>

We have conducted a page-by-page review of the four-volume DPEIS and offer the following specific comments on the content of the document:

<([#8 [1.5] Page ES-1, Line 19 and Page 1-4, Line 7: If the BLM has decided to take a “fresh look” at the land allocations from the 2008 PEIS, why does the 2012 DPEIS fail to utilize new data that has become available since the 2008 effort? Some sample pages where BLM has failed to incorporate new data are: Pages 2-15, 3-28, 3-29, 3-34, 3-62, 3-83, 3-85, 3-246, 3-247, 3-262, 3-268 through 270, 3-272, 4-9, 4-198 through 199 and A-109 to name a few. #8])>

<([#9 [2] Page ES-5, Line 39: The lands identified as suitable for potential leasing under the 2008 PEIS are considered the most geologically prospective oil shale and tar sands areas. It makes absolutely no sense to remove 75% of these lands from potential leasing given the strides made in technology, as demonstrated on non-federal lands, since 2008. #9])>

<([#10 [3.1.5] Page ES-6, Footnote 3: It makes no sense to remove lands from consideration because they are within ACEC’s that failed to warrant designation in BLM land use plans. #10])>

<([#11 [6.3.2.1] Page ES-9, Line 15: BLM has ignored the low water use technologies being employed by Red Leaf Resources (Oil Shale), Temple Mountain Energy (Tar Sands) and others despite requests by cooperating agencies that such new information must be incorporated in the DPEIS to debunk the water use myth promoted by radical environmental groups. #11])>

<([#12 [6.5] [3.15] Page 1-8, Figure 1.2-1, Page 2-14, Figure 2.3-1: These figures were not updated to reflect the latest findings from the USGS 2011 Assessment of In-Place Oil Shale Resources. #12])>

<([#13 [13] Page 1-20, Line 31: Reference is made to a text box; but it is not clear that this text box appears on Page 1-2. #13])>

<([#14 [9.5] Page 1-21, Lines 32-41: The BLM has failed to cooperate with state and local governments to promote consistency with their land use plans. The State of Utah and many counties containing oil shale and tar sands resources have established an Energy Zone that provides for energy development as the priority land use. The BLM has made no attempt in the DPEIS to explain why its preferred alternative cannot be more consistent with such local plans. #14])>

<([#15 [6.3.5] Page 2-1, Line 18: BLM fails to recognize that oil shale has already proven to be an economically viable resource. It has most recently been proven by Enefit American Oil, which recently hosted Uintah County, Utah officials at their operations in Estonia. Enefit operates economically on a three-foot thick seam of oil shale. Imagine how economically they could operate on a 25-foot or greater thickness of oil shale in NE Utah, if given the chance! Commercial production has also occurred in Scotland (see Page 4-200). #15])>

<([#16 [2] Page 2-1, Line 32: This description of the alternatives is poorly worded and could lead the reader to assume that the No Action Alternative does not allocate any lands for potential leasing. The alternatives could better be described as the No Action Alternative and three *reduced* land allocation alternatives. #16])>

<([#17 [6.3] Page 2-15, Line 17: BLM has failed to recognize the plans for commercial oil shale development by TomCo Energy, a London-based energy company that plans to seek permits on SITLA lands. It's too bad that emerging companies are not able to access federal lands for their start-ups and must confine themselves to more progressive-minded state agencies and private land owners to prove the viability of their technology. #17])>

<([#18 [13] Page 2-16, Line 33...the BLM agreed to propose changes to the rule rather than purpose changes to the rule... #18])>

<([#19 [2.2] Page 2-35, Line 24: This paragraph demonstrates the lack of business sense by those currently in power in Washington D.C. No company is going to invest in costly oil shale technology on federal lands when such small acreages are made available under Alternative 2(b). It looks like the investments will continue on non-federal lands until the bureaucrats in Washington D.C. are replaced. #19])>

<([#20 [2.2] Page 2-35, Line 37: In this paragraph, the BLM admits that the preferred alternative, Alternative 2 (b), was "not noted elsewhere in the document but will be developed further in preparation of the Final PEIS. Duchesne County requests that the DPEIS be re-written and provided to us for at least a 30-day comment period after this alternative is more fully developed.

It is impossible for cooperators and the general public to adequately comment on an alternative until it is fully developed in the draft PEIS. **#20])>**

<(**#21** [13] Page 2-48, Line 8: Two periods at the end of the sentence. Page 2-48, Line 44: Delete the word “as” after the word “acreage.” **#21])>**

<(**#22** [13] [2.4] Page 2-53, Tables 2.3.3-4 and 2.3.3-5, Page 2-75, Table 2.4.3-4, Page 2-76, Table 2.4.3-5: These tables need to be re-designed to help the reader understand them. For example, in Table 2.3.3-4, the column entitled “Acres LWC and Sage Grouse needs to be moved to the right of the “Total” acreage column and then the data subtracted from that acreage to arrive at the acreage available for oil shale development after 75% of the lands with wilderness characteristics and sage grouse habitat are protected. Similar adjustments need to be made in the remaining tables. **#22])>**

<(**#23** [2.4] Page 2-53, Line 14: This section is an analysis of Alternative 4. Why is Alternative 2 mentioned here? **#23])>**

<(**#24** [13] Page 2-66, Line 7: This section is an analysis of tar sands leasing under alternative 2. Replace “oil shale” with “tar sands” in this sentence. **#24])>**

<(**#25** [3.15] [3.1.7] Page 2-68, Figure 2.4.3-1: Along the Green River, in Uintah County, there is shown a “Colorado River Wildlife Management Area.” We have not heard of this area before and cannot find reference to it on the internet. Being located along the Green River, we suspect that this map designation may be in error. **#25])>**

<(**#26** [13] Page 2-71, Line 8 and footnote 22: The paragraph beginning on Line 8 and the footnote are repetitious. **#26])>**

<(**#27** [13] Page 2-73, Line 45: Delete the word “follow” at the end of the sentence. **#27])>**

<(**#28** [2] Page 2-76, Lines 32-38: The alternative mentioned here should be one of the alternatives analyzed in the DPEIS. Duchesne County requests that the DPEIS be re-written to include this alternative and that the DPEIS be made available for another 90-day comment period after such amendments are made. **#28])>**

<(**#29** [13] Page 2-80, Lines 39-41 and Lines 44-47: These sentences are poorly worded, repetitive and redundant. **#29])>**

<(**#30** [2] Pages 2-83 to 2-109, Table 2.6-1: For Alternative 1, why does this table refer only to the White River and Book Cliffs RMPs when the Vernal RMP and perhaps others include oil shale development areas? **#30])>**

<(**#31** [3.7.3.7] Page 2-95, Table 2.6-1, Wildlife: We doubt that there are “106,092 acres of raptor nests” under Alternative 1 and “103,719 acres of raptor nests” under Alternative 4. **#31])>**

<(**#32** [13] Page 2-100, Table 2.6-1, Visual Resources: The column for Alternative 4 erroneously contains a reference to Alternative 2. **#32])>**

<([#33 [I3] Page 2-101, Table 2.6-1, Cultural Resources: There is an acreage discrepancy (1.9 million acres vs. 2,017,714) in the Alternative 1 column. #33])>

<([#34 [3.10.3] Page 2-104, Table 2.6-1 and Page 2-127, Table 2.6-2, Socioeconomics: The positive socioeconomic impacts are understated and the negative impacts are overstated here and throughout the DPEIS. #34])>

<([#35 [3.12.2] Page 2-105, Table 2.6-1 and Page 2-128, Table 2.6-2, Environmental Justice: The positive impacts of energy development on minority and low-income populations are understated and the negative impacts are overstated here and elsewhere in the document. #35])>

<([#36 [3.12.1] Page 2-106, Table 2.6-1 and Page 2-128, Table 2.6-2, Environmental Justice: Assumptions are made that energy development will have negative effects on air and water quality and decrease water available for agricultural use by low-income or minority populations. These assumptions are based on the myths perpetuated by radical environmental groups and do not take into account the technologies being employed on private and state lands by companies such as Red Leaf Resources. #36])>

<([#37 [I3] Pages 2-111 through 2-130, Table 2.6-2: The acreage associated with tar sands leasing under Alternative 1 should be 430,686 rather than 2,017,714. The acreage associated with tar sands leasing under Alternative 2 should be 91,045 rather than 461,965. The acreage associated with tar sands leasing under Alternative 4 should be 425,790 rather than 1,963,414. See Page 2-121. Also, in this Table, the reference under Alternative 1 containing lands only within the White River and Book Cliffs RMPs appears to be erroneous. Lands within the Vernal RMP and perhaps others should be included. #37])>

<([#38 [I3] Page 2-117, Table 2.6-2, Noise: The indication that there would be 1.9 million acres identified for potential tar sands leasing under this alternative is false. #38])>

<([#39 [I3] Page 2-118, Table 2.6-2, Noise, (cont.): Reference is erroneously made to Alternative 2 in the Alternative 4 column. #39])>

<([#40 [3.7.3.7] Page 2-121, Table 2.6-2, Wildlife: We doubt that there are “7 acres of raptor nests” under Alternative 1 and “5 acres of raptor nests” under Alternative 4. #40])>

<([#41 [I3] Page 3-4 and Figure 3.1.1-1: Section 3.1.1.1 notes that the Glenwood Springs BLM Field Office is now called the Colorado River Valley Field Office. However, Figure 3.1.1-1 (and several other figures throughout the document) still refer to this field office as Glenwood Springs. #41])>

<([#42 [3.1.7] Page 3-28, Line 6: The figure of 2,800 active oil and gas wells in the Vernal Field Office is out of date (2005). Data from the *Greater Uinta Basin Cumulative Impacts Technical Support Document, August 2011*, states that there are 9,036 productive wells in the region. (http://www.blm.gov/pgdata/etc/medialib/blm/ut/vernal_fo.Par.57849.File.dat/GCW%20Cums%20TSD%2003-22-12%20final.pdf) #42])>

<([#43 [3.1.7] Page 3-29, Line 15-20: This information regarding wild and scenic rivers is out of date (2005) and inconsistent with the ROD for the Vernal FO RMP (see Figure 14a of the Approved RMP). #43])>

<([#44 [3.1.6] Page 3-37, Line 22: What authority does the Wyoming Environmental Council have to designate an area as very rare or uncommon? #44])>

<([#45 [3.1.8] Page 3-40, Lines 16-18: The assertion is made that ACEC's, WSA's, SMA's, national historic trails and lands with wilderness characteristics support higher levels of recreation use than most BLM administered areas. The opposite is true. These areas restrict public access and types of activities allowed to the point that they actually support lower levels of recreation use or prohibit recreation use by the majority of citizens. #45])>

<([#46 [3.2] Page 3-44, Line 2: Erosion by wind is more likely due to the lack of natural vegetative cover than overgrazing. #46])>

<([#47 [13] Page 3-61, Line 25: Was this water data collected from 1906 **and** 1986 or from 1906 to 1986? #47])>

<([#48 [3.4.5] Page 3-62, Line 13-15: This section, if truly a "fresh look," should be updated to include what the BOR's Basin-wide Salinity Control Program has funded and accomplished since 2004. #48])>

<([#49 [6.3.2.1] Page 3-66, Section 3.4.1.4, Water Use: This entire section is flawed in that it fails to recognize modern oil shale technology being used by companies such as Red Leaf Resources, which use little to no water. #49])>

<([#50 [3.4.5] Page 3-78, Section 3.4.2.2, Surface Water Resources: This entire section is flawed in that it fails to recognize data available for the past six years; including 2011, which was a record water run-off year. #50])>

<([#51 [3.4.4] Page 3-83, Lines 38-44, Page 3-85, Lines 9-15: Again, old data (1941 to 1970) is being used when newer data is available and should be incorporated into the draft. #51])>

<([#52 [3.5.1.8] Pages 3-103 through 3-105: The climate change predictions on these pages are filled with contradictions; for example, there are dire predictions of both drought and increased precipitation attributed to climate change. #52])>

<([#53 [3.5.5] Pages 3-106 to 3-107, Table 3.5.2-1: The air emissions data in this table are from 2002. Newer data is available and should be incorporated into this table. Also, data from Duchesne County, Utah is not included in the table. #53])>

<([#54 [3.6] Page 3-120, Line 1: Duchesne County actually limits construction and mining activities to 7 AM to 9:30 PM on weekdays, 8 AM to 9:30 PM on Saturdays and 9 AM to 9:30 PM on Sundays and holidays.

#54])>

<([#55 [3.7.1.1] Page 3-121, Line 38: A word is missing at the end of this sentence. The word could be “basin.” #55])>

<([#56 [3.7.5.1] [3.7.5.3] Page 3-134, Line 3: ...are present within in the Green River Basin... #56])>

<([#57 [3.7.5.1] [3.7.5.3] Page 3-197, Lines 31-32: One major threat to sage grouse populations (see Page 4-91) is West Nile Virus. This threat is left out in this section. #57])>

<([#58 [3.10.1] Page 3-238, Line 20: The 1989 Gulliford report is apparently flawed. If 700 new schools would be needed to support the oil shale industry in Garfield County, Colorado, with 3,000 teachers and staff, that calculates to about 4.3 teachers/staff members per school. Perhaps 70 new schools would be needed? #58])>

<([#59 [3.10.1] Page 3-243, Table 3.11.2-1: It appears that the cities of Blanding, Duchesne and Naples, within the Utah ROI, have been omitted from this table. #59])>

<([#60 [3.10.1] Page 3-245, Table 3.11.2-4: This table contains a mixture of data from 2004, 2007 and 2009, which makes the title of the table misleading and makes it difficult to draw conclusions from the data. Data from 2004 should be updated to 2009 data, if available. #60])>

<([#61 [13] Page 3-246, Lines 1-32: The employment data used in this section is from 2004. Updated employment data should be available in Utah from the Department of Workforce Services. #61])>

<([#62 [13] Page 3-251, Line 4, Page 3-254, Line 22, Page 3-255, Table 3.11.2-8, Page 3-261, Line 44: Duchesne is misspelled. #62])>

<([#63 [3.10.1] Page 3-262, Table 3.11.2-11: Much of the data used in developing this table is 6-8 years old and should be updated. #63])>

<([#64 [3.10.1] Pages 3-268 and 3-269, Tables 3.11.2-15 and 3.11.2-16: Much of the data used in developing these tables is 6-8 years old and should be updated. #64])>

<([#65 [3.10.4] Page 3-270 and 271: The value of recreation resources is unlikely to be underestimated as many agencies have been known to inflate their visitation counts to justify the budget they wish to obtain. Also, a recent study by Utah State University [*The Economic Costs of Wilderness, June, 2011*] finds that wilderness areas actually have a negative impact on the local economy rather than a positive impact. #65])>

<([#66 [3.10.1] Page 3-272, Table 3.11.3-1: The 2004 data used in this table should be updated. #66])>

<([#67 [3.10.1] Page 3-273, Lines 31 and 36: Out-of-date data is used here as well. #67])>

<([#68 [3.10.1] Page 3-276, Line 37: 2010 Census data should be available for use in Table 3.12-1 rather than 2000 Census data. #68])>

<([#69 [6.3.2.1] Pages 4-8 through 4-11, Page 4-33, Section 4.5.1.2, Page 4-43, Table 4.5.2-1, Page 4-47, Line 27, Page 4-48, Section 4.5.2.2: Water usage estimates are high given today's technologies being pioneered by companies such as Red Leaf Resources, which use very little, if any water. Some data used here [see Page 4-9, Line 11], is from 1973, which is ancient history. #69])>

<([#70 [6.3] Page 4-10, Lines 34-40, Page 4-69, Section 4.7.1.6: Upgrading may not be as extensive as depicted here under today's technologies being pioneered by companies such as Red Leaf Resources, #70])>

<([#71 [3.4.5] Page 4-48, Lines 41-43: The 2010 Western Resource Advocates water report is widely viewed to be a biased, flawed document that perpetuates the myths associated with water use in oil shale and tar sands development. Reference to this flawed report should be deleted from the document. Instead, the document should be updated to reflect more accurate information from companies working in the industry. #71])>

<([#72 [6.5] Page 4-13, Section 4.1.5. Workforce/Housing: The BLM should contact companies actively involved in oil shale production (such as Enefit and Red Leaf) for updated estimates. #72])>

<([#73 [6.2.1] Page 4-13, 4-14, Section 4.1.6, Page 4-43, Table 4.5.2-1, Electricity needs: This section fails to account for today's technologies being pioneered by companies such as Red Leaf Resources, which use synthetic natural gas to produce the energy needed for the process. New power plants may not be necessary. #73])>

<([#74 [6.5] Page 4-16, Section 4.1.8: The BLM should contact companies actively involved in oil shale production (such as Enefit and Red Leaf) for updated estimates. #74])>

<([#75 [3.1.2] Page 4-21, Section 4.2.1.4, Recreation use: The document should address how much land would actually be taken out of recreation use under the various alternatives. #75])>

<([#76 [3.5.1.5] Page 4-57, Section 4.6.1.1.2, GHG Emissions: This section fails to recognize today's technologies being pioneered by companies such as Red Leaf Resources, who claim that GHG emissions are reduced by 2/3rds compared to previous technology. #76])>

<([#77 [3.5.1.5] Page 4-61, Section 4.6.2, Mitigation Measures: The BLM should communicate with companies such as Red Leaf Resources to determine how their new technologies reduce GHG emissions. #77])>

<([#78 [3.8.3] Pages 4-143 and 4-144, Figures 4.9.1-1 and 4.9.1-2: Why doesn't the BLM obtain photos from companies that are actually operating or proposing to operate in Colorado and Utah (Enefit, Red Leaf Resources, etc...) instead of photos from Australia? #78])>

<([#79 [3.8.4] Page 4-154, Line 39: Please clarify what is meant by "fall-line cuts." #79])>

<([#80 [1.3] Page 4-159: The four bullet points should be formatted with italics as was done on Page 4-162. #80])>

<([#81 [3.10.4] Page 4-180, Lines 14-20: In reality, the important recreational areas are adequately separated from the oil shale and tar sands areas so that both activities can function without adversely impacting the other. Also, while the tourism and recreational sectors of the economy are important, they do not produce the family wage jobs that the energy industry does. #81])>

<([#82 [3.13] Page 4-191, Section 4.14.1.2 and Page 4-194, Section 4.14.1.4: These sections need to be updated to recognize today's technologies being pioneered by companies such as Red Leaf Resources and Enefit. #82])>

<([#83 [6.5] Chapter 5, beginning on Page 5-1: This entire section should be updated to incorporate new technologies, such as those used by Temple Mountain Energy [see www.templemountainenergy.com]. #83])>

<([#84 [6.3.2.1] Page 5-34, Section 5.5.2, Water Use: The water usage here is vastly overstated given today's technologies being pioneered by companies such as Temple Mountain Energy, where they re-use 93% of their water. #84])>

<([#85 [3.5.1.5] Page 5-45, Lines 1-2: Did the BLM contact Temple Mountain Energy, operating in the Asphalt Ridge area of Utah, to verify that their technology is not commercially viable? #85])>

<([#86 [3.13] Page 5-65, Lines 1-7: Temple Mountain Energy claims that their spent tar sands are benign and can be sold as "clean, high-quality sand for applications such as hydraulic fracturing, glass making and other industrial uses." Did the BLM contact this company to verify that not all spent tar sands are a pollutant? #86])>

<([#87 [3.8.3] Page 5-109, Figures 5.9.1-1 and 5.9.1-2: Did the BLM attempt to obtain photos of local operations, such as Temple Mountain Energy on Asphalt Ridge, rather than rely on photos from Alberta, Canada? #87])>

<([#88 [3.10.2] [3.12.1] Page 5-128, Line 24, Page 5-134, Line 16: If companies such as Temple Mountain Energy are able to recycle 93% of their water, the impacts on agriculture and low-moderate income populations here are vastly overstated. #88])>

<([#89 [3.13] Page 5-139, Lines 12-14: Contrary to this statement, spent tar sands do have value [see www.templemountainenergy.com] and are not necessarily to be treated as solid waste. #89])>

<([#90 [1.5] Page 6-2, Lines 15-17 and Lines 41-44, Page 6-10, Lines 28-32, Page 6-11, Lines 36-37, Page 6-12, Lines 26-28 and 40-41, Page 6-13, Lines 44-45, Page 6-17, Lines 23-24, Page 6-21, Lines 32-33, Page 6-48, Lines 39-41, Page 6-51, Lines 40-41, Page 6-56, Lines 36-37, Page 6-57, Lines 32-33, Page 6-65, Lines 28-29, Page 6-66, Lines 23-24, Page 6-242, Lines 13-22,

<[#91 [3.1.7] Page 6-7, Table 6.1.1-2: The acreage in the table does not match the acreage under Footnote c. #91]>

<[#92 [3.1.7] Page 6-53, Figure 6.1.1-7, Page 6-110, Figure 6.1.2-7, Page 6-160, Figure 6.1.3-6, Page 6-218, Figure 6.1.4-7, Page 6-355, Figure 6.2.1-6, Page 6-356, Figure 6.2.1-7, Page 6-395, Figure 6.2.2-6, Page 6-396, Figure 6.2.2-7 and Page 6-459, Figure 6.2.4-6: These maps are incorrect with respect to the location of designated wild and scenic rivers in the Vernal Field Office. Nine Mile Creek and the Middle Green River were not designated. Neither were the White River, Evacuation Creek and Bitter Creek (See Figure 14a of the Approved RMP). If certain alternatives would recognize these considered-but-not-designated streams; such should be noted in a footnote to the Figure. #92]>

<[#93 [2.2] Page 6-67, Section 6.1.2: There is no analysis in the document of the BLM preferred alternative 2(b). This analysis must be provided and re-published for review by the public and cooperating agencies before the process moves forward to a final PEIS. #93]>

<[#94 [3.10.2] Page 6-114, Section 6.1.2.11: The loss of jobs, revenue and positive economic impacts associated with Alternative 2 are drastically understated here. #94]>

<[#95 [9.5] Page 6-171, Section 6.1.4: Alternative 4, which is subject to acreage reductions associated with potential sage grouse core habitat and lands with wilderness character, is inconsistent with local plans and polices, including the Uintah Basin Utah Energy Zone designated by the 2012 Utah Legislature, Uintah County, Duchesne County and Daggett County. #95]>

<[#96 [3.1.7] Page 6-173, Line 27: Is the reference to Alternative 1 here really supposed to say Alternative 4? #96]>

<[#97 [13] Page 6-178, Line 20: correct typo “t49” perennial streams. #97]>

<[#98 [3.13] Page 6-312, Lines 5-9: This paragraph contains a mixture of references to oil shale and tar sands development when the section is supposed to be devoted only to a discussion of oil shale. #98]>

<[#99 [1.3] Page 7-1, Line 42 and Page J-5, Line 14: Duchesne County, Utah was left out of the list of local government cooperating agencies that submitted comments during the scoping period and before the release of the draft to the public. Why are the scoping comments and BLM’s

response to such comments not included at the end of Chapter 7? #99])>

<([#100 [6.5] Page A-9, Table A-1: This table utilizes 1967 data, which should be replaced by newer data from recent USGS estimates of the oil shale resource. #100])>

<([#101 [6.5] Page A-19, Section A.2.2: This section regarding Utah oil shale activity must be updated to include the activities of companies including Enefit American Oil, Red Leaf Resources and TomCo Energy. #101])>

<([#102 [6.5] Page A-21 through A-48, Section A.3: This technology overview is out of date as it fails to address new technologies being pioneered by companies including Enefit American Oil, Red Leaf Resources and TomCo Energy. #102])>

<([#103 [6.5] Pages A-109 through A-115, Sections 6 and 7: The data in these sections is 2005-2007 vintage and should be easy to update with current data. #103])>

<([#104 [2.1.1] Page A-118, Lines 24, 37 and 43 and Page A-119, Lines 3-4 and 18-19: The document recognizes that we are experiencing “declines in supply from existing major importers,” that “Alaska North Slope production has been in decline,” the “world demand for crude oil is expected to increase by 47% by 2030.” Because of these world supply issues, the document recognizes that “further international energy risk could provide additional incentive for utilization of domestic resources.” The document also recognizes that “Section 369 of the Energy Policy Act directs the Secretary of Defense to procure fuel derived from coal, shale oil and tar sands.” Based on these findings from the document, it makes absolutely no sense and is very short-sighted to select an alternative other than Alternative 1. Our national economy and our national security are at stake. Also, based on these findings, there is less likelihood of the boom and bust cycle occurring given the struggle of supply to keep up with demand. #104])>

<([#105 [6.5] Page B-4, Line 16: The document states that there are no commercial tar sands operations on public lands in Utah. Please check with the Utah State Institutional Trust Lands Administration to verify that this is correct. There is a company called Temple Mountain Energy that has been in operation on Asphalt Ridge, near Vernal, since 2006. We do not know if those lands are private or public. #105])>

<([#106 [6.5] Pages B-15 and B-16: Information regarding the Asphalt Ridge STSA is out-of-date. It does not include the operations of Temple Mountain Energy at this location from 2006 to the present. #106])>

<([#107 [6.5] Page B-17, Lines 5-7: This information from the Utah Division of Oil, Gas and Mining should be updated. This information also demonstrates that tar sands development is commercially viable and that companies are being forced to “move forward without the feds” because of the bureaucratic paralysis the federal government is mired in under the current administration. #107])>

<([#108 [6.5] Page B-19, Lines 24-34: This 1995 Speight report is outdated given today’s tar sands technology. Information from the Temple Mountain Energy web site (2011) debunks many

of the myths contained in this 1995 report. **#108])>**

<([#109 [6.3.2.1] Page B-20, Table B-2: The water use data in this table is too high and is not based on today's technologies. For example, Temple Mountain Energy states that they re-use 93% of their water, which will cut these water use figures dramatically. #109])>

<([#110 [6.5] Page B-31, Section B-5: This entire section is out of date as it does not take into account technologies being used by companies such as Temple Mountain Energy, at Asphalt Ridge. #110])>

<([#111 [6.3.5] Page B-58, Conclusions: These conclusions demonstrate that commercial tar sands development is economically viable; debunking the myths perpetuated by environmental groups. #111])>

<([#112 [2.4] Pages C-10, C-11, C-13, C-15, Table C-1: The statement under Alternative 4 on these pages that "All lands within the most geologically prospective oil shale area that are not excluded from commercial leasing under Alternative 2 will also be excluded under Alternative 4" does not make sense as Alternative 4 would allow more lands to be leased than Alternative 2. #112])>

<([#113 [6.3.2] Page D-9, Table D-5: Duchesne County, Utah has a Drinking Water Source Protection Ordinance in Title 4, Chapter 6 of its County Code. #113])>

<([#114 [3.13] Page D-10, Table D-6: Duchesne County, Utah regulates hazardous materials in its Nuisance Ordinance, which is located in Title 3, Chapter 1 of the County Code. #114])>

<([#115 [3.1.7] Page D-12, Table D-8: Duchesne County, Utah requires a conditional use permit for mining activities only when located on private lands. #115])>

<([#116 [3.6] Page D-14, Table D-9: The correct reference to the Duchesne County Code for noise regulations is the Nuisance Ordinance, which is in Title 3, Chapter 1, Section 4(G) of the County Code. #116])>

<([#117 [3.7.2] Page D-15, Table D-10: The correct reference to the Duchesne County Code for weed regulations is Title 3, Chapter 5 of the County Code. #117])>

<([#118 [3.13] Page D-16, Table D-11: The correct reference to the Duchesne County Code for solid waste regulations is Title 3, Chapter 4 of the County Code. #118])>

<([#119 [6.3.2] Page D-17, Table D-12: The correct reference to the Duchesne County Code for source water protection regulations is Title 4, Chapter 6 of the County Code as well as the Duchesne County Drinking Water Source Protection Ordinance #09-273. #119])>

<([#120 [3.4.5] Page D-18, Table D-13: The correct reference to the Duchesne County Code for water bodies and wastewater is Title 3, Chapter 1 of the County Code. #120])>

<([#121 [3.7.4.4] Page F-18, Line 7: Requiring a 300 foot setback from a threatened or endangered plant to any surface disturbance associated with oil shale or tars sands development is far too great of a setback and could place substantial areas of land off-limits for production of these vital natural resources. #121])>

<([#122 [3.10.1] Pages G-3 through G-9, Socioeconomic analysis : The data in this entire section is out-of-date and needs to be updated with readily available data from state and federal agencies. #122])>

<([#123 [3.10.1] Appendix H: The interviews of community leaders and stakeholders should be updated given the developments that have occurred in the past 5 years since the interviews were done. #123])>

<([#124 [3.10.3] Page H-3, Lines 19-21: While the boom and bust cycle has occurred in the past, the facts of increasing demand and supply issues noted in Appendix A are likely to lessen the severity of such cycles. #124])>

<([#125 [1.5] In summary, this draft PEIS is not the “fresh look” that the BLM intended. It is filled with outdated information that could have been easily updated if the BLM weren’t trying to rush this process to a conclusion before the end of the Obama Administration. Rather than fight for the family wage jobs and associated income that so many American citizens desperately need; rather than fight for responsible energy development that contributes to local, state and national economic health and security; the BLM has backed down to litigious environmental groups. #125])>

<([#126 [9.5] Again, the enclosed Resolution #12-08 summarizes our opposition to this process based on several points of law. The preferred alternative is inconsistent with state and local plans and policies, including the Uintah Basin Utah Energy Zone (see Resolution #12-06 enclosed). There has been no attempt, as required by FLPMA, to make the BLM Oil Shale and Tar Sands leasing effort as consistent with local plans as possible. If the Record of Decision adopts the BLM preferred alternative (2b), there will no doubt be legal ramifications. #126])>

Sincerely,

DUCHESNE COUNTY COMMISSIONERS

Submission Text

<([#1 [12] The BLM should strongly consider NOT opening the proposed area to potential oil shale and oil sands development. Such development puts several protected areas, their geological, and biological integrity at risk. Various forms of pollution- air, water, noise, and light to name a few- will inevitably ensue and risk compromising wildlife corridors and the public's ability to enjoy our beautiful parks. This proposal also highlights America's increasingly hazardous dependence on fossil fuels, the present trajectory of which will place this dependence before the preservation of our wild lands. In an area where water is scarce and sunlight is not, we

should not be wasting resources pursuing non-renewable energy sources.

1 RESOLUTION # 12-06

2

3 A RESOLUTION AMENDING THE PUBLIC LANDS SECTION OF THE DUCHESNE

4 COUNTY GENERAL PLAN TO INCORPORATE THE Uintah BASIN UTAH

5 ENERGY ZONE

6

7 W~~REAS, Duchesne. County has a general plan adopted pursuant to Utah Code containing
8 pohcles for the appropnate use of private and public land within the county; and

9

10 WHEREAS, Duchesne County desires to amend its general plan to incorporate provisions

11 associated with the Uintah Basin Utah Energy Zone (Senate Bi1183) that was established by
the

12 Utah Legislature in the 2012 General Session; and

13

14 WHEREAS, the Duchesne County Public Land Use Committee has reviewed and
recommended

15 approval ofthese amendments as set forth herein; and

16

17 WHEREAS, the Duchesne County Planning Commission has conducted a public hearing to

18 review the proposed plan amendment and concurs with the recommendation of the Public
Land

19 Use Committee that this Resolution should be passed;

20

21 NOW, THEREFORE, THE DUCHESNE COUNTY GENERAL PLAN IS AMENDED BY

22 INSERTING THE FOLLOWING AT THE END OF THE ENERGY AND MINERAL

23 RESOURCES SUBSECTION OF THE PUBLIC LANDS SECTION OF THE GENERAL

24 PLAN:

25

26 <([#1 [6.] SECTION 1. There is established, pursuant to Utah Code, the Uintah Basin Energy Zone in

27 Duchesne County for the purpose of maximizing efficient and responsible development of energy and mineral resources. The land area and boundaries of the Uintah Basin Energy Zone in

29 Duchesne County consist offederal lands within the Townships and Ranges described below and

30 as depicted on the map attached hereto as Exhibit A, which is incorporated herein by reference:

31

32 Uintah Special Base and Meridian:

33 Township 3N, Range 1 W; Township 3N, Range 2W; Township 3N, Range 3W; Township 3N,

34 Range 4W; Township 2N, Range 1 W; Township 2N, Range 2W; Township 2N, Range 3W;

35 Township 2N, Range 4W; Township 2N, Range 5W; Township 2N, Range 6W; Township IN,

36 Range 6W; Township IN, Range 7W; Township IN, Range 8W; Township IN, Range 9W,

37 Township 5S, Range 8W, Township 5S, Range 9W; Township 6S, Range 3W; Township 6S,

38 Range 4W; Township 6S, Range 5W; Township 6S, Range 6W; Township 6S, Range 7W;

39 Township 6S, Range 8W; Township 6S, Range 9W; Township 7S, Range 4W; Township 7S,

40 Range 5W; Township 7S, Range 6W; Township 7S, Range 7W; Township 7S, Range 8W;

41 Township 7S, Range 9W.

42

43 Salt Lake Meridian:

44 Township 8S, Range 15E; Township 8S Range 16E; Township 8S, Range 17E; Township 9S,

45 Range 15E; Township 9S, Range 16E; Township 9S, Range 17E; Township 10S, Range 14E,

46 Township 10S, Range 15E; Township 10S, Range 16E; Township 10S, Range 17E; Township

47 11 S, Range 1 OE; Township 11 S, Range 11 E; Township 11 S, Range 12E; Township 11 S, Range

48 13E; Township 11 S, Range 14E; Township 11 S, Range 15E; Township 11 S, Range 16E;

and

49 Township 11 S, Range 17E.

50

51 SECTION 2. The county finds that the lands comprising the Uintah Basin Energy Zone contain

52 abundant world-class deposits of energy and mineral resources, including oil, natural gas, oil

53 shale, oil,sands, gilsonite, coal, phosphate, gold, uranium, and copper, as well as areas with high

54 wind and solar energy potential.

55

56 SECTION 3. The highest management priority for all lands within the Uintah Basin Energ~

57 Zone is responsible management and development of existing energy and ~eral resources m

58 order to provide long-term domestic energy and supplies for Utah and the United States.

#1])> 59

.... u Resolution #12-06
 General Plan Amendment
 Uintah Basin Energy Zone
 Page2

<([#2 [1.1] SECTION 4. The county supports:

(a) Efficient and responsible full development of all existing energy and mineral resources located within the Uintah Basin Energy Zone, including oil, oil shale, natural gas, oil sands, gilsonite, phosphate, gold, uranium, copper, solar, and wind resources; and #2])>

<([#3 [1.3] The county supports: (b) A cooperative management approach among federal agencies, state, and local governments to achieve broadly supported management plans for the full development of all energy and mineral resources within the Uintah Basin Energy Zone. #3])>

<([#4 [1.3] SECTION 5. The county calls upon the federal agencies who administer lands within the

Uintah Basin Energy Zone to:

(a) Fully cooperate and coordinate with the county to develop, amend, and implement land and resource management plans and to implement management decisions that are consistent with the purposes, goals, and policies described in this section to the maximum extent allowed under federal law;

#4])> <([#5 [9.5] The county calls upon the federal agencies who administer lands within the Uintah Basin Energy Zone to: (b) Expedite the processing, granting, and streamlining of mineral and energy leases and

applications to drill, extract, and otherwise develop all existing energy and mineral resources located within the Uintah Basin Energy Zone, including oil, natural gas, oil shale, oil sands, gilsonite, phosphate, gold, uranium, copper, solar, and wind resources;

#5])> <([#6 [9] The county calls upon the federal agencies who administer lands within the Uintah Basin Energy Zone to: (c) Allow continued maintenance and increased development of roads, power lines, pipeline infrastructure, and other utilities necessary to achieve the goals, purposes, and policies

described in this section; #6])>

<([#7 [9.5] The county calls upon the federal agencies who administer lands within the Uintah Basin Energy Zone to: (d) Refrain from any planning decisions and management actions that will undermine,

restrict, or diminish the goals, purposes, and policies for the Uintah Basin Energy Zone as stated in this Resolution; and

(e) Refrain from implementing a policy that is contrary to the goals and purposes described within this Resolution. #7])>

<([#8 [1.3] SECTION 6. The county calls upon Congress to establish an intergovernmental standing

commission among federal, state, and local governments to guide and control planning decisions and management actions in the Uintah Basin Energy Zone in order to achieve and maintain the goals, purposes, and policies described in this Resolution. #8])>

NOW, THEREFORE, THE DUCHESNE COUNTY GENERAL PLAN IS AMENDED BY INSERTING THE FOLLOWING POLICY AS SUBSECTION (h) AT THE END OF THE

ENERGY AND MINERAL RESOURCES POLICIES IN THE PUBLIC LANDS
SECTION OF THE GENERAL PLAN:

(h) For private lands within the County, the County supports the provisions of the Surface Owner Protection Act, which was enacted by the 2012 Utah Legislature to establish surface owner rights and responsibilities when working with energy development companies.

DATED this \ 1J,-/!&- day of LI.pvi [2012.

Cover Letter:

Dear Reader:

<([#28 [1.1.1] On April 16, 2012, Duchesne County, Utah passed a resolution opposing the BLM's 2012 Oil Shale and Tar Sands Draft Programmatic Environmental Impact Statement (see enclosed). As a cooperating agency in this environmental review we respectfully request an extension to the comment period, currently set to expire May 4, 2012. It is our understanding that this request for an extension has also been made, by resolution, by eight other counties in Wyoming, Utah and Colorado, also acting under their cooperator status. Three distinct justifications necessitate this extension.

First, under the friendly-lawsuit settlement agreement with environmental groups, the BLM agreed to develop new oil shale regulations. We understand the draft regulations are due to be published on or about May 15, 2012. As a cooperator, it is impossible for us to make clear concise comments on the DPEIS until we have the opportunity to understand, at least in some detail, the scope of these new regulations. Indeed, cooperators run a substantial risk in proffering inconsistent and confusing responses to the DPEIS and any draft regulations; thus, undermining the integrity of NEPA process. Consequently an extension of the OSTs DPEIS comment period should be granted for at least 30 days after publication of these new oil shale regulations.

Second, the sheer volume of the DPEIS necessitates a time consuming review. As a cooperator, Duchesne County requests additional time to vet and analyze the DPEIS. This need becomes even more prominent based on the anticipation of new draft regulations pending publication, for it is extremely difficult to adequately comment on a four-volume DPEIS if we do not have all relevant information.

Third, as detailed in the attached Resolution, Duchesne County and various other cooperating agencies have raised numerous legal challenges to the legally flawed process of the BLM taking a "fresh look" at lands available for oil shale and oil sands. Granting an extension will allow the BLM to thoughtfully consider the legal consequences of continuing down this tenuous road and give time for the BLM to make the correct decision to cease and desist all actions related to the DPEIS.

#28])> We look forward to your response to this request. If you have any questions regarding this letter,

please contact Mike Hyde at mhyde@duchesne.utah.gov or by phone at 435-738-1151.

Sincerely,

DUCHESNE COUNTY COMMISSION

RESOLUTION #12-08

DUCHESNE COUNTY, STATE OF UTAH

A RESOLUTION OPPOSING THE BLM'S 2012 OIL SHALE AND TAR SANDS DRAFT

PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT, BLM PROJECT# W0-300-1310-PP-OSHL (HEREAFTER 2012 OSTs DPEIS) FOR LANDS ADMINISTERED BY THE BLM IN COLORADO, UTAH AND WYOMING,

This Resolution is adopted in open public meeting after due opportunity for public comment, by the Board of Commissioners of Duchesne County, Utah in order to redress the many violations of law, regulation and policy by the BLM with respect to the BLM's 2012 OSTs DPEIS.

As background to this Resolution, Duchesne County recites the following grievances:

WHEREAS, On April 4, 2011, the BLM caused to be published in the Federal Register, Volume 76, No 72/Thursday, April 4, 2011, pages 21003-21005, a Notice of Intent to prepare the above-referenced 2012 OSTs DPEIS; and

<([#1 [9.2.1] [3.1.3] WHEREAS, the preliminary purpose and need statement in the notice of intent, states the PEIS

will analyze removing from oil shale and tar sands leasing "All areas that the BLM has identified or may identify as a result of inventories conducted during this planning process, as lands containing wilderness characteristics[.]" Id., at page 21004; and

WHEREAS, the notice of intent further states at page 21004:

Lands that the BLM identifies as having wilderness characteristics will be considered during this planning initiative, as described above, and consistent with Secretarial Order No. 3310, dated Dec. 22, 2010, and BLM Manuals 6301 and 6302. Future leasing of lands determined by the BLM to have wilderness characteristics, if compatible with the allocation decisions stemming from this initiative, will subsequently be assessed in accordance with BLM Manual 6303, as appropriate (i.e., where the BLM has not determined, consistent with BLM Manual 6302, whether the lands with wilderness characteristics at issue should be receive a wild lands designation, BLM Manual 6303 will apply); and

WHEREAS, this language above documents the BLM's intent to implement, administer and/or enforce Secretarial Order 3310 and one or more of the BLM guidance manuals promulgated under Order 3310; and

WHEREAS, any attempt by the BLM to implement, administer and/or enforce Secretarial Order 3310, including any effort by the BLM to proceed further on the above-referenced Programmatic EIS violates the spending moratorium of Section 1769 of the April 21, 2011 Congressional Continuing Resolution to Fund Fiscal Year 2011 through September 30, 2011, which states:

For the fiscal year ending September 30, 2011, none of the funds made available by this division or any other Act may be used to implement, administer, or enforce Secretarial Order No. 3310 issued by the Secretary of the Interior on December 22, 2010; and

WHEREAS, this spending moratorium has been carried forward in all subsequent Congressional spending resolutions up to and including the current spending resolution; and

WHEREAS, the 2012 OSTs DPEIS, is an admitted attempt by the BLM to implement, administer and/or enforce Secretarial Order 3310 and its policies and objectives, all in violation of the Spending Moratorium of the 2011 Continuing Resolution; and

#1)> <([#2 [9.8] WHEREAS, the 2008 Oil Shale and Tar Sands Programmatic EIS (2008 OSTs PEIS) w. as

required under Section 369 (d) (1) of the Energy Policy Act of 2005 and was prepared in cooperation with 14 federal, state, and local governmental organizations; and

WHEREAS THE 2008 OSTs PEIS was 3 years in the making, and it honored the input of a task

force of Governors and other stakeholders as per the requirements of the 2005 Energy Policy Act;

WHEREAS, the Record of Decision (ROD) for the 2008 OSTs PEIS amended 10 land use plans in Colorado, Utah, and Wyoming to make approximately 2 million acres of public lands available for potential leasing and development of oil shale and approximately 430,000 acres available for tar sands leasing. Together with the regulations published in 2006 and 2008 for oil shale and tar sands resources, the 2008 OSTs PEIS and subsequent land use amendments constituted a reasonable and rational establishment of an oil shale and tar sands program as mandated by the Energy Policy Act of 2005; and

~~2)~~ ~~3)~~ [6.1.2] WHEREAS, the oil shale and tar sands program, to which the 2008 OSTs PEIS and related

regulations gave birth, was a reasonable response to the fact that the recoverable oil equivalent from oil shale and tar sands resources in Utah, Colorado and Wyoming exceeds 4 trillion barrels per the latest USGS scientific estimate; and ~~3)~~

~~4)~~ [9.8] WHEREAS, the preferred alternative in the draft 2012 OSTs DPEIS drastically shrinks,

diminishes and in many areas outright reverses virtually all of the lands made available for Oil Shale and Tar Sands development in 2008, and does so using the same data and science; and WHEREAS, the OSTs DPEIS fails to analyze BLM's preferred Alternative 2b, and the BLM admits as much on page 2-35 of the DPEIS; and ~~4)~~

~~5)~~ [9.2.2] WHEREAS, such a drastic reversal in lands available for Oil Shale and Tar Sands development

between the 2008 PEIS and the 2012 preferred alternative, violates regulatory Task Force requirements of certainty for industry and investors; and

WHEREAS such a drastic reversal of lands available for Oil Shale and Tar Sands development in 2008, constitutes a de facto, piece-meal revision of previous BLM Resource Management Plans, in violation of the Section 202 Planning Process under FLPMA;

WHEREAS, the preferred alternative in the draft 2012 OSTs PEIS entirely ignores the input of the task force, the cooperating agencies, and the other stakeholders which the 2005 Energy Policy Act directed the BLM to honor and follow; and moreover the draft 2012 OSTs DPEIS may well violate various memoranda of understanding (MOUs) with counties, cities and local government coalitions which require the BLM to (1) publish the written input of cooperators who have unresolved disagreements over the substantive elements of the EIS document, and (2) describe the objectives of the cooperators' land use plans and policies; and

WHEREAS the 2012 OSTs DPEIS preferred alternative greatly restricts the already meager acreage allotted in the 2008 PEIS for research and development leasing;

WHEREAS the 2012 OSTs DPEIS preferred alternative threatens to arbitrarily undermine all that was rationally and scientifically supported in the 2008 OSTs PEIS, and essentially dismantles a reasonable and rational oil shale and tar sands program in violation of Section 369 of the 2005 Energy Policy Act; and ~~5)~~

~~8)~~ [1.5] WHEREAS, the 2012 OSTs DPEIS preferred alternative is the creature of a friendly lawsuit

settlement agreement between the BLM and ideological opponents of oil shale development, and is therefore entirely pre-determined and pre-decisional in violation of NEPA, with no apparent rationale for revising the acreages approved in 2008; and

~~8)~~ ~~9)~~ [2.2] WHEREAS, the BLM has settled on a preferred alternative in the 2012 OSTs

DPEIS admittedly

without having first analyzed its impacts; BLM should be required to withdraw the preferred status of the alternative until it has performed this analysis; and

WHEREAS, the acreage approved for Oil Shale and Tar Sands development in the draft 2012 OSTs DPEIS preferred alternative bears no rational relationship to the stated purpose and need; **#9])>**

Resolution #12' ::"08

Duchesne County, Utah

April 16, 2012

Page 3 of 4

<([#11 [1.5] WHEREAS, the Department of Energy has basically abdicated the responsibility Congress

placed upon it to defend and uphold a viable oil shale energy program in America, leaving it instead to the BLM encumbered by a host of anti-oil shale, pro-wilderness groups steering BLM's every move; **#11])>**

<([#29 [9.5] WHEREAS, the alternative adopted in the ROD of the 2008 OSTs PEIS is now the No Action

Alternative of the draft 2012 OSTs DPEIS; and

WHEREAS, the 2008 OSTs PEIS chosen alternative is consistent with the multiple use, sustained yield mandate of the Federal Land Policy Management Act (FLPMA); and

“WHEREAS, the 2008 OSTs PEIS chosen alternative is consistent with county general plans and policies which call for responsible development of available energy resources, but in stark contrast the 2012 OSTs DPEIS is plainly inconsistent with state and local plans and policies, plainly inconsistent with the Uintah Basin Energy Zone Legislation passed in the 2012 Utah Legislature (Senate Bill 83- see Utah Code 63J-8-102 & 105.5), and it fails to adequately explain why consistency is not achievable; and

#29])> <([#14 [6.3.4] WHEREAS, the development and production of oil from oil shale has been proven beyond a

doubt to be technologically and economically feasible when market rates for oil are at least \$65.00 per barrel, which is well below current market rates; and

#14])> <([#15 [6.3.2.1] WHEREAS, this same technology to extract oil from the oil shale rock is not only economically

feasible at \$65.00 per barrel, but it requires little or no consumption of water, contrary to the myths which falsely claim that oil shale extraction requires large consumption of water resources; and **#15])>**

<([#16 [6.2.2] WHEREAS, the energy captured in the extraction of oil from shale (natural gas capture, etc.,) more

than makes up for energy consumed in that extraction process, thus dispelling the myth that the oil shale extraction process consumes more energy than it produces;

#16])> <([#17 [3.10.3] WHEREAS, the rising price of gasoline, coupled with ever increasing loss of family-wage jobs

due to the Obama Administration's policies against energy development on western public lands, result in increasing hardships for families and the local economy, to the point where some fear the window of opportunity is about to close for a civil, lawful and orderly response as citizens feel more and more pressured and desperate financially; and

#17])> <([#18 [6.3.3.1] WHEREAS, the 2012 OSTs DPEIS improperly limits technology testing

to strictly in-situ efforts and does not allow for development of other technologies; and

#18)> **<([#19** [1.1.1] WHEREAS, the BLM has left insufficient time for the public and cooperators to meaningfully comment on the public draft 2012 OSTs DPEIS by the present comment deadline of May 4, 2012, because a highly relevant commercial oil shale BLM regulation is not due to be published until May 15, 2012 and the public should have the right to view that regulation first and then submit comments on the draft 2012 OSTs DPEIS in light of that regulation; and

#19)> **<([#20** [9.5] WHEREAS, the same problems with lack of consistency with local plans and policies and failure to honor the input of cooperators and all stakeholders, also besets many public lands EIS projects, in addition to the 2012 OSTs DPEIS; and

#20)> **<([#21** [9.2.5] WHEREAS, while the 2012 OSTs DPEIS repeatedly asserted the supposed need to take a “fresh look,” the BLM arbitrarily failed to do so by refusing to update the document with fresh, new oil shale technological data made available since 2008 and fresh new oil shale technology that has emerged since 2008, which failures constitute a violation by the BLM of the Federal Data Quality Act;

#21)> NOW THEREFORE, BE IT RESOLVED BY DUCHESNE COUNTY, UTAH AS FOLLOWS:
 Resolution #12-08
 Duchesne County, Utah
 April 6, 2012
 Page 4 of 4

<([#22 [9.2.1] I. Duchesne County declares the BLM’s continuing to administer and carry out the 2012 OSTs DPEIS to be an open contempt and flaunting of the Congressional Spending Moratorium first imposed in the 2011 Continuing Resolution and carried forward in all subsequent Congressional spending resolutions up to and including the present;

2. Duchesne County calls upon the BLM to cease all further activities with respect to administering and carrying out the 2012 OSTs DPEIS, because doing so constitutes an open contempt and violation of the Congressional Spending Moratorium against implementing, administering and/or enforcing Secretarial Order 3310, which Spending Moratorium was first imposed in the 2011 Continuing Resolution and carried forward in all subsequent Congressional spending resolutions up to and including the present;

3. Duchesne County calls upon the BLM to immediately cease and desist all activities related to the above-referenced 2012 OSTs DPEIS and immediately publish a revised notice in the Federal Register signifying its cessation of all work on the Programmatic EIS in obedience to the above-quoted Spending Moratorium. Otherwise, the BLM would be in contempt of Congress; **#22)**>

<([#25 [2.1.1] 4. Duchesne County finds that the only way the BLM could go forward with the 2012 OSTs DPEIS in light of the Congressional Spending Moratorium, would be if the BLM adopted the No-Action Alternative, which is identical to the Alternative chosen in the ROD of the 2008 OSTs PEIS;

#25]> <(**#26** [1.1.1] 5. Duchesne County requests that the BLM should extend the May 4, 2012 deadline for

public comment on the draft 2012 OSTs DPEIS at least 30 days after publication of the expected oil shale regulation due to be published on or about May 15, 2012.

#26]> <(**#27** [1.3] 6. Duchesne County requests that the BLM honor the input of cooperators, particularly if

they are local governments, as required by Section 202(c)(9) of FLPMA and the relevant terms of BLM-Cooperator MOUs, in all matters, not just with respect to the 2012 OSTs PEIS.

#27]> DATED this ~ Uday of 11pv1 \ 2012.

<([#1 [12] [10.6.1] I am deeply troubled to learn of the BLM's proposal to to open vast areas of Western wilderness to oil shale and tar sand exploitation. These activities will degrade our landscape on a scale that will significantly damage our national heritage. Our government should be applying its resources toward developing alternative sources of energy, not leasing our public land to corporations who will destroy the very face of our country to make a buck. We need leadership, not greed. This proposal is unacceptable and must be stopped. #1])>

<([#1 [2.3.1] While I'm pleased that the BLM is apparently backing away from the wholesale leasing of millions of acres of public lands for oil shale and tar sands, I much prefer Alternative 3 that would limit such development to existing RandD leases. At a time when our country needs to be a leader in moving away from the use of fossil fuels and adopting major conservation

practices to reduce CO2 emissions, any development of fossil hydrocarbons takes us farther from this goal. The surface disturbance and associated infrastructure and population growth required to commercially develop oil shale and tar sands would spell the end of western Colorado and eastern and central Utah as a refuge from rampant urbanization, congestion, and air pollution--not to mention the loss of this region's superb night skies. Sooner or later we will have to learn to unhook our society from limitless fossil fuel consumption. We can try to do so now, when we still have some clean air and water left, or we can do it fifty or a hundred years from now, when the noise and stink of industrialization covers the entire West. I have little faith that our government will have much foresight in this matter, but one can always hope. #1)> Fred Swanson Salt Lake City, Utah May 1, 2012

Dear Bureau of Land Management, I am writing to submit comments on the Oil Shale and Tar Sands Draft Programmatic Environmental Impact Statement (PEIS). <([#1 [2.3.1] I have spent a lot of time exploring and hiking the Colorado Plateau, and studied its geology. I am convinced there is no other place like it in the world. I also believe that shale and tar sands are about the worst, most inefficient ways to develop energy. Put that together with the irreversible harm done to environments within the Colorado Plateau, and I conclude that this type of development is not worth it here, and should not be even considered. Since that Alternative doesn't seem available, I urge you to choose Alternative 3, Research Only, as the BLM's Preferred Alternative in the Final PEIS. This is essential to ensure that we have the best possible information before considering opening our natural open spaces and ecosystems to the development of oil shale and tar sand resources. #1)> Here are some of my specific concerns regarding the Draft PEIS: <([#2 [3.4.1] * The Draft Programmatic EIS needs to ensure water quality will not be adversely effected by development of oil shale and tar sand resources. The water usage for oil shale production far outstrips the amount of oil produced, even prior to the refinement process. Water resources in the West are already overused and the effects of climate change and increased population will only add further strain to an already depleted system. #2)> <([#3 [3.4.1] * The Draft Programmatic EIS should be conducted in such a way to address issues of dust, noise, and pollution in the affected areas. Heating oil shale in the ground can contaminate vital groundwater supplies. High salt concentrations in groundwater restricts water available to native plants and is harmful to agricultural production as well. The Colorado River Basin already spends millions of dollars annually on damages caused from high salinity. #3)> <([#4 [3.1.1] * The Draft Programmatic EIS should address the potential encroachment on protected areas and National Parks such as Glen Canyon Recreation Area and Canyonlands National Park. This includes a thorough analysis of the damage to these priceless parks by oil shale and tar sands development. #4)> <([#5 [2.3.1] This EIS should ensure that all alternatives seriously assess the issues outlined above. Considering the present lack of adequate information and the tremendous risks of misguided development, the only reasonable alternative at this point is Alternative 3, Research Only as outlined in the PEIS. #5)> Thank you for the opportunity to comment on the Draft Programmatic EIS. Sincerely, Crista Worthy 13015 N Shafer Way Boise, ID 83714

Submission Text

To: Bureau of Land Management, E: <http://ostseis.anl.gov/involve/comments/index.cfm> I am writing to submit comments on the Oil Shale and Tar Sands Draft Programmatic Environmental Impact Statement (PEIS). <([#1 [3] I am very concerned about the possible impacts of oil shale development on Glen Canyon, Grand Canyon, and the Colorado River. I believe that we need more research on the potential impacts of oil shale and tar sand development before allowing leasing of our public lands for this use. Such development could have serious and irreversible impacts, including on water supplies and quality, air quality, native ecosystems and wildlife, and recreational uses. #1])> <([#2 [2.3.I] I urge you to choose Alternative 3, Research Only, as the BLM's Preferred Alternative in the Final PEIS. This is essential to ensure that we have the best possible information before considering opening our natural open spaces and ecosystems to the development of oil shale and tar sand resources. #2])> <([#3 [3.4.I] Here are some of my specific concerns regarding the Draft PEIS: * The Draft Programmatic EIS needs to ensure water quality will not be adversely effected by development of oil shale and tar sand resources. The water usage for oil shale production far outstrips the amount of oil produced, even prior to the refinement process. Water resources in the West are already overused and the effects of climate change and increased population will only add further strain to an already depleted system. #3])> <([#4 [3.4.I] * The Draft Programmatic EIS should be conducted in such a way to address issues of dust, noise, and pollution in the affected areas. Heating oil shale in the ground can contaminate vital groundwater supplies. High salt concentrations in groundwater restricts water available to native plants and is harmful to agricultural production as well. The Colorado River Basin already spends millions of dollars annually on damages caused from high salinity. #4])> <([#5 [3.1.I] * The Draft Programmatic EIS should address the potential encroachment on protected areas and National Parks such as Glen Canyon Recreation Area and Canyonlands National Park. This includes a thorough analysis of the damage to these priceless parks by oil shale and tar sands development. #5])> <([#6 [2.3.I] This EIS should ensure that all alternatives seriously assess the issues outlined above. Considering the present lack of adequate information and the tremendous risks of misguided development, the only reasonable alternative at this point is Alternative 3, Research Only as outlined in the PEIS. #6])> Thank you for the opportunity to comment on the Draft Programmatic EIS. Sincerely, Robert E. Rutkowski 2527 Faxon Court Topeka, Kansas 66605-2086 P/F: 1 785 379-9671 E-mail: r_e_rutkowski@att.net

RE: CLUB 20 comments regarding 2012 Oil Shale & Tar Sands Programmatic EIS

To whom it may concern:

Thank you for the opportunity to submit comments regarding the BLM's 2012 Oil Shale & Tar Sands Draft Programmatic EIS. CLUB 20 is a 59 year old membership organization representing individuals and businesses throughout Western Colorado's 22-county region.

We have attached a copy of CLUB 20's Oil Shale Policy Statement supporting a "prudently-paced commercial scale leasing program". CLUB 20 recognizes that the U.S. Department of Energy estimates that as much as 1 trillion barrels of recoverable oil may exist within the oil shale deposits of the Green River Formation in Northwest Colorado, Southwest Wyoming, and Northeast Utah (the bulk of which is located in Northwestern CO) and this is the largest known deposit of oil shale in the world. Given our growing national dependence on foreign oil supplies and the increasing instability in most of these supplier regions, we believe it is prudent and necessary that we work to develop our domestic energy reserves to their full potential, while respecting the other environmental and cultural values that define our region's quality of life. We believe that it is important for our country to be proactive and purposeful about preparing a well-conceived plan for the thoughtful development of this important resource in order to avoid getting pushed into a crisis-oriented, commercial-scale oil shale program as was the case in the late 1970's and early 1980's. A well thought out PEIS is an important part of that deliberate effort as is a well-designed energy plan as was required be developed under Section 369 of the Federal Energy Policy Act of 2005.

<([#1 [9.8] CLUB 20 concerns regarding the "purpose and need" for a lengthy, costly PEIS in 2011-2012.

The preliminary purpose and need statement reflected in the notice of intent published in the Federal Register on April 14, 2011, indicates that this effort is engaged to implement Secretarial Order No. 3310, dated December 22, 2010. Further, one week after this stated purpose and need was published in the Federal Register, the Congressional Continuing Resolution to Fund Fiscal Year 2011 specifically stated that 2011 funds were not to be used to implement, administer and/or enforce Secretarial Order No. 3310. In light of these circumstances, CLUB 20 questions the validity of repeating a costly PEIS at this time.

The 2008 OSTSEIS has been considered by numerous parties, including CLUB 20, to have been a reasonable, cautious and acceptable approach to the development of oil shale. The document supported the research, development, and demonstration (R,D&D) program, and in doing so, the BLM provided an opportunity to ensure that oil shale technologies can operate at economic and environmentally acceptable levels before the authorization of full-scale commercial leasing on public lands. CLUB 20 strongly supported this R,D&D approach to oil shale development and urged additional opportunities for such leases; we continue to do so. Unfortunately, the 2012 OSTSEIS serves to seriously restrict opportunities for R,D&D leases and ultimately restricts the research of oil shale development technologies to only those few where current leases are in place. The current lessees are exploring in situ technologies. This is a short sighted view eliminating the possibility of research using other technologies that may allow for development of this resource at even more economic and environmentally acceptable levels. Additionally, current R,D&D leaseholders are more uncertain of the future just as their research efforts are beginning to answer the questions about the feasibility of developing this resource because of the lack of continuity in Federal policies regarding oil shale development.

The investment private companies will make in oil shale research and development is sure to

decline given the uncertainty and inadequacy of the BLM preferred alternative in the 2012 OSTs PEIS. The unknown terms for future R,D&D leases is part of the disincentive for companies interested in pursuing oil shale research on Federal oil shale lands. The recent 2nd round BLM R,D&D leases offered insufficient Preference Right acreage to support a commercial project, and other terms of the leases are more restrictive than those in the 1st round R,D&D leases. The reduction or preclusion of that investment will represent billions of dollars in lost opportunity, not to mention the potential jobs such an investment would create. #1)>

<([#2 [2.1.1] CLUB 20 continues to support the 2008 OSTs PEIS preferred Alternative CLUB 20 supported Alternative B in the 2008 OSTs PEIS, which became the alternative implemented in the Record of Decision (ROD), “because it would make the largest amount of potential oil resources available for application for leasing while still providing for an environmentally sound program and would provide the greatest flexibility in locating future development.” We continue to support this concept; the Alternative in the 2012 OSTs PEIS that most closely reflects the ROD for the 2008 PEIS is the No Action Alternative. This alternative is consistent with the multiple use, sustained yield tenets of the Federal Land Policy Management Act (FLPMA) and is consistent with policies that call for responsible development of available energy resources. #2)>

<([#3 [2.2] Much of the 2012 OSTs PEIS document is exactly the same as the 2008 OSTs PEIS yet the BLM’s preferred alternative is significantly more restrictive. The BLM’s 2012 PEIS preferred alternative has not been analyzed for its impacts as is required by NEPA. #3)> <([#4 [1.3] Further, the 2012 OSTs PEIS is remiss and disingenuous in relation to cooperating agencies. BLM must coordinate closely with the local governments where oil shale is located, as required in FLPMA, 43 USC 1712(c)(9). The BLM’s refusal to consider the alternative preferred by most of the local governments – the No Action Alternative – is a clear failure to meet that obligation. State and local governments have jurisdiction to the extent that they regulate land use on private and state land and there is a consistency obligation for federal land. Once cooperating agencies have provided technical and material comments, the federal agency must address those comments; saying it ‘disagrees’ is not sufficient. #4)>

<([#5 [9.3] BLM lands are public lands and are required to be managed for multiple-use. As such, we believe it is appropriate to designate these lands as suitable for development consideration subject to additional NEPA analyses to be conducted prior to the issuance of commercial leases and site-specific NEPA analyses to be conducted during evaluation and approval of plans of development during the project development phase in order to identify potential project-specific impacts and define appropriate lease stipulations and required mitigation measures. #5)>

<([#6 [2.2] We believe that Alternative 2A is too limiting to be considered a legitimate alternative for developing oil shale resources.

While we appreciate the BLM’s efforts to offer multiple development scenarios, and we recognize that the intent of Alternative 2A is to provide for more limited development, we are concerned about the economic feasibility of developing any of the oil shale resource on the lands identified within the alternative. Under the BLM preferred alternative, the lands proposed to be available for leasing are composed of relatively small, isolated tracts, most of which are currently leased. Because of this fact, we believe that the BLM preferred alternative does not provide for large enough contiguous parcels to warrant the substantial investment necessary to demonstrate the viability of producing commercial quantities of oil from these oil shale reserves. Alternative 2A is essentially economically unfeasible as

proposed. #6)>

<([#7 [6.3.2.1] Development of oil shale and tar sands is becoming much more technical feasible.

Oil production from oil shale has been proven to be technologically and economically feasible and production from the Green River Formation is expected to begin in some locations before the end of 2012. The technology to be used in this domestic oil production from oil shale is not only economically feasible, but it will require minimal water consumption. Worldwide, technically and economically feasible oil production from oil shale has proven to use little to no water; another reason to continue encouraging research into new technologies in the development of this resource rather than limiting opportunities for research.

The Green River Formation is the best laboratory available for developing new technologies related to oil shale development. Private industry will invest billions of dollars to determine the best way to produce oil from oil shale given a consistent and reliable set of rules by which to operate. Billions of investment dollars will translate into jobs for families in a region that has suffered tremendously as a result of the recent recession. #7)>

<([#8 [3.10.3] Socio-economic impacts are not adequately addressed in the 2012 OSTs PEIS.

We are concerned about the socio-economic impacts to the local communities with regard to the development, as well as the non-development of the oil shale resource. When the 2008 OSTs PEIS was conducted, natural gas development in Western Colorado was robust and contributed to a number of socio-economic challenges throughout the communities in Garfield, Rio Blanco and Mesa Counties. The situation is nearly opposite that now, with these counties facing widespread unemployment. While the PEIS reflects interviews and concerns, it does not provide specific socio-economic data that demonstrates potential beneficial or detrimental economic impacts for these areas. As was anticipated in the 2008 OSTs PEIS, “rapid increases in population in-migration in parts of each region of influence could impact quality of life, in particular requiring a transition from traditional rural, to more urban lifestyles, and potentially cause large social disruption impacts.” It is anticipated, however, that by using the R,D&D model, negative impacts could be more easily identified and addressed in a more reasonable timeframe. Indeed, economic activity associated with oil shale development would be an economic benefit to many Western Colorado communities and residents at this time. #8)>

<([#9 [10.5] We believe that as technology continues to prove technically feasible, economic and environmentally acceptable, government and industry need to make appropriate and substantial UP-FRONT investments in the infrastructure of each local affected community in order to enable these communities to grow their services to meet the demands associated with oil shale development. While we fully recognize that we DO have a collective responsibility to develop our domestic energy reserves in the interest of national security, we believe that we have an equal responsibility – as a nation – to ensure that the burden of this energy development isn’t borne disproportionately on the backs of local host communities. Specifically,

We believe that the states’ traditional 50% share of the Federal Mineral Lease (FML) revenue MUST be restored with specific dedication of the vast majority of those funds to be used to mitigate the impacts of energy development on local communities.

We believe that the BLM should encourage industry to make UP-FRONT investments in local community infrastructure by granting a pre-payment credit against their FML liability for any such investments. Without such up-front

investments, local communities are continually chasing their tail trying to catch up with impact needs as they wait for months to receive the lease revenues associated with those impacts. Such up-front investments by industry will allow communities to invest ahead of the impacts, thus both facilitating the development of the resource while minimizing the disruptive impact on the community. Funding infrastructure needs during oil and gas development can put local jurisdictions under enormous financial pressure since tax revenues intended to mitigate impacts of energy development are not available largely until AFTER the impacts have occurred. Although the PEIS made a passing reference to impacts on community infrastructure, there was no effort to quantify how large this impact may actually be. We believe the PEIS should attempt to identify the types of physical infrastructure investments (if not an estimate of the costs associated with those investments) that local governments will be required to make in order to meet the demands associated with commercial oil shale development.

#9])> Thank you again for this opportunity to comment on the Draft Oil Shale & Tar Sands Programmatic PEIS.

Sincerely,
Bonnie Petersen
Executive Director
CLUB 20

Oil Shale, Development and Implementation of a National Strategy

WHEREAS the U.S. Department of Energy estimates that as much as 1 trillion barrels of recoverable oil may exist within the oil shale deposits of the Green River Formation in Northwest Colorado, Southwest Wyoming and Northeast Utah (the bulk of which is located in Northwest CO), and this is the largest known deposit of oil shale in the world and one of the largest untapped hydrocarbon resources available for development; and

WHEREAS CLUB 20 recognizes the potential value of this oil shale resource, and we also recognize the need to realize this value while sustaining the other existing social, economic and environmental values that comprise the overall quality of life in western Colorado; and WHEREAS oil shale development is important for our country's national security to supplement our nation's growing energy demand; and

WHEREAS without a well-conceived strategic plan for oil shale development, Colorado, Utah and Wyoming may someday be faced with another crisis-driven, commercial-scale oil shale program;

WHEREAS the U.S. Department of the Interior continues to evaluate the environmental impacts, socioeconomic consequences, technical feasibility and economic viability of activities proposed for and being conducted on Research Development and Demonstration (RD&D) leases for oil shale resources of Western Colorado and Utah; and

WHEREAS section 369(e) of the Energy Policy Act of 2005 (EPA05) requires that after consultation with affected States, local governments and other stakeholders, if the Secretary of the Interior finds sufficient support and interest exists in a State, the Secretary may conduct a lease sale in that State under commercial leasing regulations; and

WHEREAS section 369(h)&(i) of the EPA05 requires the U.S. Department of Energy and the U.S.

Department of the Interior to take certain actions to prepare for commercial oil shale

development;

<([#12 [11] THEREFORE BE IT RESOLVED that CLUB 20 supports research and development efforts leading to an environmentally sound, socially responsible, timely and economically viable oil shale program that will result in the efficient recovery of the resource; #12])> and

<([#13 [11] BE IT FURTHER RESOLVED that CLUB 20 supports section 369 of the Energy Policy Act of 2005 which directs the U.S. Departments of Energy, Interior and Defense, in cooperation with

State and Local governments, to continue to develop and implement an oil shale strategy and urges that this strategy include the following:

1. Implement a prudently-paced and timely commercial leasing program to allow available technologies to be put into commercial production;

#13])> <([#14 [1.3] BE IT FURTHER RESOLVED that CLUB 20 supports section 369 of the Energy Policy Act of 2005 which directs the U.S. Departments of Energy, Interior and Defense, in cooperation with

State and Local governments, to continue to develop and implement an oil shale strategy and urges that this strategy include the following:

2. Utilize the existing NEPA process to provide an opportunity for ongoing participation of directly impacted state and local governments as well as “Cooperating Agencies” and the public on the development of oil shale;

#14])> <([#15 [1.3] BE IT FURTHER RESOLVED that CLUB 20 supports section 369 of the Energy Policy Act of 2005 which directs the U.S. Departments of Energy, Interior and Defense, in cooperation with

State and Local governments, to continue to develop and implement an oil shale strategy and urges that this strategy include the following:

3. Federal decisions should reflect the consensus of “Cooperating Agencies” in a meaningful manner;

#15])> <([#16 [9.5] BE IT FURTHER RESOLVED that CLUB 20 supports section 369 of the Energy Policy Act of 2005 which directs the U.S. Departments of Energy, Interior and Defense, in cooperation with

State and Local governments, to continue to develop and implement an oil shale strategy and urges that this strategy include the following:

4. Utilize the Joint-Review Process to facilitate and coordinate the federal, state and local permit process;

#16])> <([#17 [10.5] BE IT FURTHER RESOLVED that CLUB 20 supports section 369 of the Energy Policy Act of 2005 which directs the U.S. Departments of Energy, Interior and Defense, in cooperation with

State and Local governments, to continue to develop and implement an oil shale strategy and urges that this strategy include the following:

5. Support of the existing Bureau of Land Management (BLM) RD&D oil shale leasing program and Encourage fair tax & royalty structures which incentivize ongoing research and commercial development while providing for infrastructure development and impact mitigation;

#17])> <([#18 [10.5] BE IT FURTHER RESOLVED that CLUB 20 supports section 369 of the Energy Policy Act of 2005 which directs the U.S. Departments of Energy, Interior and Defense, in cooperation with

State and Local governments, to continue to develop and implement an oil shale strategy and

urges that this strategy include the following:

6. Provide for appropriate study of and mechanisms for the timely mitigation of impacts from development, including incentives for “up front” industry contributions to state agencies and local governments through establishment of a federal royalty credit for these contributions; **#18])>** **<([#19** [9.6] BE IT FURTHER RESOLVED that CLUB 20 supports section 369 of the Energy Policy Act of 2005 which directs the U.S. Departments of Energy, Interior and Defense, in cooperation with

State and Local governments, to continue to develop and implement an oil shale strategy and urges that this strategy include the following:

7. Issue commercial leases when the Secretary of the Interior has found that the applicant has demonstrated the capability of proceeding with a technically feasible, commercially viable and environmentally sound technology, and the federal, state and local governments have proper mechanisms in place (regulations, permitting program, NEPA review) to ensure prudent and responsible development;

#19])> **<([#20** [9.7] BE IT FURTHER RESOLVED that CLUB 20 supports section 369 of the Energy Policy Act of 2005 which directs the U.S. Departments of Energy, Interior and Defense, in cooperation with

State and Local governments, to continue to develop and implement an oil shale strategy and urges that this strategy include the following:

8. Concurrent with the commercial leasing program, the BLM should continue to make RD&D leases available to provide interested companies the opportunity to develop and demonstrate viable technology; **#20])>** and

<([#21 [9.2.2] BE IT FURTHER RESOLVED that CLUB 20 supports section 369 of the Energy Policy Act of 2005 which directs the U.S. Departments of Energy, Interior and Defense, in cooperation with

State and Local governments, to continue to develop and implement an oil shale strategy and urges that this strategy include the following:

9. Urge the U.S. Departments of Energy, Interior and Defense to fulfill their mandates under section 369 of the EPA05.

Submission Text

<([#1 [2.3.1] To concerned representatives at the Bureau of Land Management, I am writing in regards to the Oil Shale and Tar Sands Draft Programmatic Environmental Impact Statement (PEIS). As a renewable energy scholar, with qualifications from the University of California, Irvine, and Cambridge University in the United Kingdom, I feel that my education and experience in the field provides me with the requisite perspective and knowledge base to comment on the Draft PEIS. In brief, I am very concerned about the environmental impacts of oil shale development along the entire length of the Colorado River (Grand/Glen Canyons included). Though the accepted body of research is not 'complete', there is a preponderance of evidence to support the position that oil shale and tar sand development has a detrimental and - in the short term - irreversible impact on the local and global environment. The Colorado River ecosystem is particularly vulnerable to the impacts of oil shale and tar sand development, as increased water harvesting - and subsequent increases in siltation - have created an increasingly acidic riparian environment. Globally, tar sand development is a particularly intensive form of energy development, one that is as detrimental to the environment/climate as it is energy intensive. I concur with the Glen Canyon Institute's recommendation that the BLM choose Alternative 3, Research Only, as the the Preferred Alternative in the Final PEIS. This is essential to ensure that we have the best possible information before considering opening our natural open spaces and ecosystems to the development of oil shale and tar sand resources. #1])> <([#2 [3.4.1] Further, I concur with all of the GCI's specific concerns/recommendations for the Draft PEIS, which follow in their entirety below. * The Draft Programmatic EIS needs to ensure water quality will not be adversely effected by development of oil shale and tar sand resources. The water usage for oil shale production far outstrips the amount of oil produced, even prior to the refinement process. Water resources in the West are already overused and the effects of climate change and increased population will only add further strain to an already depleted system. #2])> <([#3 [3.4.1] * The Draft Programmatic EIS should be conducted in such a way to address issues of dust, noise, and pollution in the affected areas. Heating oil shale in the ground can contaminate vital groundwater supplies. High salt concentrations in groundwater restricts water available to native plants and is harmful to agricultural production as well. The Colorado River Basin already spends millions of dollars annually on damages caused from high salinity. #3])> <([#4 [3.1.1] * The Draft Programmatic EIS should address the potential encroachment on protected areas and National Parks such as Glen Canyon Recreation Area and Canyonlands National Park. This includes a thorough analysis of the damage to these priceless parks by oil shale and tar sands development. #4])> I appreciate your thoughtful consideration and best efforts. Kind regards, Robert Amador Sustainability Research Group Centre for Climate Change Mitigation Research Cambridge University (Currently based in Napa, California 94558) T.310 497 1559

Submission Text

<([#1 [3.4.1] I have serious concerns about opening areas of Northwestern Colorado and Utah to Tar Sand and Oil Shale development. As a Colorado resident who enjoys spending time in those regions and someone employed in the oil and gas business, I recognize the need to balance the interests of resource development with resource conservation and protection. In the case of opening these regions to such intensive resource extraction. My reasons for this are many. These industries are highly water intensive - these regions are water poor. Allocating water rights to companies extracting oil seems to be a misuse of an important regional resource. While I also realize that this development may mean jobs for a region that also suffers economically, firmly believe that regional economic drivers should NOT supercede that national interests in protecting unique natural resources that are federally protected for the ongoing use of U.S. citizens. #1])>

<([#2 [12] I have spent time in Capital Reef, Arches, and Dinosaur National Monument. These are unique and beautiful landscapes. I also work in oil and gas development and I know that even the best intentions often are not realized. In a rush to develop, the companies often take shortcuts that prove harmful to the natural environment. These companies do NOT have long term interests in the region - and as someone who does, I request that you do not open these regions to Tar Sand and Oil Shale Development.

Dear Bureau of Land Management, This is to submit comments on the Oil Shale and Tar Sands Draft Programmatic Environmental Impact Statement (PEIS). <([#1 [3] Mining shale and tar sands will have very destructive impacts on Glen Canyon, Grand Canyon, and the Colorado River. I believe that we need more research on the potential impacts of oil shale and tar sand development before allowing leasing of our public lands for this use. Such development could have serious and irreversible impacts, including on water supplies and quality, air quality, native ecosystems and wildlife, and recreational uses. #1])> <([#2 [2.3.1] I urge you to choose Alternative 3, Research Only, as the BLM's Preferred Alternative in the Final PEIS. This is essential to ensure that we have the best possible information before considering opening our natural open spaces and ecosystems to the development of oil shale and tar sand resources. #2])> <([#3 [3.4.1] Here are some of my specific concerns regarding the Draft PEIS: 1. The Draft Programmatic EIS needs to ensure water quality will not be adversely effected by development of oil shale and tar sand resources. The water usage for oil shale production far outstrips the amount of oil produced, even prior to the refinement process. Water resources in the West are already overused and the effects of climate change and increased population will only add further strain to an already depleted system. #3])> 2. <([#4 [3.4.1] The Draft Programmatic EIS should be conducted in such a way to address issues of dust, noise, and pollution in the affected areas. Heating oil shale in the ground can contaminate vital groundwater supplies. High salt concentrations in groundwater restricts water available to native plants and is harmful to agricultural production as well. The Colorado River Basin already spends millions of dollars annually on damages caused from high salinity. #4])> 3. <([#5 [3.1.1] The Draft Programmatic EIS should address the potential encroachment on protected areas and National Parks such as Glen Canyon Recreation Area and Canyonlands National Park. This includes a thorough analysis of the damage to these priceless parks by oil shale and tar sands development. #5])> <([#6

[2.3.1] This EIS should ensure that all alternatives seriously assess the issues outlined above. Considering the present lack of adequate information and the tremendous risks of misguided development, the only reasonable alternative at this point is Alternative 3, Research Only as outlined in the PEIS. #6])> Thank you for the opportunity to comment on the Draft Programmatic EIS. Sincerely, RICHARD G HILLS 787 E CENTER ST CENTERVILLE, UT 84014-2303 801-292-3744

<([#1 [3.4.1] As a resident of the great state of Utah, and an avid outdoors enthusiast, I feel that this proposal is leading towards a slippery slope of opening public land for these destructive purposes. Additionally the water requirement will undoubtedly cause strain to the already fragile conditions of southeastern Utah and southwestern Colorado. The nuclear power plant proposal near Green River already stated that there may be times the river would not be able to satisfy the needs of the plant, so why is there a proposal to put even more usage on the river? It is nonsensical, ineffective (mis)use of a water source and a threat to the beauty of the landscape

that earned recognition as some of the most beautiful national parks in the west. #1)]> <([#2 [12] As a tax paying, law abiding, active voting citizen I am absolutely against this proposal. #2)]>

<([#1 [3.10.4] I wish to express my strong opposition to the federal proposal to allow oil shale and oil sands development in parts of Wyoming, Colorado, and Utah as they would be a major threat to the national parks in those states. In addition to providing those states with Billions of dollars of tourist and sales revenue, the proposed plan will negatively effect a quarter of a million jobs. In this unstable and fragile economy it would be utterly foolish to take on such a risk. #1)]> <([#2 [6.3.2.2] Additionally the proposed development would cause immeasurable environmental damage. It takes up to 210 gallons of water to extract every gallon of othat's his means that the infrastructure required to divert that much water could require up to 122 billion gallons of water a year — equal to 1.5 times the annual consumption of Denver Water's 1.3 million customers. #2)]> <([#3 [12] This plan would then not only negatively effect the outdoor industries of those states, but also the surrounding citizens thanks to the enormous amount of water consumption. I cannot urge you strongly enough to NOT approve these plans. #3)]>

Re: Town of New Castle, Colorado

2012 Oil Shale & Tar Sands PEIS - COMMENTS

To be submitted via: <http://ostseis.anl.gov/involve/comments/index.cfm>

The Town Council of the Town of New Castle appreciates the Bureau of Land Management's review of past decisions regarding oil shale leasing and development and offers the following comments:

<([#1 [3.10.2] The Town of New Castle, Colorado (population 4,500) sits at the western edge of the Rocky Mountains, just east of the oil-shale rich Piceance Basin. When commercial development of oil shale finally occurs, our community and region will be impacted by an economic boom just as it was in the late 1970s and early 1980s. Unfortunately, in 1982, our community was also the impacted by the oil shale bust that resulted in an economic depression in our region that spanned close to two decades.

In recent years our community and region has been heavily impacted by natural gas exploration and production occurring in nearby private and public lands. Natural gas development has brought significant growth to our community and placed considerable demands upon our municipal infrastructure, resulted in a shortage of affordable housing and essential community workforce, caused material and labor costs to skyrocket and strained social services and law enforcement capacities. Full-blown commercial development of oil shale will likely have similar

and greater impacts on our community and region. #1)>

<([#2 [3.4.1] Furthermore, the Town of New Castle jealously guards our water supply, clean air, open space and nearby BLM land. We will seek assurance that whatever technology is developed for oil shale extraction includes safeguards for the resources we value. In particular we fear the loss of scarce water supplies. The Town returns a large percentage of the water we withdraw for consumption back into the Colorado River. We are concerned that oil shale extraction technologies might consume water that cannot be returned to the ecosystem. We believe that more research is needed to develop technologies that have smaller impact on Western Slope water supplies. #2])>

<([#3 [3.10.4] Finally, in our attempt to avoid another oil/gas industry boom and bust, New Castle is working hard to diversify our economy. A major part of that diversification is to encourage recreational tourism, exploiting the Town's easy access to the Flat Top Range and the hunting, fishing, hiking, camping and other recreational opportunities provided by the rich environment of our public lands. We oppose any industrialization which might harm this environment. #3])>

<([#4 [2.2.1] [2.3.1] While the Town has maintained a good relationship with the oil and gas industry and is supportive of well-regulated extraction, we urge the BLM to insist that research and development of oil shale technologies be completed and the impacts analyzed before moving forward with a commercial leasing program. Such analysis must include study of the economic, social and environmental impacts on affected communities.

At this time it makes sense to endorse Alternative 3, limiting commercial development to the existing lease areas. We could also support Alternative 2(b), since it requires research before commercial licenses are issued. The final plan should reflect a common sense approach that protects the prosperity of our region. #4)>

<([#1 [12.3] I am wholly opposed to open our National Parks to the oil industry or any other industry that seeks to profit from the extraction of resources. One of the greatest assets we have,

not only this country, but especially here in Colorado and surrounding areas are our National Parks. Allowing 'Big Oil' access to our lands sets an unbelievably dangerous precedent for the future. I believe it would be a disgusting betrayal of the people that place as much value on these lands as I do. #1)>

Salt Lake City, UT 84101

May 3, 2012

Draft OSTs PEIS Argonne National Laboratory 9700 S. Cass Avenue EVS/240 Argonne, IL 60439

To Whom It May Concern,

Please accept these comments from the National Parks Conservation Association regarding the Bureau of Land Management's (BLM) draft Oil Shale and Tar Sands Leasing Programmatic Environmental Impact Statement (PEIS). Please note that we have signed onto more lengthy and detailed comments submitted by Western Resource Advocates, but would also like to include these additional comments relating specifically to the potential impacts to National Park Service managed lands within the PEIS planning area.

The mission of the National Parks Conservation Association (NPCA) is to "protect and enhance America's National Park System for present and future generations." Founded in 1919, NPCA has become the leading private voice for the parks. It is a national non-profit headquartered in Washington, DC, with 23 regional and field offices. NPCA represents 600,000 members and supporters who care deeply about America's shared natural and cultural heritage preserved by the National Park System.

<([#1 [2.3.1] NPCA believes the BLM is heading in the right direction with the current preferred alternative 2(b) in the PEIS. This alternative drastically reduces the amount of land available for oil shale and tar sands leasing from the previous 2008 decision. However, we also concur with the National Park Service that oil shale and tar sands companies need to prove their technology works, is economically viable, and is environmentally compatible with surrounding land, water, and recreational needs. No lands should be allocated for commercial development until completion of research, including but not limited to federal research, design and demonstration (RD&D) leases, and an analysis of the impacts. For that reason, we urge the BLM to adopt Alternative 3 in the Final PEIS. If, following completion of research activities, the BLM concludes that lands should be open to application for commercial development, the BLM can then amend resource management plans and make land available.

#1])> <([#2 [3.1.1] The National Park Service itself has identified eight national park units within Wyoming, Colorado and Utah that would be directly impacted by large-scale, commercial leasing of oil shale and tar sands: Fossil Butte National Monument in Wyoming, Black Canyon National Park and Dinosaur and Colorado National Monuments in Colorado, Canyonlands,

Arches, and Capitol Reef National Parks and Glen Canyon National Recreation Area in Utah. And, in fact, many more units would be indirectly impacted if such development were to occur using current technology.

If commercial leasing were to proceed on the approximately 2 million acres identified in Alternative 1 of the BLM's PEIS for oil shale development and 430,000 acres of tar sands leasing and development, profound impacts would occur not only on the natural and cultural resources contained within iconic national park boundaries, but on the economic benefit they bring to local communities. The proximity of this proposed energy development to national park lands could have major impacts on the experience of tourists who visit to enjoy nature, solitude, starry night skies, clean air and water, and recreation.

#2])> The following comments outline the specific issues relating to national parks that NPCA believes Alternative 3 would mitigate within the PEIS planning area:

<([#3 [3.5.4] Air Quality

One of the major concerns of large scale development of oil shale and tar sands near our national parks is the impact on air quality and the ability to meet long term goals for clear air in our Class I air-sheds. The energy requirements for oil shale and tar sands processing is expected to be substantial. The increased need for power will likely come from coal-powered plants, which produce significant emissions of greenhouse gases and particulates. The two different production methods of oil shale, mining and surface retorting and in-situ retorting, will also produce greenhouse gas emissions and particulate pollution. In fact, it has been estimated that oil shale would emit 25-75% more greenhouse gases than conventional liquid fuels from crude oil feedstocks¹. The cumulative impact of new emissions from oil shale and tar sands production is particularly worrisome when added to emissions from existing oil and gas development in the potential leasing area. It is, therefore, important for the BLM to ensure that air quality will not deteriorate more than allowed by the Clean Air Act and that the National Ambient Air Quality Standards (NAAQS) will not be exceeded by oil shale/tar sands development.

1 Adam R. Brandt "Converting Oil Shale to Liquid Fuels with the Alberta Taciuk Processor: Energy inputs and Greenhouse Gas Emissions," Energy Fuels 23, no.12 (2009) 6253-6258, doi: 10.1021/ef900678d, <http://pubs.acs.org/doi/abs/10.1021/ef900678d>. #3])>

<([#4 [3.4.1] Water Quality and Quantity

Intensive use of water and potential impacts to water quality from oil shale and tar sands development using existing technologies are major concerns for our national parks, which rely on surface and groundwater for ecological health as well as recreational opportunities. It has been estimated by both the GAO and the RAND Corporation that producing one barrel of oil from shale or tar sands using current technology requires one to five barrels of water (42-210 gallons). This substantial water requirement on top of existing and projected water needs for Colorado and Utah will have broad implications for water availability, particularly from the Colorado River. Surface and groundwater quality may also be severely impacted by chemicals and organic material produced during the retort process and by leaching of spent shale by-products into surface and groundwater supplies.

Management of the Colorado River has a direct impact on the protection of resources within 5 of the 8 parks identified above: Dinosaur National Monument, Black Canyon, Canyonlands, and Arches National Parks, and Glen Canyon National Recreation Area. A change in river management to meet drastic increases in water demand from commercial oil shale and tar sands development, and subsequent water contamination from mining waste, could lead to the loss of

aquatic and terrestrial habitat for native fish and wildlife, invasion of non-native vegetation, loss of archaeological sites and cultural resources, and erosion of river sandbars. In addition, recreational use of water within these national park units could be significantly impacted with reduced flows, poor water quality, and altered river management. #4)>

<(#5 [3.8.1] [3.1.2] Viewshed

Large-scale commercial leasing near and adjacent to our national parks would severely mar the landscape and diminish the scenic qualities that draw visitors to our national parks. Specifically, tar sands development adjacent to Canyonlands National Park and Glen Canyon National Recreation Area would diminish the recreational quality of these remote, protected landscapes within the Colorado Plateau. Alternative 3 significantly reduces the impact on viewsheds of our national parks.

#5)> <(#6 [3.6] Soundscapes

Many people visit our national parks specifically to escape the sounds of urban life and to experience solitude. Noise can also affect wildlife behavior and communication. Sound management is therefore an important component of National Park Service management plans. Large-scale commercial development of oil shale and tar sands on lands adjacent to and near national parks would increase the noise levels on the landscape and potentially disturb the visitor experience of natural soundscapes within the parks. Again, Alternative 3 in the PEIS significantly reduces impacts to national parks from external noise created from oil shale and tar sands development.

#6)> <(#7 [3.8.1] Night Skies

Protecting dark night skies has become recognized as an important cultural, natural, and scientific resource by the National Park Service. Many visitors go to national parks just to experience the dark, starry skies, which in turn brings economic benefit to the parks and surrounding communities. In addition, wildlife species depend on natural patterns of light and dark for navigation, to cue behaviors, or hide from predators. Managing natural lightscapes and artificial light pollution is therefore a priority for the National Park Service from both a recreational and ecological perspective. Large-scale commercial development of oil shale and tar sands would likely include a significant increase in light pollution from drilling and mining activities.

#7)> <(#8 [3.10.4] Economic Implications

There is a serious risk that large-scale commercial development of oil shale and tar sands will destroy the very qualities that draw visitors to Colorado, Wyoming and Utah national parks, thus deterring visitors and negatively impacting the local tourism-based economies in these states. Public lands like national parks, national monuments, and recreation areas are major economic drivers in the West. They also create jobs. According to statistics from the National Park Service, Glen Canyon NRA directly supports 2,200 local jobs and Arches National Park sustains 1,600 jobs. Together, the eight Park Service sites most endangered by large-scale oil shale and tar sands development support over 5,500 jobs in Utah, Wyoming, and Colorado.

The western recreation economy extends beyond park borders to include companies like Petzl (Clearfield, UT), Black Diamond (Salt Lake City, UT), Osprey Packs (Cortez, CO), and NOLS (Lander, WY). These companies support thousands of diverse, well-paying jobs in manufacturing, design, transportation, and education that cross multiple sectors. According to the Outdoor Industry Association, the recreation economy supports 65,000 jobs in Utah, and pumps \$5.8 billion into the state's economy. In Wyoming, it generates \$4.4 billion of economic spending, sustains 52,000 jobs and represents 17% of all the retail sales and services produced in

the state. Meanwhile, Colorado racks up \$10 billion in benefits from its recreational economy, and over 100,000 jobs.

Visitor spending is strong as well. In 2010, national park visitation generated \$612 million in local spending in Utah, \$610 million in Wyoming, and almost \$300 million in Colorado, according to NPS statistics. The four business sectors most directly affected by visitor spending are lodging, food, retail, and amusements. #8]>

Conclusion

<([#9 [2.3.1] We appreciate the BLM's effort to take a second look at their 2008 decision to open nearly 2.5 million acres of public lands to oil shale and tar sands development in Wyoming, Colorado, and Utah. We also appreciate that the National Park Service has been a cooperating agency throughout this current process and that many of their concerns have been incorporated into the Draft PEIS. However, we also believe that it is important to plan for smart energy development in the Western United States by taking a landscape scale approach and taking all of the potential environmental and socioeconomic impacts into consideration. We are not convinced that the energy companies have proven their technology and therefore believe that leasing should be limited to the RD&D leases existing at the time of the Record of Decision for the 2012 PEIS (Alternative 3). With so much at stake, we can't afford to gamble with the health of our national parks, surrounding public lands, and tourism-dependent communities.

#9]> Sincerely,

Erika Pollard

Southwest Program Manager

RE: Sweetwater County's comments regarding the Draft Programmatic Environmental Impact Statement and Possible Land Use Plan Amendments for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah and Wyoming.

Dear Ms. Thompson:

Sweetwater County would like to thank you for the opportunity to comment on the Draft Programmatic

EIS for Allocation of Oil Shale and Tar Sands Resources on lands administered by the Bureau of Land

Management (BLM) in Colorado, Utah and Wyoming (2012 OSTs DPEIS).

<([#1 [2.5] After attending the BLM's open house held in Rock Springs, Wyoming, on Thursday, March 15, 2012,

and after reviewing the 2012 OSTs DPEIS, Sweetwater County recommends that the BLM adopt either

of the following courses of action in regards to the 2012 OSTs DPEIS:

1. The BLM complies with established laws and ceases all further activities related to the 2012 OSTs DPEIS and maintains its decision made in the 2008 OSTs PEIS; or

#1)]> <([#2 [2.1] Sweetwater County recommends that the BLM adopt either

of the following courses of action in regards to the 2012 OSTs DPEIS:

2. The BLM selects in its ROD the 2012 OSTs DPEIS "No Action Alternative" that maintains 1,000,453 acres of lands within Wyoming open to consideration for oil shale leasing.

#2]) <([#3 [9.2] Sweetwater County recommends these options for the following reasons:

1. Sweetwater County's rationale for recommendation one is based on its approval of Sweetwater County Resolution 12-04-CC-02 (see attached). Sweetwater County, Wyoming has joined several other counties within Wyoming, Colorado and Utah in opposing the 2012 OSTIS DPEIS. The reasons of this opposition are outlined below:

a. The creation of the 2012 OSTIS DPEIS was completed in open contempt and in violation of the spending moratorium of Section 1769 of the April 21, 2011 Congressional Continuing Resolution to Fund Fiscal Year 2011 through September 30, 2011 .

#3]) > Page 1 of 3

<([#4 [1.5] b. The 2012 OSTIS DPEIS preferred alternative is the creation of a friendly lawsuit settlement agreement between the BLM and ideological opponents to oil shale development and, therefore, this preferred alternative is entirely pre-determined and predecisive in violation of NEPA. **#4]) >**

<([#5 [1.3] c. The creation of the 2012 OSTIS DPEIS preferred alternative entirely ignores the input

into the 2008 OSTIS PEIS provided multiple cooperators including a Task Force of Governors, state and county governments and other stakeholders, which was required by the Energy Policy Act of 2005. **#5]) >**

<([#6 [3.10.3] d. If the 2012 OSTIS DPEIS preferred alternative is adopted in the Record of Decision the

vast oil shale and tar resources of Wyoming, Colorado and Utah will be off limits to development, which would result in a loss of 8 trillion barrels of oil from our nation's economy. **#6]) >**

<([#7 [3.10.3] 2. Sweetwater County's rationale for recommendation two is based on the following:

a. Mineral development provides seventy percent of Sweetwater County's ad valorem tax revenues and provides the economic base that supports the majority of the industries, businesses, jobs and housing within the County. Any reduction in mineral value or supply creates a major economic hardship for Sweetwater County and the State of Wyoming .

To prevent this economic hardship, it is essential that the County and the State strive to maintain the highest market value for its mineral resources and to continue to explore and research the development of new minerals such as oil shale. If current research on developing effective oil shale extraction technologies is successful, it is likely that the production of oil from oil shale will play a major role supporting our local, state and national economies. To take advantage of the promising economic benefits of this research, it is imperative that Sweetwater County and the State of Wyoming support the "No Action Alternative" which will preserve the potential for over one million acres within Wyoming to be available for oil shale leasing. Without the availability of these acres for potential oil shale development, we will miss an important opportunity to enhance our future economic base.

#7]) > <([#8 [10.6.3] b. The United States is currently in a growing economic crisis partially caused by an export

import cycle in which our Country exports its wealth to the Middle East and other regions of the world in exchange for oil imports to meet our Country's energy needs.

This export import cycle not only transfers the wealth of our nation to other countries, it

transfers opportunities for business growth, job creation and quality of life for the citizens within our own borders.

To break this export I import cycle and to keep our nation's wealth within its borders, our Country must develop its own mineral energy resources including oil, gas, coal, uranium and oil shale. By developing these resources, our nation will be creating wealth and jobs for its own citizens rather than for the citizens of foreign countries. Through the use of proper environmental review and proven technologies, our nation's energy resources can be developed in a manner that not only sustains our nation's economy, but also protects our nation's environment.

If we continue down the path of developing other nation's energy resource before we develop the energy resources within United States, we will only deepen our Nation's economic crisis. This is not the path that Sweetwater County believes our nation should follow, and therefore, Sweetwater County supports developing our nation's vast oil shale reserves, which are being considered in this Draft PEIS.

#8]>> In summary and based on the above comments, in regards to Sweetwater County's recommendations on the 2012 OSTs DPEIS, the County recommends either of the following options:

1. The BLM complies with existing laws and cease all further activities related to the 2012 OSTs DPEIS and maintain the Record of Decision it made in the 2008 OSTs PEIS, or
2. The BLM selects the "No Action Alternative" in the 2012 OSTs DPEIS, which maintains 1,000,453 acres of lands within Wyoming open to consideration for oil shale leasing.

If you have any questions concerning Sweetwater County's above comments, please contact me at 307-

872-3897.

Sincerely,

Enclosure: Sweetwater County Resolution 12-04-CC-02

RESOLUTION 12-04-CC-02

SWEETWATER COUNTY, STATE OF WYOMING.

OPPOSING THE BLM'S 2012 OIL SHALE AND TAR SANDS PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT, BLM PROJECT# W0-300-1310-PP-OSHL

(HEREAFTER. 2011 OSTs PEIS)

FOR LANDS ADMINISTERED BY THE BUREAU OF LAND MANAGEMENT IN COLORADO, UTAH AND WYOMING,

This Resolution is adopted in open meeting after due opportunity for public comment, by the Board of Commissioners of Sweetwater County, in order to redress the many violations of law, regulation, and policy by the BLM with respect to the BLM's 2012 OSTIS PEIS.

BACKGROUND

As background to this Resolution, Sweetwater County recites the following grievances: WHEREAS, On April 14, 2011, the BLM caused to be published in the Federal Register, Volume 76, No 72/Thursday, April 14, 2011, pages 21003-21005, a notice of intent to prepare the above-referenced 2012 OSTIS PEIS; and

<([#9 [9.2.1] [3.1.3] WHEREAS, the preliminary purpose and need statement in the notice of intent, states the PEIS

will analyze removing from oil shale and tar sands leasing "All areas that the BLM has identified or may identify as a result of inventories conducted during this planning process, as lands containing wilderness characteristics[.]" Id., at page 21004; and

WHEREAS, the notice of intent further states at page 21004:

Lands that the BLM identifies as having wilderness characteristics will be considered during this planning initiative, as described above, and consistent with Secretarial Order No. 3310, dated Dec. 22, 2010, and BLM Manuals 6301 and 6302. Future leasing of lands determined by the BLM to have 'Wilderness characteristics, if compatible with the allocation decisions stemming from this initiative, will subsequently be assessed in accordance with BLM Manual 6303, as appropriate (i.e., 'where the BLM has not determined, consistent with BLM Manual 6302, whether the lands with wilderness characteristics at issue should be receive a wild lands designation, BLM Manual 6303 will apply); and

WHEREAS, this language documents the BLM's intent to implement, administer and/or enforce Secretarial Order 3310 and one or more of the BLM guidance manuals promulgated under Order 3310; and

WHEREAS, any attempt by the BLM to implement, administer and/or enforce Secretarial Order 3310, including any effort by the BLM to proceed further on the above-referenced Programmatic

EIS, violates the spending moratorium of Section 1769 of the April 21, 2011 Congressional Continuing Resolution to Fund Fiscal Year 2011 through September 30, 2011, which states: For the fiscal year ending September 30, 2011, none of the funds made available by this division or any other Act may be used to implement, administer, or enforce Secretarial Order No. 3310 issued by the Secretary of the Interior on December 22, 2010; and

WHEREAS, this spending moratorium has been carried forward in all subsequent Congressional spending resolutions up to and including the current spending resolution; and

WHEREAS, the 2012 OSTIS PEIS, is an admitted attempt by the BLM to implement, administer and/or enforce Secretarial Order 3310 and its policies and objectives, all in violation of the Spending Moratorium of the 2011 Continuing Resolution; and #9]>

<([#10 [9.8] WHEREAS, the 2008 Oil Shale and Tar Sands Programmatic EIS (2008 OSTIS PEIS) was

required under Section 369 (d) (I) of the Energy Policy Act of 2005 and was prepared in cooperation with 14 federal, state, and local governmental organizations; and

WHEREAS THE 2008 OSTIS PEIS was 3 years in the making, and it honored the input of a task force of Governors and other stakeholders as per requirement of the 2005 Energy Policy Act;

WHEREAS, the Record of Decision (ROD) for the 2008 OSTIS PEIS amended 10 land use plans in Colorado, Utah, and Wyoming to make approximately 2 million acres of public lands available for potential leasing and development of oil shale and approximately 430,000 acres available for tar sands leasing. Together with the regulations published in 2006 and 2008 for oil shale and tar sands resources, the 2008 OSTIS PEIS and subsequent land use amendments constituted a reasonable and rational establishment of an oil shale and tar sands program as mandated in the Energy Policy Act of 2005; and

#10])> <([#11 [6.1.2] WHEREAS, the oil shale and tar sands program to which the 2008 OSTIS PEIS and related

regulations gave birth, was a reasonable response to the fact that oil shale and tar sands resources in the Green River Formation located in northeastern Utah, northwestern Colorado and southwestern Wyoming may reach 8 trillion barrels of oil; and

#11])> <([#12 [9.8] WHEREAS, the preferred alternative in the draft 2012 OSTIS PEIS drastically slashes,

diminishes and in many areas outright reverses virtually all of the lands made available for Oil Shale and Tar Sands development in 2008, and does so using the same data and science; and

#12])> <([#13 [9.2.2] WHEREAS, such a drastic reversal in lands available for Oil Shale and Tar Sands development

between the 2008 PEIS and the 2012 preferred alternative, violates regulatory and Task Force requirements of certainty for industry and investors; and

WHEREAS such a drastic reversal of lands available for Oil Shale and Tar Sands development in 2008, constitutes a de facto, piece-meal revision of previous BLM Resource Management Plans, in violation of the Section 202 Planning Process under FLPMA;

WHEREAS, the preferred alternative in the draft 2012 OSTIS PEIS entirely ignores the input of the task force and stakeholders which the 2005 Energy Policy Act directed the BLM to honor and follow; and moreover the draft 2012 OSTIS PEIS may well violate various memoranda of understanding (MOUs) with counties which require the BLM to publish the written input of cooperators who disagree with the preferred alternative;

WHEREAS the draft 2012 OSTIS PEIS preferred alternative significantly restricts the acreage allotted in the 2008 PEIS for research and development leasing;

WHEREAS the draft 2012 OSTIS PEIS preferred alternative threatens to arbitrarily undermine the process and the work utilized in creation of the 2008 OSTIS PEIS, and essentially dismantle a reasonable and rational oil shale and tar sands program in violation of Section 369 of the 2005 Energy Policy Act; and **#13])>**

<([#14 [1.5] WHEREAS, the 2012 OSTIS PEIS preferred alternative is the creature of a friendly lawsuit

settlement agreement between the BLM and ideological opponents to oil shale development, and is therefore entirely pre-determined and pre-decisional in violation of NEPA, with no apparent rationale for revising the acreages approved in 2008; and **#14])>**

<([#15 [2.2] WHEREAS, the BLM has settled on a preferred alternative in the 2012 OSTIS PEIS admittedly

without having first analyzed its impacts; BLM should be required to withdraw the preferred status of the alternative until it has performed this analysis; and

WHEREAS, the acreage approved for Oil Shale and Tar Sands development in the draft 2012 OSTIS PEIS preferred alternative bears no rational relationship to the stated purpose and need;

#15])> <([#16 [1.5] WHEREAS, the Department of Energy has basically abdicated the

responsibility Congress

placed upon it to defend and uphold a viable oil shale energy program in America, leaving it instead to the BLM encumbered by a host of anti-oil shale pro-wilderness groups steering BLM's

every move; **#16])>**

<([#17 [9.5] WHEREAS, the alternative adopted in the ROD of the 2008 OSTs PEIS is now the No Action

Alternative of the draft 2012 OSTs PEIS; and

WHEREAS, the 2008 OSTs PEIS chosen alternative is consistent with the multiple use, sustained yield of the Federal Land Policy Management Act (FLPMA); and

WHEREAS, the 2008 OSTs PEIS chosen alternative is consistent with county general plans and policies which call for responsible development of available energy resources; and

#17])> <([#18 [6.3.4] WHEREAS, the development and production of oil from oil shale has been proven beyond a

doubt to be technologically and economically feasible; and **#18])>**

<([#19 [6.3.2.1] WHEREAS, this same technology to extract oil from the oil shale rock is not only economically

feasible, but it requires little to no consumption of water, contrary to the myths which falsely claim that oil shale extraction requires large consumption of water resources; and

#19])> <([#20 [6.2.2] WHEREAS, the energy captured in the extract of oil from shale (natural gas capture, etc.,) more

than makes up for energy consumed in that extraction process, thus dispelling the myth that the oil shale extraction process consumes more energy than it produces;

#20])> <([#21 [3.10.3] WHEREAS, the rising price of gasoline, coupled with ever increasing loss of good paying jobs

due to the Administration's policies against energy development on "Western public lands, result in increasing hardships for families and the local economy, to the point where some fear the window of opportunity is about to close for a civil, lawful and orderly response as citizens feel more and more pressured and desperate financially; and

#21])> <([#22 [6.3.3.1] WHEREAS, the 2012 OSTs PEIS improperly limits technology testing to strictly in situ efforts

and does not allow for development of other technologies; and

#22])> <([#23 [1.1.1] WHEREAS, the BLM has left insufficient time for the public and cooperators to meaningfully

comment on the public draft 2012 OSTs PEIS by the present comment deadline of May 4, 2012, because a highly relevant commercial oil shale BLM regulation is not due to be published until May 15, 2012 and the public should have the right to view that regulation first and then submit comments on the draft 2012 OSTs PEIS in light of that regulation; and

#23])> <([#24 [2.1.1] WHEREAS, the same problems with lack of consistency with local plans and policies and failure

to honor the input of cooperators and all stakeholders, also besets many public lands EIS projects, in addition to the 2012 OSTs PEIS. The cooperators from Utah and Wyoming have already unanimously requested for the No-Action alternative in the draft 2012 OSTs PEIS become the preferred alternative. **#24])>**

<([#25 [9.2.1] RESOLUTION

NOW THEREFORE, BE IT RESOLVED BY SWEETWATER COUNTY, STATE OF

WYOMING AS FOLLOWS:

1. Sweetwater County declares the BLM's continuing to administer and carry out the 2012 OSTs PEIS to be an open contempt and flaunting of the Congressional Spending Moratorium first imposed in the 2011 Continuing Resolution and carried forward in all subsequent Congressional spending resolutions up to and including the present;
 2. Sweetwater County calls upon the BLM to cease all further activities with respect to administering and carrying out the 2012 OSTs PEIS, because doing so constitutes an open contempt and violation of the Congressional Spending Moratorium against implementing, administering and/or enforcing Secretarial Order 3310, which Spending Moratorium was first imposed in the 2011 Continuing Resolution and carried forward in all subsequent Congressional spending resolutions up to and including the present;
 3. Sweetwater County calls upon the BLM to immediately cease and desist all activities related to the above-referenced 2012 OSTs PEIS and immediately publish a revised notice in the Federal Register signifying its cessation of all work on the Programmatic EIS in obedience to the above-quoted Spending Moratorium. Otherwise, the BLM would be in contempt of Congress;
- #25)** **>** **<**(**#26** [2.1.1] 4. Should BLM continue to go forward with the 2012 OSTs PEIS regardless of these grievances, the only legally, viable alternative would be if the BLM adopted the No-Action Alternative, which is identical to the Alternative chosen in the ROD of the 2008 OSTs PEIS; **#26)** **>** **<**(**#27** [1.1.1] 5. The BLM should extend the May 4, 2012 deadline for public comment on the draft 2012 OSTs PEIS at least 30 days after publication of the expected oil shale regulation due to be published on or around May 15, 2012. **#27)** **>** **<**(**#28** [1.3] 6. The BLM should honor the input of cooperators, particularly if they are local governments, as required by Section 202(c)(9) of FLPMA, in all matters, not just with respect to the 2012 OSTs PEIS. **#28)** **>** Adopted at the regularly scheduled meeting of the Sweetwater County Board of County Commissioners, held on the 11th day of April 2012.

On behalf of the Backcountry Hunters and Anglers, a national conservation organization with a state chapter in Utah, I would like to submit the following comments regarding the proposed oil shale/tar sands Programmatic EIS: <([#1 [9.8] We commend the BLM for reconsidering the

extent of land in Utah, Colorado, and Wyoming to be considered for leasing for oil shale and tar sands development. The PEIS represents a considerable effort and thought on the part of the BLM. #1)> <([#2 [2.2] While we appreciate the significant reduction in the amount of land to be made available for leasing under Alternative 2B (BLM's preferred alternative), the potential for speculative lease acquisition along with the extensive area to be made available for RDandD, makes this alternative unsupportable. #2)> <([#3 [2.3] As a starting point, and to ensure the viability of oil shale extraction technology prior to issuing large scale leases, Alternative 3 offers a measured and cautious approach to allowing an oil shale/tar sands RDandD program to move forward (see attached commentary published in the Salt Lake Tribune, April 30, 2012.) #3)> <([#4 [2.5] A new alternative that focuses on protecting high value wildlife habitat, watershed, and recreation values should be formulated during the BLM's decision-making process that results in a reduction in acreage than is now proposed for leasing under Alternative 2B. #4)> <([#5 [10.4] An adaptive management approach to OS/TS development should, above all, be made part of any alternative selected for implementation: rehabilitation of individual RDandD sites must be completed before allowing an individual company to open up new sites. #5)> <([#6 [10.4] In addition to establishing the viability of oil shale/tar sands as a practical energy source, the feasibility of rehabilitating landscapes disturbed by any and all activities associated with oil shale development should be required before additional leases are permitted to individual development companies. This would help determine the potential for disturbed lands to be rehabilitated and would minimize wholesale displacement of wildlife populations in and adjacent to areas leased and developed for oil shale/tar sands extraction. Such an approach would enable other, potentially innovative approaches to oil shale extraction, development, and land rehabilitation than would occur under Alternative 3, since additional energy companies could demonstrate various technologies. #6)> <([#7 [9.2.6] Expansive road networks to multiple RDandD sites represent a highly disruptive potential impact to wildlife populations, not only by disturbances to habitat, but as a result of potential harassment and poaching. Road development should be allowed only to active extraction areas, not to be constructed to multiple sites in advance. Access roads to active RDandD sites should be closed and rehabilitated prior allowing new roads to be constructed. #7)> <([#8 [10.4] Participating energy companies should be held financially accountable and responsible for rehabilitating all areas disturbed by their individual RDandD activities , to the point of re-establishing functioning ecosystems, regardless if oil shale development proves viable or not. Taxpayers and sportsmen should not bear the financial and ecological liability of the potential impacts that oil shale and tar sands development represents. #8)> See Attachment.

<([#1 [12] I do not think that it is worth destroying millions of acres of natural beauty to meet a fleeting need. I implore you to take into account the cost of the damage to the natural surroundings which may not be able to be undone after the temporary endeavor of gathering oil resources is done. My hope is that we as a nation focus more on developing a long term solution to our oil dependence instead of destroying the very thing that gives us life, enjoyment and sustainability to solve for an issue that is short term. Trading our environmental stability for an increase in oil production is not good decision for our future. Please consider the external effects of this decision. There is more at stake here than not being able to fuel our cars. #1])>

<([#1 [2.3.1] I would like to propose Alternative #3, the closing of oil shale except for the six current RDandD leases. Develop a RDandD program and a similar one for commercial leasing that addresses: proof of viable technologies; water usage; air emissions including hazardous and criteria; wildlife habitat; restoration of areas; benefit of renewable sustainable energy sources to that of non-renewable using actual costs. For example: the actual cost of materials needed to produce the energy and transport to energy source use (i.e. communities, industries); liability issues if there is a malfunction, upset condition, or cleanup; balanced plan for measuring impacts of oil shale development. #1])>

Common Sense Oilshale Development 05/02/12 By Lance Oswald <([#1 [2.3.1] I agree with The National Parks Conservation Association that the Bush-era plan be revised, and that the BLM's preferred alternative allows far too many impacts. We should adopt a different alternative, one that would allow research only, and limit it to 34,740 acres in the Piceance and Uintah basins. This "requires oil shale and tar sands companies to prove their technology works, is economically viable, and is environmentally compatible with land, water and recreational needs." I believe in a staged approach where commercial leasing will not take place until after successful technologies have been developed and proven. #1])> <([#2 [10.4] These also must Contain reclamation standards and ensure that companies post adequate bonds for long-term protection of resources. #2])> <([#3 [6.3.4] I disagree with the Mesa County commissioners who argued production of oil from oil shale is technically and economically possible, and the plan would "essentially dismantle a reasonable and rational oil shale and tar sands program." Why do some county politicians make bloated resolutions claiming 8 trillion barrels of oil in the shale, more than six times the 1.5 trillion barrels, that other Congressional agencies and the BLM estimate? Political rhetoric in county courthouses or the halls of Congress won't trump science and the marketplace. Historic "Black Sunday" reminds us we must prepare for much larger impacts of potential oil shale development than politicians acknowledge. #3])> <([#4 [10.5] Why should a giant corporation like Shell Oil with \$7.2 billion in worldwide profits in just the third quarter of 2011 and with a history of investing millions of dollars over decades of effort in still-incomplete oil shale research, need reduced royalty rates or speculative leasing to move forward before acquiring rights to any federal land? Suddenly with surging oil prices, Oil Shale is being touted as a way for the U.S. to achieve energy independence But why should a nation seeking energy self sufficiency have among its largest exports "Finished Petroleum Products" to sell to other countries? It doesn't make sense to me? Unless--- they want to turn our own citizens public

oil reserves into gold bullion by the \$Billions in their own banks: though political government subsidies. #4])> Sincerely Yours, Lance Oswald 196 27Road Grand Junction CO 81503

<([#1 [6.1] The definition in the glossary of crude oil is somewhat helpful, but I think it could be clarified more. As I understand it, "crude oil" may refer to bitumen and similar highly viscous products that require dilution, high pressure and heating to move through pipelines. EIA reports list only crude oil, not dilbit or tar sand oil or oil sand oil or oil shale oil, as if all crude oils are very similar. To say that crude oil is liquid is true but misleading to a lay person if one considers, as some do, unprocessed bitumen to be liquid. What are the limits as to how viscous it can be or how much sand or other materials it may include and still be called crude oil? #1])>

I am writing to submit comments on the Oil Shale and Tar Sands Draft Programmatic Environmental Impact Statement (PEIS). <([#1 [3] I am very concerned about the possible impacts of oil shale development on Glen Canyon, Grand Canyon, and the Colorado River. I believe that we need more research on the potential impacts of oil shale and tar sand development before allowing leasing of our public lands for this use. Such development could have serious and irreversible impacts, including on water supplies and quality, air quality, native ecosystems and wildlife, and recreational uses. #1])> <([#2 [2.3.1] I urge you to choose Alternative 3, Research Only, as the BLM's Preferred Alternative in the Final PEIS. This is essential to ensure that we have the best possible information before considering opening our natural open spaces and ecosystems to the development of oil shale and tar sand resources. #2])> <([#3 [3.4.1] Here are some of my specific concerns regarding the Draft PEIS: * The Draft Programmatic EIS needs to ensure water quality will not be adversely effected by development of oil shale and tar sand resources. The water usage for oil shale production far outstrips the amount of oil produced, even prior to the refinement process. Water resources in the West are already overused and the effects of climate change and increased population will only add further strain to an already depleted system. #3])> <([#4 [3.4.1] * The Draft Programmatic EIS should be conducted in such a way to address issues of dust, noise, and pollution in the affected areas. Heating oil shale in the ground can contaminate vital groundwater supplies. High salt

concentrations in groundwater restricts water available to native plants and is harmful to agricultural production as well. The Colorado River Basin already spends millions of dollars annually on damages caused from high salinity. #4)> <([#5 [3.1.1] * The Draft Programmatic EIS should address the potential encroachment on protected areas and National Parks such as Glen Canyon Recreation Area and Canyonlands National Park. This includes a thorough analysis of the damage to these priceless parks by oil shale and tar sands development. #5)> <([#6 [2.3.1] This EIS should ensure that all alternatives seriously assess the issues outlined above. Considering the present lack of adequate information and the tremendous risks of misguided development, the only reasonable alternative at this point is Alternative 3, Research Only as outlined in the PEIS. #6)> Thank you for the opportunity to comment on the Draft Programmatic EIS. Sincerely, Stephen A. Burns 905 Saint James Pl Ocean City, NJ 08226

I am a big game hunter and I would like to submit the following comments regarding the proposed oil shale/tar sands programmatic EIS: <([#1 [2.2] Alternative 2B (BLM's preferred alternative), opens the door to speculative lease acquisition. It also provides for extensive area to be made available for RDandD, making this alternative unsupportable to me. #1)> <([#2 [2.3] Alternative 3 offers a better (measured and cautious) approach to allowing an oil shale/tar sands RDandD program to move forward. #2)> <([#3 [2.5] Preferably, a new alternative that focuses on protecting high value wildlife habitat, watershed, and recreation values should be formulated during the BLM's decision-making process that results in a reduction in acreage than Alternative 2B. #3)> <([#4 [10.4] In addition I am concerned that landscapes disturbed by any and all activities associated with oil shale development should be rehabilitated BEFORE additional leases are permitted to individual development companies. Road development should be allowed only to active extraction areas, not to be constructed to multiple sites in advance. Roads constructed for geological studies should be reclaimed as soon as these studies are complete. Access roads to active RDandD sites should be closed and rehabilitated prior allowing new roads to be constructed. Participating energy companies should be held financially accountable and responsible for re-establishing functioning ecosystems on all areas disturbed by their individual RDandD activities. Taxpayers should not bear the financial and ecological liability of the potential impacts that oil shale and tar sands development represents.

RE: Comments on Draft Programmatic Environmental Impact Statement (PEIS) and Possible Land Use Plan Amendments for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah, and Wyoming

Dear Sir or Madam:

On January 27, 2012, the Bureau of Land Management (“BLM”) issued a Draft PEIS that examines alternatives for modifying ten land use plans in Colorado, Utah, and Wyoming, to make lands available or not available for application for commercial leasing for oil shale and tar sands development. As the holder of an existing oil shale Research, Development and Demonstration (“RD&D”) lease in Uintah County in northeastern Utah within the BLM’s Vernal Field Office jurisdiction, Enefit American Oil (“Enefit”) has a strong interest in BLM’s management of federal lands for the development of oil shale resources. Enefit submits these comments pursuant to 40 C.F.R. §§ 1503.1(a)(3) and 1506.6(d), and requests that this letter and all its attachments be included in the administrative record for this matter.

I. INTRODUCTION

<([#1 [6.3.5] A. Enefit Has a Long History of Successful Commercial Oil Shale Production

Enefit was founded in 1939 and is the world’s largest oil shale to energy company. Enefit owns and operates oil shale mines producing up to 18 million tons of oil shale per year and owns and operates the world’s largest oil shale fired power plants with a total capacity of 2,380 MW. Estonia has also commercially produced oil from oil

shale for almost 100 years. In total, Enefit has mined 1 billion tons of oil shale, produced 550 TWh of power, and produced more than 200 million barrels of oil. Enefit employs approximately 7,000 people.

Enefit's industrial oil production experience is unique in the world and is drawn from Enefit's more than 30-year history of commercially operating its patented technology. After decades of research, development, and operations, Enefit has designed and is in the process of building the most efficient oil shale production technology available anywhere in the world. This is an advanced, new generation technology, based on Enefit's commercially proven technology which has been operating in Estonia for more than 30 years. Enefit's newest generation oil shale plant will go into production in Estonia this year and will more than double Enefit's current oil production capacity in that country. Enefit desires to bring this same, new generation technology to the Uintah Basin in Utah to help America meet its domestic energy needs.

Enefit owns extensive private oil shale resources in eastern Utah, holds State leases, and is the holder of the White River Mine federal RD&D lease. Enefit plans to make substantial capital investments, without government financing, and provide approximately 2000 direct jobs to the State of Utah. Enefit plans to produce hundreds of millions of barrels of oil over the life of its Utah project. Decades of experience in the mining and development of oil shale resources in Estonia provide Enefit with the knowledge, technology, and expertise to responsibly develop oil shale resources in the United States in an environmentally safe manner that will meet or exceed all current federal and state environmental standards. #1)>

<([#2 [6.3.5] B. Enefit's Has a Proven Oil Shale Development Technology

Enefit's commercially proven technology allows oil extraction from fine oil shale particles. The base technology, developed by Estonian scientists and patented in 2005, has operated continuously in Estonia for more than 30 years. In 2009, Enefit and Outotec formed a joint venture to undertake co-development of a new generation Enefit technology. The new Enefit technology combines Eesti Energia's improved solid heat carrier process and Outotec's Circulating Fluidized Bed technology, increasing efficiency and decreasing air emissions. The key benefits of Enefit's technology are the following:

- > Only operational fines technology available. More than 50 years of experience developing the solid heat carrier process and 30 years of operational experience in Estonia.
- > The process is energy self-sufficient and no external fuel is required.
- > Gas combustion and the use of excess heat provide more power than the process requires. Energy left in the spent shale is used to generate heat for the process.
- > Heat from ash and stack gases is extracted for power generation.
- > Retort gas with a high calorific value that is released in processing can be used for power generation.
- > No organic residual is left in the ash, which can be used as a raw material in the construction industry.
- > The oil extraction process is water free.

The modular design is essential to allow easy maintenance, process optimization, and streamlined adaptability to the individual characteristics of different oil shale

deposits.

#2)]> <([#3 [9.8] C. The Draft PEIS Undermines BLM’s Promising 2008 Blueprint for Domestic Oil Shale Development

The Draft PEIS marks a drastic and unwarranted departure from BLM’s 2008 resource management plan amendments (“2008 RMP Amendments”). The 2008 Amendments, together with the 2008 commercial oil shale regulation (“2008 OS Rule”) fairly implemented Congress’ directive that BLM establish a viable and sustainable program to encourage commercial oil shale development in the United States.¹ BLM’s 2008 RMP Amendments offered a balanced approach for oil shale development and resource management: (1) protect known, sensitive environmental areas that warrant protection under existing laws and established BLM management directives, (2) designate areas of sufficient size and contiguity that may be allocated for future commercial oil shale development, and (3) incorporate adaptive management procedures to address particular, site-specific resource issues at later stages in the commercial leasing process when more is known about the relevant development techniques and the impacted resources.

In contrast, the Draft PEIS sets forth a preferred alternative that severely restricts the amount of BLM lands available for future oil shale development without providing any substantive legal, policy, or ecological justification. BLM’s preferred alternative, if implemented, would cast a shadow over America’s domestic oil shale industry by undermining that regulatory certainty that is essential to investment in large-scale energy projects. BLM’s revised RMP proposal would undermine America’s oil shale program at a time of acute geo-political tensions in the Middle East and escalating gasoline prices at home. This approach is both arbitrary and capricious. Enefit recommends that BLM reverse its ill-advised proposal to severely restrict the acreage available for commercial oil shale development and stay the course by approving BLM’s “no action” alternative (Alternative 1) that would allow BLM’s recently-implemented 2008 RMP Amendments to guide oil shale development.

¹ Enefit focuses its comments in this letter on the portions of the proposed RMP Amendments that address oil shale leasing and development.

#3)]> <([#4 [9.1] II. THE PURPOSE AND NEED STATEMENT IS NOT CLEARLY DEFINED

AND IS INCONSISTENT WITH THE 2005 EPACT

The Council on Environmental Quality’s (“CEQ”) National Environmental Policy Act (“NEPA”) implementing regulations require that an EIS “shall briefly specify the underlying purpose and need to which the agency is responding in proposing alternatives including the proposed action.” 40 C.F.R. § 1502.13 (emphasis added). A project’s purpose and need statement forms the reference point for determining what constitutes a reasonable alternative. See *Citizens Against Burlington, Inc. v. Busey*, 938 F.2d 190, 194-95 (D.C. Cir. 1991) (citing *Vermont Yankee Nuclear Power Corp. v. Natural Res. Defense Council*, 435 U.S. 519, 551 (1978)). See also *City of Carmel-By-The-Sea v. United States Dep’t of Transp.*, 123 F.3d 1142, 1155 (9th Cir. 1997). Courts have held that “[a]lternatives that do not accomplish the purpose of an action are not reasonable and need not be studied in detail by the

agency.” *Citizens Comm. to Save our Canyons v. U.S. Forest Service*, 297 F.3d 1012, 1031 (10th Cir. 2002).

Because the purpose and need statement articulates the basis for the agency’s action, and in turn circumscribes the appropriate range of alternatives and scope of analysis, it must be defined in a manner that is both clear and defensible. Most importantly, the purpose and need statement must be consistent with any legal mandate(s) the agency has been given by Congress.

The purpose and need statement in the Draft PEIS fails to satisfy these well established principles.

A. BLM’s Purpose and Need Statement Is Not Clearly Defined

BLM offers the following rationale in Sec. 1.1, the “Purpose and Need” section of the Draft PEIS, for altering the recently implemented 2008 RMP Amendments:

The purpose and need for this proposed planning action is to reassess the appropriate mix of allowable uses with respect to oil shale and tar sands leasing and potential development. Specifically, the BLM will consider amending the applicable RMPs to specify whether any areas in Colorado, Utah, and Wyoming currently open for application for future leasing and development of oil shale or tar sands should not be available for such application and leasing development.

Draft PEIS at 1-4. Although BLM description explains in very general terms “what” the agency proposes to do, it does not explain “why”. This vague statement cannot form the legal basis for revising BLM’s existing RMPs.

BLM comes closer to explaining its real reason for upending its newly-minted RMPs in the Introduction section to the Draft PEIS: “As part of the settlement entered into by the United States to resolve the lawsuit and in light of new information that has emerged since the 2008 OSTIS PEIS was prepared, the BLM has decided to take a fresh look at the land allocations analyzed in the 2008 OSTIS PEIS and to consider excluding certain lands from future leasing of oil shale and tar sands resources.” *Id.*, at 1-4. Contrary to BLM’s representations, neither BLM’s settlement agreement nor the alleged discovery of “new information” can establish the purpose and need for BLM’s proposal to dramatically revise its recently adopted RMPs.

#4] > <([#5 [9.1] B. The Purpose and Need Statement Is Inconsistent with the 2005 EPAct

Oil shale deposits in the United States are estimated to contain roughly six trillion barrels of oil in place, with some 2 trillion barrels located in the tri-state region of Utah, Colorado, and Wyoming. Congress declared in Section 369(b) of the Energy Policy Act of 2005 (“2005 EPAct”) that such deposits are “strategically important resources that should be developed to reduce the United States’ growing dependence on politically unstable sources of foreign oil” and mandated that the development of oil shale should occur, with an emphasis on sustainability, to benefit the United States. 42 U.S.C. §15927(b)(1) & (3).

Congress further directed BLM to:

[C]omplete a programmatic environmental impact statement for a commercial leasing program for oil shale and tar sands resources on public lands, with an emphasis on the most geologically prospective lands within each of the States of Colorado, Utah, and Wyoming.

Id., at §15927(d)(1) (emphasis added). Any purpose and need statement for revisions to the RMPs in this tri-state area must implement this congressional directive and offer alternatives that provide for leasing on the “most geologically prospective lands” within those states. The purpose and need statement in the Draft PEIS entirely fails to account for the clear direction Congress gave the agency in 2005 EPAct. Instead, BLM arbitrarily assumes that it may amend the RMPs in any manner it chooses, and without considering the unambiguous congressional directive. Such an approach is arbitrary and capricious and cannot pass muster under the Administrative Procedure Act, 5 U.S.C. §§551-706. See also *Atchison, Topeka & Santa Fe Ry. Co. v. Wichita Bd. of Trade*, 412 U.S. 800, 806 (1973) (agency’s course “must be consistent with its mandate from Congress.”) #5)>

<([#6 [9.I] C. The Purpose and Need Statement Is Inconsistent with the Need for Domestic Production of Unconventional Fuels

The importance of developing America’s oil shale reserves has only increased since the 2005 EPAct was enacted. The global demand for oil that exceeds conventional supplies makes a strong case for development of the U.S.’s oil shale resources. If not quickly addressed, these deteriorating global market conditions, could, and likely will, result in even higher oil prices and reduced availability of oil resources.

The importance of energy-related projects has been recognized in Executive Order 13212, which states that the “increased production and transmission of energy in a safe and environmentally sound manner is essential to the well-being of the American people.” Further, the Executive Order establishes the policy that “agencies shall take appropriate actions, to the extent consistent with applicable law, to expedite projects that will increase the production, transmission, or conservation of energy.” Id. This policy forms the backdrop against which BLM should consider access to oil shale as a key energy resource.

America’s rich and concentrated oil shale resources, if developed in a timely and economically efficient manner, offer the potential to help offset the anticipated global production declines of conventional oil, reduce oil imports and their economic costs, stimulate domestic employment and economic activity, and provide a reliable domestic source of liquid transportation fuels. Oil shale development can also play a vital strategic role in providing the United States military with long-term, secure access to domestic fuels. These fundamental energy policy needs must be incorporated into BLM’s purpose and need statement and must govern BLM’s proposed range of alternatives, and its selection of a preferred alternative. #6)>

<([#7 [9.I] III. BLM IMPROPERLY PREJUDGED PURPOSE AND NEED, IMPERMISSIBLY NARROWED THE RANGE OF ALTERNATIVES, AND VIOLATED FEDERAL LAW BY IMPLEMENTING DOI’S “WILD LANDS” POLICY

A. BLM Improperly Predetermined the Outcome of Its NEPA Analysis

BLM has improperly prejudged the purpose and need for the instant planning effort. On February 15, 2011, BLM entered into two separate settlement agreements with a group of oil shale opponents. Long before the court had ever ruled on plaintiffs’ legal challenge to the 2008 RMP Amendments, and indeed before BLM ever filed an Answer in the case, BLM entered into a gratuitous settlement in which the agency committed to propose a number of substantive changes to the recently-revised

RMPs,² See Exhibit A, 2008 RMP Settlement.

In particular, BLM committed to prepare a new programmatic EIS and to propose at least two action alternatives that reduced the acreage allowable for commercial oil shale leasing. *Id.*, at 1J 2. The first of these required alternatives was the plaintiffs' anti-development alternative that excluded from available leasing and development large geographic areas that corresponded with plaintiffs' anti-development "wish list." See *id.*, at U 2(a). This alternative is being proposed in the Draft PEIS as Alternative 2. See Draft PEIS, at 2-34 to 2-36. The settlement also requires BLM to offer a second anti-development alternative that removes some, but not all, of the lands on plaintiffs' wish list. 2008 RMP Settlement, at 2(b). This alternative corresponds with BLM's alternative 4 in the Draft PEIS. See Draft PEIS, at 2-43 to 2-48.

Not only did BLM commit to propose RMP alternatives that drastically reduce the acreage available for commercial oil shale development, but it also agreed to prepare a purpose and need statement that would allow the agency to select either one of the plaintiffs' anti-development alternatives. Under the settlement, BLM agreed that "the purpose and need statement in the NEPA analysis supporting the RMP amendment process or processes shall be defined in such a manner that it can be met by any and all of the alternatives described in Paragraph 2(a) and 2(b) above [i.e., the two anti-development alternatives championed by plaintiffs]." 2008 RMP Settlement Agreement at U 2 (emphasis added). Curiously, BLM did not commit to construct a purpose and need statement that would also allow BLM to select the current planning regime that is represented by Alternative 1 (no action alternative) in the Draft PEIS. In other words, BLM impermissibly ruled out the no action alternative of leaving the 2008 RMPs in place.

BLM has turned the NEPA process on its head. BLM should have first identified a concrete legal and/or policy rationale that would justify revising its newly established RMP revisions. After identifying and explaining this "purpose and need" for its action, BLM should then have selected and analyzed a range of alternatives that could satisfy this purpose and need. Instead, BLM (1) committed to analyze at least two anti-development alternatives in the context of settling a friendly lawsuit, (2) committed to prepare a purpose and need statement that could be satisfied by the two anti-development alternatives, and then (3) fabricated an unsupported purpose and need statement under the pretense that there were "changed circumstances" that justified revisions to BLM's newly-minted RMPs.

BLM is required to provide the public with a coherent, and legally supportable, reason for why it has elected to revise its RMPs at this time. In contrast, BLM's course to date runs afoul of CEQ's direction that "[a]gencies shall not commit resources prejudicing the selection of alternatives before making a final decision." 40 C.F.R. § 1502.2(f). BLM's commitments in the 2008 RMP Settlement as implemented in the Draft PEIS violate the principle of administrative law that forbids federal agencies from predetermining the final outcome of their environmental analysis. See *Daws v. Mineta*, 302 F. 3d 1104, 1112-23 (10th Cir. 2002) (Court enjoined agency's proposed project which was the product of predetermined environmental analysis); see also *Metcalf v. Daley*, 214 F.3d 1135, 1142-45 (9th Cir. 2000) (invalidating agency's predetermined environmental decision that resulted from contractual commitment to support Indian Tribe's preferred action).

2 While BLM cites the 2008 RMP Settlement as one of the reasons for revisiting the 2008 RMP Amendments, BLM fails to explain why the agency settled the legal challenge to the 2008 RMP Amendments in the first place. In other words, does BLM believe the 2008 RMP Amendments were legally deficient? If so, why? The settlement of a lawsuit in and of itself provides no explanation for why BLM felt compelled to undergo a comprehensive revision to ten RMPs in a three-state area, especially since no commercial oil shale leasing has yet taken place within the geographic area made available for such leasing in the 2008 RMP Amendments.

#7])>

<([#8 [9.2.1] [3.1.3] B. BLM's Analysis Contravenes the Congressional Prohibition on the Implementation of the Department of Interior's Wild Lands Policy

BLM's analytical method of excluding lands with wilderness characteristics from prospective oil shale development is a clear violation of federal law. By way of example, when BLM published its notice of intent to prepare the oil shale PEIS, BLM explained:

Lands that the BLM identifies as having wilderness characteristics will be considered during this planning initiative, as described above, and consistent with Secretarial Order No. 3310, dated Dec. 22, 2010, and BLM's Manuals 6301 and 6302.

76 Fed. Reg. 21003, 21004 (April 14, 2011). Secretarial Order No. 3310 provided:

BLM shall maintain a current inventory of land under its jurisdiction and identify within that inventory lands with wilderness characteristics that are outside of Wilderness Study Areas and that are pending before Congress or units of the National Wilderness Preservation System.

The BLM shall describe such inventoried lands as "Lands With Wilderness Characteristics." share this information with the public, and integrate this information into its land management decisions. All BLM offices shall protect these inventoried wilderness characteristics when undertaking land use planning and when making project-specific decisions

Id. at 2 (emphasis added). From the outset of the current PEIS process, BLM made clear that one of the key reasons for revising its RMPs was to implement Secretary Salazar's "Wild Lands Policy" as articulated in Secretarial Order No. 3310.

However, on April 15, 2011, the President signed into law Pub. Law 112-10, the Department of Defense and Full-Year Continuing Appropriations Act of 2011 ("2011 C.R."). Section 1769 of the 2011 C.R. provided

For the fiscal year ending September 30, 2011. none of the funds made available by this division or any other Act may be used to implement, administer, or enforce Secretarial Order No. 3310 issued by the Secretary of the Interior on December 22, 2010.

Id. (emphasis added). This spending moratorium was continued with subsequent spending bills and remains in force today.

Notwithstanding this clear congressional moratorium, the Draft PEIS sets forth as its preferred alternative an alternative that excludes from future commercial oil shale leasing "[a]ll areas that the BLM has identified or may identify as a result of

inventories conducted during this planning process as LWC [lands with wilderness characteristics].” Draft PEIS, at 2-34. Although BLM in the Draft PEIS no longer cites to the Secretarial Order No. 3310 as the basis for excluding lands with wilderness characteristics, the resulting resource management proposal is unmistakable: BLM is attempting to preclude from future commercial oil shale leasing a broad category of lands based on a management directive (Secretarial Order No. 3310) that BLM is legally barred from implementing, administering, or enforcing.

#8])> 8

<([#9 [9.8] IV. THERE IS NO NEW INFORMATION THAT JUSTIFIES BLM’S PROPOSAL TO DRAMATICALLY REVISE ITS RMPs

BLM also suggests that “new information not available in 2008” justifies a change in the agency’s available acreage for commercial oil shale development. Draft PEIS, 1-4 & 1-5. According to BLM, there are three sources of new information: (1) a 2011 assessment by the U.S. Geological Survey (“USGS”) regarding the oil shale and naphthalene resources in Colorado, Utah, and Wyoming, (2) a 2010 decision by the U.S. Fish and Wildlife Service (“FWS”) concluding that listing the Greater Sage Grouse as threatened under the federal Endangered Species Act was warranted, but precluded by higher priority species, and (3) BLM’s revised inventory of lands with wilderness characteristics in the three-state region. Draft PEIS at 1-5. None of these events justify unraveling the 2008 RMP Amendments.

A. There Is No New Information About the Geologically Prospective Areas for Oil Shale Development That Justifies BLM’s Proposal to Overhaul Its Current RMPs

BLM never explains why the 2011 USGS study justifies a major re-calibration of permissible commercial leasing areas. In fact, the PEIS never cites the study as one of the sources relied on by BLM to ascertain the “most geologically prospective oil shale resources.” See Draft PEIS at 1-10, n. 4 (citing the technical resources used by BLM to ascertain the most prospective oil shale resource areas). Tellingly, not one of the sources relied on by BLM to make its assessment of prospective oil shale areas post-dated the 2008 RMP Amendments. *Id.*

In fact, later in its PEIS, BLM admits that Alternative 1 contains the lands with the most geologically prospective oil shale deposits:

The lands available for lease under the 2008 land use plan amendment would remain available for future leasing consideration under the No-Action Alternative [i.e., Alternative 1]. These public lands comprise the most geologically prospective oil shale and tar sands areas administered by the BLM, including lands that are exempted by statute, regulation, or [Executive Orders]. . .

Draft PEIS at 2-21 (emphasis added). BLM offers no new information that would justify a reduction in the acreage available for commercial oil shale leasing based on a reassessment of which lands contain the most geologically prospective deposits of oil shale.

#9])> <([#10 [9.2.4] B. There is No New Information About the Sage Grouse That Warrants Dramatic Changes the RMPs At This Time

Contrary to BLM’s representations in the Draft PEIS, the 2010 FWS1 decision on the

Greater sage grouse cannot support a substantial restriction of the allowable oil shale lease acreage since the FWS has declined to add the species to the list of federally protected species at this time. 75 Fed. Reg. 13910 (Mar. 23, 2010). While Enefit understands the need to strategically manage the sage grouse in order to protect the species and prevent it from being listed on the federal endangered species list, the fact is that the species is not currently regulated under the Endangered Species Act (“ESA”) and BLM’s effort to eliminate large areas from oil shale leasing at this time is unwarranted and is not supported by accurate scientific data.

1. BLM Cannot Lawfully Designate Sensitive Sage Grouse Habitat at this Time

States such as Utah have not even completed their own processes for determining which areas should be protected as core or priority areas, and indeed, it does not appear that BLM has sufficient data to identify which areas should be protected under the various classifications. BLM even acknowledges that “BLM is currently working with the Utah DWR [Department of Wildlife Resources] to refine the delineation of priority habitats in the State of Utah.” Draft PEIS, at 3-197. This process, which represents a joint planning effort between the Division of Wildlife Resources, the Utah Governor’s office, and a number of other state and federal agencies, is not scheduled to be completed until the summer of 2012—after the close of the comment period for the Draft PEIS.

According to recent press accounts, it is not even clear at this point whether the State of Utah will follow the model adopted by the State of Wyoming where certain areas are designated as “core areas,” within which mineral and other development is restricted to protect known sage grouse populations. According to Bob Budd—the range management specialist who helped develop the Wyoming sage grouse plan and is helping the State of Utah develop its plan—it remains an “open question” whether Utah will follow the “core area” approach. See April 30, 2012 article: “Saving the Sage Grouse,” KUER Local News.³

Moreover, Utah DWR has recognized that rigorous development of new information is needed to explain how sage-grouse survival and productivity are affected by habitat loss or alteration from a variety of factors. Factors unrelated to energy development include hunting mortality, West Nile virus, extreme weather conditions, non-native invasive plants (especially cheatgrass, which dramatically increases wildfire frequency, as well as severity), the proliferation of avian and mammalian predators, and other factors. See DWR, Utah’s Plan for Sage-Grouse and Development (Updated Jan. 24, 2010). The initial surveys have not even identified leks or sage grouse in some of the areas that the Draft PEIS broadly defines as core or priority habitat. As importantly, even after the general sage grouse planning activities are completed, determining the particular risks associated with oil shale development will require further rigorous evaluation even if the planning effort concludes that sage grouse numbers have been observed in or around the project area.

The BLM is also in the early stage of its approach to address sage grouse in the context of the agency’s wider land use planning effort. On December 9, 2011, BLM and the United States Forest Service (“FS”) initiated a scoping process for a series

of EISes in order to assist the agency in “incorporate[ing] consistent objectives and conservation measures for the protection of greater sage-grouse and its habitat into relevant RMPs and LMPs by September 2014 in order to avoid a listing under the Endangered Species Act.” 76 Fed. Reg. 77008, 09. This wide-ranging NEPA process, which is part of BLM’s overall sage grouse conservation program, has only just begun and will not be completed until September of 2014.

As significantly, the BLM and FS have committed to “coordinate and communicate with State, local, and tribal governments to ensure that the BLM and FS consider provisions of pertinent plans, seek to resolve inconsistencies between State, local, and tribal plans, and provide ample opportunities for State, local, and tribal governments to comment on the development of amendments or revisions.” *Id.*, at 77011. BLM’s stated commitment to collaboration and cooperation with State, local, and tribal governments in the larger sage grouse planning effort stands in stark contrast to BLM’s actions in the Draft PEIS where BLM is proposing to exclude significant areas from future oil shale leasing before the State of Utah has even completed its own planning effort, and without any apparent coordination with the county governments.

In sum, it is impossible for BLM to know at this point either (a) what areas the State of Utah will designate as core or priority habitat for sage grouse (or even whether Utah will follow the core/priority framework)⁴ (b) how local BLM field offices will implement those state designations as they impact BLM lands subject to BLM’s multiple use mandate under the Federal Land Policy and Management Act (“FLPMA”), 43 U.S.C. §§ 1701-1787.

BLM improperly discusses the sage grouse core and priority areas in the Draft PEIS as if these areas were already established, and implemented, by the BLM and the State of Utah. For example, BLM states:

Although the current oil shale RD&D lease areas are excluded from greater sage-grouse core and priority habitats, a portion of the Enefit PRLA in Utah occurs within greater sage-grouse priority habitat (approximately 2.338 acres).

Draft PEIS, at 6-140 (emphasis added); see a/so Figure 6.1.3-5 (showing roughly half of Enefit’s PRLA as covered by priority sage grouse habitat). Given its stated intent to work with the State of Utah to cooperatively manage sensitive sage grouse habitat, BLM cannot know what areas will be designated as core or priority sage grouse habitat at this stage in the process. BLM should wait for Utah to complete its sage grouse conservation process (a process which involves the participation of both the BLM and the U.S. Fish and Wildlife Service) before jumping to conclusions about the location of sensitive sage grouse habitat in the context of BLM’s resource management plan revisions for oil shale.

Moreover, even if these new designated sage grouse habitat withdrawal areas do not prevent Enefit from developing its existing RD&D areas (including the preference right lease area), they nonetheless create unnecessary uncertainty around Enefit’s existing lease and PRLA. The “one size fits all” approach also fails to give the local BLM field offices the discretion to weigh the potential impacts of site specific plans in the context of reviewing particular oil shale development proposals. BLM’s 2008 PEIS and ROD understood this need for field office flexibility and provided an

adaptive management process whereby the impacts to sensitive resources such as sage grouse habitat could be addressed at the time when BLM was revising a concrete development plan. BLM itself acknowledges that it will likely have to undergo at least two more NEPA analyses before any commercial development proposals are approved: one before approving any specific commercial lease, and another before commercial oil shale development operations are approved. The local BLM field office is best suited to assess the risks of a particular leasing or development proposal on sensitive sage grouse areas at the time when those impacts are better identified and understood.

Any reliance on purported “new information” concerning the sage grouse to withdraw or impose restrictions on lands suitable for oil shale development is premature, arbitrary and capricious, and would constitute an abuse of BLM’s discretion. 5 U.S.C. § 706. So too, BLM’s proposal to exclude sage grouse habitat areas based on speculation runs afoul of CEQ’s regulatory mandate that “[a]gencies shall insure the professional integrity, including scientific integrity, of the discussions and analysis in environmental impact statements.” 40 C.F.R. § 1502.24.

ng.the.Satze.Grouse. (Last visited April 30, 2012).

4 The Draft PEIS in many places appears to use the terms “core” and “priority” areas interchangeably.

However, this only adds to the confusion about the current state of the various federal and state sage

grouse planning efforts. For example, the BLM has recently discussed sage grouse conservation efforts in terms of “priority” and “general”¹ areas, whereas states such as Wyoming have developed

state-conservation strategies using “core areas.” Cp. BLM Instruction Memorandum No. 2012-044,

BLM National Greater Sage-Grouse Land Use Planning Strategy, December 27, 2011 (available at

http://www.blm.gov/wo/st/en/info/regulations/Instruction_Memos_and_Bulletins/national_instruction

/2012/1M_2012-044.html) with Wyoming Governor Mead’s June 2, 2011 Executive Order 2011-5,

Greater Sage Grouse Core Area Protection, (available at

http://gf.state.wy.us/web2011/Departments/Wildlife/pdfs/SAGEGROUSE_EO_COREPROTECTION

0000651 .pdf). BLM has an obligation to clearly define the terms it uses, and the context for those

terms, when proposing wide-ranging revisions to its resource management plans. **#10)>**

12

<(**#11** [9.2.4] 2. BLM’s Current RMPs Have Already Addressed Sage Grouse

BLM’s “new information” justification ignores the fact that BLM already considered the potential of oil shale leasing on sage grouse under its existing RMPs and made

clear that further plan amendments may be appropriate at the commercial leasing stage (as opposed to the present land use allocation stage). In fact, BLM itself acknowledges that Alternative 1 and 4 provide for the flexibility to address specific sage grouse areas at the commercial leasing stage once more information becomes known:

Depending on what the applicable RMP provides with respect to LWC [lands with wilderness characteristics] and core and priority sagegrouse habitat, it may be necessary to initiate a plan amendment at the leasing and/or development stage to make allocation decisions on an individual RMP basis regarding management of these lands with respect to oil shale and tar sands resources. The reason for qualifying the amount of acreage available for lease under this alternative is that while areas of core and priority sage grouse and areas of LWC are left open for potential future leasing and development of oil shale and tar sands resource, the likelihood of all this acreage as being available for further oil shale and tar sands resources leasing and development is low. National and state-specific guidance related to sage-grouse management and protection of core and priority habitat will likely result in substantially less acreage being available, as will field office management decisions related to the protection of LWC.

Draft PEIS, at 2-48, 2-52 (emphasis added). Thus, BLM's current RMPs (represented as Alternative 1 in the Draft PEIS) already provide a mechanism to address protection of key sage grouse habitat areas once that information becomes known., and as a process for protecting that habitat has been established through a cooperative federal-state process.

BLM further explains the rationale for waiting until the leasing or development stages to make RMP modifications related to sage grouse habitat areas:

It is difficult to establish disturbance amounts at the programmatic level, before more is known regarding the specifics of leasehold location and technology to be used. Tables 2.3.3-4 and 2.3.4-5 show what this might look like under different protective scenarios. The scenarios are only provided to illustrate this idea, but the decisions to protect these amounts are not being made at this time as part of this land use plan amendment initiative. These decisions would be made at the field office level as part of the NEPA and/or planning analyses completed for leasing and site specific development.

Id., at 2-52. BLM admits that (1) lands available under the existing RMPs may need to be modified in the future to account for lands that are later identified as sensitive Sage Grouse habitat, but (2) those decisions are difficult to make at the land use allocation stage before the agency knows the specific needs of the species in each geographic areas and before knowing the particular oil shale technology may be used at that location. Far from being "new information," the need to manage sensitive Sage Grouse habitat was known in 2008 when BLM established the existing RMPs. At that time, BLM incorporated an adaptive management strategy into the existing planning process to strategically protect sensitive habitat once it was

identified. That approach was, and is, the most sensible approach to minimizing the impact of oil shale development on sensitive sage grouse habitat. #11)>

<(#12 [3.1.3] C. There is No New Information About Wilderness Characteristics That Justifies Re-Upending Current RMPs

Contrary to BLM's assertions in the Draft PEIS, there is no new information about areas with wilderness characteristics that justify revisions the RMPs. As BLM properly recognized, the current RMPs already protect those lands of known environmental sensitivity that BLM has concluded should be protected under existing law:

[T]he BLM has determined that certain lands within the most geologically prospective oil shale resource areas must be excluded from commercial leasing, under all alternatives, to comply with existing laws and regulations As a result, commercial leasing is excluded from all designated Wilderness Areas, WSAs, and other areas that are part of the NLCS lands administered by the BLM (e.g., National Monuments, NCAs, WSRs, National Historic Landmarks, and National Historic and Scenic Trails), existing ACECs that are currently closed to mineral development, and lands within incorporated town and city limits.

Draft PEIS, at 2-30. Even under the status quo, sizeable portions of lands that are geologically promising for oil shale development have been excluded from available development due to the need to preserve known areas of environmental sensitivity. Unlike Alternatives 2 and 3, however, the current RMPs do not unnecessarily restrict development on lands where mineral development is not precluded under current law, and for which other means might be used to protect potentially sensitive resources at the oil shale leasing and development stages.

Moreover, the current RMPs empower individual BLM field offices to address particular lands with wilderness characteristics on a site-specific basis at the appropriate stage in the leasing process:

fThe decision as to how to manage LWCs [lands with wilderness characteristics] was left to the discretion of the individual BLM field offices, which would determine the management of such areas through additional planning and NEPA processes. . . .

Draft PEIS at 2-21 (emphasis added). BLM acknowledges that specific resource concerns may be addressed through future planning and environmental review processes. This is the only approach that makes sense when so much is unknown about the nature and impact of specific oil shale development technologies on particular areas that potentially contain wilderness characteristics.

#12)> <(#13 [9.6] V. BLM MUST CLARIFY THE LEGAL RIGHTS OF EXISTING RD&D LESSEES

Throughout the Draft PEIS, BLM represents that the existing RD&D leases will be governed by their lease terms and will not be subject to BLM's proposed land use allocations. For example, BLM explains:

The scope and analysis for this PEIS does not include review of the decisions by the Secretary of the Interior to issue RD&D leases

described in Section 1.4.1. Those leases authorize activities on six 160-acre parcels located in Colorado and Utah (see Figure 2.3.2 of this PEIS) and also identify conditions under which commercial development could occur on 4,970 acres of preference right lease areas (PRLAs) included in the leases. A total of 30,720 acres may be developed under the terms of these leases. . . . The RD&D leases are prior existing rights and are not the subject of decisions within the PEIS, with the exception that all alternatives address the subsequent availability of the lands contained in these leases should the initial leaseholder relinquish the existing leases.

Draft PEIS at 1-12 (emphasis added). Similar representations about the status of the RD&D leases are found throughout the Draft PEIS. See, e.g., *id.*, at 1-17 (“These RD&D leases and the conversion right to commercial operations on preference acreage represent a prior existing right that may be exercised upon compliance with the terms of the lease.”) (emphasis added); *Id.*, at 2-30 (“In all three allocation alternatives, the BLM recognized that the six existing RD&D leases contain terms and conditions that could allow commercial development of the original leases and associated PRLAs totaling 30,720 acres.”). BLM’s representations fail to clarify the status of the existing RD&D leases.

#13])> <(#14 [9.6] A. BLM Must Commit to Honor All RD&D Lease Terms

BLM needs to revise the Draft PEIS to specify which provisions BLM considers to be included in the “terms of the lease” for each of the RD&D leases. For example, in section 1.4.1—the section which specifically addresses the relationship of the proposed action to the existing RD&D leases—lists a series of “terms” according to which BLM offered the RD&D leases in its initial Federal Register solicitation. Draft PEIS at 1-16. In chapter 2, BLM states that “a summary of the key lease terms and conditions regarding the PRLAs is provided in Section 1.4.1.” Draft PEIS at 2-30. However, nowhere in the Draft PEIS does BLM list the actual terms and conditions from the RD&D leases themselves, nor does BLM mention whether it intends to honor all these terms and conditions.

In particular, the Draft PEIS fails to disclose whether BLM intends to honor all the terms and conditions of the June 27, 2007 RD&D lease that BLM issued to Enefit’s predecessor in interest, Oil Shale Exploration Company, L.L.C. See BLM Lease No. UTU-84087 (“Enefit RD&D lease”). Enefit’s RD&D lease includes an Addendum No. 1 (“Lease Addendum”) that was executed and added to the lease in January 2009. Among the terms of the lease addendum is a provision that allows Enefit to elect to have the conversion of its RD&D lease governed by BLM’s 2008 OS Rule “in lieu of any subsequent regulation or amendments to regulations in effect” at the time Enefit desires to make the lease conversion. Lease Addendum, Sec. 2(a).

The elective conversion option in the Lease Addendum is of considerable importance to Enefit since it provides Enefit with contractual certainty that its commercial development plans will be governed by an established regulatory framework rather than a new regulatory regime that is presently unknown and which may include provisions that undermine Enefit’s investment-backed development expectations. In short, Enefit is entitled to know whether BLM intends to honor its contract. To that end, BLM should include a clear and concise statement about the

legal rights of the existing RD&D lessees. This statement must contain an unambiguous confirmation that the BLM intends to honor all of the terms in the existing RD& #14)> D leases, including the terms and conditions contained in the Lease Addendum.

<([#15 [3.15] B. BLM NEEDS TO REVISE MAPS TO DEPICT APPROPRIATE DEVELOPMENT AREAS FOR RD&D LEASES

BLM should revise its maps to make clear that even under Alternative 2, the RD&D lessees are entitled to convert their RD&D leases into commercial leases. For example, although BLM acknowledges Enefit’s right to develop its RD&D lease according to the terms of its existing RD&D lease, (Draft PEIS at 2-30), these areas are not reflected correctly on the relevant map depicting Alternative 2’s coverage in Utah at page 2-41 of the PEIS. This map should be corrected to make clear that Enefit’s PRLA is exempt from any of the new development restrictions included in Alternative 2.

BLM needs to provide one consolidated map that clearly depicts both (1) the existing RD&D leases and PRLAs, and (2) the specific areas which BLM proposes to exclude from development by resource type (e.g., sage grouse habitat, lands with wilderness characteristics, waters with wild & scenic river characteristics, etc.). BLM’s current maps that show the lands that are excluded from leasing under Alternative 2 do not identify the existing RD&D leases or PRLAs. See, e.g, Figure 2.3.3-2, Draft PEIS at 2-38 (showing lands withdrawn from leasing under Alternative 2, but failing to identify exiting RD&D lease areas). BLM also needs to clarify, both in the text of the Final PEIS and in associated maps, the precise relationship between any new development restrictions under Alternative 2 and the existing RD&D lessees’ PRLAs.

#15)> <([#16 [2] VI. ALTERNATIVE 2 MIRRORS AN ALTERNATIVE THAT BLM HAS ALREADY REJECTED5

In contrast to Alternative 1, each of the action alternatives in the Draft PEIS unnecessarily restricts lands that would be available for future commercial oil shale leasing based on arbitrary land use policy judgments and speculation about future resource impacts that are presently unknown and unknowable.⁶ None of these alternatives satisfies the Congressional directive in the 2005 EPAct that oil shale and tar sands are “strategically important domestic resources that should be developed to reduce the growing dependence of the United States on politically and economically unstable sources of foreign oil imports.” 42 U.S.C. § 15927(b).

5 Unless specified, Enefit’s discussion of “Alternative 2” applies to both oil shale sub-alternatives:

Alternative 2(a) and 2(b). Both sub-alternatives would drastically reduce the acreage available for commercial oil shale leasing, while Alternative 2(b) suffers from the additional defects as discussed in Section VII below.

6 While Enefit focuses most of its discussion on Alternative 2 since that is the alternative BLM has put forward as its preferred alternative, Enefit also opposes alternatives 3 and 4 of the Draft PEIS.

Alternative 4 contains some, and Alternative 3 contains all, of the Alternative 2's infirmities identified in this section. Alternative 3 flaunts the clear direction of Congress to establish a commercial oil shale leasing program since it would limit leasing to the existing RD&D leases. Alternative 4, for its part, would prematurely and unnecessarily restrict the acreage that is available for commercial oil shale leasing.

#16])> <([#17 [2.2] [9.2.3] A. Alternative 2 Fails to Satisfy the Congressional Mandate to Make the Most Geologically Prospective Areas Available for Commercial Leasing

Alternative 2, which is essentially a restatement of Alternative C from the 2008 Oil Shale and Tar Sands PEIS, would designate only 461,965 acres for application for commercial oil shale leasing, with only 252,181 acres available for commercial leasing in Utah. See Table 2.3.2-2; Draft PEIS, at 2-27. This represents more than a 75% reduction in available leasing acreage from the status quo. Id. (Alternative 1 makes 2,017,741 acres available for application for commercial leasing overall, and 670,558 acres in Utah). See also id., at 6-67 (describing reduction in available leasing acreage under Alternative 2). As such, Alternative 2 is essentially a nondevelopment alternative that would make sustainable commercial oil shale leasing extremely difficult.

Alternative 2 is inconsistent with the Congressional mandate of the 2005 EPAct. BLM itself admitted this fact in 2008 when it rejected an alternative (Alternative C) that largely mirrors the current Alternative 2:

Alternative C was not selected as the Proposed Plan amendment because the alternative would not make "the most geologically prospective lands in Colorado, Utah, and Wyoming" as available for application for leasing. Thus it is not fully consistent with the mandate of the Energy Policy Act of 2005. Much of the most geologically prospective acreage would be excluded under Alternative C; in particular areas which are in close proximity to three of the six RD&D leases would be excluded.

2008 OS ROD, at 22 (emphasis added). BLM properly rejected this alternative in 2008 because it was not consistent with Congress' mandate to BLM, and BLM has provided no justification for ignoring Congress' mandate in the Draft PEIS.

By ignoring Congress' mandate and dramatically reducing the surface acreage available for commercial leasing, Alternative 2 would result in correspondingly severe reduction in the potential recovery of the underlying oil shale resource. By way of illustration, Mr. Michael Vanden Berg, Project Geologist with the Utah Geological Survey, estimates that Alternative 2 would result in a 63% reduction in the recoverable oil shale resource from the No Action Alternative (69 billion barrels to 25.7 billion barrels of in place oil). See Exhibit B, April 18, 2012 Memorandum from Michael Vanden Berg: Oil shale resource on U.S. BLM land proposed for leasing in Utah under 2012 PEIS Alternative 2b.

Mr. Vanden Berg also estimates that Alternative 2(b) would result in a 53.5%

reduction of recoverable oil shale resource on Enefit's RD&D preference lease (848.4 million barrels to 394.8 million barrels) from the No Action Alternative based on surface development constraints outlined in the Draft PEIS. See Exhibit C, April 18, 2012 Memorandum from Michael Vanden Berg: Oil resource (at 25 gpt) on Enefit American Oil's preferential BLM RD&D lease. While the Draft PEIS represents that Enefit's right to develop its existing RD&D lease will be governed by the terms of the RD&D lease rather than the proposed revisions the RMPs, (Draft PEIS at 1-12)7, Mr. Vanden Berg's resource estimates illustrate the highly deleterious character of the BLM's preferred alternative (Alternative 2(b)) in the Draft PEIS.

1 See Section V above. #17)>

<([#18 [2.2] B. Alternative 2 Undermines Commercial Development by Relegating Commercial Oil Shale Leasing to Fragmented Lease Parcels

Alternative 2 would limit commercial oil shale leasing and development to small, noncontiguous parcels. To illustrate, Alternative 2 drastically reduces the amount of acreage available for oil shale development in Utah from 670,358 acres in Alternative 1 to 252,181 acres in Alternative 2. Table 2.3.2-2; Draft PEIS at 2-27. The area made available for leasing under Alternative 2 is insufficient to justify commercial oil shale development.

To take oil shale technology to the level of a commercial facility requires access to a relatively consolidated area of land so that power inputs, surface equipment, pipelines, roads, and other facilities can be located efficiently. Alternative 2 provides little contiguous acreage deemed suitable for oil shale leasing. Given the reduction of available surface area and available resources, Alternative 2 is overly restrictive and unnecessarily confines potential oil shale development opportunities.

This "fragmentation" is another reason BUM rejected a comparable alternative during its last round of RMP revisions:

[Alternative C1 unreasonably fragments the area that would be available for application, resulting in parcels that are unlikely to be explored, leased, or developed. This could be an impediment to sound and rational development of the resource and can reduce the economic return to the public. If oil shale resources are by-passed because of the exclusions of Alternative C, that could also limit the benefits to the nation from exploitation of a domestic unconventional energy source. 2008 OS ROD, at 22 (emphasis added).

Further, the total area that will actually be developed will likely be even smaller and more fragmented than the area potentially available for leasing under the current Alternative 2 because regulatory and land management factors that will reduce the acreage will be applied in the future. For example, the pre-leasing NEPA process will provide BLM an opportunity to exclude areas that are environmentally sensitive and cannot be reasonably mitigated to protect resource values. In addition, areas may be restricted (even after leasing) by Endangered Species Act ("ESA") requirements, National Historic Preservation Act requirements, and the effect of various BLM stipulations.

The consideration and analysis of effects of post-leasing factors, like those on public

lands available for natural gas, is illustrative. See National Petroleum Council, *Balancing Natural Gas Policy*, Vol. IV, p. 6-7 (2003) (finding that 17 percent of areas open to natural gas leasing in the Uintah-Piceance Basin were, nevertheless, undevelopable because they were subject to “prohibitive conditions of approval”). Thus, a significant percentage of acreage that is actually leased may never be developed.

It is reasonable to assume that commercial project economics must be based on large-scale operations to support the initial development of project infrastructure. Section 369 of the 2005 EPA Act recognizes this fact since it defined an oil shale lease as up to 5,760 acres. In general, Alternative 2 would allow development on generally small, fragmented parcels that are unlikely to be explored or developed because of the impracticality of operating in noncontiguous areas.

Finally, there are a variety of business factors that, as a practical matter, restrict the acreage that would be developed. Once a company acquires a lease, it must learn more about the tract’s environmental factors, subsurface geology and hydrology. Different oil shale recovery technologies may operate better in one type of geology than in another, and in-depth analysis may reveal that there are geologic or hydrologic factors that affect the choice of technology, which may also modify proposed project plans. There may be economic or environmental benefits to locating facilities in one location rather than another, which could at least affect the sequence in which areas would be developed, as well as the siting of facilities or the proposed project plot plan. These, and other factors, will tend to restrict the amount of development that actually occurs, even if a large amount of land is potentially available as under Alternative 1.

#18])> <([#19 [8] C. Alternative 2 Impermissibly Restricts BLM’s Discretion to Manage Lands According to FLPMA’s Multiple Use Mandate

Alternative 2 appears to be defined by a premise that oil shale cannot be developed in a multiple land-use scenario. Alternative 2 automatically excludes major portions of federal lands at a very early stage without considering whether BLM can accommodate multiple use development at a future time. Because an additional site-specific NEPA analysis will be conducted before any commercial leases are issued, and a second site-specific NEPA analysis will be completed before BLM approves any commercial plan of development, BLM may decide on a case-by-case basis at a later stage whether an area should be open to commercial leasing and development and, if so, which protective measures and restrictions should be instituted to protect sensitive areas.

BLM specifically considered, and rejected, a comparable and overly restrictive alternative as incompatible with its multiple use mandate under FLPMA:

Selection of alternative C precipitously limits or restricts the decisionmaker’s discretion to balance oil shale use and the protection of resources or resource values, in accordance with FLPMA’s principal of ‘multiple use.’ . . . It would be premature to eliminate areas prior to site-specific analysis based on factors that are not known now, but that would be known at the leasing or operation permitting stages, such as location, timing and type of oil shale technology, that may show that these resources could be adequately protected through mitigation.

2008 OS ROD, at 22 (emphasis added). These reasons apply with equal force to Alternative 2 in the Draft PEIS.

Likewise, Alternative 2 fails to recognize the role of adaptive management in protecting sensitive resources at the appropriate stage in the oil shale leasing and development process. Section 202(c) of FLPMA, 43 U.S.C. § 1712, provides that BLM should use a multiple-use approach in its land use plans. This means that BLM must grapple with how to balance its many important surface resources with providing the energy America needs. Here, a massive oil shale resource—the largest in the world—is found in a relatively small area, and this nationally important resource should be given significant weight.

Adaptive management can and should be used to guide BLM’s commercial oil shale program. The commercial leasing process envisioned in the Draft PEIS would require environmental analysis at the pre-leasing stage and at the plan-of-development stage. Both of these stages would precede any significant land-disturbing activities and, thus, provide an opportunity to evaluate environmental protection measures based on information then available to BLM. The technology for efficiently producing oil shale is likely to progress over time, and the body of knowledge concerning oil shale production impacts will increase as well. As new information becomes available, BLM will have an increasingly clear basis for making decisions that are currently veiled by uncertainty.

This adaptive management-based leasing process provides a clear basis for making Alternative 1 the most desirable alternative. Alternative 1 allows the broadest range for future decision-making and potential resource development. Nevertheless, it fully protects environmental resources because no resources can be disturbed without further environmental analysis and administrative action. Alternative 2, in contrast, inappropriately prejudices whether vast tracts containing vast energy resources are suitable without any site-specific analysis. #19]>

<([#20 [1.5] VII. Alternative 2(b) Would Undermine Commercial Oil Shale Development BLM’s has selected Alternative 2(b) as its preferred alternative for commercial oil shale leasing. Draft PEIS at 2-76. This alternative combines Alternative 2(a), which drastically reduces the acreage currently available for commercial oil shale leasing BLM’s existing RMP regime, with a “RD&D First” requirement. Under the RD&D First requirement, BLM could issue a commercial oil shale lease only after an applicant (1) applied for and obtained an RD&D lease, and (2) satisfied the conditions of its RD&D lease, including the requirements related to converting that lease to a commercial lease. Draft PEIS at 2-35. This alternative would undermine commercial oil shale leasing and development.

A. The Draft PEIS Fails to Properly Analyze Alternative 2(b)

Although BLM selects Alternative 2(b) as its preferred alternative, the agency offers almost no analysis of this alternative. BLM simply asserts: “As the Draft PEIS was being developed, the idea for this alternative emerged. It is presented here in brief. This alternative is not noted elsewhere in the document but will be developed further in preparation of the Final PEIS.” Draft PEIS at 2-35. BLM admits that it is proposing to select an alternative that the agency itself has not thought through and for which the stakeholders have received very little information. This approach is

fraught with problems.⁸

BLM is legally obligated to provide the public with an opportunity to review and comment on any material change to the current oil shale leasing regime. The agency has not done so. Given the systemic problems with Alternative 2(b), BLM should abandon it as the preferred alternative in the final PEIS. If, however, BLM persists in pursuing this alternative in the final PEIS, the agency must provide the public another opportunity to review and comment on this approach once the details are known and revealed, and before the agency amends the affected RMPs.

B. BLM Misrepresents How and Why the Agency Decided to

Consider Alternative 2(b)

BLM's claim that the idea for this alternative emerged "as the Draft PEIS was being developed" is disingenuous. In fact, BLM committed to propose to amend its oil shale commercial leasing regulations in a manner that would only allow BLM to issue a commercial lease (1) as part of a conversion of an RD&D lease, or (2) after BLM issues a call for expression of leasing interest. 2008 Rule Settlement, at fl 3(c). Contrary to BLM's representations, the RD&D First proposal was not a recently discovered development option, but is rather an alternative that BLM has known about, and contractually committed to pursue, for over a year. BLM has an obligation to disclose to the public the true reason the agency has selected Alternative 2(b) as its preferred alternative.

⁸ Enefit focuses its discussion in this letter on Alternative 2(b) because BLM has identified this as the

agency's preferred alternative. However, because Alternative 4(b) suffers from the same infirmities

as those discussed in this section, Enefit also opposes Alternative 4(b).

#20] > <([#21 [9.6] C. BLM Fails to Explain How Alternative 2(b) Would Impact a Company That Has Already Demonstrated The Ability to Commercially Develop Oil Shale

BLM fails to explain how the RD&D first alternative would be applied to a company which has already demonstrated the ability to proceed to commercial oil shale development. This approach would be highly prejudicial to a company like Enefit which has a long and demonstrated history of developing oil shale on a commercial scale outside the United States. It would also unfairly penalize existing RD&D lessees which are able to demonstrate commercial development of oil shale resources.

BLM must address how this alternative would impact three different development scenarios: (1) where a company successfully demonstrates commercial oil shale development technology on an existing federal RD&D lease, (2) where a company successfully develops commercial oil shale development technology on private or state lands in the United States, and (3) where a company has demonstrated the ability to commercially develop oil shale in other parts of the world.

For example, would a company such as Enefit be permitted to apply for a new commercial lease once it converts its existing RD&D lease to commercial production, or would Enefit be required to apply for yet another RD&D lease if it wanted to acquire additional lease acreage over and above its current preference right lease

acreage?

Similarly, would Enefit be allowed to apply for a commercial lease based on a successful oil shale project located on private lands in Utah or elsewhere in the United States? Finally, will a company like Enefit with a long history of successful oil shale development projects in other countries such as Estonia and Jordan be allowed to apply for a commercial oil shale lease on BLM lands without first going through the RD&D process on BLM lands? Enefit and the other stakeholders are entitled to answers for each of these threshold questions.

Enefit has been working diligently toward developing the RD&D lease that its predecessor-in-interest acquired in 2007. As a company with a demonstrated ability to produce oil from oil shale on a commercial scale, Enefit stands ready and able to help America meet its domestic energy needs. Any proposal that requires Enefit to obtain and prove up yet another RD&D lease even after it has demonstrated its commercial development technology through its existing RD&D lease or activities on private lands would stifle commercial oil shale production and undermine Congress' direction to BLM to establish sustainable domestic oil shale program. See EPA Act, 42 U.S.C. §16927(b)(3).

#21)> <(#22 [1.1.1] [10.3] VIM. BLM MUST PROVIDE STAKEHOLDERS AN OPPORTUNITY TO

RESPOND TO PROPOSED RMP REVISIONS AND REGULATORY CHANGES IN A COORDINATED AND INFORMED MANNER

BLM has indicated that the public comment period for the Draft PEIS will end on May 4, 2012.⁹ Although BLM mentioned in passing that it “will be proposing some amendments to [the 2008 OS Rule] in a separate rulemaking proceeding,” Draft PEIS at 2-7, BLM does not disclose (a) when it plans to issue the draft revised commercial oil shale leasing regulation, (b) what changes those draft regulations might contain, or (3) how any such changes might impact prospective commercial oil shale developers, including existing RD&D lessees. Instead, BLM discounts the impact of regulatory changes on the RMP amendment process:

While the BLM is in the process of considering amendments to this [2008 OS Rule], this PEIS does not depend on any particular provision of the rule but anticipates that decisions regarding leasing and approval of plans of development will be informed by appropriate analysis documents as required by NEPA and other applicable authorities.

Draft PEIS at 2-33. BLM's approach of asking the public to analyze and comment on the proposed changes to the RMP Amendments with no knowledge of the changes BLM plans to propose to the commercial leasing regulation is not only bad policy, but it places Enefit and the other stakeholders in the impossible position of trying to speculate on BLM's proposed regulatory changes when they are commenting on BLM's RMP revisions.

BLM's staggered approach is even more troubling in light of commitments BLM has made in its settlement agreement involving the 2008 Rule. See Exhibit D, 2008 Rule Settlement. As part of this settlement agreement between BLM and a consortium of oil shale opponents, BLM committed to “publish a notice of proposed rulemaking (“NPR”) in which BLM will propose amendments to the [2008 OS Regulation] to address the royalty rate and environmental protection requirements applicable to oil

shale commercial leasing.” BLM has committed to publish its notice of proposed rulemaking by May 15, 2012 (fifteen months after the settlement agreement was executed) and to publish a final regulation by November 18, 2012. See 2008 Rule Settlement, at ffl 1, 5. Under the current schedule, BLM must publish its proposal to amend the commercial oil shale regulation within two weeks following the close of the comment period for the Draft PEIS.

This approach makes no sense from a public policy or legal standpoint and appears to be designed to keep the public and existing oil shale lessees in the dark about material changes to the regulatory structure for commercial leasing at the same time those parties are expected to review and comment on BLM’s proposed RMP Amendments. While BLM mentions the 2008 Rule Settlement in the Draft PEIS, (e.g., Draft PEIS at 2-16), the agency does not alert the public to key commitments BLM made in that agreement. For example, BLM committed in the settlement agreement to (a) remove the current royalty rate for oil shale production, (b) change the conditions under which a RD&D lease may be converted to a commercial lease, and (c) amend the standard used by BLM for approving a commercial lessee’s plan of development. See 2008 Rule Settlement, at ffl 2-4. These changes—the specifics of which will not be known until BLM publishes its rulemaking proposal—could radically alter the regulatory landscape for domestic oil shale production. For example, BLM’s current regulations currently set the royalty rate at 5% on products from oil shale for the first five years of commercial production. This rate will increase by 1% per year starting with the sixth year of commercial production until it reaches a maximum royalty rate of 12.5%. 43 C.F.R. § 3903.52 (b). Given the substantial capital investment required for a lessee to get to the commercial oil shale development stage, an increase in this royalty rate could well make commercial oil shale development uneconomical on federal lands in the United States. Other changes contemplated under the settlement could also undermine the viability of domestic oil shale production, and yet BLM has not even disclosed these proposed changes. BLM should extend the public comment period for the Draft PEIS by a minimum of 90 days to allow Enefit and other stakeholders to respond to all of BLM’s changes to its oil shale program in an informed and coordinated fashion.

9 See BLM Issues Draft Programmatic Environmental Impact Statement for Oil Shale and Tar Sands, available at http://www.blm.gov/wo/st/en/intb/newsroom/2QI2/februarv/NR_02_03_2012.html. There seems to be some disagreement between BLM and the Environmental Protection Agency on exactly when the comment period ends. In its February 3, 2012 Notice of Availability (“NOA”) of the Draft PEIS, EPA indicated that the comment period closes on May 2, 2012- 90 days after the official publication of EPA’s NOA. See 77 Fed. Reg. 5513 (Feb. 3, 2012), available at <http://www.gDo.gov/fdsvs/pkg/FR-2012-02-03/pdf/2012-2435.pdf>.

#22])> <([#23 [3.1.7] IX. BLM SHOULD CLARIFY THAT EVACUATION CREEK DOES NOT

CONTAIN WILD AND SCENIC RIVER CHARACTERISTICS

The Draft PEIS reflects confusion about the status of Evacuation Creek and its

impact on Enefit's right to develop its existing RD&D lease. The Final PEIS should be revised to clarify two key features of this intermittent stream. First, under the terms of its RD&D lease, Enefit is permitted to develop lands adjacent to Evacuation Creek subject to existing lease stipulations. BLM recognized this fact in its 2008 OS ROD:

Under the terms of the existing RD&D leases, the Federal government has a commitment to grant the RD&D leases [] for commercial development within the original 160-acre lease, as well as its PRLA, provided the terms and conditions of the leases are met. As a result, all lands within the PRLAs would be available for issuance of commercial leases to the current RD&D lessees, subject to lease requirements.

2008 OS ROD, at 16. Thus, regardless of whether portions of Evacuation Creek are determined to contain potentially eligible wild and scenic river characteristics, Enefit's ability to develop areas in and around Evacuation Creek will be governed by the terms of Enefit's lease instead of either the 2008 RMP Amendments or any subsequent RMP revisions.

Second, the Draft PEIS mischaracterizes the current state of Evacuation Creek. By way of example, BLM suggests that:

For Alternative 3, as is the case for Alternative 1, for the Enefit RD&D project in Utah, the same portion of the area that is not identified as available for lease also is not available for application for commercial leasing under Alternative 3 because of the presence of a potentially eligible WSR, Evacuation Creek (see discussion of this in Section 2.3.3.1).¹⁰

Draft PEIS, at 2-43. See a/so Figure 6.1.3-6, Draft PEIS, at 6-160 (mistakenly identifying Evacuation Creek as a Wild and Scenic River). This is not accurate. Although the 2008 RMP PEIS had identified portions of Evacuation Creek as potentially eligible for WSR designations, the BLM Vernal field office subsequently concluded that these segments were not eligible. See 2008 OS ROD, at 16 ("Subsequent to the publication of the PRMP/FEIS, the 2008 Vernal Field Office ROD determined that the river segments of Evacuation Creek were not eligible for inclusion."). BLM should clarify in the Final PEIS that Evacuation Creek is no longer eligible for designation as a WSR and revise its maps in the Final PEIS accordingly.

¹⁰ Notwithstanding BLM's representation, the Draft PEIS provides no discussion of Evacuation Creek in Section 2.3.3.1.

#23]> <([#24 [6.3] X. APPENDIX A SHOULD BE REVISED TO DESCRIBE DEVELOPMENTS IN ENEFIT'S RD&D PLAN AND SELECTED TECHNOLOGY

Appendix A of the Draft PEIS provides a summary of the various oil shale technologies that are proposed for the existing RD&D leases. BLM's description of Enefit's technology as explained on pages A-75 to A-83, should be revised to incorporate the following summary of Enefit's RD&D technology.

Enefit American Oil (EAO) is a wholly owned subsidiary of Enefit (known as Eesti

Energia for activities in Estonia). The Utah project was previously owned and operated by Oil Shale Exploration Company (OSEC). In March 2011, Enefit acquired 100 percent of OSEC's shares and assumed full ownership and control of the project and all of OSEC's assets. Enefit renamed OSEC as Enefit American Oil and has continued development of the project with several key modifications to the business plan and the RD&D plan put forward by OSEC and outlined in Appendix A of the PEIS. These modifications are currently under discussion and pending approval of BLM's Vernal Field Office. As such, they are outlined only briefly below. The Utah Oil Shale Project, located in the Uinta Basin of eastern Utah, is designed to develop a green field oil shale mining and shale oil production complex producing approximately 30 million tons of oil shale rock per year and 50,000 barrels per day of premium quality refinery ready shale oil from the Green River Formation. Shale oil will be produced from multiple new generation Enefit Technology surface retorts with onsite upgrading of the raw oil. The proposed facility will be located in the Uinta Basin, approximately twelve miles southeast of Bonanza in Uintah County, Utah. The RD&D Development Phase is broken up into 2 sub-phases which build on the test work and progress of the previous sub-phase. The second sub-phase will include completion of the Enefit Pilot testing and PreFEED (Preliminary Front End Engineering Design) and completion of the application for conversion of the lease. New or unexpected information in an earlier phase may impact the timing or activities in a following phase. The RD&D Development Phase activities will be carried out on both the BLM RD&D lease property and EAO's adjacent private Skyline property, as well as offsite at Enefit's R&D center in Frankfurt Germany. As Enefit has a proven technology operating industrially in Estonia and is not developing a new technology, the RD&D phases' goal will be to prove the technology of, and optimize the design for, this specific resource in Utah.

#24)]> XI. INCORPORATION OF OTHER COMMENTS

In order to avoid unnecessary duplication, and to the extent not inconsistent with these comments, Enefit hereby incorporates by reference the comment letters from the following entities:

- > State of Utah
- > American Petroleum Institute
- > National Oil Shale Association
- > Utah Association of Counties
- > Utah Mining Association

<([#25 [9.1] X. CONCLUSION AND SPECIFIC RECOMMENDATIONS

BLM's PEIS proposes changes to BLM's existing RMPs that would discourage domestic oil shale development, vitiate Congressional intent to encourage domestic oil shale development, and run afoul of the Congressional prohibition against the implementation of DOF's Wild Lands Policy. Enefit recommends that BLM make the following changes in the Final PEIS:

- > Clarify that the purpose and need of the present RMP revision process is controlled by the 2005 EPA Act's directive that oil shale and tar sands deposits are "strategically important domestic resources that should be developed to reduce the growing dependence of the United States on politically and economically unstable sources of foreign oil imports";

> Eliminate from further consideration any alternative—such as Alternatives 2, 3 or 4—that violate the 2005 EPOA’s directive; **#25)**> > <(**#26** [2.1.1] Select Alternative 1 as the proposed alternative; **#26)**>
 <(**#27** [9.6] Confirm that development of the current RD&D leases is governed by all the terms and conditions of those leases, including the Lease Addendum; **#27)**>
 <(**#28** [9.6] Confirm that a company which has demonstrated the ability to produce oil shale at a commercial scale may apply for a commercial lease on BLM lands without first going through the RD&D leasing process; **#28)**> > <(**#29** [9.2.1] [3.1.3] Cease the illegal implementation of DOI’s “Wild Lands Policy”; **#29)**>
 <(**#30** [9.3] Recognize that site-specific resource impacts, including those related to sage grouse and lands with wilderness characteristics, can be addressed at later stages in the leasing process when more is known about the particular resource and the attendant oil shale development technology; **#30)**>
 ><(**#31** [3.1.7] Explain that Evacuation Creek is no longer considered by BLM to be eligible for listing as a wild and scenic river; **#31)**> <(**#32** [6.3] Revise the summary of Enefit’s development technology in Appendix A as discussed in Section X above; **#32)**>
 <(**#33** [1.1.1] Finally, Enefit requests that BLM extend the comment period of the Draft PEIS by at least 60 days to provide Enefit and other stakeholders an opportunity to respond to any proposed revisions to the RMPs and any proposed changes to the 2008 OS Rule, in an informed and coordinated fashion. **#33)**>

SETTLEMENT AGREEMENT

Page 1 of 10

Case 1:09-cv-00085-JLK Document 63-1 Filed 02/15/11 USDC Colorado Page 2 of 10

WHEREAS, on November 17, 2008, the U.S. Bureau of Land Management issued an Approved Resource Management Plan Amendments / Record of Decision for Oil Shale and Tar Sands Resources to Address Land Use Allocations in Colorado, Utah, and Wyoming and Final Programmatic Environmental Impact Statement (“2008 OSTs ROD”);

WHEREAS, the 2008 OSTs ROD amended the decisions specific to oil shale and tar sands resources in twelve land use plans: Glenwood Springs Resource Management Plan (“RMP”), Grand Junction RMP, and White River RMP in Colorado; Book Cliffs RMP, Diamond Mountain RMP, San Rafael Resource Area RMP, Price River Resource Area Management Framework Plan (“MFP”), Henry Mountain MFP, and San Juan Resource Area RMP in Utah; and Great Divide RMP, Green River RMP, and Kcmmerer RMP in Wyoming;

WHEREAS, on January 16, 2009, Plaintiffs Colorado Environmental Coalition, Western Colorado Congress, Wilderness Workshop, Biodiversity Conservation Alliance, Southern Utah Wilderness Alliance, Red Rock Forests, Western Resource Advocates, National Wildlife Federation, Center for Biological Diversity, The Wilderness Society, Natural Resources Defense Council, Defenders of Wildlife, and Sierra Club (collectively “Plaintiffs”) filed a Complaint for declaratory and injunctive relief against Ken Salazar, in his official capacity as Secretary of the Department of the Interior, Wilma Lewis, in her official capacity as Assistant Secretary for Land and Minerals of the U.S. Department of the Interior, the U.S. Department of the Interior, Bob Abbey, in his official capacity as Director of the U.S. Bureau of Land Management, and the U.S. Bureau of Land Management (“BLM”) (collectively “Defendants”), and filed a First Amended Complaint on June 15, 2009;

WHEREAS, Plaintiffs allege that the issuance of the 2008 OSTs ROD violated BLM regulations, the Administrative Procedure Act (“APA”), the Federal Land Policy and Management Act (“FLPMA”), the National Environmental Policy Act (“NEPA”), and the Endangered Species Act (“ESA”);

WHEREAS, on May 11, 2009, Shell Frontier Oil & Gas Inc. was granted status as Intervenor in this action; and

1 Pursuant to Fed. R. Civ. P. 25(d), current agency officials have been substituted for their predecessors in office.

Page 2 of 10

Case 1:09-cv-00085-JLK Document 63-1 Filed 02/15/11 USDC Colorado Page 3 of 10

WHEREAS, Defendants and Plaintiffs (the “Settling Parties”), through their authorized representatives, and without any admission or final adjudication of the issues of fact or law with

respect to Plaintiffs' claims, have reached a settlement in this action;
 NOW, THEREFORE, THE SETTLING PARTIES HEREBY STIPULATE AND
 AGREE AS FOLLOWS:

I. No later than 120 days after this Settlement Agreement becomes effective.

Defendants will publish a notice of intent ("NOT") to consider amending each of the land use planning decisions made by the 2008 OSTs ROD. Such notice shall initiate scoping under NEPA in coordination with the RMP amendment process pursuant to 43 C.F.R. § 1610.2(c), which may be carried out on a programmatic or individual planning area basis. The NOI will propose to analyze the environmental effects of an alternative or alternatives in a NEPA analysis that would exclude from commercial oil shale or tar sands leasing:

- a. All areas that Defendants have identified, or may identify as a result of inventories conducted during this planning process, as lands containing wilderness characteristics;
- b. The whole of the Adobe Town "Very Rare or Uncommon" area, as designated by the Wyoming Environmental Quality Council on April 10, 2008;
- c. Core or priority sage grouse habitat, as defined by such guidance as Defendants may issue;
- d. All areas of critical environmental concern ("ACEC") located within the areas analyzed in the September 2008 Oil Shale and Tar Sands Resources Leasing Final Programmatic Environmental Impact Statement ("OSTs PEIS"); and
- e. All areas identified as excluded from commercial oil shale and tar sands leasing in Alternative C of the September 2008 OSTs PEIS.

2. As part of the NEPA analysis initiated by the publication of the NOI, Defendants will analyze the environmental effects of at least the following three alternatives:

- a. An alternative or alternatives removing all of the lands described above in Paragraph 1 from applications for oil shale or tar sands leasing;

Page 3 of 10

Case 1:09-cv-00085-JLK Document 63-1 Filed 02/15/11 USDC Colorado Page 4 of 10

- b. At least one alternative that removes some, but not all, of the lands described above in Paragraph I from applications for oil shale or tar sands leasing; and

c. The "no action" alternative.

The purpose and need statement in the NEPA analysis supporting the RMP amendment process or processes shall be defined in such a manner that it can be met by any and all of the alternatives described in Paragraph 2(a) and 2(b) above. Nothing in this section shall limit Defendants from analyzing additional alternatives or from selecting an alternative that best meets Defendants' objectives,

3. In conjunction with the RMP amendment process or processes and supporting NEPA analysis, Defendants will provide a public protest period, pursuant to 43 C.F.R. §§ 1610.2 and 1610.5-2, and provide for state consistency review, pursuant to 43 U.S.C. § 1712(c)(9) and 43 C.F.R. § 1610.3-2(e).

4. During the RMP amendment process or processes and supporting NEPA process, BLM will consider information timely provided by Plaintiffs and other interested parties during scoping and other public comment opportunities.

5. Subject to available appropriations and staffing and subject to compliance with applicable laws and regulations. Defendants will use best efforts to issue a final decision or decisions regarding amendments for each of the planning decisions made by the 2008 OSTs ROD no later than December 31, 2012. Pursuant to 43 C.F.R. § 1610.5-1 and 43 C.F.R. § 1610.5-2, such final decision or decisions may not be issued until after the resolution of any protests. When Defendants issue such final decision or decisions. Plaintiffs may challenge such decision or decisions in a new action brought under applicable federal law. Defendants do not waive any defenses they might have against such a challenge.

6. Defendants acknowledge that under the terms of the 2008 OSTs ROD, prior to the approval of an application to convert an oil shale Research, Development & Demonstration (“RD&D”) lease to a commercial lease, Defendants must conduct an analysis of the proposed conversion under NEPA in addition to the final OSTs PEIS supporting the 2008 OSTs ROD. If Defendants approve such an application, Plaintiffs may challenge the approval only in a new action brought under applicable federal law. Defendants do not waive any defenses they might have against such a challenge.

Page 4 of 10

Case 1:09-cv-00085-JLK Document63-1 Filed 02/15/11 USDC Colorado PageSoMO

7. Prior to the publication of a new decision or decisions regarding amendments for each of the planning decisions made by the 2008 OSTs ROD, or January 15, 2013, whichever occurs first, Defendants will not issue a call for expression of leasing interest for commercial oil shale leases pursuant to 43 C.F.R. § 3921.30. In the event that Defendants conduct the new planning processes agreed to in this Settlement Agreement by addressing individual plans rather than by using a programmatic approach, Defendants will only issue a call for expression of leasing interest for commercial oil shale leases in planning areas subject to a new decision regarding plan amendments, as described in Paragraph 5. Nothing in this Settlement Agreement prohibits Defendants from soliciting the nomination of parcels to be leased for RD&D of oil shale recovery technologies in the States of Colorado, Utah, and Wyoming. If Defendants approve the issuance of an RD&D lease prior to the publication of a new decision regarding amendments for the applicable planning decision made by the 2008 OSTs ROD as set forth in Paragraph 5, Plaintiffs may challenge such a decision in a new action brought under applicable federal law. If Plaintiffs bring such a challenge to an RD&D lease issued prior to the publication of a new decision regarding amendments for the applicable planning decision made by the 2008 OSTs ROD as set forth in Paragraph 5, they may not bring any claims that were raised or could have been raised in the above-captioned civil action with respect to the 2008 OSTs ROD.

Defendants do not waive any defenses they might have against such a challenge.

8. Prior to the publication of a new decision or decisions regarding amendments for each of the planning decisions made by the 2008 OSTs ROD, or January 15, 2013, whichever occurs first, Defendants will not, on their own initiative, offer lands for competitive tar sands leasing, or accept expressions of interest in tracts for competitive tar sands leasing pursuant to 43 C.F.R. § 3141.6-1 through 43 C.F.R. § 3141.7. The commitment in the preceding sentence, however, does not apply to the Defendants’ ongoing consideration of the expression of commercial leasing interest for tar sands in the Asphalt Ridge Special Tar Sands Area near Vernal, Utah, submitted by Jones Leasing Service on behalf of Ocean Enterprise Group on November 16, 2009, or to the possible sale or issuance of a lease for some or all of the parcels identified in that expression of leasing interest. Plaintiffs may protest or challenge such potential actions as provided by law, but shall not raise any claim that was or could have been raised in the

above-captioned civil action. In the event that Defendants conduct the new planning processes agreed to in this Settlement Agreement by addressing individual plans rather than by using a

Page 5 of 10

Case1:09-cv-00085-JLK Document 63-1 Filed 02/15/11 USDC Colorado Page 6 of 10

programmatic approach. Defendants will only offer lands for competitive tar sands leasing, or accept expressions of interest in tracts for competitive tar sands leasing, in planning areas subject to a new decision regarding plan amendments, as described in Paragraph 5.

9. Those acting with actual authority of Plaintiffs shall not authorize Plaintiffs to fund any other entity or person not a party to this Settlement Agreement specifically to commence or maintain a legal challenge against Defendants regarding the agency actions at issue in the above-captioned civil action. Defendants may terminate this Settlement Agreement upon notice to Plaintiffs of any violation of this paragraph, subject to the dispute resolution provisions of Paragraph 13.

10. In consideration of Defendants' agreement, as described above, to initiate a new planning process addressing the land use planning decisions made by the 2008 OSTs ROD, Plaintiffs waive and release all claims against Defendants arising from the issuance of the 2008 OSTs ROD. Nothing in this Settlement Agreement waives or limits in any way any legal claim Plaintiffs may pursue: (a) against any final decision or decisions regarding amendments for each of the planning decisions made by the 2008 OSTs ROD as set forth in Paragraph 5; (b) against any agency action that tiers to, relies upon, or incorporates any such final decision or decisions; (c) against any agency action that tiers to, relies upon, or incorporates by reference the 2008 OSTs PHIS, except for any decision concerning an RD&D lease issued prior to the publication of a final decision regarding amendments for the applicable planning decision(s) made by the 2008 OSTs ROD as set forth in Paragraph 5; or (d) against any agency action that tiers to, relies upon, or incorporates by reference BLM's determination of "no effect" pursuant to ESA Section

7 concerning the 2008 OSTs RMP amendments, except for any decision concerning an RD&D lease issued prior to the publication of a final decision regarding amendments for the applicable planning decision made by the 2008 OSTs ROD as set forth in Paragraph 5.

11. The Settling Parties agree to jointly move to administratively close this action pursuant to D. C. Colo. L. Civ. R. 41.2 as set forth in the attached joint motion and proposed order, which is hereby made a part of this Settlement Agreement. The terms of this Settlement Agreement shall become effective upon entry of an order by the Court administratively closing the action as set forth in the proposed order. Upon issuance of a new decision or decisions regarding amendments for each of the planning decisions made by the 2008 OSTs ROD, the

Page 6 of 10

Case 1:09-cv-00085-JLK Document 63-1 Filed 02/15/11 USDC Colorado Page 7 of 10

Settling Parties shall promptly file a motion to voluntarily dismiss Plaintiffs' claims with prejudice pursuant to Fed. R. Civ. P. 41(a)(1)(A)(ii).

12. Defendants' issuance of a new decision or decisions regarding amendments for each of the planning decisions made by the 2008 OSTs ROD discharges all of Defendants' obligations under this Settlement Agreement. If Defendants fail to fulfill any obligation required by this Settlement Agreement, Plaintiffs' sole remedy will be to move the Court to reopen this lawsuit, subject to compliance with D. C. Colo. L. Civ. R. 41.2 and Paragraph 13. Plaintiffs shall be permitted to move to reopen this action only on the following grounds: (a) Defendants fail to publish a notice of intent ("NOT") by 120 days after the effective date of this Settlement

Agreement to consider amending each of the land use planning decisions made by the 2008 OSTs ROD, in violation of Paragraph 1; (b) Defendants issue a notice of intent proposing plan amendments that does not propose excluding from commercial oil shale or tar sands leasing one or more of the areas identified in Paragraph 1; (c) Defendants issue a NHPA document that does not analyze one or more of the alternatives identified in Paragraph 2; (d) Defendants fail to provide a public protest period pursuant to 43 C.F.R. §§ 1610.2 and 1610.5-2 or fail to provide for state consistency review pursuant to 43 U.S.C. § 1712(c)(9) and 43 C.F.R. § 16103-2(e) in violation of Paragraph 3; (e) Defendants fail to issue a new planning decision or decisions by December 31, 2012 as provided in Paragraph 5; (f) Defendants approve an application to convert an RD&D lease to a commercial lease before conducting additional NEPA analysis in violation of Paragraph 6; (g) prior to January 15, 2013, Defendants issue a call for expression of leasing interest for oil shale before issuing a new planning decision applicable to the area of the proposed leases in violation of Paragraph 7; or (h) prior to January 15, 2013, Defendants offer lands for competitive tar sands leasing, or accept expressions of interest in tracts for competitive tar sands leasing before issuing a new planning decision applicable to the area of the proposed leases in violation of Paragraph 8. This Settlement Agreement shall not be enforceable through a motion to enforce this Settlement Agreement or a proceeding for contempt of court.

13. If there is a dispute over compliance with any term or provision of this Settlement Agreement, the disputing Settling Party will notify the other Settling Party in writing of the dispute. The Settling Parties shall meet and confer orally in an attempt to resolve the dispute. The Settling Parties shall attempt to negotiate a resolution of the dispute within 30 days of the written notification of the dispute. If the Settling Parties do not reach a resolution during the 30-

Page 7 of 10

Case1:09-cv-00085-JLK Document 63-1 Filed 02/15/11 USDC Colorado Page 8 of 10

day period, the disputing Settling Party may move to reopen this lawsuit based upon one of the grounds specified in Paragraphs 9 or 12. This Settlement Agreement shall terminate if the Court reopens this lawsuit.

14. No provision of this Settlement Agreement shall be interpreted as, or constitute, a commitment or requirement that Defendants take action in contravention of the APA, BLM regulations, FLPMA, NRPA, the ESA, or any other law or regulation, either substantive or procedural. Nothing in this Settlement Agreement shall be construed to limit or modify the discretion accorded to Defendants by the APA, BLM regulations, FLPMA, NEPA, the ESA, or general principles of administrative law with respect to the procedures to be followed in making any determination required herein, or as to the substance of any final determination.

15. Nothing in this Settlement Agreement shall be interpreted as, or shall constitute, a requirement that Defendants are obligated to pay any funds exceeding those available, or take any action in contravention of the Anti-Deficiency Act, 31 U.S.C. § 1341, or any other applicable appropriations law,

16. This Settlement Agreement was negotiated to avoid further litigation only. This Settlement Agreement has no precedential value and does not represent an admission or waiver by any Settling Party to any fact, claim, or defense relating to any issue in this lawsuit and may not be used as evidence of such fact, claim, or defense in any litigation.

17. Each Settling Party shall bear its own attorneys' fees and costs.

18. The undersigned representatives of each Settling Party certify that they are fully authorized by the Settling Party or Parties they represent to agree to the Court's entry of the terms and conditions of this Settlement Agreement and do hereby agree to the terms herein.

19. This Settlement Agreement may only be supplemented, modified, or amended by written agreement of the Settling Parties.

20. This Settlement Agreement represents the entirety of the Settling Parties' commitment with regard to settlement.

21. Counsel for Plaintiffs have reviewed this Settlement Agreement and have authorized Defendants' counsel to file this Settlement Agreement on behalf of the Settling Parties.

IT IS HEREBY AGREED.

Memorandum to file

Subject: Oil shale resource on U.S. BLM land proposed for leasing in Utah under the 2012 PEIS
Alternative 2b

Prepared by: Michael D. Vanden Berg, Project Geologist, Utah Geological Survey
In 2008, the Utah Geological Survey calculated the available oil shale resource within a
continuous zone averaging 25 gallons of oil per ton of rock (gpt) for lands proposed by the U.S.

BLM for commercial oil shale leasing within the 2008 PEIS. The estimated oil shale resource for the 2008 preferred alternative totaled 69.0 billion barrels (UGS Special Study 128). In 2012, the BLM revised the oil shale/tar sand PEIS and developed a new preferred alternative, which reduced the amount of available land for oil shale leasing (Alternative 2b). Using the same methods applied in Special Study 128, UGS calculated the total oil shale resource at 25 gpt on lands available for commercial oil shale leasing under the 2012 PEIS Alternative 2b as 25.7 billion barrels.

These resource estimations reflect the total in-place oil within a continuous interval averaging 25 gpt. These estimations do not take into account any environmental, land-use, or economic constraints (besides a minimum grade of 25 gpt).

UGS geologists believe that the quality of Utah lands available for commercial oil shale leasing is more important than the quantity and have worked hard to identify the areas of BLM land with the most potential for commercial development.

Memorandum to file

Subject: Oil shale resource (at 25 gpt) on Enefit American Oil's preferential BLM RD&D lease

Prepared by: Michael D. Vanden Berg, Project Geologist, Utah Geological Survey

In 2012, the BLM revised the oil shale/tar sand PEIS and developed a new preferred alternative, which reduced the amount of available land for oil shale leasing (Alternative 2b) from the previous 2008 PEIS process. A portion of Enefit American Oil's BLM RD&D preference lease was excluded from the lands available for oil shale leasing under this new preferred alternative. The UGS calculated the oil shale resource within a continuous interval averaging 25 gallons of oil per ton of rock (gpt) on Enefit's entire preference lease area as well as the preference lease area excluded as part of Alternative 2b. The methods used in calculating these resource estimations were the same as within UGS Special Study 128.

Oil shale resource on Enefit's entire BLM RD&D preference lease at 25 gpt = 848.4 million bbl.

Oil shale resource on Enefit's RD&D preference lease at 25 gpt excluded within the 2012 PEIS Alternative 2b = 394.8 million bbls.

These resource estimations reflect the total in-place oil within a continuous interval averaging 25 gpt. These estimations do not take into account any environmental, land-use, or economic constraints (besides a minimum grade of 25 gpt).

SETTLEMENT AGREEMENT

Page 1 of 9

Case 1:09-cv-00091-JLK Document 80-1 Filed 02/15/11 USDC Colorado Page 2 of 9

WHEREAS, on November 18, 2008, the U.S. Bureau of Land Management issued a
 Final Rule regarding Oil Shale Management, 73 Fed. Reg. 69,414 (Nov. 18, 2008) (“Oil Shale
 Final Rule”);

WHEREAS, the Oil Shale Final Rule amends regulations governing the leasing of federal
 lands for purposes of developing oil shale resources and are set forth at 43 C.F.R. Parts 3900 -
 3936;

WHEREAS, on January 16, 2009, Plaintiffs Colorado Environmental Coalition, Western
 Colorado Congress, Wilderness Workshop, Biodiversity Conservation Alliance, Southern Utah
 Wilderness Alliance, Red Rock Forests, Western Resource Advocates, National Wildlife
 Federation, Center for Biological Diversity, The Wilderness Society, Natural Resources Defense
 Council, Defenders of Wildlife, and Sierra Club (collectively “Plaintiffs”) filed a Complaint for
 declaratory and injunctive relief against Ken Salazar, in his official capacity as Secretary of the
 Department of the Interior, Wilma Lewis, in her official capacity as Assistant Secretary for Land
 and Minerals of the U.S. Department of the Interior, the U.S. Department of the Interior, Bob
 Abbey, in his official capacity as Director of the U.S. Bureau of Land Management, and the
 U.S. Bureau of Land Management (“BLM”) (collectively “Defendants”), and filed a First
 Amended Complaint on June 15, 2009;

WHEREAS, Plaintiffs allege that the issuance of the Oil Shale Final Rule violated the
 Administrative Procedure Act (“APA”), the Federal Land Policy and Management Act
 (“FLPMA”), the Energy Policy Act (“EP Act”), the National Environmental Policy Act
 (“NEPA”), and the Endangered Species Act (“ESA”);

WHEREAS, on May 11, 2009, Shell Frontier Oil & Gas Inc. and the American
 Petroleum Institute were granted status as Intervenor in this action; and

WHEREAS, Defendants and Plaintiffs (the “Settling Parties”), through their authorized
 representatives, and without any admission or final adjudication of the issues of fact or law with
 respect to Plaintiffs’ claims, have reached a settlement in this action;

NOW, THEREFORE, THE SETTLING PARTIES HEREBY STIPULATE AND
 AGREE AS FOLLOWS:

1 Pursuant to Fed. R. Civ. P. 25(d), current agency officials have been substituted for their
 predecessors in office.

Page 2 of 9

Case 1:09-cv-00091-JLK Document 80-1 Filed 02/15/11 USDC Colorado Page 3 of 9

t. No later than 15 months after this Settlement Agreement becomes effective.

Defendants will publish a notice of proposed rulemaking (“NPR”) in which BLM will propose
 amendments to the Oil Shale Final Rule to address the royalty rate and environmental protection

requirements applicable to oil shale commercial leasing. The proposed amendments shall be within the discretion of the Secretary of the Interior and shall include, but not be limited to, the proposed amendments set forth below.

2. The NPR will propose to remove the royalty rate for oil shale production, codified in the current regulation at 43 C.F.R. § 3903.52.
3. The NPR will propose the following changes to the environmental protection requirements applicable to oil shale commercial leasing, codified at 43 C.F.R. Parts 3900 - 3936:
 - a. Expressly stating that BLM may, in its discretion, deny an application to convert an oil shale Research, Development & Demonstration (“RD&D”) lease to a commercial lease based on environmental or other resource considerations.
 - b. Expressly stating that BLM may, in its discretion, reject an oil shale commercial lessee’s proposed plan of development based on environmental or other resource considerations.
 - c. Expressly stating that BLM will consider issuing a commercial oil shale lease only upon application of an RD&D lessee to convert its RD&D lease to a commercial lease, or after BLM issues a call for expression of leasing interest.
 - d. Providing that BLM will not issue an oil shale commercial lease, will reject any proposal to convert an oil shale RD&D lease to a commercial lease, and will not approve any plan of development for an oil shale commercial lease unless it is shown that the operations can occur without unacceptable environmental risk.
- c. Providing that plans of development for oil shale commercial leases are required to include watershed and groundwater protection plans, airshed reviews, integrated waste management plans, and environmental protection and mitigation plans. The NPR will also propose to define the requirements of such plans and reviews.

Page 3 of 9

Case 1:09-cv-00091-JLK Document 80-1 Filed 02/15/11 USDC Colorado Page4of9

4. During the rulemaking process, BLM will consider information timely submitted by the Plaintiffs and other interested parties during public comment opportunities.
5. Subject to available appropriations and staffing and subject to compliance with applicable laws and regulations, Defendants will use best efforts to publish a final decision in the rulemaking process regarding oil shale management no later than November 18, 2012. When Defendants publish such a new final decision in the rulemaking process, Plaintiffs may challenge such new final decision in the rulemaking process in a new action brought under applicable federal law. Defendants do not waive any defenses they might have against such a challenge.
6. Defendants acknowledge that, prior to the approval of an application to convert an oil shale RD&D lease to a commercial lease. Defendants must conduct an analysis of the conversion under NEPA in addition to the Oil Shale and Tar Sands Final Programmatic Environmental Impact Statement published in September 2008. If Defendants approve such an application, Plaintiffs may challenge the approval only in a new action brought under applicable federal law. Defendants do not waive any defenses they might have against such a challenge.
7. Prior to the publication of a final decision in the rulemaking process regarding oil shale management, or January 15, 2013, whichever occurs first, Defendants will not issue a call

for expression of leasing interest for commercial oil shale leases pursuant to 43 C.F.R. § 3921.30. Nothing in this Settlement Agreement prohibits Defendants from soliciting the nomination of parcels to be leased for RD&D of oil shale recovery technologies in the States of Colorado, Utah, and Wyoming. If Defendants approve the issuance of an RD&D lease prior to the publication of a final decision in the rulemaking process regarding oil shale management. Plaintiffs may challenge such a decision in a new action brought under applicable federal law. If Plaintiffs bring such a challenge to an RD&D lease issued prior to the publication of a final decision in the rulemaking process regarding oil shale management, they may not bring any claims that were raised or could have been raised in the above-captioned civil action with respect to the Oil Shale Final Rule. Defendants do not waive any defenses they might have against such a challenge.

8. Those acting with actual authority of Plaintiffs shall not authorize Plaintiffs to fund any other entity or person not a party to this Settlement Agreement specifically to commence or maintain a legal challenge against Defendants regarding the agency actions at issue in the above-captioned civil action. Defendants may terminate this Settlement Agreement upon

Page 4 of 9
Case1:09-cv-00091-JLK Document80-1 Filed02/15/11 USDC Colorado Page5of9

notice to Plaintiffs of any violation of this paragraph, subject to the dispute resolution provisions of Paragraph 12.

9. In consideration of Defendants' agreement, as described above, to initiate a new rulemaking process regarding oil shale management, Plaintiffs waive and release all claims against Defendants arising from the promulgation of the Oil Shale Final Rule. Nothing in this Settlement Agreement waives or limits in any way any legal claim Plaintiffs may pursue: (a) against any final decision in the rulemaking process regarding oil shale as set forth in Paragraph 5; (b) against any agency action that tiers to, relies upon, or incorporates any such final decision in the rulemaking process; (c) against any agency action that tiers to, relies upon, or incorporates by reference the 2008 environmental assessment on the 2008 Oil Shale Final Rule, except for any decision concerning an RD&D lease issued prior to the publication of a final decision in the rulemaking process as set forth in Paragraph 5; or (d) against any agency action that tiers to, relies upon, or incorporates by reference BLM's determination of "no effect" pursuant to the RSA Section 7 concerning the 2008 Oil Shale Final Rule, except for any decision concerning an RD&D lease issued prior to the publication of a final decision in the rulemaking process as set forth in Paragraph 5.

10. The Settling Parties agree to jointly move to administratively close this action pursuant to D.C. Colo. L. Civ. R. 41.2 as set forth in the attached joint motion and proposed order, which is hereby made a part of this Settlement Agreement. The terms of this Settlement Agreement shall become effective upon entry of an order by the Court administratively closing this action as set forth in the proposed order. Upon issuance of a final decision in the rulemaking process regarding oil shale management, the Settling Parties shall promptly file a motion to voluntarily dismiss Plaintiffs' claims with prejudice pursuant to Fed. R. Civ. P.

11. Defendants' promulgation of a final decision in the rulemaking process regarding oil shale management discharges all of Defendants' obligations under this Settlement Agreement. If Defendants fail to fulfill any obligation required by this Settlement Agreement, Plaintiffs' sole remedy will be to move the Court to reopen this lawsuit, subject to compliance with D. C. Colo. L. Civ. R. 41.2 and Paragraph 12. Plaintiffs shall be permitted to move to reopen this action only on the following grounds: (a) Defendants fail to publish a Notice of

Proposed Rulemaking (“NPR”) by 15 months after this Settlement Agreement becomes
Page 5 of 9

Case1:09-cv-00091-JLK Document80-1 Filed 02/15/11 USDC Colorado Page6of9

effective, proposing amendments to the 2008 Oil Shale Final Rule to address the royalty rate and environmental protection requirements applicable to oil shale commercial leasing, in violation of Paragraph I; (b) Defendants issue a notice of proposed rulemaking that does not propose to remove the royalty rate for oil shale production from the existing oil shale regulations in violation of Paragraph 2; (c) Defendants issue a notice of proposed rulemaking that does not propose one or more of the provisions identified in Paragraph 3; (d) Defendants fail to publish a final decision in the rulemaking process regarding oil shale management by November 18, 2012 as provided in Paragraph 5; (e) Defendants approve an application to convert an RD&D lease to a commercial lease before conducting additional NRPA analysis in violation of Paragraph 6; or (f) prior to January 15, 2013, Defendants issue a call for expression of leasing interest for oil shale resources before issuing a final decision in the rulemaking process regarding oil shale management in violation of Paragraph 7. This Settlement Agreement shall not be enforceable through a motion to enforce this Settlement Agreement or a proceeding for contempt of court.

12. If there is a dispute over compliance with any term or provision of this Settlement Agreement, the disputing Settling Party will notify the other Settling Party in writing of the dispute. The Settling Parties shall meet and confer orally in an attempt to resolve the dispute. The Settling Parties shall attempt to negotiate a resolution of the dispute within 30 days of the written notification of the dispute. If the Settling Parties do not reach a resolution during the 30-day period, the disputing Settling Party may move to reopen this lawsuit based upon one of the grounds specified in Paragraphs 8 or 11. This Settlement Agreement shall terminate if the Court reopens this lawsuit.

13. No provision of this Settlement Agreement shall be interpreted as, or constitute, a commitment or requirement that Defendants take action in contravention of the APA, BLM regulations, FUPMA, NRPA, the ESA, or any other law or regulation, either substantive or procedural. Nothing in this Settlement Agreement shall be construed to limit or modify the discretion accorded to Defendants by the APA, BLM regulations, FLPMA, NRPA, the HSA, or general principles of administrative law with respect to the procedures to be followed in making any determination required herein, or as to the substance of any final determination,

14. Nothing in this Settlement Agreement shall be interpreted as, or shall constitute, a requirement that Defendants are obligated to pay any funds exceeding those available, or take
Page 6 of 9

Case1:09-cv-00091-JLK Document 80-1 Filed 02/15/11 USDC Colorado Page 7 of 9
any action in contravention of the Anti-Deficiency Act, 31 U.S.C. § 1341, or any other applicable appropriations law.

15. This Settlement Agreement was negotiated to avoid further litigation only. This Settlement Agreement has no precedential value and does not represent an admission or waiver by any Settling Party to any fact, claim, or defense relating to any issue in this lawsuit and may not be used as evidence of such fact, claim, or defense in any litigation.

16. Each Settling Party shall bear its own attorneys’ fees and costs.

17. The undersigned representatives of each Settling Party certify that they are fully authorized by the Settling Party or Parties they represent to agree to the Court’s entry of the terms and conditions of this Settlement Agreement and do hereby agree to the terms herein.

18. This Settlement Agreement may only be supplemented, modified, or amended by

written agreement of the Settling Parties.

19. This Settlement Agreement represents the entirety of the Settling Parties' commitment with regard to settlement.

20. Counsel for Plaintiffs have reviewed this Settlement Agreement and have authorized Defendants' counsel to file this Settlement Agreement on behalf of the Settling Parties.

IT IS HEREBY AGREED.

2012 Oil Shale & Tar Sands PEIS - COMMENTS

To be submitted via:

<http://ostseis.anl.gov/involve/comments/index.cfm>

Comments in support of conducting extensive research on environmental, socioeconomic, and other impacts to local and regional economies are required research before issuing commercial licenses.

To whom it may concern:

<([#1 [3.10.2] Whether the promises of energy independence from oil shale industry proponents could be

truthful is not yet knowable. Before we rush into leasing, and allow research and development on vast tracks of arid western lands within the Piceance Basin and portions of Colorado, Utah, Wyoming, westerners and local governments need to be assured that the development plan addresses the full impacts of oil shale development. History of past oil shale and energy industry booms and busts show that the extensive needs for transportation, housing, schools, utilities (water, electric, telecommunications, broadband), and other health, safety and welfare services are immediate while financial help from fees or revenues lag years to decades behind these needs. It is impossible for a small community or county with less than 5,000 or even 60,000 people create the infrastructure and deliver services for large numbers of temporary or permanent workers that come virtually overnight.

Communities within the Colorado River Watershed that are working hard to ensure they have a healthy and diversified economy through agriculture, tourism, outdoor recreation, hunting, industry, and mining need to know if they will be subject to water calls from oil shale research or development activities downstream; and if they could suffer brown outs because the existing grid or telecommunications infrastructure is inadequate for the influx of workers or the demands that will come from extracting and processing the oil shale.

Ouray County, Colorado is a rural county within the headwaters of the Uncompahgre River watershed which is within the Gunnison and Colorado River basins. There are no reservoirs or water storage facilities other than Mother Nature's snowpack above us. Approximately 50% of our land is public land, mostly federal lands. Our valleys are green with working ranch lands.

Our rural character and scenic beauty along with our mining, ranching and railroad heritage is essential to our collective livelihoods -- for Ouray County to survive we need to make sure we can continue our land use practices and have power and telecommunications that work when our residents, visitors, and businesses need it. We need to make sure that visitors continue to find our county and region an attractive place to visit. We need to make sure that our economy is not sacrificed for another's.

Currently, our telecommunications infrastructure is such that a music festival bringing 10,000 people to a neighboring county can render most cell-phones unable to place outgoing calls for hours or days, because our current infrastructure is operating very close to capacity under "normal" conditions.

#1)> <([#2 [5] The oil shale leasing and development plan must include a thorough vetting and deep

understanding of potential impacts. Effective mitigation measures must be based on accurate data and be built into the plan, prior to leasing or activities, in order to ensure that if research and development of oil shale moves forward, it will not cause the demise of the long-existing

communities connected over long-distances from the lease areas by hydrology or infrastructure. **#2]> <([#3 [3.4.1]** We need to be thorough and have a full understanding of potential impacts to the environment and our communities before we take steps toward large-scale commercial leasing or development of oil shale. The water needed to develop oil shale could be a game changer, transforming western Colorado's agricultural heritage and precluding other options for its economy. We will continue to work with the Interior Department and are thankful for their partnership."

#3]> <([#4 [3.10.2] Some of the topics that must be detailed in the plan include at a minimum:

- Ability of Local Governments to provide health, safety, welfare prior to any revenues or impact fees being generated or compounded;
- Ability of existing transportation, education, health care, housing, local services, telecommunications and broadband, electricity, and other infrastructure to provide services that will be immediately demanded by oil shale leasing, research and development;

#4]> <([#5 [3.4.1] - Potential impacts to water rights, not just in the immediate area, but hundreds of miles

away where they may be impacts from a call, especially on the Colorado River system. Could areas with no positive revenue sources from oil-shale be dried up or subject to electrical or telecommunications brown outs? What if oil shale needs more water than is currently being discussed? Who will the winners and losers be?

#5]> <([#6 [6.2] - Will power needs by the oil shale industry exceed the fuel to be gained by exploiting

oil shale? The potentially affected area is much more vast than the areas currently proposed for leasing. We need to be assured that the range of influence of oil shale activities is properly assessed and that no community is significantly impacted unexpectedly. Local governments in Colorado such as Ouray County operate on very tight budgets. So do local cooperative utilities that distribute or provide our water and power. **#6]>**

<([#7 [3.10.4] - What will be the impacts to national parks, outdoor recreation, hunting, fishing, and

tourism. Tourism in the rural mountain west is interconnected. Visitors may stay in one area only a few days to a week, but it is part of a longer and more diverse vacation itinerary that makes the trip worth the time and expense of getting to a rural and rugged region. Most visitors enjoy a blended vacation of outdoor recreation, heritage tourism, agricultural tourism, and arts events. If activities one or more of these categories does that diminish the tourism experience so much that that visitors forgo coming altogether? **#7]>**

<([#8 [3.10.2] We want to ensure that communities expected to be impacted by commercial development of

oil shale have the appropriate and necessary financial resources to address and cope with the effects of production. We must have detailed scientific data in order to know how we can accommodate this industry, still provide basic health, safety and welfare services, and have livable communities with diversified and healthy economies. The range of influence extends far beyond the counties containing lease parcels. **#8]>**

<([#9 [2.2.1] It appears that Alternative 2(b) of the 2012 Oil Shale and Tar Sands Draft

Programmatic

Environmental Impact Statement that at least requires R&D prior to development with a conservation emphasis is on the right track. Please consider if Alternative 2 fully scopes my comments in ensuring that impacts to outlying communities will be investigated and mitigated effectively prior to conducting any activities. #9]>

Sincerely,

Lynn Padgett

Re: Draft 2012 Oil Shale and Tar Sand (OSTS) Programmatic Environmental Impact Statement (PEIS)

Via <http://ostseis.anl.gov/involve/comments/index.cfm>

Dear BLM Manager:

<([#1 [9.8] I am writing this letter on behalf of the Town of Carbondale Board of Trustees. The Board would

like to express our support for the PEIS process that is currently under way in Colorado, Utah, and

Wyoming concerning land use plan amendments for allocation of oil shale and tar sands resources

on lands administered by the Bureau of Land Management

The Town of Carbondale fully supports the review process the BLM has engaged in since publication of a Notice of Intent on April 14, 2011 in the Federal Register, and we urge the BLM to

continue the process and make appropriate amendments to the land use plans under review.

#1])> <([#2 [1.1] It is

noteworthy that the BLM held seven seeping meetings and that 4,663 individuals, organizations and governmental agencies commented or made suggestions about the scope of the PEIS that is part of the land use plan amendment process.

As elected officials in Western Colorado, we believe it is essential that the final plan allows the BLM and affected communities to present key questions to be answered about the environmental impacts on water, air and land before opening millions of acres of public land to commercial energy development. #2])> <([#3 [9.7] We also support the BLM's plan to require that the research and

development of oil shale and tar sands technologies be completed and the impacts analyzed before moving forward with a commercial leasing program. The final result from the amendment process would ideally allow for oil shale and tar sands research and development in appropriate areas while protecting other important values that make public lands an important part of our economy.

#3])> <([#4 [3.10.4] Our modern economy is largely dependent on tourism and outdoor recreation services and to a

certain extent agriculture. These economic drivers rely on a healthy environment, clean air and water, and access to the backcountry. Our ranchers rely on grazing permits on USFS and BLM lands to support their businesses. Our retailers and guides rely on trout fishing, big game hunting, mountain and road biking and climbing, hiking and Nordic skiing. Our restaurants are supported by a mix of Carbondale's cultural and natural attributes to help draw diners. In short, this community's economic prosperity is closely tied to the public lands that surround it, and thus has a considerable stake in how public lands in Northwest Colorado are managed and developed.

#4])>

<([#5 [3.4.1] The community of Carbondale wants to ensure that the BLM and local communities understand

the impacts that may result from the various technologies that would be employed in commercial production. To gain the appropriate understanding we, like other elected officials in the region, believe there are a number of threshold questions that need to be answered before opening up vast portions of our public lands to oil shale commercial development.

o How much water will be used, for what, and how will local watersheds be affected? #5])>

<([#6 [3.10.2] o How will our infrastructure, community services and facilities be impacted,

including

roads, water, sewer, housing, law enforcement, etc.? #6)>

<([#7 [6.2.1] o How will production activities be powered? #7])>

<([#8 [3.7.3.12] 1) How will the environment and wildlife be affected? #8])>

<([#9 [3.1.2] o What will be the impacts relating to hunting, fishing and recreation in the oil shale

development areas? #9])>

<([#10 [3.10.2] o How will local economies be affected, both positively and negatively? #10])>

We trust that the established process will address these issues.

Thank you for the opportunity to comment.

Sincerely,

~~vl

Stacey Bernot

See Attachment.

I want to congratulate the Bureau of Land Management on the preparation of its Draft Programmatic Environmental Impact Statement. The BLM has defined alternatives that definitely represent the range of options available to the Government in fulfilling its mandate to offer for lease Federal lands underlain by oil shale. However, <([#1 [2.2] I believe that the preferred alternative reflects a drastic and unnecessary reduction in the lands available for companies to investigate and eventually produce shale oil. #1])> <([#2 [2.4] I would argue that Alternative 4 (and possibly even the No Action Alternative) could accomplish the Administration's stated goal of ensuring careful development of oil shale with reasonable environmental impacts. #2])> I highlight a number of areas of concern below.

1) <([#3 [3.1.4] Removing 85% of the Colorado lands available in the previous PEIS serves little

purpose for environmental protection. I note that the lands of the Roan Plateau that provide the best opportunities for recreation to the Colorado portion of the oil shale area of interest are already removed in every alternative, even the No Action Alternative. For me the argument that critical habitat and scenic land were being offered up ignores this critical removal, and the likely impact on such recreational resources is already minimized by that withdrawal. #3]>

2) <[#4 [9.7] [6.3] I am aware of in situ processes still under development (and not yet patented) that might be best applied in areas not part the current preferred alternative acreage in Colorado. The developers of those processes might find it exceedingly difficult to proceed even to the Research Development and Demonstration (RD&D) level of investigation under the preferred alternative. They need the thick, very rich resource of the Piceance Basin Green River Formation, and the very limited area offered there cannot be assured to be geologically favorable for these methods. Most of the area available is already taken up by leases and lease preference areas of existing leases.

#4]>

3) <[#5 [9.2.6] It is clear that the Bureau has adequate authority to manage a carefully staged development program even with a much larger land area covered by the PEIS. The Bureau states that, even if Alternative 4 were selected, parts of the land would not be available under current guidelines. BLM could assure the protection of Federal lands from speculators, technically unsound processes or environmentally destructive plans simply by stipulating that any application for a commercial lease would require documentation of:

- a. the commercial process that the applicant intends to apply to the lease, with sufficient detail for the BLM to validate the technical and commercial viability of the process
- b. a water use plan that clearly defines the requirements for the commercial development
- c. other environmental stipulations based upon existing law and regulations.

This would avoid hasty or destructive development and allow BLM to estimate the water requirements before awarding any leases. As a reviewer on the previous RD&D lease technical review team, it is clear to me that BLM has wide discretion to require adequate input from lease applicants to ensure that the Bureau can carry out its stewardship responsibilities.

#5]>

4) <[#6 [6.3.2.1] Much has been made about the need to have better estimates of water use, for example. There is an implication that current estimates are inadequate. However, the current best estimates of water use - <3 barrel of water per barrel of produced oil - have been agreed to by most of the industry. My own wider range of estimates for a process like Shell's have been cited extensively, and the suggestion has been made by the Government Accountability Office that this work was supported by industry sponsors. This is inaccurate. The work was part of a Department of Energy project on water resources. The values reported were based upon data for the configuration of a very small test plot. Scaling up of these data to a more reasonable size (based in part upon the parallel work on carbon emissions by Adam Brandt of Stanford) give preliminary results very much in line with industry's estimate.

Given these results, further evaluation of the water use would be wasteful until BLM has offered a technically sound rationale for saying that the current range is unacceptable. This, to my knowledge, has not been done.

Estimates of water efficiency for various conventional and unconventional fuels are shown in the

figure below. It is clear that water efficiency for oil shale production is well within the range for various alternatives, and greatly less than that for, for example, biofuels for which irrigated crops are the feedstock.

In addition, water use for oil shale development has been compared to home water use in municipalities like Denver. However, comparing home water use ignores the very large water use required to provide the goods and services required by these populations. The second figure shows a comparison of the water use for one barrel of oil from oil shale to the water use to prepare one 2-liter bottle of a sweetened soft drink. Given that current U. S. soft drink consumption appears to be in the vicinity of 1 million barrels per day, this is not a negligible quantity, and should be considered in any evaluation of whether water consumption is too high for oil shale development. Much has been made of the transfer of water rights from agricultural to industrial uses for the oil industry, but the relative values created by those water uses has received far less attention.

#6)>

5) <([#7 [6.1] The preferred option is most restrictive in Colorado, where more than 85% of the area originally planned for leasing has been removed. This is the richest part of the resource, and hence the area most attractive for leasing. The third figure summarizes data on oil shale resources from the U. S. Geological Survey's recent estimates for Colorado and Wyoming. It is clear that while the total resources are roughly comparable, the Piceance Basin of Colorado holds greatly larger resources of the richest material, that likely to be produced first. #7])>

6) <([#8 [10.3] Setting a precedent for opening only 35,000 acres may lead to the need for numerous future PEIS iterations, needlessly delaying development of oil shale resources, whereas a single PEIS for as much of the land as possible would give a clear signal that the Bureau sought to encourage oil shale development without relinquishing its stewardship role.

#8])>

7) <([#9 [2.4.1] [2.1.1] I urge the BLM to reconsider its highly restrictive choice of the preferred alternative, and instead choose either Alternative 4 or the No Action alternative, opening the widest possible area, but making it clear that important requirements will need to be met to receive commercial leases. Especially in Colorado, the lands made available in this Alternative are not so environmentally sensitive that they cannot be protected by appropriate elements of the leasing process. If there are significantly sensitive areas in here, then perhaps there needs to be an additional more moderate option that provides a middle ground between the highly restrictive preferred alternative and the more open availability of the No Action alternative and Alternative 4.

#9])>

8) <([#10 [9.6] Restricting leasing now to only RD&D fails to recognize that two companies are already proceeding with commercial development on private land in Utah. Neither of these is at the research stage of development. Other companies with plans for surface processing are working on available stockpiles, and do not necessarily need RD&D leases when they are satisfied their process works. I urge the BLM not to restrict leasing, but rather to make it clear that lease applicants, whether for RD&D leases or for commercial leases must provide appropriate documentation of the present development stage of their technology to receive a lease. #10])>

<([#11 [9.6] The PEIS process for leasing is not the place to impose these restrictions, and to make choices better left to industry about which acreage is the most attractive for either research and development or ultimately for commercial development. The lease process can be defined to adequately control the pace of development without removing any but the most environmentally sensitive lands from availability. Placing such heavy limitations on land availability needlessly restricts the flexibility of companies with an interest and a right to apply for leasing of the lands that contain this potentially vital national resource. The law of the land clearly indicates that they should be encouraged to, not discouraged from, doing so. #11])>

RE: ECCOS comments on the BLM's Draft 2012 Oil Shale and Tar Sands OSTs PEIS

To whom it may concern:

Thank you for your consideration of these comments as they are submitted in relation to the *Draft Programmatic Environmental Impact Statement and Possible Land Use Plan Amendments for Allocations of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah and Wyoming* published in January by the Department of Interior (DOI) and Bureau of Land Management (BLM).

<([#1 [2.1.1] ECCOS is a grassroots, nonprofit group based in Grand Junction, Colorado. We have members in Colorado and Utah with plans to expand to Wyoming in the coming year. Our mission is to help educate people about oil shale and energy issues. We are not an advocacy group. However, we would like to see research into oil shale development continue.

It is currently recognized by the Department of Energy that the equivalent of approximately 1 trillion barrels of recoverable oils exist in oil shale deposits located in the Green River Formation located in Northwest Colorado, North Eastern Utah and Southwest Wyoming. These are also believed to be the largest and richest reserves of oil shale deposits in the world (most of which are located in Colorado).

According to the U.S. Energy Information Administration (USEIA) the U.S will be dependent on oil and carbon based fuels sources for decades to come (93% of our vehicles will still run on oil in 2035, and world oil consumption is anticipated to increase 30% by 2035). For this reason ECCOS supports the ingenuity of American intellect and industry to deliver technologies and best practices that will allow for the development of oil shale in a socio-economic an environmentally responsible and sustainable manner.

It is due to this information and the list of additional concerns with the 2012 PEIS that ECCOS supports the Alternative 1 “OIL SHALE NO ACTION ALTERNATIVE,” of the recent PEIS, and the previously BLM preferred alternative in the 2008 PEIS. #1J>

<([#2 [9.8] The following are additional concerns and comments by ECCOS on/in the *Draft Programmatic Environmental Impact Statement and Possible Land Use Plan Amendments for Allocations of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah and Wyoming:*

- The U.S. Congress recognized the critical need for development of domestic energy resources as a part of the Energy Policy Act of 2005 (EPAct 2005) when it enacted the Oil Shale, Tar Sands and Other Strategic Unconventional Fuels Act of 2005. In fact, Congress declared that “...it is the policy of the United States that...oil shale, tar sands, and other unconventional fuels are strategically important domestic resources that should be developed to reduce the growing dependence of the United States on politically and economically unstable sources of foreign oil imports.” (EPAct Section 369(b); Public Law 109-58)

- ECCOS finds that there is little, if any, new information in the 2012 PEIS to be considered in comparison to the findings of the 2008 PEIS. Therefore, we have confidence in the preferred alternative that the BLM selected in 2008.

#2])>

<([#4 [2.2]

- Currently, the BLM has stated that Alternative 2B is the current preference of the agency.
- It is also a concern that the BLM's preferred alternative is in contradiction to 100% of the 14 cooperating agencies that participated in the 2012 PEIS.

#4])>

<([#5 [3.10.1] [3.10.3]

- ECCOS finds that statements in the PEIS in relation to socioeconomic impacts to be speculative and while focusing on perceived potential negative impacts the potential benefits are not represented effectively. In addition, the facts stated around available housing, rental availability and hotels is outdated and unrepresentative of the current environment.

#5])> <([#6 [6.2.1]

- It is also perceived that it is outdated to quote environmental impacts based on the use of coal fired power plants to generate power in the in-situ process are not representative of current developments by industry. Several in the industry are considering capturing and reusing natural gas to provide on-site power production. #6])>

<([#10 [6.3.2.1] Water usage and overall need of water in the oil shale development process appear to be greatly exaggerated.

It is commonly recognized that companies in the industry already own the necessary water rights to support production needs.

A recent independent study by the Colorado River Conservations District claims that 120,000 acre feet per year of water would be required for a 1.55 million barrel per day oil shale industry, which is roughly 2-3% of the water that flows from the Colorado River into Lake Powell annually. #10]>

<([#7 [9.2.1]

- One week after the notice of intent to conduct a new PEIS was published in the Federal Register on April 14, 2011 the Congressional Continuing Resolution to Fund Fiscal Year 2011 explicitly stated 2011 funds were not to be used to implement, administer and/or enforce Secretarial order No 33103310.
 - Therefore ECCOS questions the 2012 PEIS and its findings to potentially all be in violation of the Spending Moratorium of the 2011 Continuing Resolution.

#7)]> <([#8 [1.1.1]

- Lastly, the Draft BLM Oil Shale Regulation document is not expected to be published until May 15, 2012. The comment period on the 2012 OSTs PEIS closes on May 4, 2012 and obviously does not allow time for review of the Draft BLM Oil Shale Regulation document prior to submitting comments. It seems logical that these two documents are inevitably tied to one another.
 - These two documents outline impacted areas and regulations on development. Having both documents to review simultaneously will behoove those wishing to make relevant comments and help to avoid comments that may tend to be inconsistent and confusing without all the information available.
 - Therefore, ECCOS reiterates its request that the comment period on the 2012 OSTs PEIS be extended to no less than 90 days past the publication of the Draft BLM Oil Shale Regulations.

#8)]>

<([#9 [2.1.1] For these reasons ECCOS once again states its support of the thoughtful and proactive preferred alternative of the BLM's 2008 PEIS and the current Alternative 1 "OIL SHALE NO ACTION ALTERNATIVE" of the 2012 PEIS.

Furthermore, ECCOS requests that the BLM change course and support the Alternative 1 "OIL SHALE NO ACTION ALTERNATIVE" as well.

#9])>

Thank you for your time and consideration.

Respectfully,

Brad McCloud

Executive Director

Submission Text

<([#1 [10.6.3] Opening up BLM land to drilling for oil shale will help the US become more independent when it comes to oil and gas production. We currently rely on overseas companies for the majority of our oil and gas and I think bringing these resources available would help the US stand on it's own feet. #1])> <([#2 [3.10.3] Also, allowing companies to drill will create jobs, which are badly needed especially in Colorado. Creating jobs leads to people spending money which will bring our economy back to where it needs to be. Drilling on our own soil will also bring gas prices down which means people will spend money on things other than gas, which makes our economy more stable. #2])> <([#3 [11] Please consider opening these lands for drilling for a more economically stable Colorado.

Dear BLM Review Committee:

<([#1 [12] I have a number of grave concerns about tar sands and oil shale mining in Utah, Colorado, and Wyoming. In light of these concerns, which cannot be mitigated in any substantial way, I believe bringing these destructive mining and refining processes to the U.S. would be entirely unethical. #1])>

<([#2 [3.14] First, although U.S. Oil Sands claims the citrus solvent it uses to mine oil from tar sands is safer than methods used in Alberta, this solvent poses a grave environmental hazard. Dr. William Johnson, a geophysicist at the University of Utah, has spoken out about the danger of this solvent. The solvent makes carcinogenic compounds in tar sands mobile, he says, releasing these toxins into the ecosystem. Aquifers and waterways then become poisoned with carcinogens, which poison humans and ecosystems.

In Canada, this scenario has led to tumors and mutations in animals as well as increased rates of rare cancers in humans. Often those who suffer most are Indigenous peoples. In Utah, proposed tar sands and oil shale mining areas overlap the Uintah/Ouray reservation, posing a serious threat to the people who live there. #2])>

<([#3 [3.4.1] Oil shale poses a severe threat for similar reasons. The Utah Physicians for a Healthy Environment say: “Oil shale beds often serve as the floor for aquifers. Heating the oil shale in place heats the aquifer. That causes the groundwater to become contaminated with elements like arsenic and fluoride, creating a groundwater nightmare. Because the Green River formation lies within the greater Colorado River drainage basin, any surface or groundwater contamination will not only affect the local population but will likely have a significant impact on water quality for the millions of downstream users.” #3])>

<([#4 [3.4.2] The huge demand for water imposed by tar sands and oil shale mining also demonstrates how unsustainable these practices are. Although companies claim that tar sands mining in the U.S. will require less water than in Alberta, the Bureau of Land Management and Argonne National Laboratory assert that water use will total at least several barrels of water per barrel of oil produced. This water must come from somewhere—from farming, from aquifers used for human consumption, from the ecosystem. I stand firmly against privileging industry by giving an oil company the water rights of a farmer, or the water rights of a tribe, or the water that should be fueling our tourism industry through pursuits such as rafting, before it makes its way downstream to other states and communities that need it. We cannot give away the water rights of other human beings, or allow ecosystems to dry up, so companies can profit from oil.

As Western Resource Advocates points out about companies that wish to mine Utah tar sands, “they promise lower-water use techniques, but refuse to open their books to allow the community to understand how these methods would work and what the resulting broad resource needs and impacts would be.” The public needs to understand the true impacts of water uses through a transparent and independent processes, not through companies’ claims that they’ve tested. #4])>

<([#5 [3.13] Furthermore, this water, once used, cannot simply be released into the ecosystem, because it carries toxic pollutants. In the BLM’s environmental impact statement for tar sands and oil shale mining, the BLM states that enormous amounts of waste will be created from these mining practices. This waste cannot be easily contained. In Canada, it has become dispersed through waterways and ecosystems, directly affecting human health and harming wildlife. Even when companies claim to be following proper safety precautions, waste seeps out of the vast tailings dumps. Of course, the companies don’t plan for this to happen. BP didn’t plan for its oil spill in the Gulf. But when mining oil on a grand scale, disasters happens. Salt Lake experienced its own oil disaster not so long ago. With tar sands and oil shale mining, the devastation would

be even more difficult to contain because of the vast amounts of toxic waste that would be produced—according to the BLM’s own environmental impact statement and the U.S. Government Accountability Office. #5]>

<[#6 [3.7.3.1] Habitat destruction poses another grave concern. Although companies have been vague about the specific mining processes they will use, tar sands mining has never been anything but abominably destructive to ecosystems. A diagram in a fact sheet of U.S. Oil Sands shows the mining process beginning with an extracted pile of rocks, and ending with the same. Vital wildlife habitat and some of our country’s most beautiful places would be torn up to allow toxic mining, destroying the habitat of endangered and threatened species like the bald eagle and boreal toad. Fragmentation of habitats would result. Infrastructure such as roads, pipelines, and pump stations would chase away wildlife, making the land inhospitable even if it weren’t on its way to becoming a toxic wasteland. #6]>

<[#7 [3.5.1.6] Furthermore, tar sands and oil shale mining and processing require tremendous amounts of energy. This would produce four to six times the greenhouse gases of petroleum, as Utah Physicians for a Healthy Environment says. And that’s not considering the greenhouse gases produced when burning fuel produced from tar sands or oil shale itself. #7]>

<[#8 [3.10.3] Finally, producing dirty oil won’t significantly bring jobs to Utah. Conversely, greener technologies would boost employment, and keeping Utah’s wilderness beautiful would boost tourism, which is by far the most important industry in some Utah counties. Cornell University explains, “For every \$1 million invested in renewable and clean energy, 16.7 jobs are created. By contrast, \$1 million invested in fossil fuels generates 5.3 jobs.” We need to think sustainably in terms of our economy, investing in jobs that will better society and remain viable for more than a few years rather than degrading human health and the environment. #8]>

<[#9 [10.6.1] I believe these points demonstrate the urgent need for relinquishing the pipe dream of allowing the destructive practices of tar sands and oil shale mining. We have far better options—solar and wind, for example, preferably within and around cities—and the technology to pursue them. Tar sands and oil shale technology itself is just evolving, and Utah, Wyoming, and Colorado would become glorified laboratories for the proprietary methods of industry. It’s time to move forward into a clean energy future, not take a giant step backward into a toxic nightmare. #9]>

Sincerely,

Melanie J. Martin

BLM Utah State Office
 DEIS Comments
 May 4, 2012

<([#1 [3.1.3] Page: ES-6 Line 19 Text in document: 1. All lands that the BLM has identified or may identify as a result of inventories conducted during this planning process, as lands having wilderness characteristics (LWC);

Comment: Does this mean even though the lands are LWC and the BLM has chosen not to manage them for wilderness through the RMP process they are still unavailable for leasing? It appears you are singling out oil shale and tar sands as not being able to use the lands while other resources are allowed to use the lands because of the determination that they will not be managed for wilderness. #1]>

<([#2 [2.2] Page: ES-9 Line 8 Text in document: ES.7 PREFERRED ALTERNATIVE

Comment: Does this includes or excludes the existing pending tar sand lease at Asphalt Ridge? #2]>

<([#3 [9.1] Page: 1-12 Line 15 Text in document: The scope of the analysis for this PEIS does not include review of the decisions by the Secretary to issue the RD&D leases

Comment: Does this mean the current RD&D leases along with their preference right acreage are not bound or affected by the decisions resulting from this EIS? #3]>

<([#4 [13] [3.1.7] Page: 1-18 Line 18 Text in document: there are only 5 CHL's from the mid 1980's still in existence

Comment: In the mid 1990's the BLM had another lease sale and there are 13 still in existence. They are also in the Pariette and PR Spring STSA's. #4)>

<([#5 [3.1.7] Page: 1-18 Line: 19-20 "or tar sand claims"

Comment: remove the phrase.

Note: there are 11 conversion applications that include 102 oil and gas leases. One of the applications is located within the Tar Sand Triangle STSA and also lies within the boundary of the Glenn Canyon National Recreation Area. #5)>

<([#6 [3.1.7] Page: 1-38 Comment: The portion of this line should read, "leasing in STSAs within NPS units". #6)>

<([#7 [6] Figure 2.3-2

Comment: There should be some consideration in placing holdings of Enefit American Oil Company and Redleaf as stated on Page 2-15 to give more of a complete picture. #7)>

<([#8 [3.15] Page: 2-22 Comment: FIGURE 2.3.2-1, 2.3.2-2, 2.3.2-3 (Alternative 1). The maps are too vague. They need Townships so they are useful. #8)>

<([#9 [9.6] Page: 2-23 Comment: This shows that a portion of the OSEC preference area to be un available for leasing. This contradicts the lease and the lease grants a superior right. This should be changed. #9)>

<([#10 [9.6] Page: 2-35 Line: 9 Text in document: RD&D First requirement

Comment: If a company proves up on a RD&D lease and their preference right acreage how will they be able to lease other lands in the future? THE PEIS states a RD&D lease is formed first for any leased lands. Need to address how a company with technology showed to be commercial on a RD&D lease can lease additional acreage in the future without having to prove up an additional RD&D process. #10)>

<([#11 [3.15] Page: 2-37 Comment: FIGURE 2.3.3-1, 2.3.3-2, 2.3.3-3. The maps are too vague. They need townships so they are useful. #11)>

<([#12 [3.15] [2.2] Page: 2-38 Figure 2.3.3.2 Comment: All maps show OSECs (Enefits) oil shale preference right lease acreage split with a no leasing zone because of evacuation creek. It is impossible for the company to develop their lease in this situation. The map should show the RD&D lease with the Preference Right Area. The references to the Tar Sands should be removed. A similar map should be available for the Tar Sands. This map should show the 500 foot contour for strip mining and maybe a 3000 foot overburden line for showing the extent of conventional underground mining. (This should most likely be a constraint). #12)>

<([#13 [3.15] Page: 2-41 Comment: An interesting comparison would be to show the resources that would be equal to or greater than 25 gal/ton at 25 feet thick with this map. It appears that the

oil shale resource has not been taken into account. The amount of estimated resources should be shown that would remain or removed. **#13])>**

<([#14 [3.15] Page: 2-41 Comment: The OSEC and AuraSource areas need to be enlarged in a special view. Township lines should be placed on them and the number should be on the outside margin of the map. The Tar Sand information should be removed. The land status should be shown. The field offices should be identified as field offices and not just “Price” or “Moab”. The White River should be identified. Remove the White River Field Office in Colorado on this map. The State oil shale leases should be shown. **#14])>**

<([#15 [3.1.7] Page: 2-43 Line: 20 Text in document: Alternative 3 because of the presence of a potentially eligible WSR, Evacuation Creek (see discussion on this in Section 2.3.3.1). Comment: It has already been determined in the 2008 RMP that Evacuation Creek is not eligible. Also this is not discussed in section 2.3.3.1 **#15])>**

<([#16 [3.1.7] Page: 2-53 Line 21 Text in document: Alternative 4 because of the presence of a potentially eligible WSR, Evacuation Creek (see discussion on this in Section 2.3.3.1). Comment: It has already been determined in the 2008 RMP that Evacuation Creek is not eligible. Also this is not discussed in section 2.3.3.1 **#16])>**

<([#17 [9.6] Page: 2-76 Line: 12 Text in document: 2.4.4
Comment: If a company proves up on a RD&D lease and their preference right acreage how will they be able to lease other lands in the future? THE PEIS states a RD&D lease is formed first for any leased lands. Need to address how a company with technology showed to be commercial on a RD&D lease can lease additional acreage in the future without having to prove up an additional RD&D process. **#17])>**

<([#18 [6.1.1] Page: 2-78 Line 5 Text in document: For the purpose of...
Comment: This is flawed thinking if it is acceptable to evaluate 15 gal/tn and 15 ft in one state, it should be acceptable to use the same criteria in other states. This is obviously, what the parties in the settlement agreement told the BLM to do. **#18])>**

<([#19 [3.1.7] Page: 3-13 Line 30 Text in document: 18 federal coal
Comment: All the leases are gone. They were bought out years ago by the BLM **#19])>**

<([#20 [3.1.7] Page: 3-28 Line: 14 Text in document: The West Tavaputs Plateau West Tavaputs, Sunnyside, etc are in the Price Field Office not the Vernal Field Office **#20])>**

<([#21 [3.5.1.6] Page: 3-98 Line 21 Text in document: 3.5.1.2 Global Climate Change
Comment: There is a lot of contradictory information about global climate change especially since the scandal of falsifying information. I do not think anything should be said is true fact about global climate change unless both sides are presented. **#21])>**

<([#22 [3.14] Page: 4-9 Line 20 Text in document: The statement “ Some mines would be “gassy”;
Comment: The statement “ Some mines would be “gassy”; both H₂S and CH₄ would be present,

placing additional demands on the ventilation system for worker safety and introducing additional controls for the use of explosives. “ is confusing. The terms gassy and non-gassy were classification terms that were used pre 1987 when MSHA used these classifications for non-coal mines. The term gassy means mines that require fresh air to keep methane (CH₄) levels below the explosive limit. Gassy mines have nothing to do with H₂S. After October 27, 1987 the classification of gassy was no longer used to classify mines but the word is still used in the MSHA regulations as a general term. Since October 27, 1987 all non-coal mines are classified under 30 CFR part 57 subpart T. Both the Colony and Long Ridge oil shale mines in Colorado were classified as non-gassy because they were close to the oil shale outcrop and contained no methane or no concentrations to make the mine classification as gassy.

In short, if the mine is gassy, then there are gasses or contaminants that need to be removed to ensure miner health and safety. Larger ventilation systems would be required, which normally is not an issue. “The combination of CH₄ liberated from the fragmentation of the blasted shale, the background CH₄ emissions continuously released from the developed headings, and the fine-sized dust generated in localized high concentration clouds at the face would pose a potential localized ignition hazard during some underground oil shale mining operations.” (DOI, 1995, p. 21) #22]>

<([#23 [3.14] Page: 4-204 Line: 20 Comment: the statement, The greatest concern for chemical hazards associated with underground mining centers on potential inhalation of airborne dusts (including silica dusts), inorganic gases (e.g., CO and H₂S), and organic gases (e.g., CH₄) by workers. Chronic inhalation of irritants such as mineral or metal particles causes pneumoconiosis or miner’s lung, a condition characterized by nodular fibrotic lung tissue changes. Prolonged inhalation of silica dusts causes a form of pneumoconiosis termed silicosis, which is a severe fibrosis of the lungs that results in shortness of breath. Both conditions can be fatal. Underground mining activities also present potential inhalation hazards from exhaust fumes from diesel-powered equipment, including diesel fuel vapors and criteria pollutants.” appears to project that these will happen.

In fact the Mine Safety Health Administration applies the following standard, To evaluate the hazard of exposure to mineral dusts, the content of quartz or other crystalline form of free silica is first considered. The permissible exposure limit or threshold limit value (TLV), for mineral dust containing crystalline free silica is determined by analysis of a sample of respirable dust. Under current regulations, the TLV will vary depending on the percentage of free silica in the dust. For the great majority of respirable mineral dusts, the TLV will be in the range of 0.1-3.3 milligrams per cubic meter of air (mg/m³). When the percentage of free silica is higher, the TLV will be lower. This means that the amount of silica-bearing dust that a miner can be exposed to will also be lower. Source:

http://www.msha.gov/illness_prevention/healthtopics/HHICM06.HTM).

30 CFR part 57.5001 states that any air borne contaminant will be controlled “using threshold limit values adopted by the American Conference of Governmental Industrial Hygienists, as set forth and explained in the 1973 edition of the Conference’s publication, entitled “TLV’s Threshold Limit Values for Chemical Substances in Workroom Air Adopted by ACGIH for 1973,” pages 1 through 54...”, Diesel particulate standards are also put into place in order to protect the employee underground. This is found in 30 CFR part 57.5060 which states, “After May 19, 2006, any mine operator covered by this part must limit the concentration of diesel

particulate matter to which miners are exposed in underground areas of a mine by restricting the average eight-hour equivalent full shift airborne concentration of total carbon, where miners normally work or travel, to 160 micrograms per cubic meter of air (160TC µg/m³).”

As can be seen from the above references, great measures by MSHA are taken to eliminate the effects from these contaminants in mining and if they are followed there would be no affects.

#23])>

<([#24 [3.14] Page: 4-204 Line 31 Comment: The statement ,”Experimental mine and laboratory tests have shown that, given the proper pre dispersed concentrations, particle size, and kerogen or sulfur content, oil shale and sulfide ore dust can be ignited and cause an explosion (DOI 1995), is very misleading. The actual quote from the referenced abstract is “Laboratory and experimental mine test have shown that oil shale and sulfide ore dusts can be ignited given the proper pre dispersed dust concentrations, particle size, and kerogen or sulfur content.” Later in the report on page 5 it states “When fine particles of a combustible dust (Oil shale, sulfide ore, coal etc.) are suspended in an atmosphere that contains sufficient oxygen to support combustion, a dust explosion can occur. In underground mining, the energy required to ignite this dust cloud is supplied by the explosives used in the development and production blasting.” #24])>

<([#25 [13] Page: 4-204 Line: 40 Text in document: “one of the most hazardous occupations” Comment:The statement should read “one of the more hazardous occupations”. #25])>

<([#26 [3.4.6] Page: 6-9 Line 3 Text in document: “The following is a summary of these generic impacts:” This is a true statement for in-situ mining of the oil shale but there is much information that covers retorting of oil shale on the surface which is discussed in the earlier portion of the PEIS. This should be disclosed. #26])>

<([#27 [3.4.6] Page: 6-10 Line 13 Text in document: “and other sensitive water resources in Utah”

Comment The phrase “and other sensitive water resources in Utah” should be enumerated. There is no such thing as a sensitive water resource. #27])>

<([#28 [3.5.3] [3.5.8] Page: 6-11 Line 27

Comment: The phrase “Table 6.1.6-3 presents a summary of the emissions from coal-fired electric power plants.” It is un-necessary in an oil shale analysis. This type of analysis presumes that this will take place. Even if new power generation is required not all would be tied to the project. If new power generation requirements were necessary they may be handled with natural gas, geothermal, nuclear or other forms of electrical energy which has not been disclosed. By concentrating on coal emissions this makes the development of the shale appear worse than it really is. Again the PEIS has failed in supplying information on the surface retorting facilities. There are many in use throughout the world. The information on the air quality or air emissions should be made available in this process. #28])>

<([#29 [3.6] Page: 6-12 Line 8

Comment: The phrase, “Construction-related noise levels could exceed EPA guidelines and/or Colorado regulations (there are currently no state guidelines/regulations for Utah or Wyoming).” has no basis. There should be justification to use a statement like this. Noise needs to have

receptors (such as people) to determine the applicability of noise standards. Most of the areas involved have few inhabitants. #29]>

<[#30 [3.7.2] [3.7.3.7] Page: 6-16 Line 5 Comment: The phrase, “Some impacts (e.g., habitat loss) could continue beyond the termination of shale oil production.” is unsupported and unfounded in the PEIS. #30]>

<[#31 [3.15] Page: 6-78-Line: 79 These maps are almost impossible to read. There should be 3 separate maps for this effort so it would be possible to understand what is being portrayed. #31]>

<[#32 [3.4.5] Page: 6-125 Line 38-42 Comment: This makes some major assumptions that are not necessarily true. There has been no plan approved so there cannot be any assumptions made. Yes, there is a retention dam that was to protect the White River in case of a catastrophic event was to take place. Without discharge permits in place these sentences are a guess and are not fact. They should be removed. #32]>

<[#33 [3.7.1.2] Page: 6-130 Line: 38 Comment: There is no scientific basis for the 2 miles. Why not 1 mile or 5 miles? A reason should be stated for the basis. #33]>

<[#34 [3.7.1.2] Page: 6-131 Line 4 Comment: The in-situ projects in Colorado are substantially different than the project in Utah. The broad statements made for the in-situ projects in many cases do not apply to the Utah project. There should be a distinction between the in-situ retorting and the surface retorting. Impacts of the surface retorting are known because there are many retorts worldwide. This should be acknowledged and disclosed. It is true that the in-situ retorting, the environmental impacts are largely unknown. The ground water and the aquifers at the White River Oil Shale site have been documented in reports as late as 2002. #34]>

<[#35 [3.7.2] Page: 6-133 Line: 33 Comment: The phrase “The establishment and long-term survival of these species on reclaimed land may be difficult”, has no basis. There should be a reason given for this statement like past experience at the XXX site has shown that #35]>

<([#1 [9.8] I thank you for re-opening this PEIS and reducing the amount of BLM land under consideration. #1])> <([#2 [3.4.1] While it is claimed that mining in Utah will use less water than the Canadian Tar Sands, there is a need for a significant amount of water in this, a desert-like area. This area straddles the Green River, the largest tributary of the Colorado River which serves millions of people, to say nothing of the agricultural lands and wild life downstream. In drought years, how do we assure that critical water will not be diverted to oil production when it is critically needed downstream? #2])> <([#3 [3.4.1] In case of a spill/leak/truck accident—if the product leaving the mining area gets into the Green River, or any other waterway, have studies been done on how this type of petroleum product affects waterways? Does this product float or sink? How would a spill be contained in low river situations? In a raging flood? In a blizzard? Who is responsible for a potential clean-up? Are resources available for a timely response? The same questions need to be answered with regards to the “citrus solvent” which will need to be moved to the processing site in tremendous quantities. #3])> <([#4 [3.5.1.6] While the BLM is not an air quality agency, the quality of the air does impact the human and wild life population. What is the increase in greenhouse gas emission for this whole process—from the original disturbance of the land, transportation of equipment and supplies to the site(s). the processing of the tar sands onsite, transportation of the processed product to the petroleum refineries, refining the product, and, especially, included the final combustion of the finished product? #4])> <([#5 [3.13] Please examine the “citrus solvent.” It is hardly a benign substance. Is it attractive to wild life (citrus peels are in cattle feed)? Once the treated sands are replaced, are there traces of the solvent left? How does this affect the restoration of the area—will the same plants and animals be able to live there? #5])> <([#6 [3.13] The disturbance of the land will be massive and will inevitable produce heavy metals and other toxins. Are there provisions for testing for these products and plans for safely using or disposing of them? #6])> <([#7 [1] Please spare no effort or expense in determining the current state of any area to be mined—air quality, water quality, noise levels, soil testing, flora and fauna. There should be no opportunity for a developer to

claim that they haven't made anything worse than it was. #7])> Thank you for considering my comments.

May 2, 2012 BLM Oil Shale and Tar Sands Draft Programmatic EIS Argonne National Laboratory 9700 S. Cass Ave. Argonne IL 60439 Ken Salazar, Secretary U.S. Department of the Interior 1849 C Street, N.W. Washington DC 20240 Sent this date via email: exsec@ios.doi.gov Robert Abbey, Director Bureau of Land Management 1849 C Street, N.W., Room 5665 Washington DC 20240 Sent this date via email: Director@blm.gov (These comments also submitted electronically via the OSTSEIS website.) RE: Comments regarding 2012 Oil Shale and Tar Sands Programmatic EIS

Greetings: <([#1 [1.5] I appreciate this opportunity to provide comments on the new Draft PEIS for oil shale development. My background and experience comes from my position on the Unconventional Fuels Task Force that was created in Section 369 of the Energy Policy Act of 2005, Vice Chairman of ECCOS and as a local citizen with above average understanding of the oil shale and tar sands resource and the potential industry it holds. Because of this knowledge of local economics, energy and business development, demographics and business finance, I was appointed to represent the communities of affect within the State of Utah by Secretary Bodman. This Task Force was an unbiased collaborative effort among the States of Colorado, Utah, Wyoming, Mississippi and Kentucky, their communities and the Secretaries of Defense, Energy and Interior. Since 2005, countless hours of work and research has been put forth by this group to offer many of the answers that Congress and the energy markets are looking for in relation to commercial development of unconventional fuels, oil shale being a large part of that group. Very comprehensive volumes of our findings, annual reports, and other pertinent data can be found through the parties themselves, their web site www.unconventionalfuels.org or the SPR office of the Department of Energy. I bring these items to point as I do not believe that this PEIS has consulted with those documents properly especially in the area of business economics, economies of scale and return on investment for those that enter into this unique fuel development. There must be a financial advantage for a return on investment and the opportunity for a large scale industry. The lack of this insight on behalf of this PEIS has discouraged rather than encouraged more endeavors. Should we also question if DOI and the BLM are truly

following the original scope of the law as passed in Section 369 of EPACT 2005? #1])> <([#2 [9.8] [2.1.1] A complete and acceptable PEIS was completed in 2008 at great expense to the taxpayers and small rural communities only to be thrown out to appease a very small contingent of obstructionists. In that event we have spent millions more to rebuild the “better mousetrap”! We have done this as our Nation’s economic future is in harm’s way with lower credit ratings, multi-trillion dollar budget deficits, near record unemployment and home foreclosures while we continue to pay high energy prices dictated to us by unstable and even hostile countries. Have we totally lost our minds here folks? This entire process is, as President Reagan paraphrased, the problem not the solution. We can no longer expect the majority of the United States to suffer at the hands of the special interest groups that wish to stop any and all development of the rich natural resources we have available. This PEIS is totally ludicrous and the only sensible solution at this point is Alternative 1-No Action along with a business friendly attitude to encourage responsible development of resources right here in our back yard. #2])> Sincerely, Bill Johnson, Utah Member US Congressional Task Force on Unconventional Fuels 483 E 700 N Vernal, UT 84078 435-650-5572 See Attachment.

Oil Shale and Tar Sands Resources

Draft Programmatic EIS

Argonne National Laboratory

9700 South Cass Avenue

EVS/240

Argonne, Illinois 60439

Re: Draft PEIS for Allocation of Oil Shale and Tar Sands Resources on BLM Lands in Colorado, Utah and Wyoming

Dear Sir/Madam:

On behalf of the Western Business Roundtable (“Roundtable”), I am writing to provide our input regarding the Bureau of Land Management’s (BLM) decision to revisit the 2008 Programmatic Environmental Impact Statement (PEIS) which has governed federal research-development-commercialization efforts for Western oil shale and tar sands resources.¹

As BLM notes, the planning area for the oil shale resource is the Piceance Basin in Colorado, the Uintah Basin in Utah and the Green River and Washakie Basins in Wyoming. For the tar sands resources, the planning area is within the Colorado Plateau in Utah. Given the West-centric concentration of these resources, the federal approach to oil shale/tar sands development has long been of interest to the Roundtable.

The Roundtable is a broad-based coalition of companies doing business in the Western United States. Our members are engaged in a wide array of enterprises including: engineering, construction, communications, manufacturing, retail sales, refining, iron and steel, mining, electric power generation, and oil and gas exploration, development and distribution. We work to defend the interests of the West and support policies that encourage economic growth and opportunity, freedom of enterprise and a sound approach to conservation and environmental preservation.

¹ 77 FR 5833, February 6, 2012

<([#1 [11] We participated in the public input process for the BLM’s 2008 PEIS for oil shale development. In that context, we discussed the key elements important for implementing a viable long-term federal commercial oil shale leasing program. We have linked our 2008 comments below and ask that they be incorporated, by reference, in our comments here.²

The Roundtable enthusiastically supported the goals of the Energy Policy Act of 2005 (“EPAct05”) to establish a viable commercial leasing structure for oil shale on federal lands. The Roundtable believes that a responsible federal energy policy must include the environmentally-sensitive development and utilization of all the domestic energy resources we have available to us. We believed then, and we do now, that Western oil shale resources offer significant potential as a longer-term solution to the United State’s growing energy needs.

² Roundtable Comments: 2008 BLM Oil Shale and Tar Sands Draft PEIS:

http://www.westernroundtable.com/Portals/0/Docs/energy/2012/WBRT_Comments_OilShale_Rule2008_FINAL.pdf and

http://www.westernroundtable.com/Portals/0/Docs/energy/2008/WBRT_Comments_OilShale_PEIS_FILED.pdf

#1])> <([#2 [6.1.2] The oil shale resources of the West offer tremendous potential because the region is home to the world’s largest deposits of the resource. The Green River Formation in Colorado, Utah and Wyoming contains an estimated 1.5 to 1.8 trillion barrels of oil. Even by conservative estimates, there are 800 billion barrels of recoverable oil from oil shale in the area – that is three times greater than the proven oil reserves of Saudi Arabia. Seventy percent of these reserves are under the control of the federal government. #2])>

<([#3 [10.6.3] Tapping these extraordinary energy resources will lessen our reliance on hostile, foreign sources of energy, strengthen our domestic energy independence, help bolster the West’s economy and contribute greatly to the long-term prosperity of our nation. #3])>

<([#4 [9] The challenge of developing oil shale lies in identifying an economically efficient and environmentally responsible way to develop these vast resources. It is important for the BLM to

recognize the capital investment and associated business risk that comes with developing the technology to produce this energy. BLM can best respond to these realities by:

- Making a strong commitment to a commercial oil shale leasing program;
- Providing greater certainty to the leasing process at every stage;
- Developing a regulatory structure that makes allowances for the intensive investment that businesses must make to produce this domestic energy resource.

Unfortunately, BLM's "fresh look" appears more focused on hobbling commercial leasing than on encouraging development. We believe this approach is fundamentally wrong.

Ironically, delay is hindering the development of the very technology many of the proponents of more delay are requesting. It certainly delays the objective of becoming a more energy-independent country in an unstable world, and it diminishes the economic opportunities for jobs in our Western communities. Perhaps most importantly, delay takes out of the mix a source of fuel that has the ability, in the future, to substantially mitigate the price volatility for fuels that has so battered American consumers in recent years.

Absent a reliable structure for leasing over 70 percent of the potential resource, companies cannot accurately evaluate the risk versus the reward of pursuing oil shale development. If BLM can provide greater certainty, both through a solid commitment to implement a commercial leasing program and through institution of reasonable leasing terms and requirements, businesses will respond to the opportunity. In that case, our nation will reap the benefits of a vast domestic energy resource. On the other hand, the uncertainty that persists – in the absence of a viable, appropriately-scaled commercial leasing regulatory structure -- will eventually smother the innovation needed to tap the West's tremendous domestic oil shale resources. #4]>

CONCLUSION

Thank you for your consideration of these comments.

Submission Text

Please have these comments on your proposal to lease federal Lands for tar sands/oil shale mining in Utah/Colorado/Wyoming. <([#1 [1.1] You need to hold a proper and sufficient public hearing in Salt Lake City. The hearing I attended on Wednesday, March 14, 2012 at the Grand America Hotel in Salt Lake City, was no public opportunity at all. The room did not fit. It was way way to small. Even though you must have known it was too small given the attendance at earlier presentations. Your presenters refused to answer questions and instead played musical chairs with the little room forcing most of the public to leave without answers. We want a public hearing and not the dog and pony show you presented! #1])> <([#2 [1.2] Further, I suggest, even demand, that you NOT expand the land available for tar sands/oil shale mining in Utah/Colorado/Wyoming. I understand there are several relatively small plots currently under lease for experimental tar sands/oil shale mining in Utah/Colorado/Wyoming. These sites should be promptly remediated and NOT expanded. No additional acres should be allocated to this loser project. In short hand: Several Problems with Tar Sands and Oil Shale Mining are: It requires huge amounts of energy to produce, leading to high greenhouse gas emissions. It releases toxic substances into the environments, including carcinogens. It uses massive amounts of water and will pollute ground water and surface waters now used for other purposes. It destroys habitat. It produces dirty energy that pollutes the environment. #2])> Specifically consider: <([#3 [6.3] The PEIS is deficient because you cannot determine the programmatic environmental impact of committing so many acres to this project when the technology intended to be used for the project is quite unknown and unproven. #3])> <([#4 [4.2] [3.14] Further we do know that toxic waste/citric solvent would be released during the project including carcinogens into the environment and the cumulative impact has not been disclosed in the PEIS. #4])> <([#5 [3.4.1] Also, recent research indicates that Oil shale beds often serve as the floor for aquifers and heating the oil shale in place will heat the aquifer. That will likely causes the groundwater to become contaminated with elements like arsenic and fluoride, creating a groundwater nightmare. Because the Green River formation lies within the greater Colorado River drainage basin, any surface or groundwater contamination will not only affect the local population but will likely have a significant impact on water quality for the millions of downstream users. #5])> <([#6 [3.4.1] Water use. While the details remain unclear, the implication is unmistakable – unconventional fuel development will increase demand for water in an arid region where demand for water often exceeds supply. Not all who seek water will be able to satisfy their thirst at a

palatable cost, and non-consumptive uses will be pitted against powerful economic interests. #6)> <(#7 [1.5] This PEIS is fatally deficient. Best to rescind, research and reissue. #7)> Sincerely, ____/ Lionel Trepanier____ Lionel Trepanier 411 s 800 e Salt Lake City UT 84102 LionelTrepanier@gmail.com 801-487-2295 See Attachment.

CHARLES PRICE

The staff of the Wyoming Game and Fish Department has reviewed the Draft Programmatic Environmental Impact Statement for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by Bureau of Land Management in Colorado, Utah and Wyoming. We offer the following comments regarding the four alternatives for your consideration.

<([#1 [2.1] [3.7.3.1] Alternative 1- No Action

This alternative would provide no additional protection for wildlife or habitat in Wyoming, but could have a number of potential negative effects on the state's wildlife and habitat resources. Although there are no anticipated impacts from the allocation of leases in the Kemmerer, Rock Springs, and Rawlins Field Offices, Alternative 1 leaves an estimated 1,000,574 acres open for future commercial oil shale leasing in southwest Wyoming, including approximately 248,000 acres available for surface mining operations. Given the amount of surface disturbance involved in all three methods of oil shale extraction - surface mining (5,760 acres), underground mining (1,650 acres), and in-situ process (5,760 acres) - the Department would anticipate the potential for negative impacts on wildlife and habitat resources related to habitat loss, fragmentation, and degradation, among other things. Project and site-specific NEP A would reveal those potential impacts, and is required for all future oil shale leasing.

Although the allocation of leases in Alternative 1 does not necessarily mean that + 1 million acres

of land in the Green River and Washakie Basins will be leased for commercial oil shale production, Alternative 1 would allow for the possibility of oil shale leasing on approximately 31,000 acres of identified floodplains, wetlands, and riparian areas and could impact 228.7 miles of stream (includes a 2 mile buffer as described in the PEIS) on 18 different streams in these basins. Additionally, the leasing area proposed in Alternative 1 overlaps a number of sensitive, critical, and crucial habitats, including Areas of Critical Environmental Concern (ACECs) open to mineral development. As described in the PEIS, oil shale development and commercial production in these areas would have many short-term, long-term, direct, and indirect impacts on the state's wildlife and habitat resources and would likely increase the difficulty of managing for healthy species populations in southwest Wyoming due to increasingly disturbed and fragmented habitat conditions.

Specifically, the leasing area proposed in Alternative 1 overlaps 22 aquatic, terrestrial, and combination priority areas (i.e., crucial habitat) and enhancement areas that are defined in the Department's Strategic Habitat Plan (SHP). The SHP was developed to help guide the Department in meeting the challenges of habitat conservation in the face of forces like energy development, climate change, invasive species, and drought. Future leasing and commercial oil shale development in these identified areas would necessarily create more complexity in managing for healthy wildlife and habitat. The leasing area proposed in Alternative 1 overlaps thousands of acres of big game crucial winter range, including important winter habitats for

pronghorn, mule deer, and elk. The disturbance, fragmentation, and long-term loss of crucial winter habitats is detrimental to the ability of these species survive difficult winter months and maintain good body condition, and so also impacting reproductive success. In addition to crucial winter range, the leasing area overlaps pronghorn, mule deer, and moose winter range, as well as elk calving areas. The Alternative 1 proposed leasing area overlaps both riparian and terrestrial key non-game wildlife areas in southwest Wyoming. Although some of these habitats may be protected by timing stipulations during the development phase, few protections would exist once commercial oil shale production begins. Moreover, timing stipulations do not mitigate the loss or fragmentation of habitat. It is unclear whether or not oil shale extraction would be treated like oil and gas activities and the leases would have resource protecting stipulations attached, or whether it is treated as a mining activity with very little restriction under existing mining laws. #1)>

The leasing area proposed in Alternative 1 overlaps thousands of acres of greater sage-grouse habitat, including areas designated as core population areas by the State of Wyoming Greater Sage-Grouse Core Area Protection Executive Order 20 11-5 (E.O. 2011-5). In June 2011, Governor Mead signed E.O. 20 11-5 to replace E.O. 2010-4 signed by former Governor Freudenthal in August 2010, which replaced E.O. 2008-2, also signed by Governor Freudenthal, in August 2008. Wyoming's "Core Population Area" strategy is a statewide conservation strategy developed in response to declining sage-grouse populations and the potential federal listing by the U.S. Fish and Wildlife Service (Service) of the greater sage-grouse as threatened or endangered. In March 2010, the Service rendered a status finding for the greater sage-grouse of wanted for listing but precluded. The Service will repeat its assessment and make a determination either to list the bird under the Endangered Species Act of 1973 or find that a listing is not wanted by September 2015 for the majority of the bird's range (including Colorado, Utah, and Wyoming).

<([#2 [3.7.5.1] Wyoming's greater sage-grouse core area strategy defines priority conservation areas within the state and sets forth a permitting process and stipulations for development within those defined core areas. The strategy also has established two connectivity areas in northern Wyoming with stipulations for development. As noted in previous comments on the PEIS (see 5/16/ 11 letter), the area made available for application for oil shale leasing in Alternative 1 in Wyoming overlaps the Greater South Pass, Seedskaadee, Uinta, Blacks Fork, and Salt Wells core areas. Per E.O. 201 1-5, each application for development in core area would require the use of the Density and Disturbance Calculation Tool (DDCT) as part of the permitting process and the application of stipulations for development, which, among other things, includes limits on surface disturbance and density of anthropogenic disturbances within core area. The Department has been on the front lines of implementing this statewide conservation strategy, and to date, some of the biggest barriers to its success are valid and existing lease and development rights on BLM lands. Given the extent to which oil shale operations disturb the surface - surface mining (5,760 acres), underground mining (1,650 acres), and in-situ process (5,760 acres) - allowing for the allocation of oil shale leasing in Wyoming's sage-grouse core areas has the potential to undermine E.O. 2011-5 and the core population area strategy by adding additional rights to lease and develop, that are not likely to be denied, in core sage-grouse habitat. Surface disturbance levels exceeding 5% in an area defined by the E.O. 2011 -5 DDCT process, and oil and gas and mining disturbance density levels that exceed an average of 1 per 640 acres are projected to cause declines in local sage-grouse populations in these areas. The declines would necessarily

contribute to a future listing decision by the Service. #2])>

<([#3 [3.1.2] In addition to directly impacting various species and their habitats, the Department anticipates

that commercial oil shale leasing could impact recreational hunting and angling opportunities in southwest Wyoming. #3])>

<([#4 [2.2] [3.7.3.8] Alternative 2 - Conservation Focus (2a), and with RD&D First Requirement (2b,

Preferred)

Of the four alternatives, this alternative offers the most protection to Wyoming's wildlife and habitat, aside from no allocation of oil shale leases in Wyoming as described in Alternative 3. Alternative 2 reduces the amount of area available for future commercial oil shale leasing by approximately 826,000 acres, and Alternative 2a further restricts the issuance of commercial leases until an initial Research Development and Demonstration (RD&D) lease demonstrates both the technical and economic feasibility of the extractive technology, which is limited to a 160 acre area. If the RD&D program requirements are met, the lease may be converted to a commercial production lease, which could include up to an additional 4,960 acres of contiguous area.

Although there are no anticipated impacts from the allocation of leases in the Kemmerer, Rock Springs, and Rawlins Field Offices, Alternative 2 leaves an estimated 174,476 acres open for future commercial oil shale leasing in southwest Wyoming. Given the amount of surface disturbance involved in all three methods of oil shale extraction - surface mining (5,760 acres), underground mining (1,650 acres), and in-situ process (5,760 acres) - the Department would anticipate the potential for negative impacts on wildlife and habitat resources related to habitat loss, fragmentation, and degradation, among other things. Project and site-specific NEPA would reveal those potential impacts, and is required for all future commercial and RD&D oil shale leasing.

With regard to this alternative, the Department would anticipate fewer (2a and 2b) and smaller scale (2b) impacts than the no action alternative. Both Alternative 2a and 2b exclude many critical and sensitive habitats in Wyoming from future oil shale leasing. Exclusions include: Lands with wilderness characteristics; Adobe Town; sage-grouse core areas; ACECs; land identified as having steep slopes and/or fragile, highly erosive soils; and identified, protected wetlands, riparian habitats, and floodplains. An estimated 79.6mi of stream (includes a 2 mile buffer as described in the PEIS) on 12 different streams in the Green River and Washakie Basins has the potential to be impacted by oil shale development under this alternative, which is ~ 150 fewer miles than the no action alternative. A majority of big game crucial winter habitats in Wyoming are avoided, as well. #4])>

<([#5 [2.2] In addition to fewer and smaller scale impacts, Alternative 2b would allow existing technology

to continue to advance and possibly become more efficient and a less disturbing and disruptive activity than it is at present. Also, the issuance of RD&D leases prior to conversion to commercial leases would allow operators to work with state and federal agencies early on in the planning and siting processes, as well as in developing resource mitigation plans in advance of commercial development. #5])>

<([#6 [2.3] [3.7.3.8] Alternative 3 - Research Lands Focus

Alternative 3 allows for additional RD&D leasing in existing oil shale development areas in Colorado, and therefore no RD&D or commercial leases would be available in Wyoming. The Department would not anticipate any terrestrial or aquatic wildlife and habitat impacts in southwest Wyoming resulting from this alternative. However, similar to Alternative 2b, this alternative would allow existing technology to continue to advance and possibly become more efficient and a less disturbing and disruptive activity than it is at present. Also, the issuance of RD&D leases prior to conversion to commercial leases would allow operators to work with state and federal agencies early on in the planning and siting processes, as well as in developing resource mitigation plans in advance of commercial development. #6])>

<([#7 [2.4] [3.7.5.1] Alternative 4 - Moderate Development (4a), and with RD&D First Requirement (4b)

The potential impacts on Wyoming's wildlife and habitat resources as a result of Alternative 4 would be similar to those described under Alternative 1. Although there are no anticipated impacts from the allocation of leases in the Kemmerer, Rock Springs, and Rawlins Field Offices this alternative leaves an estimated 967,446 acres open to future commercial leasing (a 33, 128 acre reduction from Alternative 1). Given the amount of surface disturbance involved in all three methods of oil shale extraction - surface mining (5,760 acres), underground mining (1,650 acres), and in-situ process (5,760 acres) - the Department would anticipate the potential for negative impacts on wildlife and habitat resources related to habitat loss, fragmentation, and degradation, among other things. Project and site-specific NEPA would reveal those potential impacts, and is required for all future oil shale leasing.

Although the allocation of leases in Alternative 4 does not necessarily mean that - 1 million acres of land in the Green River and Washakie Basins will be leased for commercial oil shale production, Alternative 4 would allow for the possibility of oil shale leasing on identified floodplains, wetlands, and riparian areas and could impact 217.3 miles of stream (includes a 2 mile buffer as described in the PEIS) on 18 different streams in these basins. Additionally, the leasing area proposed in Alternative 4 overlaps a number of sensitive, critical, and crucial habitats, excluding only Adobe Town and ACECs. Lands allocated for leasing in this alternative overlap thousands of acres of big game crucial winter habitat; sage-grouse habitat, including defined core areas; Department-identified priority and enhancement areas; and key non-game wildlife areas as described under Alternative 1. Although some of these habitats may be protected by timing stipulations during the development phase, few protections would exist once commercial oil shale production begins. Moreover, timing stipulations do not mitigate the loss or fragmentation of habitat. #7])>

<([#8 [3.7.5.1] As with Alternative 1, the Department would have the same concerns about allocating oil shale

leases in sage-grouse core area. Although Alternative 4 is a moderate development alternative when compared to the no action alternative, given the extent to which oil shale operations disturb the surface - surface mining (5,760 acres), underground mining (1,650 acres), and in-situ process (5,760 acres) - allowing for the allocation of oil shale leasing in Wyoming's sage-grouse core areas has the potential to undermine E.O. 201 1-5 and the core population area strategy by adding

additional rights to lease and develop, that are not likely to be denied, in core sage-grouse habitat. Surface disturbance levels exceeding 5% in an area defined by the E.O. 2011-5 DDCT process, and oil and gas and mining disturbance density levels that exceed an average of 1 per 640 acres are projected to cause declines in local sage-grouse populations in these areas. The declines would necessarily contribute to a future listing decision by the Service. #8]>

<([#9 [3.1.2] Similar to Alternative 1, in addition to directly impacting various species and their habitats, the Department anticipates that commercial oil shale leasing could impact recreational hunting and angling opportunities in southwest Wyoming. #9])>

<([#10 [2.4] Under Alternative 4b, the Department would initially anticipate fewer and smaller scale impacts than alternative 4a or the no action alternative. In addition to fewer and smaller scale impacts, Alternative 4b would allow existing technology to continue to advance and possibly become more efficient and a less disturbing and disruptive activity than it is at present. Also, the issuance of RD&D leases prior to conversion to commercial leases would allow operators to work with state and federal agencies early on in the planning and siting processes, as well as in developing resource mitigation plans in advance of commercial development.

RE: Notice of Availability of the Draft Programmatic Environmental Impact Statement for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah and Wyoming, 77 Fed. Reg. 5833 (Feb. 6, 2012)

Dear BLM Manager:

ExxonMobil Exploration Company ("ExxonMobil") appreciates the opportunity to comment on the Bureau of Land Management's ("BLM's") Oil Shale and Tar Sands Resources draft Programmatic Environmental Impact Statement ("2012 Draft PEIS"). <([#1 [10.6.3] The company

believes a commercial oil shale and tar sands leasing program is in the best interest of the nation in helping to meet the country's energy needs. BLM lands in Colorado, Utah and Wyoming present strategically important long-term domestic energy resource potential. ExxonMobil urges the BLM to take a similarly long term view of land use policy that may ultimately allow development of oil shale and tar sand resources in an environmentally sound manner, pursuant to The Energy Policy Act of 2005 ("EP Act"). [#1]> <([#2 [9.7] Premature and precautionary removal of access to

the vast majority of land with this resource potential will put the viability of continued research and development at risk by making commerciality of development far less likely. ExxonMobil is currently pursuing a Research, Development and Demonstration ("RD&D") lease in Colorado to continue to develop and assess the feasibility of in-situ oil shale and nahcolite recovery. The proposed removal of 90 percent of lands in Colorado and three-quarters of currently available land in the three-state area will discourage our and others' continued RD&D expenditure by drastically shrinking the size of and introducing huge discontinuity for potential resource recovery. This action would have serious economic and national security implications and should not be taken before the viability, means and need for recovery of this resource are known.

#2])> <([#3 [2] ExxonMobil is concerned that the alternatives analyzed, and the preferred alternative identified, in the 2012 Draft PEIS are overly restrictive and contrary to the purposes of the EP Act. BLM has already analyzed the potential environmental effects and identified lands that may be available for development of oil shale and tar sands resources in a 2008 Programmatic Environmental Impact Statement (“2008 PEIS”). In that document and the subsequent Record of Decision (“2008 ROD”), BLM correctly concluded that specific environmental impacts, and therefore appropriate mitigation, could not be adequately analyzed until the leasing or project approval phase. Notwithstanding, the 2012 Draft PEIS reverses this decision and purports to reanalyze the environmental impacts associated with amending ten land use plans in Colorado, Utah and Wyoming in order “to reassess the appropriate mix of allowable uses with respect to oil shale and tar sands leasing and potential development.”¹ BLM’s Notice of Availability states that, while the 2012 Draft PEIS assesses various mitigation measures, “[n]o decision regarding the adoption of such measures is being made as part of this planning initiative; such measures may be applied, if appropriate, at the discretion of the decision-maker, at the time these resources are leased and/or developed.”² This position is contrary to the preferred alternatives listed in the 2012 PEIS.

1 77 Fed. Reg. 5833, 5834 (Feb. 6, 2012)

2 Id. at 5835 **#3])> <([#4** [9] The U.S. oil shale industry needs consistency in federal policy and regulation to provide

the confidence needed for industry to make long-term investments in technology and research demonstration projects. This important resource development must carefully balance other priorities with respect to the use of Federal lands, including environmental protection and the need for paced, sustainable development that is required to progress technology and infrastructure over a multiple-year horizon. **#4])> <([#5** [10.6.3] While renewable or alternative energy supplies will

make an important contribution to our energy mix, fossil fuels still supply the great majority of energy in the U.S. and will continue to do so for the foreseeable future. As Congress recognized in Section 369 of the EPAct, access to the oil shales of Colorado, Utah, and Wyoming is therefore critically important to sustain our country’s energy security.

#5])> <([#6 [2.1.1] ExxonMobil continues to support the BLM in its efforts to develop a commercial leasing

program to make Federal lands available for commercial oil shale and tar sands leasing. We strongly urge BLM to select the “no action alternative” and leave the current allocation decisions from the 2008 ROD in place. We believe that access to oil shale resources as outlined in BLM’s 2008 PEIS and ROD could significantly increase domestic sources of energy supply in the years to come. The in-place oil shale resource for the Green River formation in the three-state area has been estimated at 1.5 to 1.8 trillion barrels. The size of the resource supports its strategic importance and the economic impact that its development would have. We believe that there would be significant economic benefits locally, statewide, and nationally as a result of oil shale development in the form of jobs and economic growth.

Of the Alternatives presented, Alternative 1 (No Change to 2008 ROD) is the most consistent with the EPAct and the only reasonable alternative at this stage of the NEPA process. “The lands available for lease under the 2008 land use plan amendment decisions would remain

available for future leasing consideration under the No Action Alternative. These lands comprise the most geologically prospective oil shale and tar sands areas administered by the BLM . . . but excluding lands that are exempted by statute, regulation, or Executive Order.”³ ExxonMobil supports the BLM’s 2008 amendment of land use plans to guide future management of geologically prospective areas where oil shale and tar sands resources are present. We believe a commercial oil shale and tar sands leasing program is in the best interest of the nation with respect to meeting the country’s energy needs. Thus, ExxonMobil strongly favors Alternative 1, the No Action Alternative, which would leave the current allocation decisions from the 2008 ROD in place, and best meets the requirements of the EPO Act.

There is no compelling reason to change BLM’s well researched and considered oil shale and tar sands leasing decisions made in 2008. The process took several years, was thorough and involved broad public participation from all stakeholders. We believe the 2008 BLM ruling provides appropriate acreage for potential commercial leasing, while preserving the adequate measures for environmental and socioeconomic protection. We strongly believe that viable economic development can only be sustained if performed in a safe, environmentally sound way. The “no action alternative” would support a long-term approach that favors resource access, and regulatory and fiscal stability with a level of certainty that supports the significant research investments required to develop technologies to unlock these vast oil and gas resources.

3 2012 Draft PEIS at ES-5 #6)>

<([#7 [9.2.4] Contrary to BLM’s conclusion in its 2008 PEIS and ROD, and without any explanation

for its change in position, the 2012 Draft PEIS’s Preferred Alternative (Alternative 2) would impose mandatory mitigation measures for greater sage grouse by excluding “core or priority sage grouse habitat” from development. As an initial matter, neither “core” nor “priority” sage grouse habitat has yet been defined by BLM, even though the Preferred Alternative purports to incorporate restrictions on development in these areas. As a result, interested parties cannot meaningfully comment on these restrictions at this time, because BLM has not defined the relevant terms.

Moreover, approval of this Alternative would still allow incorporation of mitigation measures identified as part of the ongoing efforts to increase the protections of sage grouse habitat, as BLM concedes additional NEPA analyses are required before any leases could be issued or developed. Thus, it is not the case here that BLM is ignoring its current policy on sage grouse management, rather BLM is presuming what such future guidance may entail and impermissibly imposing that guidance as mandatory mitigation at the programmatic stage. In fact, the total area actually developed even under Alternative 1 is certain to be smaller than outlined, precisely because regulatory and land management factors analyzed at the leasing and project approval phases have not yet been considered and will undoubtedly come into play. Indeed, as discussed further in the attached, BLM has recognized that the environmental impacts cannot be fully assessed at the programmatic level, but must be done at the leasing or project approval stage. Indeed, this would allow BLM to consider not only the resources that may be affected and whether any “core” or “priority” habitat are in the area, but also the actual technology being used and additional efforts by industry to reduce the impacts on sage grouse

habitat.

#7)> <([#8 [2.4] Although ExxonMobil strongly supports Alternative 1 in the 2012 Draft PEIS, we note that Alternative 4 (moderate development alternative) may also be consistent with the EPA Act, unlike Alternatives 2 and 3. Alternative 4 is similar to Alternative 1 except that it would exclude from oil shale and tar sands leasing the whole of the Adobe Town “Very Rare or Uncommon” area, as designated by the Wyoming Environment Quality Council on April 10, 2008, and 76,666 acres in existing Areas of Critical Environmental Concerns (ACEC) in the 2008 PEIS plus an additional ACEC acreages as a result of Colorado, Utah, and Wyoming planning efforts recently completed.⁴ This less restrictive Alternative (Alternative 4) was also found to be consistent with the BLM’s 2011 settlement agreement with the Colorado Environmental Coalition, et al.⁵ It would manage sage-grouse habitat the same as under Alternative 1 but with individual field offices determining the management of such areas through additional NEP A and planning processes.^{fi} As discussed further in the attached, BLM is undergoing a separate process to develop national management considerations, which would also apply to Alternatives 1 and 4.

4 See 2012 Draft PEIS at ES-8 to ES-9

5 Id. at ES-9 #8)> Additional detailed comments of ExxonMobil are provided in the attached document.

Again, we appreciate the opportunity to comment on the 2012 Draft PEIS. Please do not hesitate to contact us with any questions.

Thank you for the opportunity to comment.

DETAILED COMMENTS OF EXXONMOBIL EXPLORATION COMPANY
ON THE DRAFT PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT
FOR ALLOCATION OF OIL SHALE AND TAR SANDS RESOURCES ON
LANDS ADMINISTERED BY THE BUREAU OF LAND MANAGEMENT IN
COLORADO, UTAH, AND WYOMING

77 Fed. Reg. 5833 (Feb. 6, 2012)

OUTLINE

I. Background

A. Energy Access Perspective

II. BLM Has Not Adequately Explained its Change in Position from the 2008 ROD and its Decision to Issue a New PEIS.

A. The 2012 Draft PEIS does not identify any new information to support exclusion of undefined “core or priority sage grouse habitat” from any oil shale or tar sands development.

B. BLM does not explain its change of position to exclude all of Adobe Town, contrary to its decision in 2008.

C. BLM’s voluntary settlement does not justify its change in position.

III. The Preferred Alternative (Alternative 2) is Counter to the United States’ Energy Policy as Identified in the Energy Policy Act, Which Defines the Purpose and Need for the BLM

Action Here.

- A. An RD&D-first component is inconsistent with the EPAct.
- B. The 2012 Draft PEIS is inconsistent with the EPAct and with FLPMA and BLM policy.
- C. The EPAct defines the Purpose and Need for this action, and BLM should return to the Purpose and Need statement in the 2008 PEIS and ROD.
- IV. As BLM Found in the 2008 ROD, Decisions Regarding Sage Grouse Mitigation Should be Considered at Later Planning Stages.
- V. Any Exclusion of Potential Oil and Gas Leasing on “To Be Defined” Sage Grouse Habitat may be viewed as Arbitrary and Capricious.
 - A. Protection for the sage grouse should be deferred to the environmental reviews of leasing or project-specific actions.
 - B BLM cannot impose mandatory limitations based on future “guidance.”
 - C. BLM has failed to take a “hard look” at the potential impacts of the alternatives in the 2012 Draft PEIS.
 - D. Basing a decision prior to defining the precise parameters of the agency action is arbitrary and capricious.
- VI. BLM Should Await Completion of its Ongoing Review of Sage Grouse Management on Public Lands.

VII. Other Technical Comments

- A. Oil Shale development and water usage
 - B. Multi-Mineral Leasing
- Comments of ExxonMobil Exploration Company
Oil Shale and Tar Sands Draft PEIS
May 4, 2012

Page 2

I. Background

<([#9 [9] A. Energy Access Perspective

Increased access to U.S. energy supplies will strengthen energy security, create jobs, stimulate economic growth, and generate tremendous revenues to federal and local governments. In order to increase U.S. energy supplies, expanded access is needed to both areas that are currently off-limits to the oil and gas industry and to areas with large unconventional oil and natural gas resources. Decisions and regulatory frameworks governing the development of these resources need to be efficient and transparent. They should also recognize current scientific, technological and economic realities of oil and natural gas exploration and production.

The oil and gas industry currently faces significant regulatory challenges that are limiting development of our national resources. The business and national energy security implications of ever-growing barriers and regulatory requirements are significant and add uncertainty, time, and expense to the leasing and permitting process at all levels, making it more difficult, expensive, time-consuming and even possible to secure leases and to translate them into actual drilling permits, new drilling activity, and eventual production.

U.S. energy policy should provide for responsible development of oil and gas resources to help meet the nation’s long term energy needs. Policies should provide for both conventional and unconventional oil and natural gas resources and must require that exploration and development be done in an environmentally and socially responsible manner. Recent studies project global energy demand will be about 30 percent higher in 2040 than in 2010, even with

substantial gains in efficiency across all regions of the world. Meeting this demand will require all energy sources and must include development of new oil and natural gas supplies. One important resource that will help us meet this demand is oil shale.

ExxonMobil supports development and use of high-quality scientific and technical knowledge bases to inform science-based regulation, leasing, and permitting decision making. Industry and the federal government should also continue to conduct and support research in key safety, health, and environment related areas associated with exploration.

#9) > <(**#10** [9.2.2] [2.2] II. BLM Has Not Adequately Explained its Change in Position from the 2008 ROD and its Decision to Issue a New PEIS.

EPAct Section 369(d) required BLM to prepare a PEIS for a commercial leasing program for oil shale and tar sands resources, emphasizing “the most geologically prospective lands within each of the States of Colorado, Utah, and Wyoming.” Pub. L. No. 109-58, § 369(d)(1). Congress imposed stringent timelines to ensure that a leasing program would be in place by February 2008. Additional provisions in the EPAct evidences Congress’ intention to provide for diligent development of these resources. Id. § 369(d), (e), (f). BLM issued a Final PEIS in September 2008 and the Approved Resource Management Plan Amendments/Record of Decision (ROD) for Oil Shale and Tar Sands Resources to Address Land Use Allocations in Colorado, Utah, and Wyoming and Final Programmatic Environmental Impact Statement in November 2008. The 2008 ROD amended ten RMPs to open nearly two million acres of federal lands for potential oil shale and tar sands leasing.

In the 2008 ROD, BLM rejected those alternatives that would not make the “most geologically prospective lands . . . available for application for leasing.” 2008 ROD at 22 (oil shale), 35 (tar sands). As BLM recognized, certain alternatives excluded much of the most geologically prospective acreage and unreasonably fragmented the area that would be available for application, resulting in parcels that are unlikely to be explored, leased, or developed. Id. at 22, 35-36. BLM also recognized that the allocation decision was only a first step in the process to establish a commercial oil shale and tar sands program, and that prior to the leasing and development additional analyses under the National Environmental Policy Act (“NEPA”) would be required. Id. at 38. BLM concluded, “[i]t would be premature to eliminate areas prior to sitespecific analysis based on factors that are not known now, but that would be known at the leasing or operation permitting stages, such as location, timing and type of oil shale technology, that may show that these resources could be adequately protected through mitigation.” Id. 22; see also id. at 36.

Yet, Alternative 2 of the Oil Shale and Tar Sands Resources draft Programmatic Environmental Impact Statement (“2012 Draft PEIS”), which BLM has preliminarily selected as its Preferred Alternative, would “exclude from commercial oil shale leasing” numerous categories of public lands “and/or their resource value that may warrant protection from potential oil shale leasing and development.” 2012 Draft PEIS at ES-6 (emphasis added). This alternative would, among other things, exclude “[c]ore or priority sage-grouse habitat, as defined by such guidance as the BLM or the DOI may issue.”⁷ Id. “As a result, the acreage made available for application for commercial lease under Alternative 2 (461,965 acres) would be less than a

quarter of that available under Alternative 1.”⁸ *Id.* at 6-114. BLM provides no rationale and cites no authority to support such blanket exclusions at this stage of the planning process. The Preferred Alternative would provide significantly less than the 830,297 acres that would have been available for oil shale leasing under a similar alternative rejected in 2008.⁹ In now identifying Alternative 2 as the “Preferred Alternative” in the 2012 Draft PEIS, BLM has taken the opposite approach than it took in 2008 by excluding lands from allocation even before a full environmental impact analysis can be completed.¹⁰ BLM has failed to adequately explain or support this change in position.

⁷ This alternative would also exclude “[a]ll areas that the BLM has identified or may identify as a result of inventories conducted during this planning process, as lands having wilderness characteristics” and “[t]he whole of the Adobe Town ‘Very Rare or Uncommon’ area, as designated by the Wyoming Environmental Quality Council on April 10, 2008.” 2012 Draft PEIS at ES-6 (emphasis added). As noted further below, ExxonMobil questions the basis for these exclusions, including the procedural process by which BLM is purporting to exclude them from potential leasing. See, *infra* §II.B. and n.11.

⁸ The Preferred Alternative would make an additional estimated 91,045 acres available for application for commercial tar sands leasing.

⁹ This Alternative in the 2008 PEIS would have identified a total of 229,038 acres available for application for commercial tar sands leasing.

#10)> <(**#11** [9.2.4] A. The 2012 Draft PEIS does not identify any new information to support exclusion of undefined “core or priority sage grouse habitat” from any oil shale or tar sands development.

As with the 2008 PEIS, the 2012 Draft PEIS “is limited to an allocation decision.” 2012 Draft PEIS at 1-5. BLM concedes further analysis will be required at the leasing and project stages “when more specific information is known about the specific technologies being proposed and associated environmental consequences in the locations being proposed.” *Id.* The 2012 Draft PEIS also recognizes that oil shale and tar sands development remains relatively new, and there is simply not sufficient information at this time to assess the environmental impacts. *Id.*; see also *id.* at 1-14, 1-20. Notwithstanding, BLM now proposes to exclude a significant portion of lands from any further consideration, contrary to its decision in 2008 and without adequate explanation. As the Supreme Court has found, “a reasoned explanation is needed for disregarding facts and circumstances that underlay or were engendered by the prior policy.” *FCC v. Fox Television Stations, Inc.*, 129 S. Ct. 1800, 1811 (2009). BLM provides no explanation for its change in position.

In 2008, BLM rejected alternatives that would unduly restrict the lands that may be available for oil shale and tar sands leasing.

Unlike Alternative C,¹¹ which excludes lands based on existing management decisions for oil and gas development, Alternative B¹² provides the decisionmaker with the discretion to balance the oil shale use and protection of

resources on the public lands during subsequent site-specific NEPA analysis. This balanced approach is consistent with the Federal Land Policy and Management Act (FLPMA) principles of “multiple use,” and “sustained yield.” The requirement to perform future NEPA analyses and to comply with other environmental laws allows the decisionmaker to optimize the recovery of energy resources, to establish appropriate lease stipulations to mitigate anticipated impacts, or to fully protect a resource or resource value by choosing not to offer an area for lease at any particular time. Even if some technologies may not allow mining of some tracts to proceed without unacceptable impacts to other resource values, Alternative B would allow the agency the opportunity to choose to offer leases when a technology is proposed that can be used compatibly with the resource values in question. This is consistent with the comments that supported a viable and sustainable commercial oil shale leasing program, while ensuring that any impacts to sensitive resources or resource values are mitigated to any commercial development. It is also consistent with the planning decisions for other mineral resources for these parcels which authorize leasing subject to restrictive conditions, rather than preclude leasing altogether.

2008 PEIS at 16-17. Alternative 2, on the other hand, would amend the RMPs to designate less than the 830,000 acres opened under Alternative C in the 2008 PEIS as available for future commercial oil shale leasing, estimating only 461,965 acres would be available for oil shale leasing. BLM provides no explanation for abandoning this determination in the 2012 Draft PEIS.

BLM contends it “decided to take a fresh look at land use allocations made in the 2008 ROD,” because of new information not available in 2008. 2012 Draft PEIS at 1-5, 2-7. BLM purported such new information to be “nationwide and state-specific guidance recommending the consideration of certain management practices to address the appropriate management of sage-grouse habitat in the context of land use actions.” *Id.* at 2-21 (referencing a text box in Section 4.1.1 of the 2012 Draft PEIS). However, the information provided in the 2012 Draft PEIS concerning alleged impacts of oil shale leasing on greater sage grouse is taken practically verbatim from the same discussion of the impacts considered in 2008. *Id.* at 4-124 to 4-126. In fact, the only “new” information identified was that “BLM is in the process of updating its guidance regarding protection of sage-grouse habitat,” and that BLM is working with Utah to refine the delineation of preliminary priority sage grouse habitats. *Id.* at 4-126. BLM further states that “[i]t is anticipated that protection measures will be essentially as described.” *Id.* But again, the mitigation measures identified in the 2012 Draft PEIS are the same as those identified in the 2008 PEIS, and neither contains an outright prohibition on development in undefined “core or priority” sage grouse habitat. *Id.* See also 2012 Draft PEIS, App. F, at F-19.13 The fact that BLM may issue at some point in the future new sage grouse management policies does not justify closing off these areas from development entirely at this time, particularly when those policies must be adhered to in any subsequent leasing or project approval action.¹⁴ Indeed, the 2012 Draft PEIS states that “[c]urrent BLM guidance on similar actions (e.g., fluid mineral resources) requires that the least restrictive stipulation that effectively accomplishes the resource objectives or resource uses for a given alternative should be used while remaining in compliance with the ESA.” 2012 Draft PEIS at 4-131.

¹⁰ Throughout its analysis of the alleged impacts of the alternatives analyzed, as it did in the

2008 PEIS, BLM

recognized that “there is no environmental impact associated with amending land use plans to make lands available

or not available for application for commercial leasing in the three-state study area, but there may be impacts on

land values.” See, e.g., 2012 Draft PEIS at 6-68 (discussion of Alternative 2). “In general, potential impacts of

future commercial development on specific resources located within the 461,965 acres cannot be quantified at this

time, because key information about the location of projects, the technologies employed, the project size or

production level, and development time lines are unknown.” Id. at 6-68 to 6-69.

11 Alternative C was the conservation alternative in the 2008 PEIS and ROD and would have excluded lands that

are identified as requiring special management or resource protection in existing land use plans (which included,

among other things, sage grouse leks and nesting habitat). 2008 PEIS at ES-5 to ES-6.

12 Alternative B is the alternative that formed the basis of the 2008 RMP amendments and ROD.

13 Without any support, therefore, BLM then states as possible mitigation “[a]void leasing and/or development in

sage-grouse habitats.” 2012 Draft PEIS at 4-133. BLM, however, does not explain what “sage-grouse habitats” are

being referenced here, or how this proposed mitigation differs from the current stipulations with respect to avoiding

disturbances to leks or winter habitats.

14 As BLM recognizes, the proposed amendments to the RMPs would themselves have “no effect” on species. See

2012 Draft PEIS at 4-131 (“The conservation measures developed in initial consultation with the USFWS, then, will

not necessarily be applied, unless warranted by the results of the consultation that will take place at the time the

BLM prepares to issue leases.”). **#11)>**

<(#12 [3.1.5] B. BLM does not explain its change of position to exclude all of Adobe Town, contrary to its decision in 2008.

Alternative 2 would also exclude “[t]he whole of the Adobe Town ‘Very Rare or Uncommon’ area, as designated by the Wyoming Environmental Quality Council on April 10, 2008.” 2012 Draft PEIS at ES-6. The Alternatives considered in the 2008 PEIS included the designated Wilderness Study Areas within Adobe Town, but the “remaining fringe area was not.” 2008 ROD at 41.15 In 2008, BLM further stated:

During the subsequent NEPA analysis, if an oil shale application is received for a parcel in the fringe area around the Adobe Town WSA or the Monument Valley Management Area, when specific technical and environmental information is available for analysis at that time, any potential conflicts with the Wyoming Environmental Quality Council’s designation can be addressed. The appropriate BLM Field Office will consider all available information and a range of alternative actions to mitigate or eliminate impacts to resource values present.

This is consistent with the intent of the “Very Rare or Uncommon” designation to provide a higher level of scrutiny when it comes to non-coal mine permits. Id. at 41-42. The 2012 Draft PEIS notes that “[d]uring the process of developing the Rawlins RMP, the BLM chose not to carry the analysis of wilderness characteristics into the Proposed RMP/Final EIS because valid existing lease rights prohibit management actions to protect the identified wilderness characteristics.” 2012 Draft PEIS at 3-34. BLM, however, provides no explanation for its decision now to exclude the broader area from potential leasing or of its assessment that the “whole” of Adobe Town should now be restricted in use, merely referencing Wyoming Environmental Quality Council’s designation of the area. Id.

#12])> <([#13 [9.I] C. BLM’s voluntary settlement does not justify its change in position. In support of BLM’s change in position from the 2008 PEIS and ROD with respect to closing significant new areas from even the potential for leasing, BLM cannot rely on a settlement agreement with Colorado Environmental Coalition, et al. (“2011 Settlement”), to determine a purpose and need and to identify alternatives that are contrary to the EPA Act.¹⁶

Although BLM agreed as part of that settlement to consider alternatives that would exclude oil shale and tar sands leasing from various categories of lands, the plaintiffs conceded the settlement could not “prejudice the outcome of the RMP review process,” and did not irretrievably commit resources prior to the environmental review being conducted. Opp’n to Mot. to Reopen, Colorado Env’tl. Coalition, No. 09-cv-0085, at 37 (citations omitted) [Docket No. 68]; see also *Metcalf v. Daley*, 214 F.3d 1135, 1142-45 (9th Cir. 2000) (government officials predetermined and prejudiced NEPA outcome when, prior to NEPA compliance, the officials signed a contract with an Indian tribe that required officials to support and help implement tribe’s proposal to resume whaling). As explained further below, *infra* § III.C., this settlement agreement conflicts with NEPA by mandating the analysis of certain alternatives, and requiring BLM to define the “Purpose and Need” so as to encompass the mandated alternatives. NEPA, on the other hand, requires an agency to first define the Purpose and Need for an action, and then develop a reasonable range of alternatives that meet the Purpose and Need. The 2011 Settlement flips NEPA’s requirements on its head, and preordains the outcome. Moreover, BLM’s implementation of a voluntary settlement agreement cannot override statutory requirements and cannot replace Congress’ clear policy decisions. See 43 C.F.R. § 1610.4-7.

15 The description of the Wilderness Study Areas within Adobe Town appear somewhat inconsistent and should be clarified. Compare 2008 ROD at 41 with 2012 Draft PEIS at 3-34.

16 In 2009, a coalition of environmental groups filed a lawsuit challenging the 2008 PEIS and ROD. Colorado

Env’tl. Coalition v. Salazar, No. 09-cv-0085 (D. Colo. filed Jan. 16, 2009). The parties entered into a settlement

agreement in February of 2011, in which, citing to no authority, BLM agreed to analyze the environmental effects of

an alternative or alternatives in a NEPA analysis that would exclude all of certain identified areas, including “core or

priority sage grouse habitat, as defined by such guidance as Defendants may issue,” from commercial oil shale or tar

sands leasing. At the time of the settlement, Secretary of the Interior Ken Salazar nonetheless

recognized the need to encourage further exploration of oil shale and tar sands resources: “For more than a century, and through many busts, we in the West have been trying to unlock oil shale resources to help power our country. . . . If we are to succeed this time, we must continue to encourage RD&D, determine whether the technologies would be viable on a commercial scale, and find a way to develop the resources in a way that protects water supplies in the arid West.

With commercial oil shale technologies still years away, now is the time to ensure that our rules and plans reflect the latest information and will deliver a fair return to the American taxpayer.” DOI Press Release, Salazar: Technology,

Water Supplies, and Fair Return Must Guide Nation’s Oil Shale Program (Feb. 15, 2011), http://www.blm.gov/wo/st/en/info/newsroom/2011/february/NR_02_15_2011.html. The 2012 Draft PEIS does not

explain how Alternative 2 can meet these goals. #13]>

<([#14 [2.2] III. The Preferred Alternative (Alternative 2) is Counter to the United States’ Energy

Policy as Identified in the Energy Policy Act, Which Defines the Purpose and Need for the BLM Action Here.

EPAct Section 369 highlights the critical role of energy supplies for the United States and expressly “declares that . . . oil shale [and] tar sands . . . are strategically important domestic resources that should be developed to reduce the growing dependence of the United States on politically and economically unstable sources of foreign oil imports.” Pub. L. No. 109-58, § 369(b). While recognizing that such development should be conducted in an environmentally sound manner, Congress found that “development of those strategic unconventional fuels should occur, with an emphasis on sustainability, to benefit the United States while taking into account affected States and communities.” *Id.*; see also 43 U.S.C. § 1701(a)(12) (noting policy of United States to manage public lands “in a manner which recognizes the Nation’s need for domestic sources of minerals . . .”); 30 U.S.C. § 21a. Alternative 2, however, would “exclude from commercial oil shale leasing” numerous categories of public lands “and/or their resource value that may warrant protection from potential oil shale leasing and development.” 2012 Draft PEIS at ES-6 (emphasis added). This alternative would, among other things, exclude “[c]ore or priority sage-grouse habitat, as defined by such guidance as the BLM or the DOI may issue.” *Id.* Although these core or priority habitat are not yet defined, BLM estimates that this Alternative would allow only 461,965 acres for oil shale resources to be “made available for application for commercial lease,” including only 6,612 acres of the 30,720 acres in existing RD&D leases.¹⁷ *Id.* at 2-27. Exclusion of these areas at the programmatic stage of the NEPA analysis is unwarranted and counter to the EPAct.

¹⁷ This alternative would also exclude “[a]ll areas that the BLM has identified or may identify as a result of

inventories conducted during this planning process, as lands having wilderness characteristics.” 2012 Draft PEIS at

ES-6 (emphasis added). BLM cannot designate areas with wilderness characteristics, without

complying with the requirements under the Federal Land Policy and Management Act (“FLPMA”) and its own regulations for modifying RMPs. 43 U.S.C. §§ 1711(a), 1712. As BLM has recognized, the inventory does not “of itself change or prevent change of the management or use of the lands.” BLM California, Other BLM Lands with Wilderness Characteristics, http://www.blm.gov/ca/st/en/prog/wilderness/other_blm_lands_with.html (last updated Sept. 12, 2011). Exclusion of areas from oil shale leasing that the BLM has identified or may identify as a result of inventories conducted during this planning process, as lands having wilderness characteristics combined with the unclear definition of what constitutes “core or priority sage-grouse habitat” make it virtually impossible for industry to either identify the excluded acreage or understand any associated restrictions.

#14])> <(#15 [9.6] A. An RD&D-first component is inconsistent with the EPAct.

The 2012 Draft PEIS Preferred Alternative for oil shale (Alternative 2.b.), which makes significantly less acreage available for potential oil shale leasing than what BLM found in 2008 was necessary to make leasing feasible, appears to be in direct conflict with the goals of the EPAct. All policy and regulatory decisions made by the BLM with regard to development of oil shale on federal lands must comply with EPAct Section 369, which provides for a competitive commercial leasing program that is separate and distinct from the RD&D program.¹⁸ Under Preferred Alternative 2.b. for oil shale, it seems that the BLM decision to issue a commercial lease can only occur once a lessee satisfies the conditions of its RD&D lease. BLM’s new “contingency requirement” appears inconsistent with the EPAct. Moreover, in a separate settlement agreement, BLM agreed to issue a notice of proposed rulemaking in which it will propose amendments to its oil shale regulations¹⁹ to address the royalty rate and environmental protection requirements applicable to oil shale commercial leasing. See Attachment to Joint Motion for Order to Administratively Close the Case, Colorado Env’tl. Coalition v. Salazar, No. 09-cv-0091 (D. Colo. filed Feb. 15, 2011) [Docket No. 80-1]. Under the settlement agreement, the notice of proposed rulemaking is due by May 15, 2012. To the extent BLM determines that oil shale development should be done in two phases -- RD&D and then commercial development -- BLM can address such requirements in its proposed rule and should not select Alternative 2.b. as beyond the scope of this action, which is merely intended to allocate lands potentially available for oil shale and tar sands leasing. For these same reasons, Alternatives 3 and 4.b. must be rejected.

¹⁸ With respect to RD&D leasing and the information developed therefrom, ExxonMobil also has concerns regarding the use of proprietary information obtained from such leasing. While we support appropriate environmental reviews and permitting processes, we feel that the current NEPA analysis presents a challenge for BLM and companies that invest a significant amount of dollars and resources to develop proprietary technologies.

The review process must keep proprietary information confidential while providing the government agencies with all the necessary information for thorough environmental analysis.

19 The challenged regulations were published at 73 Fed. Reg. 69,414 (Nov. 18, 2008). #15]>

<([#16 [9.2.3] B. The 2012 Draft PEIS is inconsistent with the EPAct and with FLPMA and BLM policy.

Even if an RD&D first component within an alternative is appropriate to consider, none of the iterations of Alternative 2 is consistent with the EPAct. As noted above, in the 2008 ROD, BLM rejected those alternatives that would not be consistent with EPAct's mandate. BLM recognized that certain alternatives would "unreasonably fragment[] the area that would be available for application, resulting in parcels that are unlikely to be explored, leased, or developed." 2008 ROD at 22, 35-36. BLM found that "[t]his could be an impediment to sound and rational development of the resource and can reduce the economic return to the public." Id. at 22, 36. Resources are likely to be by-passed because of the exclusions, limiting the benefits to the nation from exploitation of a domestic unconventional energy source. Id. at 22, 36.

"Selection of Alternative C precipitously limits or restricts the decisionmaker's discretion to balance [oil shale or] tar sands use and the protection of resources or resource values, in accordance with FLPMA's principal of 'multiple use.'" Id. at 22, 36; see also id. ("Alternative C does not give the decisionmaker the necessary discretion to optimize the recovery of energy resources, establish appropriate lease stipulations to mitigate anticipated impacts, or to fully protect a resource or resource value by choosing not to offer an area for lease.").

Notwithstanding BLM's conclusions in 2008 that the fragmented nature of lands under Alternative C would preclude development of the resources, Alternative 2 of the 2012 Draft PEIS would impose even more significant restrictions than the Alternative C rejected in the 2008 ROD. Indeed, all of the versions of Alternatives 2 and 3 would make significantly less acreage available for potential oil shale and tar sands leasing than would have been made potentially available under Alternative C in the 2008 PEIS and ROD. Yet, the 2012 Draft PEIS fails to adequately explain how Alternative 2 can fulfill the requirements of the EPAct, given BLM's prior determination that this approach would preclude development. BLM provides no reasoned explanation for the dramatic change in its assessment of appropriate areas for potential leasing.²⁰ As reflected in Figures 2.3.3-1 and 2.3.3-4 (Colorado), 2.3.3-2 and 2.3.3-5 (Utah), and 2.3.3-3 and 2.3.3-6 (Wyoming) of the 2012 Draft PEIS, areas that would be excluded from development under Alternative 2 render the lands available for oil shale and tar sands leasing to be limited and widely scattered, despite BLM's finding of these to be important areas of oil shale resources in the United States. Unduly restricting areas within this important resource would severely limit resource access, because the fragmented areas reduce operational efficiency and increase infrastructure impacts. It is BLM's policy to optimize the potential for oil and gas development to secure the maximum return to the public in revenue and energy production, prevent avoidable waste of the public's resources, honor the rights of lessees, and mitigate environmental impacts. See 2012 Draft PEIS at 2-13. Alternative 2 fails to comply with this policy. It would prematurely exclude areas, limiting the availability of continuous acreage to support a commercial operation that would justify the investments necessary to engage in such operations.

Further, excluding lands in the manner proposed under Alternative 2 is inconsistent with the multiple use management mandate of FLPMA, as it may preclude any significant

development of oil shale resources. The 2012 Draft PEIS goes against the mandate in the EPAct to promote the responsible development of this important energy resource. The primary difference between the new 2012 Draft PEIS and the 2008 PEIS is that the current document contains several alternatives that would dramatically reduce the acreage of BLM administered land where applications for oil shale and tar sands leases could be submitted. Yet, BLM has chosen Alternative 2.b. as its Preferred Alternative for oil shale, even though it previously found this approach would severely restrict the potential for oil shale development.

This approach is counter to the EPAct and this nation's energy policy, which governs BLM's decisionmaking process. Indeed, the EPAct recognized the need for large, contiguous areas, expanding the size of potential oil shale leases under the Minerals Leasing Act. Pub. L. No. 109-58, § 369(i). Alternative 2 also unduly limits the land available for land exchanges, again contrary to the EPAct, which requires consideration of land use exchanges to consolidate land ownership and mineral leases into management areas "[t]o facilitate the recovery of oil shale and tar sands." Id. § 369(n). On public lands within the Green River, Piceance Creek, Uintah, and Washakie geologic basins, BLM is to give priority to implementing land exchanges within those basins to determine the optimum size of lands to be consolidated. Id. The 2012 Draft PEIS does not even consider possible locations for such land use exchanges. 2012 Draft PEIS at 1-12. Thus, Alternative 2 places restrictions on such exchanges and size of leases that was not intended by the EPAct, and unnecessarily constrains potential oil shale development opportunities before the full impacts of any potential development can be explored.

20 Concerns regarding the limitations to development under Alternative C in the 2008 PEIS were raised in the public

comments during the scoping process of the current PEIS. 2012 Draft PEIS, App. J. at J-39. BLM's response was

simply that such comments were "not relevant to the scope of the current analysis." Id. #16)>
<(#17 [2.2] Further, given BLM's policy to promote use of resources to the benefit of the public,

BLM has not adequately analyzed the alternatives in the 2012 Draft PEIS. It wholly fails to explain how Alternative 2 may affect the ability to feasibly develop oil shale and tar sands resources, including development of valid existing rights on private lands. It also fails to assess state initiatives regarding the sage grouse, noting only that states are taking action. 2012 Draft PEIS at 3-197. Thus, it is unclear whether Alternative 2 appropriately applies a balanced approach, as it appears to be designed solely to significantly limit the ability to explore and develop any oil shale or tar sands resources. #17)>

<(#18 [9.1] C. The EPAct defines the Purpose and Need for this action, and BLM should return to the Purpose and Need statement in the 2008 PEIS and ROD.

The Purpose and Need for BLM's action here is to implement the requirements of Section 369 of the EPAct. Pursuant to NEPA, BLM must properly identify and reject alternatives based on the purpose and need of the proposed action as outlined in the EPAct, as it did in the 2008 PEIS. See *Hells Canyon Alliance v. U.S. Forest Serv.*, 227 F.3d 1170, 1181 (9th Cir. 2000) (finding agency "had no obligation to consider an alternative unlikely to be implemented and inconsistent with basic policy objectives for managing the area") (citations omitted); *Headwaters, Inc. v. BLM, Medford Dist.*, 914 F.2d 1174, 1180 (9th Cir. 1990) ("Nor must an agency consider alternatives which are infeasible, ineffective, or inconsistent with the

basic policy objectives for the management of the area.”) (citation omitted).

In this case, Congress mandated that the purpose and need include the need to develop domestic oil shale and tar sands resources. *Citizens’ Comm. To Save Our Canyons v. U.S. Forest Serv.*, 297 F.3d 1012, 1030 (10th Cir. 2002); see also *Citizens Against Burlington, Inc. v. Busey*, 938 F.2d 190, 196 (D.C. Cir. 1991) (“Perhaps more importantly, an agency should always consider the views of Congress, expressed, to the extent that the agency can determine them, in the agency’s statutory authorization to act, as well as in other congressional directives.”) (citations omitted). In the 2008 PEIS, BLM identified the purpose and need to “describe the most geologically prospective areas managed by the BLM . . . and to decide which portions of those areas will be open to application for commercial leasing, exploration, and development.” 2008 PEIS at 1-2. The 2008 PEIS was drafted “to meet the requirements of the Energy Policy Act of 2005.” *Id.* at 1-3. This stands in stark contrast with the purpose and need in the 2012 Draft PEIS, which BLM structures to address the commitments it made in its voluntary settlement agreement.

BLM is not required to craft a statement so broad that it requires consideration of alternatives that are inconsistent with the overarching purpose of the proposal. *Northwest Ecosystem Alliance v. Rey*, 380 F. Supp. 2d 1175, 1186 (W.D. Wash. 2005) (citation omitted). Moreover, NEPA is a procedural statute, and does not require an agency to choose environmental concerns over other policy choices. See *Robertson v. Methow Valley Citizens Council*, 490 U.S. 332, 350 (1989); *Biodiversity Conservation Alliance v. BLM*, 404 F. Supp. 2d 212, 216 (D.D.C. 2005). Here, Congress made the policy decision that “development of those strategic unconventional fuels should occur, with an emphasis on sustainability, to benefit the United States while taking into account affected States and communities.”

BLM cannot rely on the 2011 Settlement to avoid its statutory directives. Paragraph 2(a) and (b) of the 2011 Settlement required that BLM consider “[a]n alternative or alternatives removing all of the lands described . . . from applications for oil shale or tar sands leasing” and “[a]t least one alternative that removes some, but not all, of the lands described . . . from applications for oil shale or tar sands leasing.”²¹ Attachment to Joint Motion for Order to Administratively Close the Case, *Colorado Env’tl. Coalition*, No. 09-cv-0085, at 3-4 [Docket No. 63-1]. It further provided that “[t]he purpose and need statement in the NEPA analysis supporting the RMP amendment process or processes shall be defined in such a manner that it can be met by any and all of the alternatives described in Paragraph 2(a) and 2(b) above.” *Id.* at 4 (emphasis added). In the 2012 Draft PEIS, BLM merely states it seeks to “reassess” the allocations from the 2008 ROD. 2012 Draft PEIS at 1-4.

The “purpose statement is an obvious place for the court to start when analyzing the adequacy of an environmental impact statement or an environmental assessment. It is from this statement that the agency, public, and, ultimately, the court may begin to judge whether the agency has fully analyzed the possible impacts of the action and reviewed a reasonable range of alternatives to that action.” *Soda Mt. Wilderness Council v. Norton*, 424 F. Supp. 2d 1241, 1261 (E.D. Cal. 2006). “In sum, NEPA forces agencies to explain what it is they seek to do, why they seek to do it, what the environmental impacts may be of their proposed action, and what alternatives might be available to the agency that might lessen environmental impact. Without a

clear ‘what and why’ statement, the public is kept in the dark.” Id. at 1262. Thus, when an agency evaluates alternatives to a proposed action in an impact statement, it “must answer three questions in order. First, what is the purpose of the proposed project? Second, given that purpose, what are the reasonable alternatives to the project? And third, to what extent should the agency explore each particular alternative?” *Habitat Educ. Ctr., Inc. v. U.S. Forest Serv.*, 593 F. Supp. 2d 1019, 1026-27 (E.D. Wis. 2009), *aff’d* 609 F.3d 897 (7th Cir. 2010) (citing *Simmons v. U.S. Army Corps of Eng’rs*, 120 F.3d 664, 668 (7th Cir.1997)). In other words, the purpose of the action is to determine the “reasonable range of alternatives” to be considered. However, the 2011 Settlement required BLM to identify the alternatives and then define the purpose and need. This turns NEPA on its head and must be rejected.²²

21 The lands described are those that are listed under Alternative 2.

22 We are not aware that BLM provided notice or sought public comment on the 2011 Settlement. Rather, the settlement was submitted to the Court only as an exhibit to a “Joint Motion for Order to Administratively Close the Case,” *Colorado Envntl. Coalition*, No. 09-cv-0085 [Docket No. 63]. Although Intervenor in the case identified potential NEPA violations with certain terms within the settlement agreement, BLM nonetheless chose to enter the settlement agreement. This flawed NEPA process is evidence that the federal government should invite more open discussion and seek public input to settlements that purport to address environmental protection concerns, including obtaining and considering the comments of industry who face unreasonable access barriers or permit restrictions as a result of the terms or conditions within the settlement agreement. In a very real sense, energy policy in the U.S. is increasingly driven by NGOs and not by Congress. EPA, DOI, NOAA and other federal agencies have settled environmental NGO lawsuits that have imposed new arbitrary barriers to oil and gas access under regulations pursuant to the Clean Air Act, ESA, Clean Water Act, Marine Mammal Protection Act, NEPA, Clean Water Act and other laws. **#18)** <(**#19** [9.3] [9.2.4] IV. As BLM Found in the 2008 ROD, Decisions Regarding Sage Grouse Mitigation Should be Considered at Later Planning Stages. Alternative 2 would eliminate significant lands from allocation even for potential consideration of leasing. It is premature to make this type of decision within the context of a PEIS, particularly on the bases of protection of a resource that has not yet even been defined. Exclusion of environmentally sensitive lands that may be impacted is a decision that is more appropriate to review and determine when a leasing or project-specific analysis is conducted. BLM should make more lands available at the PEIS stage and allow site-specific analyses to assess the local resources and appropriate measures. Amendment of the land use plans, along with the supporting PEIS, is the first step in a commercial oil shale and tar sands leasing program that includes federally mandated further

reviews. Separate NEPA analyses, including compliance with the Endangered Species Act (“ESA”), would be required before leasing or site development activities could occur. As such, any commercial oil shale lease sales will undergo multiple site-specific environmental analyses and project-specific NEPA reviews prior to approval of any proposed projects on the oil shale leases. These subsequent environmental analyses for oil shale/tar sands leases will be the focal point of resolution for site-specific concerns (e.g., groundwater protection, historic and cultural resources, and threatened and endangered species). These analyses will allow for informed evaluation of the environmental impacts of proposed technologies and development plans at a time when those technologies are more mature and better understood.

Leveraging the existing process is the most effective way to continuously evaluate land use. Conducting periodic revisions of the PEIS before specific operations are proposed and projecting speculative impacts from undetermined methods is not an effective or efficient way to proceed. The 2102 Draft PEIS fails to properly account for and utilize these subsequent NEPA reviews because they prematurely remove large areas of potential oil shale and oil sands leasing without allowing proper site-specific environmental reviews.

Finally, the environmental reviews should take place after the access to the lands is granted to avoid large pre-investments required to gather the necessary environmental information. We must remember that assignment within a phased permit approach precludes operations until all permits and requirements are in place. Therefore, granting such a lease will not, in itself, allow or cause environmental impacts because no activities are authorized by the actual lease terms. Project development activities will continue to be subject to a project-specific NEPA analysis, which will require project development plans, as well as the required mitigation activities to meet local, state, federal regulatory requirements, and conformity of the lease to the applicable RMP.

Indeed, this is the approach BLM took in the 2008 ROD. BLM found that the initial RMP amendments to address oil shale and tar sands resource development “serves as the first step in the process to establish a commercial oil shale and tar sands program that meets the intent of Congress while taking advantage of information and practices to minimize future impacts and ensure that states, local communities, and the public have the opportunity to be involved at future NEPA steps in the oil shale and tar sands program.” 2008 ROD at 38. “The allocation decision essentially removes an administrative barrier present today that prevents the BLM from accepting and considering applications to lease oil shale or tar sands without first amending the respective land use plan. Prior to the leasing and development phases additional NEPA analysis will be required.” *Id.* BLM correctly concluded at the time, “[i]t would be premature to eliminate areas prior to site-specific analysis based on factors that are not known now, but that would be known at the leasing or operation permitting stages, such as location, timing and type of tar sands technology, that may show that these resources could be adequately protected through mitigation.” *Id.* at 36.

In particular, in 2008, BLM recognized that subsequent project or site specific NEPA documents will be prepared to evaluate specific occurrences of sage grouse. 2008 PEIS, Vol. 4, at 509, 5485-5486 (Sept. 2008). Mitigation measures would also include recommendations from BLM’s national sage grouse habitat conservation strategy, as well as those contained in statewide and regional sage grouse conservation strategies that have been prepared by state agencies. *Id.* BLM recognized that site-specific review can more adequately map sage grouse habitat in relation to potential oil shale and tar sands development. *Id.* at 515. As BLM conceded, identifying lands for potential leasing “does not imply a commitment to leasing that is too large

to be sustainable or that would threaten the existence of species.” Id. at 780. The agency retains discretion to decide which particular tracts to offer for leasing and the stipulations on such leases. Id. In any event, BLM must comply with the ESA in approving specific leases or projects and in the development of those areas. BLM correctly determined in 2008 that the initial allocation decision is not, however, the appropriate time to limit its ability to do so.

The decision on viability and compatibility of oil shale commercial development with other alternative uses or preservation priorities on the land should be based on proposed techniques and specific plans of operations. Exclusion of lands without clearly understanding the technologies to be employed to develop the oil shale resource is therefore premature. Experience with onshore conventional and unconventional oil and gas operations indicates that it is possible to recover the mineral potential without adversely impacting the protected surface uses on lands that currently have stipulations for no surface disturbance or seasonal limitations. We can achieve the multi-use purpose intended for these lands through careful planning, management, mitigation and reclamation.

There is no information BLM can point to support its 180-degree change of position. Subsequent project and site-specific NEPA analyses will still be required. Identification of sensitive resources, including sage grouse habitats, and appropriate mitigation measures, including those identified in BLM and state sage grouse conservation strategies, still must occur. BLM still retains the discretion to determine which specific tracts to offer for leasing and what stipulations will be imposed. BLM still must comply with the ESA, as well as all applicable laws. The only new information is BLM’s decision to settle litigation challenging its 2008 ROD, but that alone is inadequate justification for BLM’s abandoning its prior position. #19)>

<([#20 [9.2.4] V. Any Exclusion of Potential Oil and Gas Leasing on “To Be Defined” Sage Grouse

Habitat may be viewed as Arbitrary and Capricious.

A. Protection for the sage grouse should be deferred to the environmental reviews of leasing or project-specific actions.

In any event, existing BLM and state recommendations concerning management of sage grouse habitat would not prohibit all development. Moreover, even without having defined these terms, it is clear Alternative 2 could eliminate any production of oil shale or tar sands resources due to the fragmented nature of the lands that BLM may open under this alternative. As BLM correctly concluded in its 2008 PEIS and ROD, such fragmentation would undermine the purposes of the EPAct. Again, BLM has not provided an adequate justification for its change of position excluding “core or priority sage-grouse habitat” from potential leasing. Moreover, it is important to recognize that the 2012 Draft PEIS is only intended to identify lands that may be “available for application for leasing.” 2012 Draft PEIS at ES-1 (emphasis added). As BLM recognized in 2008, the protections for the sage grouse, including identification of any areas where development may appropriately be limited, should be deferred to the environmental reviews of leasing or project-specific actions, by which time BLM can have defined the “core” and “priority” habitat areas to be protected. Consequently, BLM should choose Alternative 1 (No Action) in the Final PEIS, affirming its 2008 decision.

BLM is currently undergoing an assessment of its sage grouse conservation policies in the context of a separate NEPA process. Until that process is complete, each of the relevant States here has its own sage grouse conservation program that includes mitigation measures aimed at protecting the sage grouse, which can be used in the interim by BLM when considering leasing applications and specific projects. These measures are more appropriate than an outright

prohibition on development of oil shale and tar sands resources in certain as-of-yet undefined sage grouse habitats. BLM should abandon its piecemeal approach, and determine the appropriate sage grouse conservation measures for all ground disturbing activities in the context of the on-going Sage Grouse Conservation NEPA process, the purpose of which is to develop BLM's sage grouse conservation strategy.

#20]> <(**#21** [9.2.4] B. BLM cannot impose mandatory limitations based on future “guidance.” FLPMA requires public lands to be managed “in accordance with the land use plans developed.” 43 U.S.C. § 1732(a). Alternative 2 would exclude from the potential for leasing “core or priority sage-grouse habitat, as defined by such guidance as the BLM or the DOI may issue.” Subsequent BLM action, then, would be bound by some future guidance, which is subject to revision and change. This again, is a reversal from its position in the 2008 PEIS and ROD where the only lands excluded were those based on “existing laws and regulations, executive orders and other administrative designations or withdrawal.” 2008 ROD at 17. Even assuming BLM could explain its change from the 2008 ROD and that Alternative 2 meets the purpose and need identified in the EAct, BLM cannot adopt in a ROD an alternative that relies on some future guidance to define its terms.

First, reliance on such guidance violates the public participation requirements of NEPA and FLPMA. NEPA requires an analysis of alternatives that “sharply” defines the issues and provides a clear basis for choice among options by the decisionmaker and the public. 40 C.F.R. § 1502.14. The EIS must also provide the scientific and analytic basis for the comparisons under Section 1502.14. *Id.* § 1502.16. “Accurate scientific analysis, expert agency comments, and public scrutiny are essential to implementing NEPA.” *Id.* § 1500.1(b). FLPMA also requires an opportunity for public involvement in the formulation of RMPs. 43 U.S.C. § 1712(a), (f); see also 43 C.F.R. § 1610.2 (“The public shall be provided opportunities to meaningfully participate in and comment on the preparation of plans, amendments and related guidance and be given early notice of planning activities.”) (emphasis added).

BLM failed to meet these obligations. The 2012 Draft PEIS does not clearly define Alternative 2, BLM's Preferred Alternative, because it incorporates as one of its principal elements some future guidance. Although the 2012 Draft PEIS includes maps and estimates of acreage of lands to be made available for allocation, BLM has made clear that its guidance is as yet to be developed and, moreover, applicable guidance can include any guidance developed by the Department of the Interior.²³ The public, therefore, does not have an adequate opportunity to comment, because the lands to be excluded are not anywhere clearly defined. See *Grand Canyon Air Tour Coal. v. FAA*, 154 F.3d 455, 468 (D.C. Cir. 1998) (“An agency is required to provide a meaningful opportunity for comments, which means that the agency's mind must be open to considering them.”) (citing *McLouth Steel Products Corp. v. Thomas*, 838 F.2d 1317, 1323 (D.C. Cir. 1988)).

BLM must manage its lands consistent with applicable laws and regulations and development of BLM lands must be consistent with the applicable RMP, which can only be amended after notice and an opportunity to comment. By committing now to prohibit development in areas defined by future guidance, BLM is impermissibly elevating the status of the future guidance to have the force and effect of law. The issuance of subsequent “guidance,” even if the public is allowed to comment on it, is insufficient to satisfy the public's right to notice and comment before BLM makes binding decisions concerning development of BLM lands. See *Kennecott Corp. v. EPA*, 684 F.2d 1007, 1019 (D.C. Cir. 1982) (finding “[t]hat EPA allowed petitions for reconsideration is not an adequate substitute for an opportunity for notice

and comment prior to promulgation”) (citation omitted); *PPG Indus., Inc. v. Costle*, 659 F.2d 1239, 1250 (D.C. Cir. 1981) (finding subsequent publication of guidelines related to “new measurement technique” insufficient to meet notice requirement of Administrative Procedure Act).

Second, reliance on subsequent guidance to define what lands will be excluded from leasing, a clear term of the amended RMPs, is insufficient to meet the requirements of FLPMA. A formal plan amendment is required whenever a proposed action changes a term, condition or decision of a RMP. *Douglas Timber Operators v. Salazar*, 774 F. Supp. 2d 245, 256-57 (D.D.C. 2011) (citing *Klamath Siskiyou Wildlands Ctr. v. Boody*, 468 F.3d 549, 556-57 (9th Cir. 2006); *Seattle Audubon Soc’y v. Robertson*, 1991 WL 180099, at *9 (W.D. Wash. 1991)), appeal dismissed, No. 11-5137, 2011 WL 2618209 (D.C. Cir. June 24, 2011). “An amendment shall be initiated by the need to consider monitoring and evaluation findings, new data, new or revised policy, a change in circumstances or a proposed action that may result in a change in the scope of resource uses or a change in the terms, conditions and decisions of the approved plan.” 43 C.F.R. § 1610.5-5. It is clear that, under Alternative 2, the substance of the future guidance would be “new or revised policy,” “a change in circumstances,” or a “change in terms.” BLM has regulations governing the requirements for amending a RMP, 43 C.F.R. Part 1610, which cannot be met through issuance of guidance. Thus, imposing a requirement to comply with future guidance does not meet FLPMA’s requirement to amend the RMP.

Indeed, it is clear that BLM intends for this future guidance to have binding legal effect on parties. “A ‘legislative rule’ is one the agency has duly promulgated in compliance with the procedures laid down in the statute or in the Administrative Procedure Act.” *Appalachian Power Co. v. EPA*, 208 F.3d 1015, 1021 (D.C. Cir. 2000); see also *General Elec. Co. v. EPA*, 290 F.3d 377 (D.C. Cir. 2002). Here the guidance would not merely give substance to clarify vague or ambiguous language, it would embody the requirements in the RMP, requirements that the public cannot adequately assess based on the 2012 Draft PEIS. Because subsequent agency action must comply with the applicable RMP, under Alternative 2 such “guidance” would have a legally binding effect and must be promulgated appropriately. Simply stating that future guidance would be binding on subsequent development clearly does not meet FLPMA’s requirements for amending an RMP or the requirements of the Administrative Procedure Act for promulgation of rules.

23 Although the greater sage grouse has been identified as a candidate for listing, it has not yet been listed under the

ESA. As a result, no critical habitat has been designated. #21])>

<([#22 [1.5] C. BLM has failed to take a “hard look” at the potential impacts of the alternatives in the 2012 Draft PEIS.

An EIS serves two purposes: (1) “[i]t ensures that the agency, in reaching its decision, will have available, and will carefully consider, detailed information concerning significant environmental impacts”; and (2) “it ‘guarantees that the relevant information will be made available to the larger audience that may also play a role in both the decisionmaking process and the implementation of that decision.’” *Dep’t of Transp. v. Public Citizen*, 541 U.S. 752, 768 (2004) (quoting *Robertson v. Methow Valley Citizens Council*, 490 U.S. 332, 349 (1989)). “The EIS must show that agency officials have ‘[thought] through the consequences of-and alternatives to-their contemplated acts,’ and must ensure that ‘citizens get a chance to hear and consider the rationales the officials offer.’” *Habitat Educ. Ctr., Inc.*, 593 F. Supp. 2d at 1025

(quoting Simmons, 120 F.3d at 666). BLM must demonstrate that it “has taken a ‘hard look’ at environmental consequences.” *Kleppe v. Sierra Club*, 427 U.S. 390, 410 n.21 (1976). It is unclear how BLM can purport to have taken a “hard look” at the potential environmental impacts as NEPA requires without having identified the lands that will, in fact, be defined as “core” or “priority” sage grouse habitat and therefore subject to the restrictions on allocation. By failing to define these lands, BLM has not engaged in “informed decision-making” or, as described above, has not provided for “informed public participation.” *Habitat Educ. Ctr., Inc.*, 593 F. Supp. 2d at 1025 (citation omitted).

Alternative 2 is defined to exclude as of yet undefined “core or priority” sage grouse habitat that is to be based on as of yet issued guidance.²⁴ Yet, BLM estimates the amount of acreage that would be available under this Alternative (and others)²⁵ and, in so doing, it purports to identify various resources that will be impacted by future development. See, e.g., 2012 Draft PEIS at 6-71 (“Of the acreage designated under Alternative 2, a total of 423,292 acres (about 92% of the 461,965 acres that would remain available under Alternative 2) have been identified as overlying geologic formations having a high potential to contain important paleontological resources (Murphey and Daitch 2007).”); 6-74 to 6-75 (“Under Alternative 2, 14 perennial streams and about 41 mi of perennial stream habitat within the Piceance, Uinta, and Washakie Basins are directly overlain by areas that would be potentially available for oil shale development. There are no perennial streams in the Green River Basin that are directly overlain by areas that would be potentially available for oil shale development.”). BLM fails to explain how it identifies these resources, providing only a map of purported “core or priority” sage grouse habitat.²⁶ See, e.g., *id.* at 6-108 (Figure 6.1.2-5).²⁷ The cumulative impacts analysis similarly makes only mere conclusory statements regarding habitat fragmentation, but provides no analysis of the cumulative impacts with respect to each alternative. *Id.* at 6-302. More important, the public cannot identify these lands nor can it fully understand the potential impacts of the alternative.²⁸

Further, BLM states it cannot quantify the impacts without project specific information, but it wholly fails to explain how the more limited amount of land available may affect the type of development or technology required to develop and, thereby, the differences in potential environmental impacts. For land use impacts for Alternative 2 (tar sands), for example, the 2012 Draft PEIS merely states that the land use impacts “would be essentially the same as those listed for Alternative 1 in Section 6.2.1.1, with the following exceptions: ... Core or priority sagegrouse habitat, current and recommended ACECs, and about 86,000 acres of land identified as potential ACECs under Alternative C of the 2008 OSTS PEIS would be removed from application for commercial tar sands leasing.” 2012 Draft PEIS at 6-368 to 6-369. While BLM may not be able to identify site-specific impacts at this point, it must define the lands it is excluding and must clearly identify the differences in each. The key distinction among the new alternatives of alleged impacts appears to be the estimated lands that may be disturbed, but merely providing an estimated amount of land, without clearly explaining the data behind it, does not provide the decisionmaker, or the public, with the type of information required under NEPA. Moreover, BLM fails to take a hard look at the mitigation measures under each alternative with respect to sage grouse, noting only “[f]or Alternatives 1, 3, and 4, however, existing BLM policies regarding protection of sage grouse habitat would be implemented.” 2012 Draft PEIS at 6-237. The Draft PEIS further recognizes that “Local sage grouse working groups have been formed across the region to support activities that support sage grouse population

recovery. Executive Order (E.O.) 2011-5 for the State of Wyoming (Wyoming Governor's Office 2011) outlined the identification and protection of 'core population areas' for the greater sage-grouse within the State of Wyoming. . . . Similarly, the State of Utah maintains a database of priority habitat areas for the greater sage-grouse. These priority areas were determined by Utah DWR field biologists in 2010. BLM is currently working with the Utah DWR to refine the delineation of priority habitats in the State of Utah.”²⁹ Id. at 3-197 (citation omitted). The 2012 Draft PEIS does not provide an assessment of these state programs in comparison to a prohibition on development in any “core” or “priority” sage grouse habitat as would be provided under Alternative 2. Indeed, as further explained below, BLM is undergoing a separate process that is seeking to make such an assessment, and BLM should not predetermine the outcome of that process.

24 Similarly, Alternative 4 would remove “an undetermined percentage of the LWC and sage-grouse core habitat area.” 2012 Draft PEIS at 6-225.

25 See 2012 Draft PEIS at 6-236.

26 Nor is it easy to decipher how to compare this map with the other, various figures purporting to identify “Greater Sage-Grouse Core Habitat.” Compare 2012 Draft PEIS at 6-50 (Figure 6.1.1-5 - Alternative 1), with 6-215 (Figure 6.1.4-5 - Alternative 4).

27 Chapter 6 of the 2012 Draft PEIS states that, under Alternative 2, “oil shale development would be excluded from core or priority habitats for the greater sage-grouse (*Centrocercus urophasianus*) as defined by the guidance set forth in the BLM’s sage-grouse interim policy (BLM 2005i).” 2012 Draft PEIS at 6-80. But, the reference used for this interim policy is: “BLM, 2005i, Draft Vegetation Treatments Using Herbicides on Bureau of Land Management Lands in 17 Western States Programmatic Environmental Impact Statement, DES 05-56, U.S. Department of the Interior, Reno, Nev., Nov.” This appears to be an error, and, in any event, BLM cannot rely on a draft document as an “interim policy.” To the extent BLM intended to refer to its interim conservation policies and procedures for sage grouse, it addresses “Preliminary Priority Habitat.” In any event, these are only “interim,” and BLM should await the outcome of its ongoing process to assess management of sage grouse prior to making any amendments to RMPs that would unduly close off areas to leasing.

28 This map appears different from the map in the 2008 PEIS regarding overlap of lands made available under the rejected Alternative C “with the Known Distribution of the Greater Sage-Grouse.” 2008 PEIS at 6-101. In that map, leks, brood areas and winter ranges were identified. This can be contrasted with leks and the undefined

“Greater Sage-Grouse Core Habitats” in Figure 6.1.2-5 in the 2012 Draft PEIS. “The potential impacts on threatened, endangered, and sensitive species (and their habitats) by commercial oil shale development are directly related to the amount of land disturbance that could occur with a commercial project (including ancillary facilities such as power plants and utility and pipeline ROWs), the duration and timing of construction and operation periods, and the habitats affected by development (i.e., the location of the project).” 2012 Draft PEIS at 6-82.

29 On February 10, 2012, BLM issued Instruction Memorandum No. WY-2012-019, entitled “Greater Sage-Grouse Habitat Management Policy on Wyoming Bureau of Land Management (BLM) Administered Public Lands

Including the Federal Mineral Estate,” which purports to be consistent with the State Executive Order. #22])>

<([#23 [9.2.4] D. Basing a decision prior to defining the precise parameters of the agency action is arbitrary and capricious.

Without fully understanding the parameters of the sage grouse management decisions currently ongoing, any determination by BLM regarding excluding as yet undefined areas would be arbitrary and capricious. “Reasoned decisionmaking requires an agency to ‘examine the relevant data and articulate a satisfactory explanation for its action[s].’” *Portland Cement Ass’n v. EPA*, 665 F.3d 177, 187 (D.C. Cir. 2011) (quoting *Motor Vehicles Mfrs. Ass’n v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 43 (1983)). In an analogous situation, the D.C. Circuit found EPA was arbitrary and capricious in setting a standard based on data that was affected by a separate, parallel rulemaking, before the subsequent rulemaking was completed. *Id.* In *Portland Cement Ass’n v. EPA*, EPA set a standard for Portland cement kilns, while at the same time undergoing a separate rulemaking to define the sources subject to those standards. Although a number of sources considered in setting the standard may not be covered by the standard, EPA considered them in setting the Portland cement kiln standard “because EPA had not yet decided the precise parameters of its definition.” *Id.* at 186-87. The court found this to be arbitrary and capricious. “The impending definition of an undeniably related source category is clearly a ‘relevant factor[]’ or an ‘important aspect of the problem’ that must be considered.” *Id.* at 187 (quoting *Motor Vehicles Mfrs. Ass’n*, 463 U.S. at 43). The D.C. Circuit found it was inappropriate for EPA to ignore the separate, ongoing rulemaking -- “an eventuality over which EPA had full control.” *Id.* “It is not absurd to require that an agency’s right hand take account of what its left hand is doing.” *Id.* Similarly here, BLM has “put the cart before the horse.” *Id.* at 188. BLM has full control over the timing of its actions with respect to adequately assessing appropriate sage grouse management on public lands. It is arbitrary and capricious to make a decision excluding areas for which BLM “had not yet decided the precise parameters.” #23])>

<([#24 [9.2.4] VI. BLM Should Await Completion of its Ongoing Review of Sage Grouse Management on Public Lands.

Nothing in the 2012 Draft PEIS explains why BLM has identified exclusion of sage grouse “core or priority” habitat from even being considered for leasing. Nor does BLM explain

why existing protections and mitigation measures are insufficient. Moreover, BLM utterly fails to explain why it would exclude lands based on guidance that is not yet even completed, when BLM is undergoing an entirely separate process to assess sage grouse management issues.

In December of 2011, BLM and the U.S. Forest Service issued a notice of intent to prepare environmental impact statements and supplemental environmental impact statements to incorporate greater sage-grouse conservation measures into RMPs and land management plans (“LMPs”). 76 Fed. Reg. 77,008 (Dec. 9, 2011). Based on measures identified and assessed by the U.S. Fish & Wildlife service, the BLM and Forest Service propose to incorporate consistent objectives and conservation measures for the protection of greater sage-grouse and its habitat into relevant RMPs and LMPs by September 2014, in order to avoid a potential listing under the ESA. These conservation measures would be incorporated into RMPs and LMPs through the plan amendment and revision processes of the respective agencies. In this notice, BLM identified most of the same RMPs as potentially being amended as in the 2012 Draft PEIS. Under this process, BLM and the Forest Service intend to evaluate the adequacy of sage-grouse conservation measures in RMPs and selected LMPs. BLM Wyoming has already begun a programmatic EIS that will analyze amendments to all of the State’s RMPs not currently being amended or revised to address needed changes to the management and conservation of greater sage-grouse habitats.

BLM should await the completion of this NEPA process, the sole purpose of which is to develop appropriate sage grouse conservation measures, before impermissibly imposing restrictions relating only to oil shale and tar sands.³⁰ There is no reason for BLM to pre-judge the outcome of the sage grouse conservation NEPA process in the context of the PEIS. Experience with conventional oil and gas operations indicates that there are lands that currently have stipulations for no surface disturbance or seasonal limitations that can be leased and developed to recover the mineral potential without adversely affecting protected surface uses. This includes sage grouse habitat. BLM does not identify any different impacts on sage grouse resulting from oil shale or tar sands development to justify exclusion of large areas from consideration for leasing. Moreover, because as BLM concedes additional NEPA analyses will be required before any oil shale or tar sands resources can be developed, there is adequate time to complete the sage grouse conservation process and no need to impermissibly foreclose areas for potential development before that occurs.

Thus, withdrawing lands from potential oil shale leasing due to sage grouse habitat protection appears to be premature given that no specific federal regulatory or administrative actions have occurred with respect to managing core or priority sage-grouse habitat. ExxonMobil supports development of multi-stakeholder conservation plans to protect and restore threatened and endangered species rather than simply instituting avoidance areas. In addition, the use of suggested management practices may make it possible to site future oil shale and oil sands projects without causing unacceptable impacts to the greater sage-grouse. ExxonMobil believes that there are compatible opportunities to further develop oil shale energy resources while simultaneously protecting the greater sage-grouse. As such, ExxonMobil believes that broad scale greater sage-grouse habitat mapping should not be the basis for eliminating large areas of important energy resources from future consideration. Adhering to the project-specific NEPA process where the scale of the evaluation is more granular with site-specific greater

wildlife data is the best means to evaluate potential impacts and develop proper mitigation measures.

Again, this would not leave sage grouse unprotected. As BLM recognizes, there are already numerous existing stipulations and state policies aimed at avoiding the listing of greater sage grouse. Each of the three states has established and implemented a greater sage grouse management plan in coordination with the U.S. Fish & Wildlife Service, which include conservation measures for the sage grouse. These policies can be utilized to develop leasing or project specific mitigation measures until BLM has completed its review.³¹

30 Indeed, BLM's "fresh look" is limited to the potential use of lands for oil shale and tar sands development. Other potential uses of the same lands could cause conflicts for eventual oil shale and tar sands developments. Applying restrictions to the lands available for potential oil shale and tar sands leasing favors other land uses without considering the overall benefit to society that multiple uses could generate.

31 BLM has issued two instruction memoranda regarding interim conservation policies and consideration of the recommendations of the Sage Grouse National Technical Team ("NTT"). Under this interim policy, the conservation measures developed by the NTT must be considered and analyzed, as appropriate, through the land use planning process by all BLM State and Field Offices that contain occupied greater sage grouse habitat. BLM is to "refine" the habitat data through the land use planning process. It does not appear that BLM followed even this interim policy in identifying conservation measures or priority habitat. Nonetheless, these are "interim" policies that are only intended to guide action until the BLM and Forest Service review is completed. #24]]><([#25 [3.4.1] VII. Other Technical Comments

A. Oil Shale development and water usage

Any leasing or project development would be subject to existing laws, including state water appropriation laws. ExxonMobil, therefore, expects no significant adverse impacts from oil shale development, as water usage in these areas is already regulated and any usage must be consistent with those requirements.

In any event, ExxonMobil believes that responsible, low-impact, and sustainable water usage is both technically and economically feasible for the oil shale industry. We are committing significant capital and research toward developing technologies and processes to reduce energy usage in our project while protecting ground and surface water resources. We are also seeking an RD&D lease to successfully verify that our technology is viable, environmentally acceptable, and sustainable in order to proceed to commercial scale implementation. Although some uncertainty remains regarding the potential water use requirements for oil shale development technology, continued research and technology development will validate the environmental and economic viability prior to proceeding to commercial application. Water use requirements will continue to be evaluated in subsequent NEPA reviews where potential impacts

will be assessed on a site and project-specific basis. These future detailed reviews will provide project, technology, and site-specific information on water use to BLM decision makers. #25])>

<([#26 [8.3] B. Multi-Mineral Leasing

Oil shale development can be compatible with the development of other mineral resources, especially conventional oil and gas and nahcolite resources, on the same lands. Industry is currently developing technology to enhance this type of multiminerale development, and we encourage the BLM to develop leasing programs that accommodate multiminerale leasing. The use of such compatible technologies can be considered during site-specific analyses. #26])>

Submission Text

To Whom It May Concern,

The Board of Commissioners of Carbon County, Utah appreciates the opportunity to work with the Bureau of Land Management (BLM) as a Cooperating Agency in the preparation of the Draft PEIS for the Allocation of Oil Shale and Tar Sands Resources on Lands in Colorado, Utah, and Wyoming. Carbon County expects that our comments will be used for creating a plan to support and further the multiple use mandates of the BLM and the utilization of our natural resources in the best interest of the American public. We expect these comments to be included as a part of the administrative record for the action and given due consideration. We also strongly support the comments rendered by the State of Utah and those from our adjoining counties (Duchesne and Uintah counties) who are also involved in this endeavor.

<(#1 [9.8] As you know Carbon County worked with BLM along with State agencies and counties from Utah, Colorado and Wyoming as well as various other agencies of the Federal Government hoping to help development a reasonable draft to management for exploration and extraction of Oil Shale and Tar Sands in a region containing the largest volume of oil in the world. At the end of a very rapid and whimsical experience that lasted almost four months BLM felt they could substitute this effort for the existing Oil Shale and Tar Sands program that took the previous administration three years of cooperative agency review between public comments to finalize. At the end of reviews of sometimes as much as 1000 or more pages of information with a 2-week deadline the Cooperators were asked to consider an alternative they could support as the, "Agency Preferred Alternative." The Cooperators not directly under the control of the Federal Administration were mostly unanimous in their position to make the No Action Alternative, (The Alternative that would

leave the existing OS&TS program in tact) as their agency preferred alternative. Some time after that and before this PEIS was released for public comment decisions were made at the highest level of the Department of Interior to add two sub-alternatives to the four alternatives for oil shale and made the, Agency Preferred Alternative. Their reasoning for ignoring our recommendation after asked and replacing it with an option that we as cooperators were not asked to consider or support was stated as, thus far, technological and economic conditions have not combined to support a sustained commercial oil shale industry in the United States, and tar sands is not at present a proven commercially-viable energy source, the DOI/BLM is adding these oil shale alternatives in support of the BLM and the Department's emphasis on a robust RD&D program. Although many of the cooperators informed BLM of many countries using technology to extract Oil Shale and Tar Sands and in one case Uintah County, Utah provided a slide presentation of the Commissioners visiting a site in Estonia that has been economically producing oil from Tar Sands for many years, the BLM chose to ignore the facts and go with the spin.

#1])> <((#2 [2.2] The new Preferred Alternative; Alternative 2 known as the Conservation Focus Alternative is analyzes removing from possible oil shale and tar sands leasing the following kinds of areas:

1. All areas that the BLM has identified or may identify as a result of inventories conducted during this planning process, as lands containing wilderness characteristics (preliminary information may be found in chapters 2 and 3 of the 2008 Programmatic EIS;
2. The whole of the Adobe Town "Very Rare or Uncommon" area, as designated by the Wyoming Environment Quality Council on April 10, 2008;
3. Core or priority sage grouse habitat, as defined by such guidance as the BLM or the Department of the Interior may issue;
4. All areas of critical environmental concern (ACEC) located within the areas analyzed in the September 2008 Oil Shale and Tar Sands Resources Leasing Final EIS; and
5. All areas identified as excluded from commercial oil shale and tar sands leasing in Alternative C of the September 2008 OSTTS Programmatic EIS.

Also, under this Alternative lands open for future leasing consideration would be the same as those in Alternative 2(a), but only for oil shale Research, Development, and Demonstration (RD&D) leases. The BLM would issue a commercial lease only when a lessee satisfies the conditions of its RD&D lease and the regulations at 43 C.F.R. subpart 3926 for conversion to a commercial lease. The preference right acreage, if any, which would be included in the converted lease, would be specified in the RD&D lease.

The Record of Decision (ROD) for the 2008 OSTTS PEIS amended 10 land use plans in Colorado, Utah, and Wyoming to make approximately 2 million acres of public lands available for potential leasing and development of oil shale and approximately 430,000 acres available for tar sands leasing. Together with the regulations published in 2006 and 2008 for oil shale and tar sands

resources, the 2008 OSTs PEIS and subsequent land use amendments constituted a reasonable and

rational establishment of an oil shale and tar sands program as mandated in the Energy Policy Act of

2005, which was approved and passed by Congress. The oil shale and tar sands program from which the 2008 OSTs PEIS and related regulations came was a reasonable response to the fact that

the recoverable oil equivalent from oil shale and tar sands resources in northeastern Utah, northwestern Colorado and southwestern Wyoming exceeds 4 trillion barrels per the latest USGS scientific estimate would be available to the American public for extraction and use.

The preferred alternative in the 2012 OSTs PEIS drastically shrinks, diminishes and in many areas outright reverses virtually all of the lands made available for Oil Shale and Tar Sands development in 2008, and does so using the same data and science. Such a drastic reversal in lands

available for Oil Shale and Tar Sands development between the 2008 PEIS and the 2012 preferred

alternative, violates the regulatory standards from the Task Force requirements of certainty for industry and investors; and would probably also violate the Data Quality Act of 2000.

Regarding the preliminary purpose and need statement in the notice of intent, which states the PEIS will analyze removing from oil shale and tar sands leasing “All areas that the BLM has identified or may identify as a result of inventories conducted during this planning process. as lands

containing wilderness characteristics. #2)>

<([#3 [9.2.1] On April 14, 2011, the BLM caused to be published in the Federal Register, Volume 76, No 72/Thursday, April 14, 2011 pages 21003-21005, a notice of intent to prepare the above-referenced 2012 OSTs PEIS. The notice of intent further states at page 21004:

Lands that the BLM identifies as having wilderness characteristics will be considered during this planning initiative, as described above, and consistent with Secretarial Order No. 3310, dated Dec. 22, 2010, and BLM Manuals 6301 and 6302. Future leasing of lands determined by the BLM to have wilderness characteristics, if compatible with the allocation decisions stemming from this initiative, will subsequently be assessed in accordance with BLM Manual 6303, as appropriate (i.e., where the BLM has not determined, consistent with BLM Manual 6302, whether the lands with wilderness characteristics at issue should be receive a wild lands designation, BLM Manual 6303 will apply.)

This language documents the BLM’s intent to implement, administer and/or enforce Secretarial Order 3310 and one or more of the BLM guidance manuals promulgated under Order 3310. Carbon County and others have reminded BLM that any attempt by the BLM to implement,

administer and/ or enforce Secretarial Order 3310, including any effort by the BLM to proceed further on the above-referenced Programmatic EIS, violates the spending moratorium of Section 1769 of the April 21, 2011 Congressional Continuing Resolution to Fund Fiscal Year 2011 through

September 30, 2011, which states:

For the fiscal year ending September 30, 2011, none of the funds made available by this division or any other Act may be used to implement, administer, or enforce Secretarial Order No.

3310 issued by the Secretary of the Interior on December 22, 2010. The spending moratorium has been carried forward in all subsequent Congressional spending resolutions up to and including the current spending resolution and the 2012 OSTs PEIS, is an admitted attempt by the BLM to implement, administer and/or enforce Secretarial Order 3310 and its policies and objectives, all in violation of the Spending Moratorium of the 2011 Continuing Resolution. BLM in no way can distance this PEIS from Order 3310. Truly, no excuse rendered will avail. All one has to do is look at the provisions of the PEIS in light of the February 2011 court settlement agreement, to realize that the center-piece of this effort is to repeal oil shale and tar sands development on lands with so-called wilderness characteristics, which have just about everything to do with the now defunct Order 3310 Wildlands Policy. It is brazen disregard of the CR, for the BLM to now pretend that this PEIS hostile as it is to oil shale and tar sands development on “wilderness characteristics” lands, suddenly has nothing to do with the now defunct and Congressionally barred Wildlands Order. BLM apparently is too blatant to even bother amending the April 14th NOI, which expressly ties this PEIS to the CR barred Order 3310 Wildlands Policy. It is either sheer brazenness, or bureaucratic inability to alter BLM’s pro-stance of Order 3310 allowing its continued direction to move along on the same illegal course despite the moratorium of the CR. At this point even though through the review process of this PEIS the references to Secretarial Order 3310 might be removed; it will never legitimize this project. It underscores this administration’s motivation to stop all domestic sources of energy from being explored and extracted.

#3]> <(#4 [3.1.3] BLM stated that they have recently completed updating its inventory of lands with wilderness characteristics in each of the three states for the planning area, and the status of several areas originally proposed to be Areas of Critical Environmental Concern (ACECs) in Utah has changed since the preparation of the 2008 PEIS. In light of the combined weight of these several developments, as well as other policy considerations, the BLM has decided to take another look at the land use plan allocations made in the 2008 ROD

That is an incorrect statement for the RMPs in Utah. The only legitimate inventorying of lands with wilderness characteristics in Utah was completed as part of the process to revise the six Resource Management Plans (RMPs) in Utah (Price, Vernal, Moab, Monticello, Richfield and Kanab). Out of that process the Price BLM Field Office identified 97,100 acres of wilderness characteristics lands suitable for wilderness characteristics management. Additionally, the lands

looked at for Wilderness Characteristics through the RMP on the West Tavaputs where this PEIS would apply in Carbon County was found as having a higher value for oil and gas production.

Map

R-11 of the Price RMP/ROD states, “Non-WSA Lands with Wilderness Characteristics not Carried

Forward into the Approved Plan.” Therefore, in our view, any attempt to augment wilderness characteristics inventory already completed in Utah would be invalid, because it was done under the

auspices of now defunct Secretarial Order 3310, which is barred by the moratorium (see discussion

above). Moreover, no attempt has been made to amend any of the Utah RMP determinations of wilderness characteristics lands worthy of wilderness characteristics management. Therefore, any

attempt to try to prop up the supposed necessity of the present PEIS with notions of so-called ‘recently completed’ wilderness characteristics inventories is invalid and merely *belies* further the

illegitimate agenda-driven nature of this PEIS.

Further, while the updated inventory of lands with wilderness characteristics has been considered in the development of the alternatives and will be considered in the analysis of environmental consequences of possible future leasing and development, BLM noted in the April 14, 2011, NOI, “because this is a targeted planning process focusing on allocation of oil shale and

tar sands resources, this planning initiative will not consider designating Wild Lands.” further exposes the invalid, circular nature of BLM’s concerted effort with the wilderness advocacy group

lawsuit plaintiffs to manufacture a de facto wilderness allocation without legitimately amending an

existing RMP and without complying with the 2003 Utah-Norton Wilderness Settlement Agreement. The updated inventory of lands (illegitimate as it is) appears to be a step toward ultimate designation of the implementation of Secretarial Order 3310. That is a transparent · assertion, especially when considered in light of the April 14, 2011 NOI which clearly parked this

whole effort under the Wildlands Order. This is all about an agenda to ratchet down a previously legitimate allocation of oil shale and tar sands lands to conform to the lawsuit plaintiffs’ own vision

of wilderness designation, plain and simple. #4])>

<([#5 [1.3] Since BLM has categorically given the involved State and Counties an open door treatment

in allowing us to join them as a cooperating agency and then thrown out our comments and recommendations, violated the Energy Policy Act, The Data quality Act and the Congressional moratorium on Wildlands secretarial order 3310 and then placed into the draft an Agency preferred

alternative that was never commented on by the cooperators and in place before the public comment

process took place, Carbon County believes that this entire process should be thrown out and the existing Oil Shale and Tar Sands regulations be implemented without any need to amend RMP’s

that considered and planned for it during the RMP process.

#5)> Included with these comments is our Resolution No. 2012-02 that we want incorporated as part of the comments. It had been pleasure to comment again with the hope some of this information will be used or at least considered on this go-round. But judging by our past experience

we will tend not to expect much from this agency to support the security of this nation to allow domestic extraction and production of its own natural resources.

Very truly yours,

CARBON COUNTY BOARD OF COMMISSIONERS

Michael S. Milovich

Commission Chairman

RESOLUTION NO. 2012-02

RESOLUTION OF CARBON COUNTY

STATE OF UTAH

OPPOSING THE BLM'S 2012 OIL SHALE AND TAR SANDS PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT, BLM PROJECT# W0-300-13 1 0-PP-OSI IL (HEREAFTER 2011 OSTs PEIS)

FOR LANDS ADMINISTERED BY THE BLM fN COLORADO. UTAH AND WYOMING, This Resolution is adopted in open meeting by the Board of Commissioners of Carbon County. Utah in order to redress the many violations of law, regulation, and policy by the BLM with respect to the BLM's 2012 OSTs PEIS.

BACKGROUND

As background to this Resolution, Carbon County, Utah recites the following grievances: WHEREAS. On April 14. 2011, the BLM caused to be published in the Federal Register, Volume 76. No 72ffhursday, April 14.2011, pages 21003-21005. a notice of intent to prepare the above-referenced 2012 OSTs PEIS; and

WHEREAS, the preliminary purpose and need statement in the notice of intent, states the PEIS will analyze removing from oil shale and tar sands leasing "All areas that the BLM has identified

or may identify as a result of inventories conducted during this planning process, as lands containing wilderness characteristics[.]"/d.. at page 2 1004; and

WHEREAS. the notice of intent further states at page 21004:

Lands that the BLM identifies as having wilderness characteristics will be considered during this planning initiative, as described above, and consistent with Secretarial Order No. 3310, dated Dec. 22, 2010, and BLM Manuals 630 I and 6302. Future leasing of lands determined by the BLM to have wilderness characteristics, if compatible with the allocation decisions stemming from this initiative. will subsequently be assessed in accordance with BLM Manual 6303. as appropriate (i.e., where the BLM has not determined, consistent v.ith BLM Manual 6302, v. hether the lands with wilderness characteristics at issue should be receive a wild lands designation. BLM Manual 6303 v..ill apply); and

WHEREAS, this language documents the BLM's intent to implement, administer and/or enforce Secretarial Order 3310 and one or more of the BLM guidance manuals promulgated under Order 3310;and

WHEREAS, any attempt by the BLM to implement, administer and/or enforce Secretarial Order

3310. including any effort by the BLM to proceed further on the above-referenced Programmatic EIS. violates the spending moratorium of Section 1769 of the April 21, 2011 Congressional Continuing Resolution to Fund Fiscal Year 2011 through September 30, 2011 which states: For the fiscal year ending September 30, 2011, none of the funds made available

b) this division or any other Act may be used to implement, administer, or enforce Secretarial Order No. 3310 issued by the Secretary of the Interior on December 22, 2010; and

WHEREAS, this spending moratorium has been carried forward in all subsequent Congressional spending resolutions up to and including the current spending resolution; and

WHEREAS, the 2012 OSTIS PEIS is an admitted attempt by the BLM to implement, administer and/or enforce Secretarial Order 3310 and its policies and objectives, all in violation of the Spending Moratorium of the 2011 Continuing Resolution; and

WHEREAS, the 2008 Oil Shale and Tar Sands Programmatic EIS (2008 OSTIS PEIS) was required under Section 369 (d) (1) of the Energy Policy Act of 2005 and was prepared in cooperation with 14 federal, state, and local governmental organizations; and

WHEREAS THE 2008 OSTIS PEIS was 3 years in the making, and it honored the input of a task force of Governors and other stakeholders as per requirement of the 2005 Energy Policy Act;

WHEREAS, the Record of Decision (ROD) for the 2008 OSTIS PEIS amended 10 land use plans in Colorado, Utah, and Wyoming to make approximately 2 million acres of public lands available for potential leasing and development of oil shale and approximately 430,000 acres available for tar sands leasing. Together with the regulations published in 2006 and 2008 for oil shale and tar sands resources, the 2008 OSTIS PEIS and subsequent land use amendments constituted a reasonable and rational establishment of an oil shale and tar sands program as mandated in the Energy Policy Act of 2005; and

WHEREAS, the oil shale and tar sands program to which the 2008 OSTIS PEIS and related regulations gave birth, was a reasonable response to the fact that oil shale and tar sands resources in the Green River Formation located in northeastern Utah, northern Colorado and southwestern Wyoming may reach 8 trillion barrels of oil; and

WHEREAS, the preferred alternative in the draft 2012 OSTIS PEIS drastically shrinks, diminishes and in many areas outright reverses virtually all of the lands made available for Oil Shale and Tar Sands development in 2008, and does so using the same data and science; and

WHEREAS, such a drastic reversal in lands available for Oil Shale and Tar Sands development between the 2008 PEIS and the 2012 preferred alternative, violates regulatory and Task Force requirements of certainty for industry and investors; and

WHEREAS such a drastic reversal of lands available for Oil Shale and Tar Sands development in 2008, constitutes a de facto, piece-meal revision of previous BLM Resource Management Plans, in violation of the Section 202 Planning Process under FLPMA;

WHEREAS, the preferred alternative in the draft 2012 OSTIS PEIS entirely ignores the input of the task force and stakeholders which the 2005 Energy Policy Act directed the BLM to honor and follow; and moreover the draft 2012 OSTIS PEIS may well violate various memoranda of understanding (MOUs) with counties, which require the BLM to publish the written input of cooperators who disagree with the preferred alternative;

WHEREAS the draft 2012 OSTIS PEIS preferred alternative significantly restricts the acreage allotted in the 2008 PEIS for research and development leasing;

WHEREAS the draft 2012 OSTIS PEIS preferred alternative threatens to arbitrarily undermine the process and the work utilized in creation of the 2008 OSTIS PEIS, and essentially dismantle a

reasonable and rational oil shale and tar sands program in violation of Section 369 of the 2005 Energy Policy Act; and

WHEREAS, the 2012 OSTIS PEIS preferred alternative is the creature of a friendly lawsuit settlement agreement between the BLM and ideological opponents to oil shale development; and

is therefore entirely pre-determined and pre-decisional in violation of NEPA. "With no apparent rationale for revising the acreages approved in 2008; and

WHEREAS, the BLM has settled on a preferred alternative in the 2012 OSTIS PEIS admittedly without having first analyzed its impacts: BLM should be required to withdraw the preferred status of the alternative until it has performed this analysis; and

WHEREAS, the acreage approved for Oil Shale and Tar Sands development in the draft 2012 OSTIS PEIS preferred alternative bears no rational relationship to the stated purpose and need;

WHEREAS, the Department of Energy has basically abdicated the responsibility Congress placed upon it to defend and uphold a viable oil shale energy program in America, leaving it instead to the BLM encumbered by a host of anti-oil shale preservation wilderness groups steering BLM's

every move:

WHEREAS, the alternative adopted in the ROD of the 2008 OSTIS PEIS is not the "No-Action Alternative" of the draft 2012 OSTIS PEIS; and

WHEREAS, the 2008 OSTIS PEIS chosen alternative is consistent with the multiple use, sustained yield of the Federal Land Policy Management Act (FLPMA); and

WHEREAS, the 2008 OSTIS PEIS chosen alternative is consistent with county general plans and policies which call for responsible development of available energy resources; and

WHEREAS, the development and production of oil from oil shale has been proven beyond a doubt to be technologically and economically feasible; and

WHEREAS, this same technology to extract oil from the oil shale rock is not only economically feasible, *it requires little to no consumption of water*, contrary to the myths which falsely claim that oil shale extraction requires large consumption of water resources; and

WHEREAS, the energy captured in the extraction of oil from shale (natural gas capture, etc..) more than makes up for energy consumed in that extraction process, thus dispelling the myth that the oil shale extraction process consumes more energy than it produces;

WHEREAS, the rising price of gasoline, coupled with ever increasing loss of good paying jobs due to the Administration's policies against energy development on western public lands, result in increasing hardships for families and the local economy, to the point where some fear the "end of opportunity" is about to close for a civil, lawful and orderly response as citizens feel more and more pressured and desperate financially; and

WHEREAS, the 2012 OSTIS PEIS improperly limits technology testing to strictly in situ efforts and does not allow for development of other technologies; and

WHEREAS, the BLM has left insufficient time for the public and cooperators to meaningfully comment on the public draft 2012 OSTIS PEIS by the present comment deadline of May 4, 2012, because a highly relevant commercial oil shale BLM regulation is not due to be published until May 15, 2012 and the public should have the right to view that regulation first and then submit comments on the draft 2012 OSTIS PEIS in light of that regulation; and

WHEREAS, the same problems with lack of consistency with local plans and policies and failure to honor the input of cooperators and all stakeholders, also besets many public lands EIS projects, in addition to the 2012 OSTIS PEIS. The cooperators from Utah and Wyoming have

already) unanimously requested for the No-Action alternative in the draft 2012 OSTs PEIS become the preferred alternative.

RESOLUTION

NOW THEREFORE. BE IT RESOLVED BY CARBO~ COUNTY, STATE OF UTAH AS FOLLOWS:

<([#6 [9.2.1] 1. Carbon County. Utah declares the BLM's continuing to administer and carry out the 2012

OSTs PEIS to be an open contempt and flaunting of the Congressional Spending \loratorium first imposed in the 2011 Continuing Resolution and carried forward in all subsequent Congressional spending resolutions up to and including the present;

2. Carbon Count) calls upon the BLM to cease all further activities with respect to administering and carrying out the 20 12 OSTs PETS, because doing so constitutes an open contempt and/or enforcing of the Congressional Spending Moratorium against implementing. administering and/or enforcing Secretarial Order 3310. Which Spending Moratorium was first imposed in the 2011 Continuing Resolution and carried forward in all subsequent Congressional spending resolutions up to and including the present:

3. Carbon County calls upon the BLM to immediately cease and desist all activities related to the above-referenced 2012 OSTs PEIS and immediately publish a revised notice in the Federal Register signifying its cessation of all work on the Programmatic EIS in obedience to the above quoted Spending Moratorium. Otherwise. the BLM would be in contempt of Congress:

#6)> <([#7 [2.1.1] 4. Should BLM continue to go forward with the 2012 OS1S PEIS regardless of these Grievances, the only legally viable alternative would be if the BLM adopted the "No-Action

Alternative, which is identical to the Alternative chosen in the ROD of the 2008 OSTs PEIS:

#7)> <([#8 [1.1.1] 5. The BLM should extend the May 4, 2012 deadline for public comment on the draft 2012 OSTs PHS at least 30 days after publication of the expected oil shale regulation due to be

published on or around May 15, 2012.

#8)> <([#9 [1.3] 6. The BLM should honor the input of cooperators. particularly if they are local governments. as required by Section 202(c)(9) of FLPMA. in all matters. not just with respect to the 2012 OSTs PEIS. #9)>

<([#1 [2.3.1] Regarding the follow up PEIS detailing land use plans and for the future

development of oil shale and tar sands resources in Colorado, Utah, and Wyoming, I would encourage the adoption of Alternative 3 which releases no land in Wyoming; only 30,000 acres in Utah and Colorado for research purposes only . The chronic water shortages that exist in Wyoming make it a poor choice for oil shale extraction. #1)> Thanks you.

2 May 2012

To Whom It May Concern:

Thank you for the opportunity to provide comments on the Oil Shale and Tar Sands (OSTS)

Programmatic EIS. We at HawkWatch International, a non-profit conservation science organization that specializes in birds of prey and with specific knowledge related to the proposed areas for potential OSTs development, wish to offer our input at this juncture in the planning process. <([#1 [2.3.1] We recognize that we live in an era of decreasing fossil fuel resources, and the need for alternative sources of energy, both renewable and otherwise, is becoming increasingly necessary. We also recognize that our dependence on these resources is strong and that there exists a need for increased domestic production of fossil fuels. However, due to the fact that these resources contribute to climate change and the extraction of such resources has the potential to alter landscapes such that they will no longer be able to support the wildlife and human communities that depend on them, it is absolutely imperative that novel methods of extraction be completely vetted before public resources are allowed to be leased. These technologies are as yet unproven at a commercial scale, both financially and environmentally, within the United States, and require a large number of already-scarce energy and water resources in the process of extraction. As such, we are in support of Alternative 3 – Research Lands Focus, and are strongly opposed to any leasing options that do not include a strong research and development focus prior to resource extraction. #1])>

<([#2 [3.7.3.6] [3.7.3.9] Wildlife Impacts with regards to raptors:

We recommend that the PEIS consider the likely cumulative landscape impacts on wildlife and habitats of existing and reasonable foreseeable conventional oil and gas development when evaluating whether this landscape can support oil shale and tar sands. BLM should encourage the least surface disturbing forms of development. We also recommend that surface disturbance limits be set for all forms of resource extraction that, when reached, would require reclamation before further development could occur (e.g., see the ROD for the Roan Plateau). We suggest appropriate spatial and temporal buffers be applied to protect all known raptor nests. For example, refer to “Utah Supplemental Planning Guidance: Raptor Best Management Practices” published by the Utah State Office of BLM. Additionally, we urge the BLM to recognize the potential value of pinyon-juniper habitats in the Piceance Basin as nesting habitat for Accipiters (i.e., Northern Goshawks, Cooper’s Hawks, and Sharp-shinned Hawks; refer to BLM Technical Note 435: <http://www.blm.gov/nstc/library/pdf/TN435.pdf>).

WWW.HAWKWATCH.ORG

<([#3 [3.7.3.1] [3.7.3.5] We do not agree that vegetation loss will only comprise a moderate impact to raptors, and instead argue that it presents a potentially large impact. Loss of vegetation, especially shrubs and trees, can lead to loss of important habitat for tree nesting and roosting birds and the loss of foraging habitat and prey base species in historical raptor territories, therefore making it difficult to support a nesting population in the area. Additionally, removal of vegetation and increased surface disturbance has the potential to completely eliminate Burrowing Owl habitat, a fossorial diurnal owl native to these areas that is listed as a species of concern in all three states within the OSTs area. Furthermore, increased fire potential does not present a small impact to raptors. More likely, fire has a moderate to large impact on raptors. Research in the western part of Utah has shown drastic declines in Golden Eagle nesting success, nest starts and productivity following intense fire years and loss of critical shrub cover for prey species, such as jackrabbits.

#3) **<(#4** [3.7.3.9] [3.7.4.4] Given the potential raptor foraging habitat destruction associated with the proposed activities, we also suggest that the BLM use a larger buffer around nest sites and high value raptor areas than the 1-mile buffer BLM currently suggested for Golden Eagles. The current BLM spatial buffer was designed to prevent disturbance to birds on nests (e.g., from point-source activities, such as oil and gas drilling); they were not intended to protect foraging habitat surrounding nests. The Golden Eagle literature suggests that birds breeding in the western U.S. exploit home ranges averaging 20–33 km² in size (equivalent to a 1.6–2.0-mile-radius), depending on the study area (reviewed in Kochert et al. [2002]), but they can be as large as 83 km² (3.2-mile radius) in southwestern Idaho (Marzluff et al. 1997). Therefore, we suggest a minimum 2-mile buffer around Golden Eagle territories. In contrast, Ferruginous Hawks forage over average home ranges of 6.0–7.6 km² in size (equivalent to a 0.8–1.0-mile radius; Smith and Murphy 1973, McAnnis 1990), so the existing 1-mile disturbance buffer may also be a sufficient buffer for this species.

#4) **<(#5** [3.7.4.4] State-specific issues:

Utah and Colorado

HawkWatch International has done extensive work with the BLM offices in Eastern Utah and Western Colorado involving raptor responses to oil and gas development (see BLM Technical Notes 432-436; <http://www.blm.gov/nstc/library/techno2.htm>). From the data compiled under these efforts, we are able to compile basic information on the number of historical raptor nests within the area that may be affected by OSTs development for all alternatives for both states (Table 1 and 2). Please note that these datasets are historic and are not comprehensive for the regions of interest and have not been updated since 2006 or 2007. We urge BLM to refer to any additional data collected by their representative Field Offices and the various environmental consultants contracted by oil and gas companies in the intervening years.

Table 1. Historical nests potential affected by OSTs development in Eastern Utah. Mexican Spotted Owl and Burrowing Owl Nests were not included in this analysis. GOEA – Golden Eagle. FEHA – Ferruginous Hawk.

[SEE TABLE]

Table 2. Historical nests potentially affected by OSTs development in Western Colorado. Mexican Spotted Owl and Burrowing Owl Nests not included in this analysis. NOGO is Northern Goshawk, a state species of concern.

[SEE TABLE]

Alternatives 1 and 4 have the potential to affect a huge number of raptor nests in both states, even when considering the conservation measures set forth in this document. With such high numbers of potential disturbance, it is absolutely imperative that mining technology be thoroughly researched to avoid unwanted environmental risk. Alternative 3 presents the least amount of risk to raptor nests of the four alternatives, and allows for adequate testing of the technology prior to commercial **#5)**

<(#6 [3.7.3.10] Wyoming

South-central Wyoming supports a large number of raptors, including one of the largest known breeding populations of Ferruginous Hawks (Olendorff 1993), a recognized BLM species of concern, and Golden Eagles, a species of increasing conservation concern for the USFWS and states within the region. Our communications with Rock Spring BLM FO staff suggests there is also substantial raptor data available for this area that should be consulted. **#6)**

<([#7 [3.7.3.10] [3.7.4.1] Overall KRAs:

This document makes little mention of a number of “Key Raptor Areas” (KRAs) that have been previously identified within the region considered for OSTs development. Through BLM co-authorship and signing of Raptor Research Report #8 (see Olendorff et al. [1989]), BLM signaled a commitment to “protect and manage raptor habitats on public lands to the best of its ability within the multiple-use mandate provided by the Federal Land Policy and Management Act (FLPMA). In preparing the report, individual BLM field offices identified a total of 223 KRAs with the intention of providing guidance to future planning and management efforts, such as this one. KRAs were defined as areas with unusually high raptor nesting, migration, or wintering concentrations that deserved special consideration during decision making (Olendorff et al. 1989). Table 3 outlines the XX KRAs that occur adjacent or in potential OSTs areas.

Table 3. Key Raptor Areas within Alternative 1 for OSTs development
[SEE TABLE] #7)>

<([#8 [3.7.3.9] [3.7.4.4] Proposed conservation measures Bald and Golden Eagles and Mexican Spotted Owls

We fully support all of the proposed conservation measures detailed in Appendix F, and implore the BLM to extend conservation measures to other state-listed species of concern that potentially occur within the areas of proposed OSTs leasing (See table 4). We suggest also increasing the survey radius from 1 mile to 2 miles for nesting and roosting Bald and Golden Eagles, given that their home range size can be anywhere from 1.6 to 2.0 miles in radius. Because this home range size is one of the largest for raptors, we feel confident that this radius would safely include all other species of concern within the OSTs leasing areas. We also support the need for increased effort in under-surveyed areas within potential Mexican Spotted Owl habitat in the OSTs leasing areas.

Table 4. State species of concern for OSTs leasing areas. [SEE TABLE]

The proposed conservation measures mention restoration of activities of wetlands, and we further want to stress the need to include restoration measures for habitat structure in areas of shrublands and pinyon-juniper woodlands, given their importance to raptor prey base and nesting habitat. #8)>
