<([#1 [6.3.] CryoRain Inc. offers several environmental fixes to current practices used in oil shale fuel extraction: 1. Fracking is done with cold using Liquid Nitrogen sourced Nitrogen gas. Rock conductivity allows rapid space cooling. 2. With ground and contained water frozen, the 10% expansion of water frozen vibrated by dissonant tones will crush the rock sufficiently to allow evaporated fuel release. 3. Carrying the fuel from the ground with Nitrogen gas while raising the temperature in the center of the frozen zone will force fuel to surface for condensing by liquefaction temperature. 4. Water components are separated out and fresh water used in agriculture. 5. Technique covered in applied US patent 12/217,915. Advantages include - no water used, no harsh chemicals added to ground, no moving parts in extraction system which is thermally powered. Diagram of system attached. All tar sands and oil shale vehicles should carry Liquid Nitrogen fire extinguisher to end a fire flareup, catch and spilled fuel, and stop leaking situation.

Attachment:

A New Technology Births a New Science - Thermistry This Presentation is Directed to the Oil & Gas Industry

With seven years experience and now an issued patent, USP 7,631,506, on the discovery that Liquid Nitrogen, when rained through a perforated pan or trough produces pure, inert, cryogenically cold Nitrogen gas which opens a world of capabilities from ending fires and crises to extracting fuel and polluting compounds from the earth. It is; Green, mean and clean since Nitrogen is already 78% of the atmosphere, it not only is available everywhere and mixes back in with no mess, no damage, no change. A fire burning flooded with pure Nitrogen just isn't burning any more.

The new science, Thermistry, is the study of or related to using temperature difference to drive change or motion using an inert material - here Nitrogen, N₂, molecules - the fourth coldest liquid in the world - creating action without chemical reaction. Chemical reaction is prevented both by having reactive materials surrounded by inert Nitrogen gas which eliminates the reactive Oxygen and even Hydrogen from interacting, and, second, by taking the ambient temperature of the materials below their temperature window of reaction.

Thermal techniques start cryogenically using Liquid Nitrogen rained through a spaced-hole sieve descend in drops through warmer air causing the drops to evaporate into pure Nitrogen gas. Nitrogen's wrapped-tight molecule prefers to neighbor itself and in the evaporation process will force other air components out

of the cloud of Nitrogen giving pure Nitrogen gas, an inert gas cloud at cryogenic temperature. On evaporating the Liquid Nitrogen drops in a calm environment, one can see the size of the pure gas cloud because its rim is clouded with condensed water vapor. A burning match placed in the clear air stops burning.

Factors included in Thermistry using Liquid Nitrogen sourced Nitrogen gas:

1. transferring temperature. It will cool things down rapidly, passing the cryogenic Nitrogen gas through pipes, it freeze things. It also will solidify spilled liquids for easy pick up and even gaseous toxins keeping them in the canister or aerosol they are in preventing their dissemination. Used in oil shale extraction, the cold will crack the kerogen that contains the fuel components. Working with unexploded ordnance, the freezing will prevent able power function and then at lower temperature, prevent the chemical reaction that causes the explosion. In controlling coal mine fires, it counters the inferno in the surface burns and rapidly reduces the underground temperature that would re-ignite methane gas and coal burning. To cool the last Chinese coal mine fire, it took three years
2. enabling Oxygen-free transport of flammable materials as fuels and reactive mixtures. Extracting fuel with Nitrogen as the carrier of the fuel to the surface, one can reach the needed 375oC. temperature to carry all the heating oil and nothing will burn. It is offered to cool down the Fukushima Nuclear facility fuel rods to prevent meltdown. They report temperatures of 322oC in the reactors and spent fuel rod storage, but that is below our heating oil extraction temperature and way above water boiling so as to insure a dry environment which brings danger of Oxidizing the fuel rod chemicals.
3. ending fuel fires by bathing the burn in Nitrogen gas evaporated from Liquid Nitrogen relates to energy safety from coal mines and petroleum facilities to chemical plants and even particle fires as lint, dust in silos and shipboard with grain shipments, sugar production and the like.
4. freezing the containment of fuels as in oil shale and landfill seams where stored water freezes expanding its 10% microscopically fracturing the material containing the fuel components which allows release of contained fuels upon heating later in the process. In the fuel extraction, the locked in fuels in sedimentary situations is opened by the expanding water in the materials. With oil shale it let heating the rock after Liquid Nitrogen / cryogenic Nitrogen treating give off light, sweet fuels and water and then, as the heating continued, the gasoline, kerosene and heating oil. Without the Nitrogen treatment, it gave off sulfur compounds.
5. saturating the ground, the Nitrogen eliminates the Oxygen so high temperature extraction can be done without ignition of the fuel bringing even Methane safely to the surface and capturing it by condensation, and providing means to end subterranean coal mine, peat and other embedded fires. This again is for fuel extraction and coal mine fire control as well as other embedded fires that burn long now since, other than this new Nitrogen technology, there is no means to end them. This also relates to remediation as fuel leaked from storage tanks which is

extracted from the ground in the same way we pull fuel from oil shale reserves and landfill seams.

6. penetrating the ground with Nitrogen gas in the pure state to control embedded fires stop the smoke and toxin releases by cooling the ground to below ignition temperature, and as mentioned in #5, suffocates the burn.

7. flooding the fire draft with Nitrogen, a gaseous fire suppressant, see NFPA Code 2001, ends the burning and counters infernos which pull the Nitrogen cloud into the fire going to whatever level of the structure or of forest the most active burn is happening. The fire brings the fire suppressant to itself ending the burn. In contrast, water and foams drop fall through the fire, and puddle on the ground, and in the case of oil fires, it splatters the fire giving new areas of burning. Extending this further, when a cloud of Nitrogen is drawn into a fire, it can be pulled into and be effective in ending a series of fires because it stays as a gas and has no chemical change. If it does mix in the fire it is flooded with Carbon dioxide which, as you know, is also a fire extinguishing agent.

8. using the cryogenic temperature of just evaporated Nitrogen in condensing tubes in a coal smoke environment freezes out the water on the walls of the tubes causing soot to drop out of the air. Further cooling can condense Carbon dioxide (CO₂), into dry ice, or like the Dutch practice, pass CO₂ through greenhouses to enhance plant growth. This gas stack scrubber method eliminates the smoke rather than disseminating it into the air off the top of a tall chimney and applies the smoke components to enhancing plant growth. This scrubbing can be done with heavy oil burning furnaces as well.

9. SAFETY FACTOR - breathing pure Nitrogen or Argon, Neon or Helium air by man or beast causes fainting, because the level of CO₂ in the lungs ends with no Oxygen exchange. The diaphragm action stops and the brain sleeps inducing fainting. In this state, fires and their smoke do not damage or destroy the lungs of those caught in a fire and, if resuscitated within six minutes, they will survive without mental or physical damage. Also flooding a Methamphetamine Lab situation both controls the occupants and prevents explosions making it safer for first responders. First responders with extra SCUBA equipment must be in the fire area to quickly restrain suspects and resuscitate anyone caught in the fire and walk them out. The non-lethal weapon use also ends hostage situations and robbery attempt at banks or convenience stores or airliner hijackers. Presently half the fire deaths in the USA have been from smoke inhalation only. A fire being fought with Nitrogen will put those caught in the crises in Coma saving their lungs. Breathing the CO₂ of the fire floods the lungs with smoke so N₂ atmosphere is preferred. First responders with SCUBA gear will have the IPV units in the building before the Nitrogen is released for fire fighting so they can resuscitate those caught, even handling a crowd of people in time.

10. realizing this Nitrogen gas is invisible to the eye, unidentifiable to the

nose, not tasted by the tongue and silent to the ear – knowledge of its effects and actions to remedy a situation will protect the population in the environment of its use. Using this Nitrogen gas sourced from Liquid Nitrogen was suggested to the US military as a favored means to do urban warfare in Iraq in that both persons and property are protected and undamaged, yet the terrorists can be easily separated and interrogated. They say money is the issue and then choose the most expensive means – drone bombs which are costly as is recovery from the explosion to say nothing of unnecessarily loss of lives.

11. fighting fires with Nitrogen leaves no water damage and no electrical arcing making this technology optimal for handling vehicle fires with the ever increasing number of electric and hybrid automobiles on the road mixing with the fossil fuel powered vehicles. It leaves homes which have had fires more quickly recoverable since only what burned away, warped, melted, or was scorched needs replacing. It still smells so bring on the Fabreeze™.

12. winter fire fighting using Nitrogen does not cause ice build up as using water does, damaging the structure and coating the ground with ice endangering those walking, working and driving in the area.

13. measuring Nitrogen gas volume from one gallon of Liquid Nitrogen, one gets 230 gallons super cold (30.7 cubic feet) – the volume of a twin bed with mattress; at room temperature, 250 gallons (33.4 cubic feet); and at inferno temperatures, over 600 gallons (80+ cubic feet). A truckload of 3,000 gallons of Liquid Nitrogen floods 92,240 cubic feet with super cold and 100,260 cubic feet with room temperature Nitrogen. It is not consumed in the fire so can end burns over a large tract. When having heated in countering inferno temperatures, it will rise in the atmosphere flooding 240,000 cubic feet of treetop infernos. With a sheering 5 MPH wind, it becomes part of the atmospheric gases being normally 78% Nitrogen. Once polluted like this, it mixes easily with the air.

14. determining Nitrogen molecular reactivity with its diatomic structure, it shares three electrons putting its reactivity between Oxygen (O₂) and diamond structure of Carbon (C₄). It takes legumes – peas, peanuts, beans of all sorts - to split the Nitrogen atom pairs with their rhizome bacteria. These bacteria create nodules on the roots which when left in the field will fertilize the ground for several years of growing other crops.

15. preventing flooding by freezing water and gravel in sandbagging and levees and freezing temporary patches in dams and dikes. This was offered to protect the just rebuilt New Orleans against Category #5 hurricane flooding and river flooding using sandbagging for towns threatened in general river flooding. The patches were offered to stop the flow of radioactive water from the Fukushima Nuclear Facility. Since the New Orleans oil storage and refining is now being flooded with the Mississippi River bulging its banks and covering lands unbothered in recent history, this should be included in handling troubles in oil industry.

16. reducing pollution, nuclear or toxic, by freezing out the water containing

the irritant and transporting it to a place safe to dispose or degrade it. Here again was a solution to a Fukushima difficulty where radioactive water was gushing from a reactor flooded to cool it. Also, when crude is harvested, a large component of the material shipped to the refinery is water. A freezing process can strip the water components in condensing sequence and then liquid separation can take out more from the light gasoline component of the raw petroleum.

These sixteen factors alone can influence our decisions on fire and crises handling, oil and gas industry needs, remediation of organics from the soil and ground to prevent further contamination of aquifers, implement fuel extraction from fossil fuel deposits of all but solid carbon materials - diamond, slate, and anthracite coal, and freezing levee cores, sandbagging and breach repair to prevent flooding. Many problems cannot be handled by current technology except for this cryogenic means and others are poorly or expensively handled, either economically or environmentally as the dispersing detergent to counter the BP Oil Crisis in the Gulf. Using this technology, CryoRain offered to end the flow of crude from the wellstem which would have cut the polluting of the Gulf of Mexico by two months, but someone put as the first reason to reject a proposal that "Freezing is not Feasible." Our triple pack offer there was to end the flow from the well, freeze the crude on the surface of the water and freeze the crude on the shores and take collected crude to area refineries to convert to fuel.

Chefs on television of late have been pouring Liquid Nitrogen into their mix for the best ice creams...no after taste in Nitrogen. Having Nitrogen in the kitchen can end a kitchen fire is a flash and not destroy the meal(s) in preparation. This practice should be part of every oil rig and oil transport vessel galley.

Enjoy discovery of applications remembering I have a eight year advantage and an array of patents pending and proposals implementing those I found useful. If the administering scientists in our crises centers would have the courage of great chefs, this technology would have been in the field years ago. Let us work together to get this logical choice for countering fires and crises into use from fire departments to fixed systems like replacing water sprinkler systems to the nondamaging Liquid Nitrogen sourced Nitrogen gas which do not expand the damage beyond that caused by the fire and ending the fire more quickly even reduces the damage the fire might have caused if fought with water, foams or chemicals. Communities should convert their crises fighting to our most abundant gas and save money, property, and, most importantly, lives.

Sincerely,

Denyse DuBrucq EdD, #1)>

<([#1 [2.5] We submit this letter regarding the BLM's "draft programmatic environmental impact statement" (Draft PEIS) for oil-shale and tar-sand development in Colorado, Utah and Wyoming (our former home state). We are deeply concerned about the potential environmental

effects to water, wildlife, communities and public lands if the BLM initiates a commercial leasing program. The two million acres in Utah, Wyoming and Colorado previously allocated for commercial leasing is a massive amount of public taxpayer land that would be sacrificed for a single use of the landscape. Between global climate change, extinctions occurring at a rapid pace, and a quickly-drying Colorado River -- problems that oil-shale and tar-sand development would only exacerbate -- it's hard to imagine a less prudent use of our public lands. We have appreciated BLM's "go slow" approach that is requiring industry to reasonably develop and prove the technologies prior to allowing commercial leasing, and Alternative 2 of the Draft PEIS is a step in the right direction. However, the Draft PEIS should have included an alternative that does not in any way endorse the use of additional public lands with which this unproven industry can speculate. #1)> <([#2 [3.10.4] [3.10.5] Oil shale is currently producing no jobs and no revenue; the Congressional Budget Office confirmed that it is not expected to produce significant revenues through 2022. So we have the luxury of time in which to carefully assess the impacts of development on our water, wildlife, and communities. No one knows if oil shale will ever create jobs for our communities, since the barrier to oil shale is the rock itself. Leasing our public lands and providing our tax dollars for oil industry speculation is simply wrong. And meanwhile, the land overlying oil-shale resources in Utah, Colorado and Wyoming is some of the best wildlife habitat in the West; outdoor recreation and tourism are huge economic drivers for the region. It is imperative that we protect this sustainable economy by making smart decisions based on sound information. #2)> <([#3 [3.4.1] Moreover, speaking as former residents of Wyoming, we know that state is already facing chronic water shortages in its arid steppes. With no clear answer from the oil industry about what potential oil shale development would mean for the water needed by Wyoming's farmers and ranchers, who are already providing real jobs, commercial leasing is a gamble the region should not be required to take. The hard-working people of Wyoming deserve better than the unavoidable environmental degradation that will result from this speculation. Wyoming folks value their open spaces, water, and hard-won agricultural heritage, and deserve to retain it rather than being treated as chess pieces in a massive and speculative oil industry game. #3)> <([#4 [12] We oppose any action by the BLM to continue or to authorize any new oil-shale or tar-sand development on public land, or to create or continue land-use allocations that would allow for such uses in the future. Take another long look at oil shale development. Evaluate carefully, and disclose fully, the serious impacts of all new energy required for oil-shale and tar-sand production, including its potentially devastating impacts to our climate and the threat it poses to wildlife, special-status, threatened and endangered species, and to our water, air and communities. #4)> Thank you for giving our concerns your most serious and thoughtful consideration.

<([#1 [6.3.1] [11.2] Recent research on hybrid energy systems that combine shale oil, nuclear

energy, and renewables indicate that future shale oil may have the lowest environmental impact of any fossil fuel source of gasoline and diesel. The greenhouse gas releases per vehicle mile may be half those of vehicles consuming gasoline and diesel from crude oil. The attached paper “A Nuclear Wind Oil-Shale System for Variable Electricity and Liquid Fuels Production” by Charles Forsberg to be given at ICAPP’12 in Chicago (June 24-28) provides the details. It changes shale oil from what was once considered a fossil fuel with one of the larger environmental impacts into the fossil fuel with the lowest environmental impact per gallon of gasoline or diesel fuel. Because of the shale-oil resource base, it is an option that eliminate U.S. dependence on foreign oil. Because of the benefits of reducing greenhouse gas emissions and getting off foreign oil, the decisions should be made to allow very wide use of shale oil where it can be shown such benefits exist. <([#1 [6.3] I am an expert in thermal chemical processing of solid feedstocks for the production of gases and liquids. Oil shale is fantastic resource that has been held in reserve these many years due largely to economic constraints, and in part due to technology limitations. With oil at \$100 per barrel the economics are now attractive. The situation that has changed even more during the past decade has been the broad base of technologies that focus on bio-fuels production. So many of the thermal processing methods that are being developed for biomass conversion into liquids are directly applicable to oil shale. However, this fact is not widely known. There is a technology revolution in progress relative to synthetic fuels and biofuels. How many billions are being spent on biofuels development, most of which is directly applicable to oil shale. My comment; the technology has changed significantly since the last time the major oil companies took a run at oil shale. In my opinion, the business is not ideally suited for the oil companies. But it is ideal for all the medium size companies that are pursuing biofuels. Make it easy to test now technology; provide the up-side incentives for the winners; the private sector will bring products to market, without harming the environment, and without using scarce water resources. For example, who ever said you need to use water to process shale? That is just not necessarily the case. #1])>

<([#1 [2.5] [I2.3] As a Utah-based oil and gas consultant who has done client studies in tar sands and the Green River Formation I am very strongly opposed to opening large tracks of public lands to speculation in tar sand and oil shale leases. The present action being followed by the BLM of granting small research and development leaseholds to serious operators is the correct one to follow. These are as yet energy resources with no clear development path. Until commercially viable and environmentally sustainable methods of exploitation are found, the public lands should remain in reserve and off-limits to speculators interesting only in “flipping” leases and their unproven development concepts. I have seen in my practice numerous examples of serious energy investors being closed out of commercial development by energy lease speculators holding out for a still better price. This is not in the public interest and it does not promote national energy independence. The “no change” option is not a viable option for the long-term rational development of the region’s heavy oil and oil shale resources. The BLM should hold back the public lands with these potential resources until such time that proven commercial processes are available for thier rational development. Steven Schamel, PhD For reference, I am a former Research Professor in Chemical Engineering at the University of Utah, former President of the AAPG-Rocky Mountain Section and Past-President of the Utah Geological Association. I am currently founding President of GeoX Consulting Inc. #1])>

BLM Oil Shale and Tar Sands PEIS

Argonne National Laboratory

EVS Division

Building 240

9700 South Cass Avenue

Argonne, Illinois 60439

Re: Draft Programmatic Environmental Impact Statement (PEIS) and Possible Land Use Plan Amendments for

Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the BLM in Colorado, Utah, and

Wyoming (CHS #48519)

To Whom it May Concern:

<([#1 [1.4] [3.9.7] Thank you for your correspondence dated January 25, 2012 (received by our office on February 6, 2012) and

for the opportunity to discuss this project with both Dan Haas and Sherri Thompson on April 11, 2012.

Their formal presentation of possible oil shale development within the Piceance Basin study area in Colorado

certainly helped us understand the nature of this undertaking.

We recognize that BLM is currently in the initial Oand use planning) stage of what is described as a three-step

process. Currently the commercial viability and development for this new technology is unknown, but is

actively being studied through ongoing research, development, and demonstration (RD&D) lease analysis.

We anticipate that additional Section 106 consultation will occur with our office for each of these subsequent

steps including BLM lease review and the consideration of site-specific development plans.

Under the process established for the protection of cultural resources as required by Section 106 of the National

Historic Preservation Act (Section 106) and implemented through 36 CFR 800, it is the statutory requirement

of the Federal agency to fulfill the procedural obligation of Section 106 and to ensure that an agency official

with jurisdiction over an undertaking takes legal and financial responsibility for Section 106 compliance (36 CFR

800.2). The lead agency official remains legally responsible for all required findings and determinations if the

services of a consultant have been utilized for the purpose of obtaining recommendations regarding National

Register-eligibility and project effect (36 CFR 800.2(a)(3)) or if an applicant for Federal assistance has been

authorized by the lead agency to initiate consultation with the State Historic Preservation Officer

(36 CFR
800.2(c)(4)).

The findings from the Section 106 studies can inform the National Environmental Policy Act (NEPA)

studies, such as including mitigation measures identified under Section 106 into the NEPA decision

document. Once we receive the Section 106 studies, we will be able to fully complete our reviews under both NHPA and NEPA.

As such, we recommend that a cultural resources survey be completed for the individual site-specific

development plans prior to mineral extraction to document all the historic properties within the project area and

to determine the potential effects to these resources as a result of the proposed undertaking.

Oil Shale and Tar Sands Resources Draft

Programmatic EIS

Argonne National Laboratory, EVS/240

9700 South Cass Avenue

Argonne, Illinois 60439

Re: WO-300-1310-PP-OSHL — Notice of Availability of the Draft

Programmatic Environmental Impact Statement for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah, and Wyoming, 77 FR 5833 (February 6, 2012).

<([#1 [2.1.1] Dear Sir or Madam:

The Center for Regulatory Effectiveness (CRE) is pleased to submit these comments to the Bureau of Land Management (BLM) regarding the 2012 Draft Oil Shale and Tar Sands Programmatic Environmental Impact Statement (hereinafter “2012 PEIS”),¹ that proposes to amend land use plans relating to oil shale and has the potential to substantially reduce existing allocations of land already available for oil shale and tar sands development. CRE recommends that BLM take no action as prescribed by Alternative 1, which would leave the current allocation decision from the 2008 Programmatic EIS and Record of Decision (ROD) in place.

BLM should not amend the eight land use plans—as modified by the 2008 ROD—which allocated public lands for leasing and development of oil shale resources. BLM’s decision that it is necessary for it to take a “hard look” at whether the lands should be designated for the development of oil shale is based on the premature determination that oil shale development is “not at present a proven commercially-viable energy source.”² BLM has not provided developers with ample opportunity to develop oil shale commercially. As the Federal Register notice states, “The BLM will decide whether any changes should be made to the existing land use allocation decisions, in light of the nascent character of technology for developing oil shale and tar sands resources.”³ Until the testing and development of oil shale extraction technologies have been completed, any modification to the allocated land use for oil shale would be hasty and conflict with the intent of Congress that “It is the policy of the United States that— (1) United States oil shale, tar sands, and other unconventional fuels are strategically important domestic resources that should be developed.”⁴

4 Energy Policy Act of 2005, P.L. 109–58, § 369 **#1)**>

<(**#2** [6.1.2] CRE offers the following recommendations to BLM in order for it to fulfill the mandates of the Energy Policy Act of 2005 and to remain committed to pursuing the development of oil shale.

I. BLM’s Preferred Alternative is Not a Viable Alternative

A. The United States Oil Shale Reserves Are Five Times Greater Than Saudi Arabian Oil Reserves

A report by the Government Accountability Office states, “The U.S. Geological Survey (USGS) estimates that the Green River Formation contains about 3 trillion barrels of oil, and about half of this may be recoverable, depending on available technology and economic conditions. This is an amount about equal to the entire world’s proven oil reserves.”⁵ According to the Department of Energy, the United States could potentially have over 6 trillion barrels of in-place oil shale.⁶ The Department of Energy’s Office of Naval Petroleum and Oil Shale Reserves estimates that the United States has 1.38 trillion barrels of oil shale that are recoverable.⁷ The Rand Corporation offers a more conservative estimate of 800 billion barrels of recoverable oil shale.⁸

At current US demand for oil, the “800 billion barrels of recoverable resources would last for more than 400 years.”⁹ And this is the most conservative estimate. Furthermore, since BLM has published the final Programmatic EIS in 2008, the United States Geological Survey (USGS) has upgraded its in-place assessment of oil shale reserves by 50 percent in the Green River Formation in the Piceance Basin of Western Colorado.¹⁰

BLM’s own estimates state the US oil shale reserves are nearly five times greater than the known oil reserves in Saudi Arabia.¹¹ Given these estimates, BLM needs an extremely compelling justification to scrap oil shale development as it seeks to do so under the Preferred Alternative.

⁵ Government Accountability Office, ENERGY-WATER NEXUS A Better and Coordinated Understanding of Water Resources Could Help Mitigate the Impacts of Potential Oil Shale Development, page 1 (October 2010) available at <http://www.gao.gov/assets/320/311896.pdf> (emphasis added).

http://www.blm.gov/wo/st/en/prog/energy/oilshale_2/background.html. #2]>

<([#3 [2.2] B. The Preferred Alternative Will Eliminate Oil Shale Development in the United States

In the 2012 PEIS, 12 BLM's preferred alternative for oil shale, Alternative 2b, would reduce the amount of land available for oil shale leasing from over 2,017,741 acres to 461,965 acres—greater than a seventy-five percent (75%) reduction in the land available. Specifically, in Colorado, the preferred alternative would reduce available acreage from the current allocation of 360,000 acres to only 35,000 acres—over a ninety percent (90%) reduction.¹³

One of the effects of the reduced acreage for oil shale is that the Preferred Alternative would create a patchwork of isolated plots of land. Accordingly, these isolated plots of lands will either be too small to commercially develop oil shale or will be inaccessible. Thus, this substantial reduction in the amount of land available for commercial oil shale leasing would effectively eliminate commercial oil shale development.

<([#4 [9.8] C. There is No Compelling Basis for the 2012 EIS

The alternatives under consideration in the 2012 PEIS, specifically the Preferred Alternative and the No Action Alternative, have already been fully considered in the 2008 PEIS. For instance, the Preferred Alternative in the 2012 PEIS (Alternative 2(b)) was considered as Alternative C in the 2008 PEIS. Nonetheless, after extensive analysis in the 2008 PEIS, BLM determined that the land use plans that are currently in effect were the most appropriate (the No Action Alternative for the 2012 PEIS).

Importantly, BLM conducted a more thorough analysis in the 2008 PEIS than it has in the 2012 PEIS by working closely with other agencies. For instance, in Section 1.1.1 of the 2008 PEIS, BLM states:

As part of the development of the PEIS, the BLM circulated an internal draft of the PEIS to its cooperating agencies for review and comment that included a commercial lease development scenario. Most of the cooperating agencies commented that the BLM's analysis did not contain enough information for the specific environmental, cultural, and socioeconomic effects of such development, and that it would be too speculative at this point to support a decision to issue any

commercial leases. Therefore, consideration was given whether specific information was lacking on the effects of oil shale and tar sands leasing and development relevant to making an allocation decision.¹⁴

In addition to circulating internal drafts to cooperating agencies, during the 2008 PEIS “BLM held many informal meetings and discussions with the cooperating agencies.” Notably, the cooperating agencies played a substantial part in reaching the final determinations made by BLM in the 2008 PEIS.¹⁵ As provided in the 2008 PEIS, “the BLM worked collaboratively with its cooperating agencies throughout the process to create a balanced commercial leasing program, consistent with the intent of Congress.”¹⁶

¹⁴ BLM, *Propose Oil Shale and Tar Sands Resource Management Plan Amendments to Address Land Use Allocation in Colorado, Utah, and Wyoming and Final Programmatic Environmental Impact Statement* (2008) p 1-3 available at http://ostseis.anl.gov/documents/fpeis/volumes/OSTS_FPEIS_Vol_1.pdf [hereinafter “2008 PEIS”].

¹⁵ *Id.* at 7-11, Comment by the Department of Agriculture, (“In conclusion, based on the programmatic nature of this analysis we believe the documents are thorough and provided sufficient information for the decision being made. It will also provide an excellent document to tier to or reference during subsequent analyses should lease applications be received.”)

¹⁶ *Id.* at ES-3. #41)>

<([#5 [9.8] BLM justifies its choice to reevaluate the land use plans with the 2012 PEIS by stating, “As part of a settlement agreement entered into by the United States to resolve the lawsuit and in light of new information that has emerged since the 2008 OSTs PEIS was prepared, the BLM has decided to take a fresh look at the land allocations analyzed in the 2008 OSTs PEIS and to consider excluding certain lands from future leasing of oil shale and tar sands resources.” As discussed below in Section II, the new information and reasons stated by BLM to “Take a Fresh Look” do not justify amending the 2008 land use plans. Moreover, after a thorough NEPA analysis in 2008, BLM concluded:

This PEIS discloses, under the Proposed Plan Amendment (Alternative B) [the current land use plans that BLM is seeking to change], that the allocation decisions opening areas to future leasing do nothing more than to remove the administrative barrier to BLM considering any application to lease. The amendment of the land use plans does not authorize any ground-disturbing activities and is not an irreversible or irretrievable commitment of resources under NEPA. Therefore, the action alternatives presented would not result in any impacts on the environment or socioeconomic setting of the area under consideration. These decisions analyzed in the PEIS serve as the first step in the process to establish a commercial oil shale and tar sands program that meets the intent of Congress while taking advantage of the best available information and practices.¹⁷

As BLM admits, the current land use plans do not pose any threat to the environment or the socioeconomic composition of the affected areas, and only removes the “administrative barrier” to the development of oil shale. Therefore, amending the land use plans without justification would result in the agency action being arbitrary and capricious.

17 2008 PEIS, p ES-6 (emphasis added) #5)>

<([#6 [9.3] D. Oil Shale Development Will Have Minimal Effects and the No Action Alternative Will Produce No Negative Impacts

As BLM concluded in the 2008 PEIS, the current land use plans do nothing more than “remove the administrative barrier to BLM considering any application to lease.”¹⁸ It is impossible for the mere consideration of a lease to have any detrimental impact on the environment.

Importantly, under the current land use plans, BLM still has further NEPA analysis to undertake during the site-specific leasing stage and the approval of the detailed plans of project development required before an oil shale project can be approved. Importantly, “it is at this final [project development] stage, when the particulars of a project are known, that the BLM requires the most detailed analyses and may condition approval on specific requirements to avoid, minimize, or mitigate adverse impacts on various resources.”¹⁹

BLM specifically intended to have this phased approach to its NEPA analysis. Recognizing that it was working with limited information on oil shale development, BLM decided to defer decisions regarding specific leases to later stages of NEPA analysis.²⁰ This provided BLM with the opportunity to take a “phased approach—proceeding from this allocation decision [2008 EIS] to a leasing decision and then to an operational permit approval. This allocation decision essentially removes an administrative barrier preventing the BLM from accepting and considering applications to lease oil shale acreage,” while still requiring additional NEPA analysis before any actual leasing or development.

Furthermore, BLM admits that the current land use plans do “not authorize any ground-disturbing activities...[and] would not result in any impacts on the environment or socioeconomic setting of the area under consideration.”²¹

Thus, whereas BLM has already concluded that the 2008 land use plans do not pose any threat to the environment or socioeconomic setting of the affected areas, BLM is not justified to select any alternative other than the No Action Alternative.

18 2008 PEIS, p ES-6 (emphasis added)

19 BLM, Draft Programmatic Environmental Impact Statement and Possible Land Use Plan Amendments for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah, and Wyoming, page 1-2 (2012), available at <http://ostseis.anl.gov/documents/peis2012/index.cfm>

20 Id. #6)>

<([#7 [9.8] E. BLM Is Hindering Oil Shale Development

Despite BLM’s clear intention in the 2008 PEIS to “remove the administrative barrier to BLM considering any application to lease,” BLM’s actions under the 2012 PEIS serve no purpose other than to restore that very same “administrative barrier.”²²

BLM’s arbitrary change in oil shale policy as proposed by the Preferred Alternative stands as a substantial impediment to the development of oil shale. One of the largest challenges for the development of oil shale is volatility in the oil markets.²³ While BLM cannot reduce volatility in the oil markets, it can reduce volatility in the regulatory landscape. Regulatory certainty is necessary to motivate oil shale developers to make the massive investments required to bring production of oil shale to commercial levels. BLM has failed to provide oil shale developers with

this certainty.

Not even four years after publishing the 2008 PEIS, BLM is now seeking to “take a hard look” at whether it was appropriate to make the land in Colorado, Utah, and Wyoming available for oil shale development. BLM has not provided oil shale developers with ample time to demonstrate whether oil shale is commercially viable. It is only half way through the term for the 10-year leases to conduct research, development, and demonstration; and BLM has precipitously declared that oil shale is not commercially viable by removing blocks of prospective acreage from consideration for oil shale development. Oil shale may not continue to receive the necessary investments unless developers are provided with the regulatory certainty to justify the investments.

21 2008 PEIS, p ES-6

22 2008 PEIS, p ES-6.

23 The Congressional Research Service reports, “The recent spike in crude oil price has once again stirred interest in oil shale. As in the past, however, the rapid runup in prices (to a high of \$145/barrel) was soon followed by a rapid precipitous drop in prices [to levels as low as \$60/barrel]...such volatility discourages the investment in contingent resources such as oil shale.” CRS concluded, “While OPEC cuts oil output to prop up prices, the major and super major oil companies continue to use an oil price of \$32/barrel for their business planning. In this climate, the development of oil shale seems difficult indeed.” CRS Report RL 34748, *Developments in Oil Shale*, at 29, November 17, 2008 #7)>

<([#8 [9.2.3] The mandates in the Energy Policy Act of 2005 require BLM to continue to pursue and support the development of oil shale. In order to do so, BLM should choose the No Action Alternative, Alternative 1. The Preferred Alternative in the EIS will in effect eliminate oil shale development. #8])>

<([#9 [9.8] II. The Reasons Stated by BLM to “Take a Fresh Look” Do Not Justify Amending the Land Use Plans

The Bureau of Land Management (BLM) states that the “purpose and need for this proposed planning action is to reassess the appropriate mix of allowable uses with respect to oil and shale and tar sands leasing and potential development.” BLM further justifies “tak[ing] a fresh look” for the reasons stated in the April 14, 2011 Notice of intent, 24 further specifying “Chief among these was new information available in 2008, including:

1. A recently completed U.S. Geological Survey (USGS) in-place assessment of oil shale and nahcolite resources in Colorado, Utah, and Wyoming,
2. A March 2010 U.S. Fish and Wildlife Service (USFWS) Notice of Petition Findings, Endangered Wildlife and Plants, 12-month Findings to List the Greater Sage-Grouse as Threatened or Endangered.
3. BLM’s updated inventory of lands having wilderness characteristics (LWC) and Areas of Critical Environmental Concern (ACECs).” 25

As described in greater detail below, not one of three justifications by BLM for “taking a hard look” at the land use plans finalized in the 2008 EIS, justify amending the land use plans.

24 The reasons stated in the April 14, 2011 Notice of Intent mirror the reasons outlined above (which are contained in the 2012 PEIS). Notably, BLM does not cite water issues as being a

justification for “taking a hard look” or a “fresh look” at the land use plans finalized in the 2008 PEIS.

25 2012 PEIS at 1-5. [#9](#))>

[<\(\[#10 \[6.1.2\] A. USGS In-Place Assessment Of Oil Shale Resources In Colorado, Utah, And Wyoming](#)

Although USGS has completed its in-place assessment of oil shale since the 2008 PEIS, the findings in the report do not justify amending the 2008 land use plans. In fact, the USGS report does just the opposite and actually justifies devoting additional resources to developing oil shale resources. Specifically, in the report, USGS concluded that there is 1.525 trillion barrels of oil alone in just the Piceance Basin of western Colorado—an upward increase of nearly 50% from the 1989 USGS assessment of 1 trillion barrels of oil.²⁶

26 USGS in place assessment Fact sheet available at

<http://pubs.usgs.gov/fs/2009/3012/pdf/FS09-3012.pdf> [#10](#))>

[<\(\[#11 \[9.2.4\] B. 2010 U.S. Fish and Wildlife and Plants, 12 month Findings to List the Greater-Sage Grouse as Threatened or Endangered](#)

The USFWS did release a finding in 2010 on the Greater-Sage Grouse, but importantly USFWS decided not to list the Greater Sage-Grouse as a threatened or endangered species, because there were “higher priority listings.”²⁷ Moreover, the 2008 EIS thoroughly analyzed the impact of oil shale development on the Greater Sage-Grouse,²⁸ for which the analysis is nearly identical as that listed in the 2012 Draft PEIS.²⁹ Thus, absent any new findings or analyses concerning the impact of oil shale development on the Greater Sage-Grouse, BLM is not justified in amending the 2008 land use plans based on the Greater Sage-Grouse.

27 U.S. Fish and Wildlife Service (USFWS) Notice of Petition Findings, Endangered Wildlife and Plants, 12-month Findings to List the Greater Sage-Grouse as Threatened or Endangered.

28 2008 Final Oil Shale and Tar Sands Programmatic Environmental Impact Statement, pages 3-148 – 3-149; 4-78 – 4-80, available at

http://ostseis.anl.gov/documents/fpeis/volumes/OSTS_FPEIS_Vol_1.pdf

29 2012 Draft Oil Shale and Tar Sands Programmatic Environmental Impact Statement, pages 4-124 – 4-126; available at http://ostseis.anl.gov/documents/peis2012/vol/OSTS_VOLUME_2.pdf

[#11](#))>

[<\(\[#12 \[9.2.1\] \[3.1.3\] C. BLM’s updated inventory of lands having wilderness characteristics \(LWC\) and Areas of Critical Environmental Concern \(ACECs\).](#)

Lands having wilderness characteristics is a designation that takes place during the land use planning process, which is required pursuant to a Secretary Order from December 2010.³⁰ Clearly, BLM does not intend to amend all existing land use plans as a result of Secretary Order 3310. Nor should Secretary Order 3310 now serve as a basis for amending the land use plans established in the 2008 EIS.

30 Department of the Interior, Secretary Order 3310: Protecting Wilderness Characteristics on Lands Managed by the Bureau of Land Management, available at

<http://elips.doi.gov/elips/0/doc/172/Page1.aspx> [#12](#))>

<([#13 [3.1.5] Likewise, ACECs only account for a small proportion of land coincident with land that is designated for oil shale development. Specifically, ACECs comprised only 76,666 acres of the 2,017,714 acres of land available for oil shale leasing. The environmental integrity of the ACECs can be preserved with the additional required NEPA analysis for the leasing and project development phases. #13])>

<([#14 [1.1] [9.2.5] III. BLM Is Defying President Obama's Open Government Directive; Agency Spending Questioned

Government should be transparent. Transparency promotes accountability and provides information for citizens about what their Government is doing. Information maintained by the Federal Government is a national asset. My Administration will take appropriate action, consistent with law and policy, to disclose information rapidly in forms that the public can readily find and use.

-- President Barak Obama, Memorandum to Heads of Executive Departments and Agencies

On January 18, 2011, the President issued Executive Order 13563, in which he directed regulatory agencies to base regulations on an "open exchange of information and perspectives" and to promote public participation in Federal rulemaking. The President identified Regulations.gov as the centralized portal for timely public access to regulatory content online.

-- Cass Sunstein, White House Blog, February 21, 2012.

President Obama has made Open Government a hallmark of his Administration. BLM apparently disagrees.

- BLM has not released the public comments submitted on their 2011 Notice of Intent Notice of To Prepare a Programmatic Environmental Impact Statement (EIS); and
- BLM has made no provision for release of comments received in response to their Notice of Availability of the Draft Programmatic Environmental Impact Statement for oil shale which bypasses the Regulations.gov comment portal.

Public access to public comments on a public proceeding is a basic prerequisite of open government.

For decades, federal agencies have made public comments available to the public, first through docket rooms and then, as the internet developed, through online systems developed by each agency. Agency-specific solutions to providing public access to public comments were superseded by Regulations.gov. President Obama has emphasized the importance of the public comment portal and has enhanced its operation.

Despite the Administration's emphasis on use of Regulations.gov to promote public participation and collaboration in agency proceedings, BLM has chosen to bypass the open process in favor of their own comment processing system, a system which excludes the public from reading public comments.

It should be noted that agency-prepared comment summaries are no substitute for the original, unabridged documents. Moreover, public access to the full text of the comments submitted is essential for assessing agency compliance with the third-party provisions of the Data Quality Act

(DQA). Although DQA issues are discussed in more detail in the DQA section of these comments, it is noted here that BLM may not rely on any data submitted to the agency which does not comply with the quality requirements established by OMB and BLM.

The public needs access to the full text of the documents the agency uses and relies on in order to exercise their statutory due process rights under the DQA to “seek and obtain” correction of non-compliant information by filing Requests for Correction against third-party data.

Unless BLM makes public comments public, the agency will not have established an administrative record valid for decision-making purposes since the documents in the record which inform BLM’s decisions would not be available to the public for inspection and correction.

A. Privacy Concerns Addressed in Federal Register Notice

It has been suggested that concern over protected personal information (PPI) could justify an agency withholding public comments from public inspection. Such an assertion is contrary to:

1. Federal policy to make public comments public, e.g., Regulations.gov; and
2. BLM’s own Federal Register notice statement for draft PEIS. Specifically, BLM stated: Before including your address, phone number, email address, or other personal identifying information in your comment, you should be aware that your entire comment—including your personal identifying information—may be made publicly available at any time. 77 Fed Reg 5835, col. 3

B. FOIA Is Not a Substitute for Making Comments Public: It Creates Privileged Access for the 1%

It has been suggested that anyone who wants to see public comments could obtain them through a Freedom of Information Act (FOIA) request. FOIA requests can take months or years to process – preventing the comments from being evaluated by stakeholders contemporaneously with the BLM proceedings.

Moreover, given the large volume of comments that BLM is likely to receive in response to the draft PEIS, the expense of a FOIA request may run in the tens of thousands of dollars. Actual costs of a given request would vary based on how many comments a person seeks and whether individuals seeking public access to the public comments know the subtleties of the FOIA process well enough to request what they want and exclude extraneous materials.

If BLM requires the public to use FOIA to access the PEIS comments, the agency would be creating a two-tiered system of public participation in federal proceedings. Unless BLM releases the full text of the comments to everyone, the agency would be granting privileged access to the full text of public comments to only those persons and organizations who have the resources to make effective use of FOIA while everyone else would have access to only BLM summaries of the material – a situation that is separate and not equal.

C. Regulations.gov Is Used for EIS Comments

Although the PEIS is not in a rulemaking process, the Regulations.gov website is one appropriate

mechanism (among others) for collecting and providing public access to comments on Environmental Impact Statements. Federal agencies already use Regulations.gov to process and provide public access to comments received on draft Environmental Impact Statements and other non-rulemaking proceedings. Examples of agencies using Regulations.gov to solicit – and disseminate – public comments on environmental impact statements include:

- NOAA requesting comments on a notice of Intent to Prepare a Draft Environmental Assessment or Environmental Impact Statement, <http://www.regulations.gov/#!documentDetail;D=NOAA-NOS-2012-0061-0002>.
- The Forest Service requesting comments on a Notice of intent to prepare an environmental impact statement, http://www.regulations.gov/#!documentDetail;D=FS_FRDOC_0001-1291.
- The Coast Guard requesting comments on a Notice of Availability of Final Environmental Impact Statement, <http://www.regulations.gov/#!documentDetail;D=USCG-2009-0097-0087>.
- BLM's sister agency, the Bureau of Ocean Energy Management, soliciting comments on a Notice of the Availability of an Environmental Assessment, <http://www.regulations.gov/#!documentDetail;D=BOEM-2012-0011-0001>.
- BLM itself, jointly with a Department of Energy component, requesting comments on a Notice of Intent To Prepare an Environmental Impact Statement, http://www.regulations.gov/#!documentDetail;D=WAPA_FRDOC_0001-0167.

D. The White House Example of Open Government

There are a few informal proceedings in which public comments are not legally required that agencies may choose not to use Regulations.gov. Even in these cases, however, agencies use online dockets to provide public access to public comments with the White House leading by example.

When the White House sought public comments on President Obama's National Policy for the Stewardship of the Ocean, Our Coasts, and the Great Lakes, they created an online docket to speed public access to public comments,

<http://www.whitehouse.gov/administration/eop/oceans/comments>.

E. The Department of Commerce Example of Open Government

Other agencies have followed the White House's leadership in providing public access to public comments, even in those circumstances when no solicitation of comments is required. For example, when a Department of Commerce Internet Policy Task Force prepared a working paper on cyber security, the NIST established an online docket to ensure public access to the full text of the submitted comments, <http://www.nist.gov/itl/greenpapercomments.cfm>. #14)>

<([#15 [9.2.5] IV. The Data Quality Lens for Evaluating the Draft Shale PEIS: OMB's Data Quality Guidelines Receive Chevron Deference

The Data (Information) Quality Act (DQA) 44 U.S.C § 3516, note, sets standards for the quality of virtually all information disseminated by federal agencies. Under the law, OMB developed binding, government-wide quality standards and processes for ensuring data quality. OMB's DQA guidelines implementing the Act may be found here, Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies.31

In addition to the overall guidelines, OMB has also issued specialized data quality guidance implementing the law including the White House's Final Information Quality Bulletin for Peer Review.³²

Based on OMB's DQA implementation instructions, Departments and agencies developed their own organization-specific implementing documents that were consistent with OMB's directive. The Department of Interior's DQA guidelines may be found here, Interior – Information Quality Guidelines Pursuant to Section 515 of the Treasury and General Government Appropriations Act for Fiscal Year 2001.³³ BLM's agency-specific guidelines are found here, Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Bureau of Land Management.³⁴

Additional background information about the DQA may be found here, A Decade of the Data Quality Act³⁵ and here, 'Data Quality' Law is Nemesis of Regulation.³⁶

A. The Request for Corrections Process: Empowering Citizen Watchdogs to "Seek and Obtain" Correction of Agency Data

Unusual among federal statutes, the DQA created an administrative process "allowing affected persons to seek and obtain correction of information maintained and disseminated by the agency that does not comply with the guidelines." In short, the DQA empowers citizens and non-citizens to "seek and obtain" correction of data used and maintained by the agency which does not comply with OMB and agency quality standards.

CRE notes that BLM's sister agency, the US Fish and Wildlife Service has experience in fulfilling their DQA duties, see, U. S. Fish and Wildlife Service Will Correct Panther Information In Response to Information Quality Act Challenge.³⁷

B. The Data Quality Act Applies to Third-Party Data

The DQA's quality requirements – and the Request for Correction process – apply to all data used and relied on by agencies in their information disseminations, such as Environmental Impact Statements, as was discussed in the Bureau of National Affairs/Daily Environment article, Advocacy Group Data Submitted to Agencies Must Meet OMB Requirements, Official Says.³⁸

There are two key implications of the third-party DQA requirements:

1. The various studies BLM used in the drafting of the PEIS need to comply with the DQA, even if they were originally published prior to the enactment of the law.

For example, in Table 4.15-2, "Estimated Health Effects Associated with a Hypothetical 1,000,000-bbl/day Oil Shale Industry," the draft PEIS is relying on a 1984 study for some of its key health data. This study is subject to the DQA standards and BLM will need to verify that it currently complies with DQA standards as part of its pre-dissemination review process.

Similarly, the 1973 DOE study that is cited as a source for estimates in Table 4.1.2-1 "Assumptions Associated with an Underground Mine with Surface Retort at Production Levels of 25,000–30,000 bbls of Shale Oil per Day" will also need to be vetted to see if it meets DQA requirements.

2. BLM will not be able to rely on the data, models and assumptions provided to the agency in any comments on the draft PEIS unless those materials are DQA compliant.

Since individuals and watchdog organizations have the statutory right to file petitions seeking

correction of the third-party data, BLM has the legal obligation, as was previously explained, to release the full text of all public comments received.

C. DQA Correction of Third-Party Data in Action: The World Health Organization Example
For an example of the ability of watchdogs to effectively use the DQA's Request for Corrections process with respect to third-party data, please see CRE's Request for Correction of Information Contained in A World Health Organization Report.³⁹ CRE's action resulted in the Department of Health and Human Services informing the Director-General of the World Health Organization that a major WHO report could not be used by the US Government because:

The consultation process of the development of the WHO/FAO Report and the resulting Report itself would not meet these current U.S. data quality standards, as the process lacked a high degree of transparency, and the data and analytic results contained within the Report were not subject to formal, independent, external peer review among other criteria.⁴⁰

D. The United States Court of Appeals for the D.C. Circuit Determined that OMB's DQA Guidelines are "Binding"

In *Prime Time Int'l Co. v. Vilas*, 599 F.3d 678 (D.C. Cir. 2010), the court ruled⁴¹ that OMB's DQA guidelines were "binding" because they contained a permissible interpretation of the DQA under Chevron and thus, agency compliance with the DQA is a non-discretionary duty.⁴² In its ruling, the Court clearly held that the OMB interpretation was entitled to Chevron-level deference (as opposed to a lower level of deference under Skidmore), because the OMB guidelines have the force of law having been promulgated under a specific Congressional delegation in the DQA.

Thus, the Court held that the OMB guidelines are legally binding, not just internally binding, as might be the case with many Executive orders and agency manuals or handbooks. A detailed legal analysis of the court's opinion may be found here⁴³ while a news account of the case and its implications may be found here, *Industry Sees Ruling Opening Door To Court Review Of Data Quality Suits*.⁴⁴

It should be noted that the Department of Justice took great exception to CRE's interpretation of the D.C. Circuit's decision. Justice was sufficiently concerned by CRE's analysis of the opinion that they appealed the ruling. In their appeal, Justice requested that the court "amend its opinion to clarify that the Court did not decide whether the Information Quality Act ("IQA") creates judicially enforceable rights." The Justice Department took the unusual but well-warranted step of including a print-out of CRE's website (found in Exhibit B of DOJ's appeal⁴⁵) even though CRE was not a party to the case. The court rejected DOJ's appeal.

Thus, BLM adherence to the DQA is judicially enforceable. Moreover, OMB and BLM Data Quality Act standards apply to: the draft PEIS; the studies BLM relied on in developing the PEIS; and comments and supporting material received on the draft PEIS that the agency uses or relies on its decision-making process. Accordingly, CRE recommends: (1) BLM should release their pre-dissemination review record for the draft PEIS and (2) BLM should release the full text of all public comments on the draft PEIS.

<([#16 [9.3] V. Water Rights Issues Do Not Provide a Basis for Modifying the Land Use Plans Notably, water rights have not changed between the 2008 PEIS and the current 2012 PEIS. Water rights were thoroughly considered by BLM in the 2008 PEIS, which contributed to BLM’s 2008 land use plan allocations. Furthermore, the land use planning stage is not the appropriate point in the environmental planning process to make premature determinations on how water rights could potentially be used. This would be more appropriate in the leasing state or the project development stage. **#16])>**

<([#17 [3.4.2] [6.3.2.I] VI. There Are Adequate Water Quantities to Sustain Oil Shale Development

Much of the criticism associated with oil shale focuses on the impacts that oil shale development would have on water supplies.⁴⁶ For example, the 2009 lawsuit brought by environmental organizations (that resulted in the settlement requiring BLM to take a fresh look at the EIS) argued, “oil shale development could dry up many streams and rivers – including the Colorado river.”⁴⁷ The complaint further contended that “commercial oil shale development will impact water supplies, as water dedicated to this use will increase stress on a resource already over taxed by other activities....[And] commercial oil shale development will cumulatively impact water supplies by contributing to global warming.”⁴⁸ Likewise, reports issued by Western Resource Advocates offer cautionary language about water usage and oil shale development.⁴⁹ While extracting oil from oil shale would require significant amounts of water, there is no evidence that the water usage required would be unsustainable or problematic.

Of great importance, in the 2012 Draft PEIS, BLM has not identified the water usage required for the development of oil shale as a justification to revisit the 2008 land use plans.⁵⁰

Accordingly, it would be inappropriate for BLM to modify land use plans based on the quantity of water that is projected for use for oil shale production.

Moreover, both the 2008 Final PEIS and the 2012 use the same assumptions and analyses regarding water usage for oil shale development. For example, both the 2008 PEIS and 2012 Draft PEIS assume (based on a 2005 study by the Rand Corporation) that the in-situ process would require 1-3 bbl of water per barrel of oil shale produced; and that 2.6-4.0 bbl of water per barrel of oil shale produced would be required for a surface mine and surface retort. Likewise, both the 2008 PEIS and 2012 Draft PEIS find that production levels of 50,000 bbl of oil per day would require 7,050 acre-ft/year of water. Finally, both the 2008 PEIS and 2012 draft PEIS conclude that there will be a water surplus of 340,348 (ac-ft/yr) in 2000 and 268,425 (ac-ft/yr) in 2030 in Colorado.

Just as the 2008 PEIS did, the 2012 Draft PEIS supports the conclusion that oil shale development will not adversely impact water availability. Without any changes in the data or analysis for water use between the 2008 PEIS and 2012 Draft PEIS, water usage for oil shale development cannot serve as a purpose to revisit the land use plans.

Moreover, recent developments in technology suggest that the assumptions used by BLM regarding water usage for oil shale development are incorrect. Red Leaf Resources has recently stated that the company uses less than half barrel of water to produce a barrel of oil. Red Leaf further explains that the amount of water required for oil shale production is unrelated to the technology used to produce the oil shale, but is instead required for dust control and to meet on-site worker demand.⁵¹

The CRE endorses BLM's position that the quantity of water that will be used for oil shale is not a problem based on the 2008 land use allocations. Accordingly, it would be arbitrary and capricious to amend the 2008 land use plans based on the level of water usage for oil shale development.

46 See, e.g., Western Resource Advocates, *Water on the Rocks: Oil Shale Water Rights in Colorado*, 2009 available at

<http://www.westernresourceadvocates.org/land/wotrreport/wotrreport.pdf>.

<http://www.westernresourceadvocates.org/oilshale2050/WRA-OilShale2050.pdf>.

50 2012 Draft Oil Shale and Tar Sands Programmatic Environmental Impact Statement, pages 1-5, available at http://ostseis.anl.gov/documents/peis2012/vol/OSTS_VOLUME_2.pdf. The reasons stated in the April 14, 2011 Notice of Intent mirror the reasons outlined in the 2012 PEIS. Notably, BLM does not cite water issues as being a justification for "taking a hard look" or a "fresh look" at the land use plans finalized in the 2008 PEIS.

51 Amy Joi O'Donoghue, *Oil Shale Project Approved*, KSL, April 1, 2012, available at [#171](http://www.ksl.com/?nid=960&sid=19773270)>

<([#18 [10.6.3] VII. Conclusion

In a speech by President Obama on the United States energy security, the President declared, “We’ve known about the dangers of our oil dependence for decades. . . We cannot keep going from shock when gas prices go up to trance when they go back down -- we go back to doing the same things we’ve been doing until the next time there’s a price spike, and then we’re shocked again. We can’t rush to propose action when gas prices are high and then hit the snooze button when they fall again...our best opportunities to enhance our energy security can be found in our own backyard.”⁵²

Oil shale is the answer to enhance the US energy security and most of the world reserves are located in the United States. Nonetheless, oil shale development and investment has suffered from the very same boom-bust cycle as described by President Obama. Historically, when oil prices are high, oil shale is the solution for the United States energy needs. But once the price of oil falls again, oil shale is written off as “not at present a proven commercially-viable source.” The United States cannot once again “hit the snooze button” on oil shale. The United States needs a sustained commitment to oil shale development—a commitment provided by Congress in the Energy Policy Act of 2005— in order for it to become economically viable.

52 President Barack Obama, Remarks by the President on America’s Energy Security, March 30, 2011,

<http://www.whitehouse.gov/the-press-office/2011/03/30/remarks-president-americas-energy-security> #18])>

<([#19 [2.2] As recognized by the BLM,⁵³ technological advances for the extraction of oil shale lie just over the horizon. Rand Corporation concluded, “Advances in thermally conductive in-situ conversion

may enable shale-derived oil to be competitive with crude oil prices below \$40 per barrel. With a firm commitment to oil shale development, oil shale will occupy a central role in the national energy agenda.

However, by proceeding with Preferred Alternative in the 2012 PEIS, BLM will effectively eliminate oil shale development in the United States. BLM concluded in the 2008 PEIS that the land use plans currently in place “do nothing more than to remove the administrative barrier to BLM considering any application to lease....[and] would not result in any impacts on the environment or socioeconomic setting of the area under consideration.”⁵⁴ Nevertheless, BLM has decided to, without justification, revisit the land use plans established in 2008 and to restore the administrative barriers that stand in the way oil shale development. Moreover, BLM concluded that the 2008 PEIS, “create[d] a balanced commercial leasing program, consistent with the intent of Congress.” Instead, counter to its own conclusion and Congressional intent under the Energy Policy Act of 2005, the Preferred Alternative in the 2012 PEIS will eliminate oil shale development in the United States.

53 76 FR 21003, at 21004, April 14, 2011. #19])>

<([#20 [2.1.1] For the foregoing reasons, CRE recommends that BLM remains firmly committed to the development of oil shale by not reducing the land allocated for oil shale and therefore to not adopt the Preferred Alternative, and instead select the No Action Alternative. CRE also urges BLM to adhere to DQA guidelines in assessing the viability of oil shale development.

#20])> CRE is a Washington, DC based regulatory watchdog which works to ensure that federal agencies comply with the “good government” laws including the Data Quality Act, the

Paperwork Reduction Act, and the Regulatory Flexibility Act. As previously mentioned, what is at stake in the US oil shale program are reserves about equal to the entire world's proven oil reserves. To ensure that federal and state regulatory agencies, the Congress, and stakeholders are apprised of the most significant events affecting the development of this critical resource, CRE is making available to the aforementioned groups an Interactive Public Docket dedicated to this important subject which is titled BLM Oil Shale, and is described herein. The public is invited to provide comments on CRE work products.

To Whom It May Concern:

Please find attached nearly 40,000 comments from Defenders of Wildlife supporters on the Draft Oil Shale and Tar Sands Programmatic Environmental Impact Statement. Many of these individuals signed on to a version of the text below, however some chose to personalize their comments.

“(¶1 [2.3.] As a supporter of Defenders of Wildlife and someone who cares about America's wildlife and wild places, I am writing today to urge the Bureau of Land Management to protect millions of acres of public lands from oil shale development by selecting “Alternative 3” in the oil shale Draft Environmental Impact Statement, the alternative most protective of our public lands.

I am pleased that BLM is taking clear and measured steps to restore order to the federal oil shale and tar sands policy. While the agency's preferred alternative (2(b)) is a step in the right direction, a stronger approach is needed to protect our public lands.

Alternative 3 in the Draft Environmental Impact Statement would not allow for commercial development of oil shale extraction until further research is done for a clearer understanding of

its impacts on our public lands and the wildlife that live there.

This alternative places important environmental and ecological areas off-limits to development and requires companies to prove their technologies and evaluate their impacts on communities, human health and the environment.

The two million acres of land in Utah, Wyoming and Colorado being considered for oil shale development is a massive amount of America's public land to be sacrificed for the development of a destructive and unproven energy source.

#1)>

<([#2 [3.7.3.1] These vast expanses of public lands are home to the iconic pronghorn, sage grouse, prairie dogs, golden eagles and other wildlife. They are also habitat that is key to the survival and recovery of the highly endangered black-footed ferret.

#2)>

<([#3 [6.3] Oil shale production is a dirty business that is not economically viable. The BLM itself estimates that its development would consume large amounts of water, cause significant air pollution and destroy thousands of acres of wildlife habitat.

#3)>

<([#5 [3.10.3] Oil shale is currently producing no jobs and no revenue. The Congressional Budget Office confirmed that it is not expected to produce significant revenues through 2022.

#5)> <([#4 [3.10.4] The industry already has access to thousands of acres of public and private lands for research and development. We shouldn't sacrifice even more western public lands for such a destructive and unproven energy source.

These millions of acres of western public lands are vital to economies that rely on tourism and wildlife-related recreation. In Colorado alone these activities generate \$3 billion in economic activity. Protecting jobs and related revenue from these sustainable economies must be prioritized over the speculative investment in oil shale production on public lands.

America's wildlife and wild places are too valuable to squander on the destructive and unproven practice of oil shale development.

#4)>

Thank you for the opportunity to comment on this matter."

Please accept these individuals' comments with regard to Draft Oil Shale and Tar Sands Programmatic EIS and our thanks for your agency's collaboration in ensuring that the voices of these concerned citizens are heard.

Sincerely,
Addie Haughey

Submission Text

To Whom It May Concern:

The American Petroleum Institute (API) offers the following comments on the *Draft Programmatic Environmental Impact Statement and Possible Land Use Plan Amendments for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah, and Wyoming* published by the Department of Interior (DOI) Bureau of Land Management (BLM) in January 2012.

The API is a trade association representing over 500 companies involved in all aspects of the oil and natural gas industry, including the development of oil shale and oil sands as a future energy supply in the United States. The API has formed an Oil Shale Subcommittee with the goal of addressing issues associated with oil shale development and educating policy-makers and the public at large on this important domestic energy resource. Our members are greatly interested in leasing and developing oil shale and oil sands resources found on lands managed by the BLM in Colorado, Utah and Wyoming. Oil Shale Subcommittee members, and the oil shale industry as a whole, are committed to delivering technologies and best practices that will allow for the development of oil shale in an environmentally sustainable manner.

Intent of the United States Congress in Establishing an Oil Shale Program under EPAct 2005

As we have with previous written comments to the Bureau of Land Management on its management of the federal oil shale program, API would like to reiterate the intent of the United States Congress in establishing a program under the Energy Policy Act of 2005.

The U.S. Congress recognized the critical and urgent need for development of domestic energy resources when it enacted the Oil Shale, Tar Sands and Other Strategic Unconventional Fuels Act of 2005, as part of the Energy Policy Act of 2005 (EPAct 2005):

“Congress declares that it is the policy of the United States that...oil shale, tar sands, and other unconventional fuels are strategically important domestic resources that should be developed to reduce the growing dependence of the United States on politically and economically unstable sources of foreign oil imports.” (EPAct §369(b); Public Law 109-58)

EPAct 2005 directed the Department of the Interior to promote commercial development of oil shale resources by making land available within each of the States of Colorado, Utah and Wyoming for leasing to conduct Research, Development and Demonstration (R, D, and D) of technologies to recover liquid fuels from oil shale. The Department of the Interior was charged with the creation of an oil shale and oil sands research and development leasing program. The Department of Energy, and expressly the Office of Petroleum Reserves, was directed to create

and implement a “commercial strategic fuels development program”.

With the passage of the Energy Policy Act of 2005, Section 369, the Congress and the President forwarded a clear message to the American people of its intention to evaluate and to develop the massive multi-trillion barrel energy source locked in its domestic unconventional hydrocarbon resources, such as oil shale, oil sands, and coal. Congress reiterated the extreme importance of those resources to the national energy security of the nation, while recognizing that development must be accomplished in an “environmentally sound manner and that development should emphasize sustainability”.

The intent of EAct 2005 was that the Department of Interior *shall* establish a royalty rate to “encourage development of oil shale and tar sand resources,” “make available” public lands to “conduct research and development activities with respect to technologies for the recovery of liquid fuels from oil shale,” and promulgate regulations establishing “a commercial leasing program for oil shale.”

It is API’s assertion that the lawsuit and settlement agreement with several non-governmental organizations is driving current Administration policy toward reconfiguring the federal oil shale program under the 2012 PEIS. It is further our assertion that all policy and regulatory decisions made by the BLM on development of oil shale on federal lands should be made under the context of Section 369 of EAct 2005.

<([#1 [1.1.1] Request for Extension of Comment Period

The comments on the January 2012 OSTs Draft Programmatic Environmental Impact Statement (DPEIS) to amend the BLM Resource Management Plans (RMPs) are due May 4, 2012. The current public comment period does not provide sufficient time for API to analyze the Draft PEIS’ 1900 pages of technical analysis, consult its membership, and address the numerous and complex issues which could impact our members. In addition, under the settlement agreement with environmental organizations dated February 15, 2011 concerning the 2008 Final Oil Shale and Tar Sands (OSTs) Programmatic Environmental Impact Statement (PEIS), BLM is required to issue proposed rules to amend the existing oil shale leasing regulations by May 15, 2012.

Given the connection between the RMP amendments and the oil shale leasing regulations, API recommends that BLM extend the public comment period on the DPEIS so that the public can fully understand and comment on these closely-related matters. As such, API recommends that BLM extend the DPEIS comment period until July 3, 2012 to allow thoughtful development and submission of comments to the docket.

#1)> Background

In September 2008, BLM issued a Final Oil Shale and Tar Sands (OSTs) Programmatic Environmental Impact Statement (PEIS) analyzing the environmental and socioeconomic impacts of amending 12 land use plans in Colorado, Utah, and Wyoming to designate public lands administered by the BLM as available for commercial leasing for oil shale or oil sands development. No actual oil shale or oil sands leasing was approved under the 2008 OSTs PEIS as the analysis only identified those BLM lands where oil shale and oil sands lease applications would be accepted and resulted in amendments to the corresponding BLM RMPs. Separate National Environmental Policy Act (NEPA) analyses (including compliance with the Section 7 of the Endangered Species Act) would be required before leasing or site development activities could occur. As such, there are multiple future opportunities for site-specific environmental analyses and project-specific NEPA reviews.

The land allocation decisions established by BLM’s 2008 land use plan amendments were challenged in a lawsuit brought by several environmental organizations in January 2009. As part

of a settlement agreement entered into by the United States to resolve the lawsuit, the BLM agreed to take another look at the land use allocations resulting from the 2008 OSTs PEIS (now covered under 10 land use plans after some consolidation), and to consider excluding certain lands from future leasing of oil shale and oil sands resources. The settlement mandated that the new NEPA analysis must include a specific alternative that would amend BLM land use plans to restrict the lands available for potential applications for oil shale and oil sands leasing (identified as Alternatives 2a and 2b for oil shale and Alternative 2 for tar sands in the current DPEIS). As a result, BLM is reassessing its 2008 decision that made 1,991,222 acres available for potential development of oil shale and approximately 431,224 acres of public land available for potential development of tar sands. On February 3, 2012, the U.S. Environmental Protection Agency published a Notice of Availability of the BLM OSTs DPEIS regarding possible land use plan amendments affecting oil shale and tar sands allocation on BLM administered lands. Comments regarding the 2012 OSTs DPEIS are due May 4, 2012.

The primary differences between the new 2012 OSTs DPEIS and the 2008 OSTs PEIS on this same subject, is that the current document contains several alternatives (Alternative 2 - the Conservation Focus Alternative, and Alternative 3 - the Research Lands Focus Alternative) that would dramatically reduce the acreage of BLM administered land for which applications for oil shale and oil sands leases could be submitted. Alternative 4 (the Moderate Development Alternative) would be similar to that adopted in the 2008 OSTs PEIS land use allocations except that the Adobe Town "Very Rare or Uncommon" area lands (180,910 acres) designated by the Wyoming Environmental Quality Council in 2008 and BLM designated Areas of Critical Environmental Concern (ACEC) identified in the 2008 OSTs PEIS (76,666 acres - and those ACECs recently established by BLM in Wyoming and Utah) would be excluded from oil shale and oil sands leasing. Under Alternative 1, the No Action Alternative, no existing land use plans would be amended. Alternatives 2b and 4b only apply to oil shale but would first require a company to obtain and comply with all of the provisions of a Research Development and Demonstration (RD&D) lease before it could be later converted to a commercial lease. BLM has chosen Alternative 2(b) as the preferred alternative for oil shale, and Alternative 2 as the preferred alternative for oil sands. These alternatives are described more fully below. Alternative 2a is also described below because it informs the agency's preferred alternatives for oil shale and oil sands.

Alternative 2a: Conservation Focus Alternative, Oil Shale. Under this alternative, 10 land use plans in Colorado, Utah, and Wyoming would be amended to designate less than 830,000 acres (acreage opened under Alternative C in the 2008 OSTs PEIS) as available for future commercial oil shale leasing. BLM estimates the final area available under Alternative 2a to be 461,965 acres. This alternative would exclude from commercial oil shale leasing the following categories or groups of categories of public lands:

1. All areas that the BLM has identified or may identify as a result of inventories conducted during this planning process, as lands having wilderness characteristics (LWC);
2. The whole of the Adobe Town "Very Rare or Uncommon" area, as designated by the Wyoming Environment Quality Council on April 10, 2008 (180,910 acres total; 167,517 acres of public land, of which 10,920 acres are already a BLM Wilderness Study Area [WSA]);
3. Core or priority sage-grouse habitat, as defined by such guidance as the BLM or the DOI may issue;
4. All Areas of Critical Environmental Concern (ACECs) located within the areas analyzed in the 2008 OSTs PEIS (76,666 acres in existing ACECs in the 2008 OSTs PEIS plus additional

ACEC acreages as a result of Utah and Wyoming planning efforts recently completed); and 5. All areas identified as excluded from commercial oil shale and tar sands leasing in Alternative C of the September 2008 OSTs PEIS (Alternative C made 830,296 acres available for potential commercial oil shale leasing and 229,038 acres available for potential commercial tar sands leasing).

Alternative 2b, RD&D First Requirement, Oil Shale. Under this alternative, the lands open for future oil shale leasing consideration would be the same as those in Alternative 2(a), but only for RD&D leases. The BLM would issue a commercial lease only when a lessee satisfies the conditions of its RD&D lease and the regulations at 43 CFR Subpart 3926 for conversion to a commercial lease. The preference right acreage, if any, which would be included in the converted lease, would be specified in the RD&D lease.

Alternative 2, Conservation Focus Alternative, Tar Sands. Under this alternative, six land use plans in Utah would be amended to designate less than 229,000 acres (acreage opened under Alternative C of the 2008 plan amendment) as available for future commercial tar sands leasing. This alternative would exclude from commercial oil shale leasing the same categories or groups of categories of public lands and/or their resource values as listed above under Alternative 2, Oil Shale. The final area proposed for potential leasing under BLM's tar sands Alternative 2 was estimated as 91,045 acres.

<([#2 [2.1.1] API's Preferred Alternative

API and its member companies strongly support Alternative 1, the No Action Alternative. There is no compelling reason to change BLM's well researched and thoroughly considered oil shale and oil sands leasing decisions made in 2008.

The analysis in the current 2012 OSTs DPEIS does not support the adoption of alternatives other than Alternative 1. API notes that the other alternatives do not fully comply with Congressional intent established in Section 369 of the Energy Policy Act of 2005 to promote the orderly development of oil shale, oil sands, and other unconventional fuels or current U.S. government initiatives to expand domestic oil and gas production. API is strongly opposed to Alternatives 2a and 2b (for oil shale)

Alternative 2 (for oil sands), and Alternative 3 (as applied to both oil shale and oil sands) as they severely restrict the lands available for potential oil shale and oil sands leasing. While inferior to Alternative 1, Alternative 4 (and its various sub-alternatives for oil shale) is acceptable to API as substantial acreage remains available for oil shale leasing applications under this alternative.

#2])> API Opposes BLM's Preferred Alternatives.

<([#3 [2.2] API is strongly opposed to BLM's selection of Alternative 2b for oil shale and Alternative 2 for oil sands as the preferred alternatives. If adopted, these alternatives would dramatically reduce the amount of land potentially available for oil shale leasing from 2,017,714 (slightly revised from the 2008 OSTs PEIS) to 461,965 acres (22.89% of the original allocation) and the land potentially available for oil sands leasing from 430,686 to 91,045 acres (21.14% of the original allocation).

#3])> <([#4 [2.3] Although not listed as BLM's preferred alternative, Alternative 3 would also severely limit leasing opportunities to only those areas where there is an existing oil shale RD&D lease signed at the time of the 2012 OSTs Record of Decision is issued (a maximum of 32,640 acres including the Preference Right Lease Areas associated with each RD&D lease). For oil sands, only the pending Asphalt Ridge lease application south of Vernal, Utah covering approximately 2,100 acres is included. If selected, Alternative 3 represents over 98% reduction in area available for potential lease applications and development for oil shale and more than

99.5% reduction in the area now available for potential oil sands lease applications and development (as compared to the existing allocations approved under the 2008 OSTs PEIS ROD).

#4])> <([#5 [2.4] Alternative 4a may be acceptable; however, API is opposed to Alternative 4b. While the same lands would be available for oil shale leasing under Alternatives 4a and 4b, Alternative 4b would require companies to first obtain a Research, Development, and Demonstration (RD&D) lease before the lease could be converted to a commercial lease. API believes this requirement will be an unnecessary, expensive, and time-consuming step in the future as oil shale and oil sands development technology matures. **#5])>**

<([#6 [2.1] API believes that Alternative 1 (the No Action Alternative) is the right choice for the preferred alternative and believes that the majority of the other alternatives do not comply with the Congressional mandate to promote the responsible development of this important energy resource. The result is greater future dependence on foreign sources of oil and gas and corresponding loss of potential new U.S. jobs and economic activity. API believes that BLM's severe restriction of potential oil shale and oil sands leasing opportunities in the 2012 OSTs DPEIS alternatives represents an unfortunate lack of planning and poor public policy.

#6])> API's Detailed Comments

Our review of the document identified a number of areas where we believe further attention to the statements made is worthwhile on the part of BLM's authors. We have attached one document that contains more detailed comments on the DPEIS. Attachment 1, Comments on the DPEIS for Allocation of Resources, is a table that presents comments that generally reference a specific section or page within the DPEIS. The comments are designed to assist in refining the DPEIS and in several instances describe typographical or other errors noted in the document. The paragraphs below also provide additional API comments and recommendations on the January 2012 DPEIS.

General Comments

<([#7 [9.8] API is disappointed in the tone and abrupt change in direction from that presented in the original 2008 OSTs PEIS. The current document does not provide credible factual, legal or policy reasons for proposing to amend the ten Resource Management Plans (RMPs) at this time. Rather, BLM offers two reasons for the proposed RMP amendments: (1) the agency committed to revisit the RMPs as part of the 2011 lawsuit settlement agreement with environmental organizations; and (2) new information has come to light that was not available in 2008. A review of the "new information" described in Section 1.1.1. at page 1-5 includes a list of routine developments that combined do not rise to a level requiring that a new NEPA analysis be conducted of the oil shale and oil sands land use plan allocations made in the 2008 OSTs PEIS Record of Decision (ROD), including:

- a. A recently completed U.S. Geological Survey (USGS) in-place assessment of oil shale and nahcolite resources in Colorado, Utah, and Wyoming.
- b. A March 2010 U.S. Fish and Wildlife Service (USFWS) Notice of Petition Findings, Endangered Wildlife and Plants, 12-Month Findings to List the Greater Sage-Grouse as Threatened or Endangered (75 FR 13910), concluding that while listing was warranted, it was precluded by higher priority listing actions.
- c. BLM recently completed updating its inventory of lands having wilderness characteristics (LWC) in each of the three states for the planning area, and the status of several areas originally proposed to be Areas of Critical Environmental Concern (ACECs) in Utah has changed since the preparation of the 2008 OSTs PEIS.

API believes that the “new information” described above represents routine resource management updates and could have been easily accommodated within the context of required lease sale or other project-specific NEPA and Endangered Species Act reviews. In fact, BLM chose not to use the new USGS in place assessment of oil shale and nahcolite resources in Colorado, Utah, and Wyoming to update the boundaries of the 2012 OSTs DPEIS study area (see Section 2.5.1 at page 2-77). The routine nature of the “new information” leads API to the conclusion that the only reason the 2008 OSTs PEIS is being reconsidered now is to accommodate the 2011 settlement with environmental organizations that included the reassessment as a component of the settlement.

API notes that BLM’s publication of the 2012 OSTs DPEIS constitutes an abrupt change in direction on the entire federal oil shale and oil sands leasing program in the face of a routine legal challenge from special interest groups. This is disappointing because the U.S. oil shale and oil sands industry needs consistency in federal policy and regulation to provide the confidence needed to make continued investments in technology and demonstration projects. The industry was hopeful that Section 369 of the Energy Policy Act of 2005 would provide federal agencies with the clear intent of Congress to support the responsible development of oil shale and oil sand resources and technology. The new 2012 OSTs DPEIS represents a significant step backwards in this regard.

API believes that BLM’s efforts to reexamine the existing RMPs as part of a settlement agreement does not provide an independent basis to amend the RMPs absent some other reasoned decision making. While BLM has the discretion to reopen both the RMPs and the oil shale leasing rules, it should not do so based on arbitrary reasons. Moreover, it cannot violate Congressional intent to encourage research and development of oil shale and oil sands resources located on public lands. #7])>

The Document Improperly Abandons/Ignores the Convincing Analysis in the 2008 OSTs PEIS

<([#8 [9.8] The 2008 OSTs PEIS and subsequent ROD were well researched and written, and compliant with NEPA and other applicable laws and regulations. API believes that the ROD for the 2008 OSTs PEIS reached logical and appropriate conclusions regarding land use plan amendments for allocation of oil shale and oil sands resources on lands administered by BLM. Under the ROD approving the 2008 OSTs PEIS and land use plan amendments, eight land use plans were amended to designate 1,991,222 acres as available for application for commercial oil shale leasing. Specifically, the lands that were available for application include all lands within the most geologically prospective oil shale areas that are BLM-administered public lands. The rationale for this decision (Alternative B in the 2008 OSTs PEIS) is extremely instructive in the current case and API recommends that BLM carefully review their prior conclusions in this matter to inform the current analysis. This important discussion in the 2008 OSTs PEIS ROD is repeated below for emphasis:

BLM’s 2008 OSTs PEIS ROD beginning at Page 16.

“Alternative B for oil shale was selected as the Proposed Plan Amendment based on: 1) its consistency with the requirements of the Energy Policy Act of 2005, 2) its balanced use and protection of resources, 3) the FPEIS’s analysis of potential environmental impacts, and 4) the comments and recommendations from cooperating agencies and the public.

Alternative B is structured to be consistent with the congressional mandate of the Energy Policy Act to emphasize the “most geologically prospective lands in Colorado, Utah and Wyoming” as available for application for leasing. Alternative B, therefore, identifies and offers the most

geologically prospective acreage (based on grade and thickness of the oil shale deposits) of the Green River Formation located in the Piceance, Uinta, Green River, and Washakie Basins of Colorado, Utah, and Wyoming. As compared with Alternative C, Alternative B makes more Federal oil shale available for application, and provides for fewer fragmented tracts. Alternative B also provides for more contiguous tracts that could be configured for economically and technically feasible extraction or recovery of the resources. Alternative B would also allow access to more of the most geologically prospective oil shale lands, particularly in Colorado. **Unlike Alternative C, which excludes lands based on existing management decisions for oil and gas development, Alternative B provides the decisionmaker with the discretion to balance the oil shale use and protection of resources on the public lands during subsequent site-specific NEPA analysis (emphasis added).** This balanced approach is consistent with FLPMA (Federal Land Policy Management Act) principles of “multiple use,” and “sustained yield.” The requirement to perform future NEPA analyses and to comply with other environmental laws allows the decisionmaker to optimize the recovery of energy resources, to establish appropriate lease stipulations to mitigate anticipated impacts, or to fully protect a resource or resource value by choosing not to offer an area for lease at any particular time. **Even if some technologies may not allow mining of some tracts to proceed without unacceptable impacts to other resource values, Alternative B would allow the agency the opportunity to choose to offer leases when a technology is proposed that can be used compatibly with the resource values in question. This is consistent with the comments that supported a viable and sustainable commercial oil shale leasing program, while ensuring that any impacts to sensitive resources or resource values are mitigated to any commercial development (emphasis added).** It is also consistent with the planning decisions for other mineral resources for these parcels which authorize leasing subject to restrictive conditions, rather than preclude leasing altogether.

Alternative B does, however, exclude certain lands within the most geologically prospective oil shale areas under the basis of existing laws and regulations, executive orders and other administrative designations or withdrawal. These include WSAs, National Monuments, WSRs, NCAs, and existing ACECs that are closed to mineral development.”

BLM used similar language in the 2008 OSTs PEIS ROD at page 31 regarding the selection of Alternative B for oil sands development by amending four land use plans to designate a total of 431,224 acres available for application for commercial oil sands leasing. The key drivers for selection that BLM identified were compliance with the Energy Policy Act of 2005, a balanced use of natural resources, maintaining decisionmaker discretion, and maintaining the proper role of subsequent NEPA analysis in the decisionmaking process.

It is also instructive to review the logic BLM used in not selecting Alternative C in the 2008 OSTs PEIS ROD (which would have significantly reduced the lands available for potential leasing and development of oil shale and oil sands resources). In describing their logic for not selecting Alternative C regarding oil shale, BLM concluded the following:

BLM’s 2008 OSTs PEIS ROD beginning at Page 22.

“Alternative C was not selected as the Proposed Plan Amendment because the alternative would not make the “most geologically prospective lands in Colorado, Utah and Wyoming” as available for application for leasing. Thus it is not fully consistent with the mandate of the Energy Policy Act of 2005. Much of the most geologically prospective acreage would be excluded under Alternative C; in particular areas which are in close proximity to three of the six RD&D leases would be excluded. In addition, this unreasonably fragments the area that would

be available for application, resulting in parcels that are unlikely to be explored, leased, or developed. This could be an impediment to sound and rational development of the resource and can reduce the economic return to the public. If oil shale resources are by-passed because of the exclusions in Alternative C, that could also limit the benefits to the nation from exploitation of a domestic unconventional energy source. Selection of alternative C precipitously limits or restricts the decisionmaker's discretion to balance oil shale use and the protection of resources or resource values, in accordance with FLPMA's principal of "multiple use." "

All of the iterations of Alternatives 2 and 3 of the 2012 OSTs DPEIS make significantly less acreage available for potential for oil shale and oil sands leasing than was offered under Alternative C of the 2008 OSTs PEIS. API can only assume that BLM's well considered analysis from 2008 would apply equally to current Alternatives 2a and 2b for oil shale and Alternatives 2 and 3 for oil sands. API strongly supports the sound logic and balanced approach taken by BLM in the Record of Decision on the 2008 OSTs PEIS. In view of the above, API strongly encourages BLM to reconsider their "preferred alternatives" of 2b for oil shale and Alternative 2 for oil sands. #8]>

The Document Fails to Meet the Intent of the Energy Policy Act of 2005

<([#9 [9.2.2] In August 2005, the U.S. Congress enacted the Energy Policy Act of 2005, Public Law (P.L.) 109-58. In Section 369 of this Act, also known as the "Oil Shale, Tar Sands, and Other Strategic Unconventional Fuels Act of 2005," Congress declared that oil shale and oil sands (and other unconventional fuels) are strategically important domestic energy resources that should be developed to reduce the Nation's growing dependence on oil from politically and economically unstable foreign sources. To support this declaration of policy, Congress directed the Secretary of the Interior (the Secretary) to undertake a series of steps, several of which are directly related to the development of a commercial leasing program for oil shale and oil sands. Compliance with Section 369 of the Energy Policy Act of 2005 is mandatory for Federal agencies, including BLM. The preferred alternatives (Alternative 2b for oil shale and Alternative 2 for oil sands) substantially reduce the acreage of lands potentially available for oil shale and oil sands leasing, but BLM does not explain in the 2012 OSTs DPEIS how the RMP amendments (particularly Alternatives 2a, 2b, and 3) are consistent with Section 369 of the Energy Policy Act of 2005, which encourages commercial leasing of oil shale and oil sands. Moreover, the proposed RMP amendments and upcoming revisions to the oil shale leasing regulations have effectively eliminated the regulatory certainty Congress intended to establish to encourage oil shale and oil sands investment. In the 2012 OSTs DPEIS, BLM and DOI appear to be using agency policy decisions to obstruct existing Federal Law. In selecting Alternative 2(b), BLM says the only path to potential commercial oil shale production is through the RD&D Program. However, the Energy Policy Act of 2005 specifically mandated that BLM establish a competitive commercial leasing program that is separate and distinct from the RD&D program. #9]>

The Document Fails to Support Executive Branch Efforts to Expand U.S. Domestic Energy Production

<([#10 [2.1] Speaking at the Cushing Pipe Yard in Cushing Oklahoma on March 22, 2012, President Obama clearly articulated the Administration's position on U.S. energy policy. The President described an "all-of-the-above" energy strategy to "keep us on track to further reduce our dependence on foreign oil, put more people back to work, and ultimately curb the spike in gas prices that we are seeing year after year after year". President Obama went on to say "so yes we're going to keep on drilling. Yes we're going to keep on emphasizing production. Yes we're going to make sure we can get the oil to where it is needed." The President noted that renewable

energy, new clean energy sources, and improving energy efficiency were also part of the “all-of-the-above” strategy. The President observed that “We want every source of American made energy. I don’t want the energy jobs of tomorrow going to other countries. I want them here in the United States of America. And that’s what an all-of-the-above strategy is all about. That’s how we break our dependence on foreign oil.” The President’s message was clear.

Nearly seven years since the passage of the Energy Policy Act, global oil demand has increased, markets have become tighter, and instability in the Middle East and Africa have caused prices to jump markedly, almost doubling, to close to \$110 a barrel, which only underscores our country’s alarming dependence on foreign oil supplies. These recent events and continued political instability in the Middle East underscore the critical importance of domestic oil shale and oil sands resources to our national security and strategic interests. The clear policy direction as provided in EAct 2005 indicates the paramount importance of oil shale development to meet urgent national energy needs.

BLM’s 2012 OSTs DPEIS fails to support the President’s “all-of-the-above” energy strategy to encourage domestic energy production from significant oil shale and oil sands deposits.

Estimates for the oil shale resource in Colorado, Utah, and Wyoming are placed at between 1.2 and 1.8 trillion barrels of oil

equivalent of resource in the ground with as much as 500 billion to 1.1 trillion barrels of oil that is considered potentially recoverable. It is with a sense of incredulity that with a gallon of gasoline surging to above \$4 in many parts of the country, we are urging an agency of the Obama Administration to keep American energy supplies on the table for development.

As agencies of the Executive Branch, DOI and BLM are obligated to actively support and assist in implementing the President’s energy strategy. Such support is more likely to resemble the alternatives selected in the Record of Decision (ROD) for the 2008 OSTs PEIS than BLM’s preferred alternatives presented in the 2012 OSTs DPEIS. In fact, supporting the President’s policies requires that BLM abandon the agency’s current Preferred Alternatives 2b (for oil shale) and 2 (for oil sands) in favor of Alternative 1 (the No Action Alternative). **#10)>**

<([#11 [9.1] The Purpose and Need of the DPEIS is Defective and Fails to Comply with the Intent of NEPA

The 2012 OSTs DPEIS is biased in that it describes the probable outcome of the NEPA analysis within the purpose and need Statement. Page 1-4 of the DPEIS reads as follows:

*“As noted above, the BLM has decided to reconsider the 2008 allocations. The purpose and need for this proposed planning action is to reassess the appropriate mix of allowable uses with respect to oil shale and tar sands leasing and potential development. **Specifically, the BLM will consider amending the applicable RMPs to specify whether any areas in Colorado, Utah, and Wyoming currently open for application for future leasing and development of oil shale or tar sands should not be available for such application for leasing and development** (emphasis added).”*

This purpose and need statement portends the outcome of this supposedly unbiased NEPA analysis by stating that the document will only consider removing lands from those areas currently approved to receive oil shale and oil sands lease applications. There is no consideration of expanding the currently available oil shale and oil sands leasing areas even in the face of potential domestic energy shortages or the recent spike in U.S. gasoline prices. The expected outcome of the analysis is quickly confirmed in Section 2.4.4 at page 2-76 where BLM identifies Alternative 2b (for oil shale) and Alternative 2 (for oil sands) as the agency’s preferred alternatives. Both of these alternatives severely contract the public lands available for receiving

applications for oil shale and oil sands leasing and possible future development.

In stark contrast to the predetermined outcome identified in the purpose and need of the 2012 OSTs DPEIS, the 2008 OSTs PEIS identifies the purpose and need of the NEPA document “to meet the requirements of the Energy Policy Act of 2005”. This is a vastly superior NEPA approach because it does not drive the analysis to a predetermined outcome. The NEPA analysis contained in the current document has been structured so that it inappropriately bends to meet the requirements of the 2011 settlement agreement rather than representing a fresh look at the issues. API recommends that the purpose and need statement be rewritten to be more neutral or should adopt the original purpose and need statement from the 2008 OSTs PEIS. **#11)**>

<((#12 [1.5] [9.3] The 2012 OSTs DPEIS Fails to Follow the Prescribed “Multi-Step” NEPA Process

The 2012 OSTs DPEIS clearly states that the document is the first step in a multi-step NEPA process. This first step considers potential impacts associated with amending 10 BLM Resource Management Plans

(RMPs) to identify appropriate lands for receiving applications for oil shale and oil sands leases and future development. The 2012 OSTs DPEIS notes in multiple places that subsequent site-specific NEPA analyses will be required for issuing RD&D leases and for those cases where a RD&D lease is converted into a commercial lease (e.g. 2012 OSTs DPEIS at Section 1.1.1 page 1-6 lines 8-23 and Section 1.4.1 page 1-17 lines 32-38). As such there will be multiple opportunities for public review and site-specific analyses of proposed oil shale and oil sands leases and development. Alternatives 2a, 2b, and 3 in the 2102 OSTs DPEIS fail to properly account for and utilize these subsequent NEPA reviews because they prematurely remove large areas of potential oil shale and oil sands leasing without allowing proper site-specific environmental reviews.

#12)> **<((#13 [2] [9.3] These alternatives fail to properly acknowledge the multi-step NEPA review process that follows inclusion of BLM lands in agency land use plans as available for consideration of oil shale and oil sands lease applications. This top-down resource management approach relegates the local or regional BLM land manager to that of an observer rather than a participant in resource management decisionmaking. This local resource “management from Washington DC” approach could have the unintended consequence of restricting important domestic energy development opportunities without receiving the input of commercial energy interests, workers, local land managers, other government agencies, special interest groups, and the affected public. Furthermore, Alternatives 2a, 2b, and 3 in the 2102 OSTs DPEIS do not provide for the necessary fine scale (site-specific) environmental reviews that can effectively reconcile necessary resource protections with ongoing needs for developing additional domestic energy resources. The restrictive “policy level” edicts contained in Alternatives 2 and 3 of the 2012 OSTs DPEIS are not appropriate for this high-level NEPA screening phase of the process because they may inappropriately preclude important energy development by not allowing the needed lease specific NEPA review to occur. #13)**>

<((#14 [9.3] Alternatives 2 and 3 of the 2012 OSTs DPEIS Inappropriately Restrict the Role of Local/Regional BLM Land Managers

In addition to shortcutting the NEPA process, the 2012 OSTs DPEIS inappropriately restricts the authority of the Federal Land Manager by identifying a host of criteria that would automatically withdraw BLM administered lands from potential leasing for oil shale and oil sands development. In comparison, the 2008 OSTs PEIS ROD describes a process that includes more acreage for potential applications for oil shale and oil sands leases and properly engages local

and regional BLM land managers in the resource allocation and management decisionmaking process. Each potential application would be subject to a lease sale NEPA review and a project specific NEPA review. This approach provides the decisionmaker with the discretion to balance the oil shale and oil sands use and protection of resources on the public lands during subsequent site-specific NEPA analysis. These NEPA reviews are the appropriate administrative venue for considering site-specific environmental issues such as ACEC designations or the specific protections needed for threatened and endangered species (or candidate species such as the greater sage-grouse) under Section 7 of the Endangered Species Act. It is inappropriate to remove this site-specific resource management responsibility from BLM land managers.

In discussing the logic for not selecting Alternative C (which would have significantly limited the acreage of lands available for receiving oil shale and oil sands lease applications) contained in the 2008 OSTs PEIS, BLM clearly articulated their thoughts on this matter as shown below: **BLM's 2008 OSTs PEIS ROD beginning at Page 22.**

“Selection of alternative C precipitously limits or restricts the decisionmaker’s discretion to balance oil shale use and the protection of resources or resource values, in accordance with FLPMA’s principal of “multiple use.” Although as presently being researched, in situ oil shale extraction would have many impacts similar to those of oil and gas development, exclusion of areas based on existing management prescriptions (e.g., no surface disturbance or seasonal limitation that are in place for oil and gas leasing) unnecessarily speculates upon the nature and degree of impacts that would be caused by future oil shale development. It would be premature to eliminate areas prior to site-specific analysis based on factors that are not known now, but that would be known at the leasing or operation permitting stages, such as location, timing and type of oil shale technology, that may show that these resources could be adequately protected through mitigation.”

API agrees with the resource management approach and convincing logic articulated by BLM on the topic of oil shale and oil sands leasing in the 2008 OSTs PEIS ROD. API suggests that the authors of the 2012 OSTs DPEIS review the current document and make necessary adjustments to restore the proper balance of potential oil shale and oil sands use and the protection of resources or resource values. In making these adjustments, API recommends that the proper role of site and project-specific environmental reviews and federal land manager discretion be emphasized. #14)>

<([#15 [2.2] [1.5] Conservation Focus Alternative 2a and 2b for Oil Shale and Alternative 2 for Oil Sands are Defective and Do Not Comply with NEPA

NEPA requires that agency alternatives be well defined so that both agency decisionmakers and the general public can understand the reasonably foreseeable impacts associated with each alternative. As currently constructed, Alternatives 2a and 2b for oil shale and Alternative 2 for oil sands do not meet that requirement. This is particularly true with the component of Alternative 2a and 2b (oil shale) and Alternative 2 (oil sands) that states that “*core or priority sage-grouse habitat, as defined by such guidance as the BLM or the DOI may issue*” would be excluded from the lands available for potential leasing applications. These alternatives also include a similar non-specific statement excluding areas from oil shale and oil sands leasing that the BLM has identified or may identify as a result of inventories conducted during this planning process, as lands having wilderness characteristics (LWC). The lack of clarity regarding the current restrictions posed by Alternatives 2a and 2b for oil shale and Alternative 2 for oil sands, combined with the open-ended nature of what constitutes “*core or priority sage-grouse habitat*” and the unknown future requirements of the “*guidance as BLM or the DOI may issue*”, make it

virtually impossible for oil shale and oil sands interests to either identify the excluded lands or understand any associated restrictions. API contends that this lack of clarity as to the specifics of these alternatives makes them defective from a NEPA process perspective and potentially from a legal perspective, as well. #15]]>

<([#16 [9.2.4] [2.2] **The Sage-Grouse Related Restrictions are Premature and there are Other, Less-Onerous, Methods of Achieving Sage Grouse Protection**

API believes that withdrawing lands from potential oil shale and oil sands leasing due to sage-grouse habitat protection is premature given that no specific federal regulatory or administrative actions have occurred with respect to managing core or priority sage-grouse habitat. As a result, these alternatives are vague and poorly defined making it difficult for interested parties to accurately identify the lands that are being withdrawn from potential leasing. API strongly objects to the provisions of Alternatives 2a and 2b for oil shale and Alternative 2 for oil sands that would result in the wholesale exclusion of core or priority sage-grouse habitat from future lease sale applications and believes that greater sage-grouse protection and management can be effectively achieved without the use of such draconian measures.

Wholesale removal of hundreds of thousands of acres of potential energy resources from possible future leasing based on the limited analysis contained in the OSTs DPEIS is clearly inappropriate.

API believes that the potential leasing acreage being eliminated, at least at the PEIS stage, as a result of the greater sage-grouse is unnecessary and is not supported by the analysis contained in the DPEIS. The current programmatic document is not the appropriate stage in the NEPA process to make these site-specific determinations. API supports further detailed analysis of potential greater sage-grouse impacts and site-specific mitigation measures in future lease sale or project-specific NEPA documents where the scale of the evaluation is finer and additional (and site-specific) greater sage-grouse data is available. In addition, the use of suggested management practices may make it possible to site future oil shale and oil sands projects without causing unacceptable impacts to the greater sage-grouse. API believes that there are compatible opportunities to further develop oil shale and oil sands energy resources while simultaneously protecting the greater sage-grouse. As such, API believes that coarse scale greater sage-grouse habitat mapping should not be used to automatically eliminate large areas of important energy resources from future consideration.

API points to the large text box at Section 4.8.1 beginning at page 4-124 of the 2012 OSTs DPEIS that describes greater sage-grouse habits and habitats and identifies a number of measures and suggested management practices that can be used to reduce or eliminate harm to the greater sage-grouse. API and our member companies recognize that implementing some of these management practices could result in specific areas being excluded from potential oil shale and oil sands leasing and development. Nonetheless, we believe that the site-specific approach for greater sage-grouse management described in Alternatives 1 and 4 for oil shale and oil sands is superior to the inappropriate and restrictive approaches included in the various iterations of Alternatives 2 and 3. #16]]>

<([#17 [9.7] **Alternative 2b and 4b for Oil Shale Could Result in Unnecessary Project Delays**

API is opposed to Alternative 2b. While the same lands would be available for oil shale leasing under Alternatives 2a and 2b, Alternative 2b would require companies to first obtain a Research, Development, and Demonstration (RD&D) lease before the lease could be converted to a commercial lease. API believes this requirement will be an unnecessary, expensive, and time-

consuming step in the future as oil shale and oil sands development technology matures. API also believes that RD&D leases as the current sole lease interest is contrary to the EAct 2005 direction to implement a commercial leasing program. Alternative 2b is predicated on the inappropriate conclusion that oil shale energy projects will operate indefinitely in a research and development mode. Once technically sound and environmentally acceptable technologies have been developed under the current RD&D program, there is no reason to require all future commercial oil shale lease applications using the same technology to repeat the cumbersome RD&D process. While BLM could amend appropriate RMPs in the future to allow direct commercial applications using proven oil shale technology, the amendment process is time consuming and will result in significant project delays. The same unnecessary project delays described above for oil shale Alternative 2b would also apply to Alternative 4b. #17)>

<([#18 [6.3.2.1] **Water Use Estimates in the 2012 OSTs DPEIS do not Reflect Current Patterns and Result in Unrealistically High Water Use Estimates**

Although some uncertainty remains regarding the potential water use from various oil shale development technologies, API notes that the 2012 OSTs DPEIS has assumed a worst case scenario. The analysis does not provide any credit for water recovery from oil shale processing or reuse of water from other local mineral extraction industries (water used or recovered for local oil and gas operations). The

analysis also includes significant additional water use associated with coal-fired power production that it assumes will be built to support the oil shale industry. Even with these worst-case scenario assumptions, the document concludes that there is sufficient water currently available to support a robust oil shale industry and also serve other needs for the foreseeable future.

The 2012 OSTs DPEIS evaluates potential impacts using the assumption that any additional power needed to operate RD&D or commercial oil shale projects would be provided by expanding or building new coal-fired power plants (Section 4.1.6 at page 4-13). BLM advises that they made this assumption to avoid the possibility of underestimating potential impacts. API believes that this assumption is inappropriate and does not reflect the ongoing changes to the power production marketplace in Colorado, Wyoming, and Utah resulting from the rapid expansion of natural gas production in this region. There are multiple examples of power plants switching to burning natural gas in this region with resulting decreases in both air emissions and water use as compared to coal-fired power plants of equivalent capacity (see for instance the April 12, 2012 article in the Wyofile online news service regarding a Wyoming power plant making plans to switch from coal to natural gas fired generation at an existing facility at <http://wyofile.com/2012/04/utility-wants-to-convert-wyoming-coal-unit-to-natural-gas/>). API urges BLM to review the trends in natural gas power plant construction (and switching) in the region and revise the water use section of the 2012 OSTs DPEIS to make a more realistic estimate of potential water use in oil shale operations. The current pessimistic water use assumptions are not supported by the facts on the ground. While the NEPA process supports an impact analysis that is conservative, it does not require one that is unrealistic.

In any event, API notes that water rights are unique in these western states and that potential oil shale projects would have to acquire these rights in the state and local water marketplace like other current and future water users. There is every indication that necessary water rights will be available to support a robust oil shale industry in Colorado, Utah, and Wyoming. The input from our members strongly suggests that an objective examination of available technologies and costs would conclude that responsible, low-impact, and sustainable water usage is both technically and

economically feasible for an oil shale industry producing one to two million barrels per day. The member companies of the API Oil Shale Subcommittee are committing significant capital and research toward developing technologies and processes to reduce energy usage in their projects while protecting ground and surface water resources. Many of these same firms are collaborating under BLM's RD&D leasing program, under which the developer has to successfully verify to the BLM that its technology is viable, environmentally acceptable, and sustainable before commercial scale implementation. Regardless of location, each company pursuing oil shale operations will have to validate the environmental and economic viability of its project. API also notes that water use requirements will be evaluated at a finer scale in subsequent NEPA reviews where potential impacts can be assessed on a site and project-specific basis. These future detailed reviews will provide project, technology, and site-specific information on water use to BLM decisionmakers. #18]>

<([#19 [6.3] **Additional Note on the Political Nature of BLM Decision-making and Global Commercial Development**

As stated previously, BLM has failed to make a compelling technical or legal case for reconfiguring the 2008 OSTS PEIS. As we seek an intellectually honest rationale for the BLM's arbitrary reconfiguration of the 2008 OSTS PEIS, we have examined BLM's recent statements on the economic case for oil shale development.

BLM has repeatedly pointed to the economic viability of oil shale development (or rather its presumed lack of viability) as a factor in its decision making process [In its February 3, 2012 announcement of the DPEIS, BLM justified its preferred alternative selection by stating that “*t+o date, technological and economic conditions have not combined to support a sustained commercial oil shale industry in the United States,...” and in its April 14, 2011 “Notice of Intent to Prepare a Programmatic Environmental Impact Statement (PEIS) and Possible Land Use Plan Amendments for Allocation of Oil Shale,” BLM stated as its rationale that “*a+s there are not economically viable ways yet known to extract and process oil shale for commercial purposes, the BLM, through its planning process, intends to take a hard look at whether it is appropriate for approximately 2,000,000 acres to remain available for potential development of oil shale, and approximately 431,224 acres of public land to remain available for potential development of tar sands.”].

As we have stated previously, we are hard-pressed to understand the connection between the viability of commercial oil shale technologies and whether certain lands should be made available for oil shale development in the future and believe they are entirely separate issues. This is a technologically intensive industry and as with other high-tech industries, development takes time. Progression towards development of U.S. oil shale resources also requires a strong, positive, partnership between industry, financial markets and the federal government. Industry and capital investment have responded negatively to the uncertain terms, uncertain regulation, and policies under this Administration's stewardship of the federal oil shale program. #19]>

<([#20 [10.3] [6.3.5] However, since BLM has chosen to include it [economic viability of oil shale development] as a factor in its decision making process, we would like to provide for BLM more insight into commercial oil shale development globally.

It is a fact that several technologies have been developed around the world and that oil shale has been produced on a commercially viable basis for decades outside of the United States. A close examination of activities, technologies, and government policies that have been set into motion elsewhere in the world indicate that, where government policies promote rather than prohibit commercial-scale oil shale development, existing technologies are already in place that can

successfully process oil shale resources in a manner that complies with strict environmental standards.

From Estonia, where commercial-scale oil shale development has taken place for decades, to Jordan, where foreign companies have made recent and significant investments toward the eventual development of oil shale, governments have instituted policies that recognize and promote the value and significance of this natural resource in terms of its benefits to their economic, energy, and national security. More recently, renewed interest in this resource has been sparked in Israel, where oil shale deposits could yield billions of barrels of domestic oil. The cases provided below demonstrate that the U.S. might well follow examples set by these governments in other parts of the world.

Estonia

The Estonian government's National Development Plan for the Utilization of Oil Shale [See National Development Plan for the Utilization of Oil Shale 2008-2015, Ministry of the Environment of the Republic of Estonia, Tallinn 2008, *available at* http://www.envir.ee/orb.aw/class=file/action=preview/id=1155858/P%F5levkivi_arengukava_+EN.pdf; and Ministry of the Environment, News, "Riigikogu approves development plan for use of oil shale," *available at* <http://www.envir.ee/1082834>.]

sets forth the strategy for developing oil shale in the country from 2008-2015. Approved by the Estonian parliament in October 2008, the Plan is based on securing a stable supply of oil shale energy and energy independence, as well as achieving increased efficiencies in and reduced environmental impacts of oil shale mining and use. The plan notes the energy security and economic benefits of the country's oil shale resource, while also seeking to diversify its energy portfolio by immediately establishing an annual upper limit of 20 million tons of oil shale mining capacity and a 15 million ton upper limit by 2015. To mitigate environmental impacts associated with oil shale mining and use, the plan calls for the implementation of modern technologies, acceleration of the recycling of residues, and instituting new environmental charge rates for the use of oil shale and related groundwater needs.

Today, the Estonian energy company Eesti uses two Enefit-140 units at its Estonian oil plant to process oil shale in the country. Enefit-140 uses solid heat carrier technology to produce liquid fuel and retort gas. The patented technology relies on a three-part process comprised of the following stages: drying, thermal decomposition, and combustion. The plant's two units can process up to 140 tonnes of oil shale per hour and annually produce up to 240,000 tonnes of liquid fuel (1.5 million barrels) and 60 million Nm³ of retort gas, which can be used to produce hydrogen and power. In recent years, annual production levels have increased to 1 million barrels of liquid fuels and 40 millions Nm³ of retort gas. Improvements to the units' design have increased their online time from about forty-five percent to nearly eighty percent, exceeding the plant's planned capacity of seventy-five percent.

In terms of the impact of this process on the environment, this oil shale production does not require the use of water, and only about one percent of the production waste is comprised of total organic compounds. In addition, carbon dioxide emissions from liquid fuel production are notably less than the emissions emanating from the generation of electricity from oil shale, since most of the carbon remains in the liquid fuel. In spite of production volume increases, technological advances have enabled Eesti to reduce the amount of pollution discharged from the production of liquid fuels.

These developments are not being conducted without any environmental scrutiny. Oil shale

activities in Estonia are subject to fifty-five international conventions and agreements that contain environmental restrictions. Included among them are the U.N. Convention on Biological Diversity and European Commission Directives 79/409/EEC pertaining to the conservation of wild birds, 92/43/EEC relating to conservation of natural habitats and wild fauna and flora. These provisions require the protection of endangered species and their habitats, with protected areas that restrict geological and mining activity.

Jordan

The Government of Jordan has estimated that the country is home to between 50 and 70 billion metric tonnes of identified oil shale reserves, ranking third in the world. Studies conducted since the 1960's indicate that oil shale deposits are located in more than 60% of the country.

While it has traditionally relied on imported energy to meet most of its needs, Jordan's National Energy Strategy for 2007-2020 is focused in part on achieving greater energy independence by increasing the country's use of domestic energy resources, including oil shale. In order to raise the portion of domestic energy resources from 4% in 2008 to 25% in 2015 and 39% in 2020, the country aims to raise oil shale's contribution to the nation's energy portfolio to 11% in 2015 and 14% in 2020. This would require an estimated \$1.4 to \$3.8 billion in investments in oil shale exploration.

At the same time, the Jordanian government has embarked on a comprehensive mission to craft a regulatory environment that ensures responsible development of the country's oil shale resources. Oil shale projects must comply with a variety of rules and standards, including World Bank/International Finance Corporation guidelines, Equator Principles, reasonable and prudent operator standards, and emission limits, which are included in concession agreements. While commercial-scale oil shale production in Jordan has not yet taken place, international companies are devoting significant resources toward achieving that reality.

For example, following a formal agreement reached with the Jordanian government in 2009, the Jordan Oil Shale Company (JOSCo), a wholly-owned subsidiary of Royal Dutch Shell (Shell), registered as a company in Jordan to explore the potential for commercial development of oil shale resources in the country using proprietary In situ Conversion Process (ICP) technology.

The area to be assessed is located on 22,250 km² of land on three tracts in the central, southern, and northwestern parts of Jordan.

Shell's ICP technology, which is currently under development but has been the subject of research and testing since the early 1980's, does not rely on incineration or mining and surface retort techniques to produce energy from oil shale. Rather, ICP uses underground heaters to raise the temperature of the oil shale in place to remove the kerogen and hydrocarbon gas below ground, and then relies on conventional methods of extraction to produce the resources. As a result, the waste that is generated during the separation process remains underground.

Additional benefits of ICP technology include the capacity to access oil shale resources without mining, its ability to produce higher quality crude oil and larger quantities of oil and gas more efficiently, requiring a smaller surface area than other production techniques.

Israel

According to the Israeli government, oil shale deposits are present in 15% of the country [See Reuters, "Oil shale may help energy independence," May 8, 2011, available at <http://www.ynetnews.com/articles/0,7340,L-4061436,00.html>.],

and one assessment estimates that the total amount of oil shale in place in Israel to be close to 250 billion barrels. In turn, public policies have sought to promote investment in the development of these resources.

For example, the Ministry of Energy and Water Resources' Energy Research and Development Department has sought to promote technologies that can turn oil shale into an energy resource to provide an antidote to "excessive fuel price increase or supply difficulties" [See Ministry of Energy and Water Resources, Energy Research and Development Department, *available at* <http://energy.gov.il/English/Subjects/RAndDChiefScientist/Pages/GxmsMniEnergyResearchAndDevelopmentDepartment.aspx>.].

In addition, the Ministry's Earth Science Research Administration seeks in part to maintain the scientific infrastructure for oil shale [See Israel Ministry of Foreign Affairs, Ministry of National Infrastructures, *available at* http://www.mfa.gov.il/MFA/MFArchive/2000_2009/2002/10/Ministry+of+National+Infrastructures.htm#energy.].

Israel Energy Initiatives Ltd (IEI), a subsidiary of U.S.-based Genie Energy, has been working to develop a means to produce clean transportation fuels from oil shale using In-Situ conversion technology [See IEI, About Us, *available at* <http://www.iei-energy.com/aboutus.php>.].

In 2008, IEI obtained an exclusive exploration and production license from the Israeli government in an area covering 70,000 acres with an estimated 40 billion barrels of oil [See IEI, About Us, *available at* <http://www.iei-energy.com/aboutus.php>; IEI, Home Page, *available at* <http://d129998.u26.alsonetworks.com/index.php>; and IEI, Oil Shale – Our National Treasure, *available at* http://d129998.u26.alsonetworks.com/shale_oil-natural_treasure.php.].

This area is located within Israel's Shfela basin, which has been estimated to hold approximately 150 billion barrels of oil [See IEI, What is Oil Shale?, *available at* http://d129998.u26.alsonetworks.com/what_is_oil_share.php.].

IEI's Chief

Executive Officer has stated that successful production in the license area could yield 50,000 barrels of oil per day (20% of Israel's consumption rate) for thirty years.

In sum, as other countries as well as the United States seek to become more energy self-sufficient and chart courses to greater economic and national security, the game-changing impacts associated with commercial development of oil shale resources is spurring governments to take actions that will help turn potential benefits into reality. In such cases, businesses are responding by making investment decisions and applying proven technologies to oil shale development in a manner that could significantly meet the growing energy demands of citizens around the globe.

With the passage of time, oil shale production technologies that have developed and advanced over time will continue to evolve and achieve even greater efficiencies and improvements. How this vast resource is developed in the United States remains uncertain. U.S. Federal actions that create obstacles or uncertainty about the potential for commercial-scale development will surely be a limiting factor.

During this period of unprecedented economic and geopolitical uncertainty, the examples seen in Estonia, Jordan, and now Israel should serve as a wake-up call to action for decision-makers in the United States and countries around the world who have an interest in achieving greater energy independence. #20)>

Conclusion

<([#21 [2.1.1] For the reasons discussed above and further outlined in Attachment 1, API strongly urges BLM to adopt Alternative 1, the No Action Alternative. The 2012 OSTIS DPEIS provides no convincing logic for changing the thoughtful conclusions BLM reach in the ROD for the 2008 OSTIS PEIS. Accordingly, API recommends that current (2008) BLM land use plan

allocations for oil shale and oil sands leasing be retained as written and not amended. #21))>
In closing, the API appreciates the opportunity to comment on the *Draft Programmatic Environmental Impact Statement and Possible Land Use Plan Amendments for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah, and Wyoming* and asks the Bureau of Land Management to carefully consider our comments and address them as it finalizes the OSTs PEIS document. Should you have any further questions, please contact me at 202-682-8260 or kennedye@api.org.

Comments

<([#22 [13] 1. General: The large document has incorporated much of the information from the 2006-2008 EIS effort and does reflect updating data in some sections. This is particularly important when discussing important resource issues such as water. Please consider making a statement to the effect that this document represents the current state of the information when many references are pre-2007. The statement could be included as part of the opening remarks in each of the resource descriptions in Section 3. #22))>

<([#23 [13] 2. Executive Summary: The ES addressing only the alternatives and BLM's preferred alternative lacks a summary discussion of the resource findings presented in Sections 3-6

#23))> <([#24 [13] 3. Page ES-6, line 28: BLM inserts uncertainty into the available lands restriction by adding "may issue" to this limitation. Suggest rewording to ... "or the DOI has promulgated through regulation"

#24))> <([#25 [3.1.7] 4. Page ES-6, line 31: BLM inserts uncertainty into the available lands restriction by not defining specifically what Utah & Wyoming have "recently completed". Please direct the reader toward a specific document that identifies the applicable ACECs or where they are discussed.

#25))> <([#26 [9.3] 5. Page 1-17, line 31: Why bother discussing commercial projects in this EIS when it is stated that this document's NEPA scope is limited to something less than the RD&D level of projects? The RD&D leases do have a PRLA included but it is stated that further NEPA review is required prior to commercial development.

#26))> <([#27 [9.6] 6. Page 1-21, line 15: How different are the oil and gas lease stipulations relative to those seen in the RD&D leases to date? Why not include current RD&D lease stipulations in the BLM handbook? It would demonstrate similarities or differences among industries to the Resource Manager.

#27))> <([#28 [6.3] 7. Page 2-1, line 27: A more informed discussion on the methods/process for oil shale and oil sands resources recovery could be inserted in this section. Alternatively, reference to select subsections of 4.0 and Appendix A could be made to indicate that more technology description is included in the document.

#28))> <([#29 [3.1.8] 8. Table 3.1.1-1, line 2: Suggest deletion of the Utah GSENM Plan from the table to consistently show the 10 RMP that are affected in prominent tables.

Acknowledgment of the RMP could be inserted in the text following the table similar to the presentation on page 1-19 since the existing leased acreage will likely never be developed nor acreage be available for leasing in the future. #29))>

<([#30 [13] 9. Table 3.1.2-1: The data presented is that available in 2006 as noted in the footnote. Please review and update the table as needed to reflect more recent information (References note that this was reviewed in October 2011). This could be done for Section 3 in general as much of the document appears based on information gathered for the 2008 EIS.

- #30)**> <(**#31** [3.12.2] 10. Page 3-276, line 30: The socioeconomic history of oil shale development in the area suggests that the maintenance of a current baseline is important in keeping the future impacts in perspective. The socioeconomic section does reflect current information; however, the tables related to the environmental justice discussion reflect the pre-2010 census data. It is suggested the section be reviewed and updated as necessary to reflect current data. This comment is applicable to similar discussions in Sections 4 thru 6.
- #31)**> <(**#32** [6.3.6] 11. Page 4-4, line 2: For completeness, consider giving a short reason that surface mining of oil shale in Colorado is not being discussed in the EIS.
- #32)**> <(**#33** [6.2.1] 12. Page 4-14, line 11: The premise that coal is the energy source for oil shale and oil sands development is not reasonable in today's or predicted future energy markets. For comparative purposes consider providing the summary of emissions if natural gas was used as the energy source. Such a comparison would allow the reader to infer their own magnitude of impacts when reviewing impacts presented in the remainder of the document that are based solely upon coal as a fuel versus a project sited gas fired power plant.
- #33)**> <(**#34** [6.2] 13. Page 4-25, line 19: Assuming Comment 15 was accepted and addressed, a sentence could be added that long-term disturbance of electrical transmission lines would be reduced if power were generated at the project site. Similar remarks could also be added as appropriate in other resource discussions.
- #34)**> <(**#35** [6.2] 14. Pages 4-36 & 4-37, line 45: BLM discussion on climate change cites reports and numbers where they acknowledge the values have a high level of uncertainty. It might be better to return to the qualitative discussion consistent with the rest of the section than contain numbers with high uncertainty.
- #35)**> <(**#36** [3.4.4] 15. Page 4-39, lines 9-21: Data are presented from operations monitoring in this paragraph; however the information lacks good context such as information on background or reference well data to demonstrate the impact of the RD&D activity.
- #36)**> <(**#37** [3.4.6] 16. Page 4-39, line 24: Consider review and possible revision to the remarks regarding Chevron's project based upon recent announcements regarding their oil shale leases.
- #37)**> <(**#38** [3.4.5] 17. Page 4-40, line 27: Consider adding some context to the change in groundwater flow by giving the range of flows in Yellow Creek in the vicinity of the study.
- #38)**> <(**#39** [13] 18. Page 4-55, line 46: Reference to oil sands could be deleted in this sentence as well as others in the section because the focus is oil shale development.
- #39)**> <(**#40** [3.5.1.8] 19. Page 4-57, line 4: Consider providing an update on the status of the proposed rulemaking for the final PEIS.
- #40)**> <(**#41** [13] 20. Page 4-74, line 1: Table 4.8.1-1 presents the magnitude of unmitigated impacts to the aquatic resources. A more reasonable assessment would to present the magnitude after application of generally accepted mitigation practices typically required by BLM in permitted actions. This comment is also applicable to other resource topics where the magnitude of impacts is presented before mitigation. **#41)**>
- <(**#42** [13] 21. Page 4-142, lines 15-16: Typo: What is the need for the italic in this paragraph?
- #42)**> <(**#43** [13] 22. Page 4-148, line 32: Typo: Similar vs. Similarly
- #43)**> <(**#44** [6.2.1] 23. Page 4-149, line 35: Consistency is suggested when discussing new power plants sizes (Pg. 4-13 Line. No. 38).
- #44)**> <(**#45** [6.2.1] 24. Section 4.9.1.4.2, page 4-152: The discussion on power plants in the section on transmission lines and pipelines appears out of place. Would such a discussion be better in Section 4.1.6 leaving only the focused remarks on visual resources (i.e. power plant

have a visual impact).

#45)> <(**#46** [13] 25. Page 4-200, lijne 6: Consider restating the sentence “If exposures....” because emissions will be limited by controls and worker safety requirements that are stipulated in the permits issued for operations.

#46)> <(**#47** [6.2.1] 26. Page 5-5, lines 20-29: What is the justification for the authors in the oil shale and oil sands evaluation of impacts use of different external energy sources, coal fired power plants and on site natural gas/propane respectively? A similar change is also noted for other parameters defined in the assumptions. Also compare Tables 4.1.1-1 and 5.1.1.-1 for impact values.

#47)> <(**#48** [6.3] 27. Chapters 4 and 5: The impact descriptions presented in Sections 4 & 5 contains information that are duplicative or common to both oil shale and oil sands development. Such information could be presented once. This allows the mineral specific information to be presented more concisely and with a short reference back to the general information when needed. The present approach makes finding unique Area information difficult. Much of Chapter 5’s 162 pages could be reduced about 90 % by presenting only the unique oil sands impact discussion.

#48)> <(**#49** [3.7.4.5] 28. Table 6.1.4-4, page 6-205: The listing of the mammal species needs to be reviewed and several bird entries deleted and if not already listed, added under the bird section of the table.

#49)> <(**#50** [13] 29. Section 6.1: The treatment of comparing alternatives among the resources is inconsistent. For example, land use and water use describe impacts by alternative but wildlife is done by state. Consider placing a table at the front of the section providing guidance on what level of analysis will be provided for each resource and resource alternative discussed. (The comparison of alternatives is more fully presented in Section 6.5.1)

#50)> <(**#51** [13] 30. Sections 6.1 and 6.2: The impact descriptions presented in Sections 6.1 and 6.2 contains information that are duplicative or common to both oil shale and oil sands development. Such information could be presented once. This allows the mineral specific information to be presented more concisely and with a short reference back to the general information when needed. The present approach makes finding unique Area information difficult. Much of Chapter 6.2’s 251 pages could be reduced presenting only the unique oil sands impact discussion.

#51)> <(**#52** [8.3] 31. Page 6-4, lines 40-44: The statement that oil shale and oil sands development is largely incompatible with oil and gas development is misleading. Use Agreements and various drilling technologies are available to resolve conflicts among willing parties. Mineral development conflicts would occur where resource recovery would use the same extraction method (i.e. surface or underground mining) on the same land; however, precedent leasing would typically result in a design and subsequent lease agreements that is compatible with development. The Enefit RD&D project is an example where both mining and oil and gas development co-exist (see page 6-122).

#52)> <(**#53** [3.10.1] 32. Section 6.1.1.11.2, page 6-63: Table 6.1.1-13 should be updated to reflect the more recent community input data

#53)> <(**#54** [3.9.6] 33. Page 6-113, lines 32-33: It seems unreasonable to state the act of leasing has the potential to adversely impact cultural resources by lease terms limiting an agency’s ability to avoid, minimize, or mitigate adverse effects of proposed development. This statement should be deleted or expanded upon to describe the lease terms that allow a lessee to impact cultural resources. See page 4-158 or 5-118 for a possible expansion of this thought. A

similar situation is noted in Section 6.1.3.9, pg. 6-162, line 26.

#54)> <(**#55** [2.3] 34. Section 6.1.3.4, page 6-125: The purpose of Alternative 3 needs to be more fully explained. Sec 6.1.3 appears to summarize the prior NEPA work. The RD&D projects have all the commercial acres identified. It appears that Alternative 3 effectively closes future lands to any commercial development (except PRLA) and would only allow RD&D projects.

#55)> <(**#56** [4.2] 35. Page 6-129, lines 4-6: What does this sentence add to defining the GHG emission concerns for the project? Consider adding the period at the end of the sentence and expanding the discussion to include any data on expected emissions.

#56)> <(**#57** [2.4] 36. Page 6-171, line 19: Alternative 4 proposes to remove lands that are “proposed for” future planning restrictions in addition to those lands removed by BLM action since the 2008 PEIS. The analogy is similar to Candidate T&E species status to the Listed species. The listed has the full support of law where the candidate does not.

#57)> <(**#58** [2] 37. Section 6.1.5, page 6-224: This is most useful section in the EIS for assessing comparatives. Information from this section could be put in tabular form to expand the Executive Summary.

#58)> <(**#59** [4.3] 38. Table 6.1.6-2, page 6-246: The information on coal mining and preparation impact should be reviewed and updated as appropriate. More recent data from the three western state agencies regulating mining would be the source for such an update as opposed to the central / eastern state mining operations.

#59)> <(**#60** [4.3] 39. Table 6.1.6-3, page 6-249: The information on coal fired power plant impact should be reviewed and updated as appropriate. In addition, an analysis of gas fired power plant impact should be added to reflect the future trend in electric power generation.

#60)> <(**#61** [4.3] 40. Page 6-304, line 44: The information on socioeconomic impacts should be reviewed and updated as appropriate using data from those current RD&D developments and projecting forward when appropriate.

#61)> <(**#62** [4.3] 41. Page 6-307, line 30: The discussion of hydraulic fracturing should be reviewed and updated based on information that is more recent.

#62)> <(**#63** [4.3] 42. Page 6-311, lines 38-42: A discussion of gas-fired power plant should also be provided, as coal may not be the fuel choice for newly constructed power plants.

BLM Oil Shale and Tar Sands Draft Programmatic EIS Argonne National Laboratory 9700 S.
 Cass Ave. Argonne IL 60439

Ken Salazar, Secretary

U.S. Department of the Interior 1849 C Street, N.W. Washington DC 20240

Bob Abbey, Director

Bureau of Land Management 1849 C Street, N.W., Room 5665 Washington DC 20240

RE: draft 2012 OSTs PEIS Comments

Dear Secretary Salazar, Director Abbey, et al:

Rio Blanco County has offered comments on previous iterations of this OSTs PEIS and welcomes the opportunity to do so again. As a county directly in the crosshairs of any potential development of oil shale, any such opportunity is of great interest to us. We wish to see no repeat of the crisis-oriented, federal push for a commercial oil shale industry such as was played out in the late 1970's and early 1980's. We must have a thoughtful and rational path allowing for the economic development of natural resources while doing so in a way that respects the environment, wildlife, and people in the region. It is in the best interests of the nation, the state, and Rio Blanco county that a quality OSTs PEIS is the result of this process.

In the past our comments have focused on two points. The first has been the extraction processes being considered and how this would impact the natural environment and wildlife in our county. The second has been the potential impacts to our citizens, communities and way of life, particularly the importance of mitigating these impacts in a timely and appropriate manner.

<([#1 [1.3] On this occasion, however, our comments will be more focused on issues which, when commented upon in earlier phases of this process, have been viewed by those conducting the PEIS as outside of the scope of the study. This unfortunate circumstance echoes what we see as the disconnect within the process between the federal government and the local governments with the most at stake concerning oil shale. In addition, we will again comment in some detail on the socioeconomic aspects of the study. Just one indicator that the focus has shifted away from the local connection is seen in where the public hearings were NOT held: in the White River district where the richest potential oil shale resource lies, where the large majority of RDD leases exist, and where kerogen extraction is likely to be most profitable. In general, we continue to be skeptical of the validity and purpose of the 2012 OSTs PEIS.

#1)> <([#2 [9.8] General concerns with the process and draft 2012 OSTs PEIS:

Beyond an agreement which settled the lawsuit by “a coalition of environmental organizations” it is very difficult to find references to any significant new information which would cast doubt on the validity of the 2008 record of decision (ROD), at least in the Piceance Basin of Colorado. Climate change and air quality have many post-2008 citations included in the draft but it is noted in the summary on page 6-230:

“However, because of the need for project- and site-specific information, it is not possible to identify the nature and magnitude of regional air quality and AQRVs impacts of commercial oil shale development under all four alternatives. Thus, it is not possible to differentiate among these alternatives regarding regional air quality and AQRVs impacts.”

#2)> <([#3 [3.10.2] On the other hand, a regional socioeconomic study released in 2008 by the Associated Governments of Northwest Colorado (AGNC) and the Colorado Department of Local Affairs (DOLA), as an example for contrast, is cited nowhere in this ‘revised’ PEIS. In particular, very little appears to have been done in reviewing the socioeconomics of our region or considering how impacts might be mitigated.

#3)> <([#4 [9.8] Taken together with the regulations published in 2006 and 2008 for oil shale and tar sands resources, the 2008 OSTs PEIS and subsequent land use amendments constituted a reasonable and rational establishment of an oil shale and tar sands program as mandated in the Energy Policy Act of 2005. The 2008 OSTs PEIS’s chosen alternative is consistent with the multiple use requirement of the Federal Land Policy Management Act (FLPMA), and is consistent with the Rio Blanco County Master Plan and county policies which call for responsible development of available energy resources.

#4)> <([#5 [2.1.1] [2.4.1] Indeed, it appears that much of the 2012 draft OSTs PEIS is exactly the same as the 2008 final OSTs PEIS which makes it very difficult for us to understand the rationale for the BLM’s preferred alternative being so restrictive as compared to the one adopted in the 2008 ROD. The Rio Blanco County Commissioners can support either the No Action alternative or alternative 4 in the 2012 draft OSTs PEIS but reject the Preferred Alternative.

#5)> <([#6 [1.3] While Rio Blanco County was a cooperating agency in the 2008 PEIS, we did not respond to solicitations in time to have that status in the 2012 OSTs PEIS. In retrospect, it does not appear that our input as a cooperating agency would have made any difference, seeing what has

transpired to this point. In contrast to the open and complete process seen in 2008, it does not appear that the BLM coordinated closely, as required by FLPMA, with the local governments where the oil shale resource is located.

#6)> <([#7 [1.3] The preferred alternative in the draft 2012 OSTs PEIS is at odds with the input of the majority of the task force and stakeholders which the BLM was directed to honor and

follow in the 2005 Energy Policy Act. This would seem to us to violate the memoranda of understanding (MOUs) with cooperators which require the BLM to publish the written input of cooperators who disagree with the preferred alternative. Rio Blanco County was unable to locate an explanation of the points of difference and rationale for the choice being made. #7)>

<([#8 [9.2.2] The preferred alternative in the draft 2012 OSTS PEIS drastically shrinks, diminishes and in many areas removes virtually all of the lands made available for Oil Shale and Tar Sands development in 2008, and does so using the same data and science. Such a drastic reversal in lands available for development between the 2008 PEIS and the 2012 Preferred Alternative seems to violate regulatory Task Force requirements of certainty for industry and investors. Further, this drastic reversal of lands made available in 2008 for development constitutes a piecemeal revision of previous BLM Resource Management Plans, in violation of the Section 202 Planning Process under FLPMA. This Preferred Alternative threatens to undermine the process and the work of the 2008 OSTS PEIS, and dismantle a reasonable and rational oil shale and tar sands program in violation of Section 369 of the 2005 Energy Policy Act. #8])>

<([#9 [8] The Preferred Alternative is inconsistent with the BLM's mandate to manage our public lands for multiple uses. Given the size of the resource located in Rio Blanco County it seems inappropriate to exclude all but 35,308 acres of the greatest potential for development from leasing. These lands outlined in the Piceance basin as Most Geologically Productive are currently leased for grazing, nahcolite, oil and natural gas and it makes no rational sense to exclude most them from oil shale leasing. There is a reason why all but one of the first round RDD leases and all of the second round candidates are in the Piceance basin in Rio Blanco County: this is where the potential economic value of the resource is greatest.

#9])> <([#10 [9.2.1] [3.1.3] On April 14, 2011, the BLM caused to be published in the Federal Register, Volume 76, No 72/Thursday, April 14, 2011, pages 21003-21005, a notice of intent to prepare the 2012 OSTS PEIS.

The preliminary purpose and need statement in the notice of intent, states the 2012 OSTS PEIS will analyze removing from oil shale and tar sands leasing "All areas that the BLM has identified or may identify as a result of inventories conducted during this planning process, as lands containing wilderness characteristics[.]" Id., at page 21004; and further:

"Lands that the BLM identifies as having wilderness characteristics will be considered during this planning initiative, as described above, and consistent with Secretarial Order No. 3310, dated Dec. 22, 2010, and BLM Manuals 6301 and 6302. Future leasing of lands determined by the BLM to have wilderness characteristics, if compatible with the allocation decisions stemming from this initiative, will subsequently be assessed in accordance with BLM Manual 6303, as appropriate (Le., where the BLM has not determined, consistent with BLM Manual 6302, whether the lands with wilderness characteristics at issue should be receive a wild lands designation, BLM Manual 6303 will apply)".

This language seems de facto evidence of the BLM's intent to implement, administer and/or enforce Secretarial Order 3310 and one or more of the BLM guidance manuals promulgated under Order and violates the spending moratorium of Section 1769 of the April 21, 2011 Congressional Continuing Resolution to Fund Fiscal Year 2011 through September 30, 2011, which states:

"For the fiscal year ending September 30, 2011, none of the funds made available by this division or any other Act may be used to implement, administer, or enforce Secretarial Order No. 3310 issued by the Secretary of the Interior on December 22, 2010"

This spending moratorium has been carried forward, to the best of our knowledge, in all subsequent Congressional spending resolutions up to and including the current one.

#10) > **<([#11 [1.5]** Detailed concerns with the draft 2012 OSTs PEIS and the Preferred Alternative:

1. Lack of nexus between LWC, Sage Grouse, any stated concerns and new information and the wholesale reduction of acreage from 346,609 to 35,308 available for leasing

The 2012 OSTs PEIS Preferred Alternative, appears to be the direct result of the lawsuit settlement agreement between the BLM and ideological opponents to oil shale development, and was entirely pre-determined and pre-decisional, in violation of NEPA. We can find no legitimate rationale for revising the acreages approved in 2008, and feel that the BLM has settled on this preferred alternative without having first analyzed its impacts. **#11)** > **<([#12 [9.1]** Further, we see no rational relationship to the stated purpose and need "... to reassess the appropriate mix of allowable uses with respect to oil shale and tar sands leasing and potential development." and the acreage proposed for development under the Preferred Alternative.

#12) > **<([#13 [3.1.3] [3.7.5.1]** Rio Blanco County has reviewed the Lands Excluded from Application for Oil Shale Leasing

as shown in Figure 2.3.3-1 excluding ACECs, Sage Grouse Habitat, and Lands with Wilderness Characteristics (LWC). Our review included recent data concerning Greater Sage Grouse Preliminary Priority Habitat (PPH) and Preliminary General Habitat (PGH) from March 12, 2012, which we understand that the BLM is considering for further modification of its alternatives.

As stated elsewhere in our comments, we support the exclusion of ACECs and under our land use regulations would not approve development in an ACEC. We oppose excluding LWC and oppose the exclusion of all these mapped PPH and PGH areas in Rio Blanco County where fluctuations in habitat, predation and bird populations place us at the extreme margins of the bird's historical range. The point is that wholesale exclusion of these areas provides no justification of the acreage reduction seen in the Preferred Alternative.

If one excluded all of these LWC, PPH, PGH, and ACEC areas from the Most Geologically Prospective BLM-administered lands in the Piceance basin, one is left with between 232,000 and 315,000 acres which should still be available for application for leasing. The difference between these numbers being the choice of which sage grouse habitat mapping one uses: that in the draft 2012 OSTs PEIS or the March, 2012, revised mapping. These areas are shown in the following maps.

Figure 1: 315,078 acres Available for Leasing (2012 draft data)

Figure 2: 232,869 acres Available for Leasing (revised PPH, PGH data)

Thus Rio Blanco County cannot support the wholesale reduction of lands available for application for leasing down to 35,308 acres.

#13) > **<([#14 [9.7]** 2. Limiting the only path to gaining a lease to RDD projects.

The draft 2012 OSTs PEIS Preferred Alternative significantly restricts the acreage allotted in the 2008 PEIS for research and development leasing and improperly limits technology testing to strictly in situ efforts. Therefore, it does not allow for the development of other technologies and does not provide leasing opportunities for technologies developed outside of the current Research Development and Demonstration (RDD) program. This is an inappropriate limitation given that development and production of oil from oil shale has been demonstrated to be technologically and economically feasible elsewhere in the world.

To limit public lands available for commercial leasing to the those lands encompassed by

existing oil shale RD&D leases and their associated preference right lease acreage, plus the areas encompassed by the three RD&D lease applications currently under review is to deny that good science and technology development can occur on private lands or elsewhere in the world and prevent those in possession of such technology from access to the oil shale resources on public lands in the United States. This point, in and of itself, would seem to be adequate grounds for disallowing the Preferred Alternative.

#14) > <(**#15** [6.3.2.1] 3. Analysis of water-related issues

Some technologies, such as those utilized by projects currently under construction in Utah to extract oil from the oil shale rock are not only economically feasible, but require little or no consumption of water. Such technologies have not received any treatment under this PEIS.

#15) >

<(**#16** [6.3] Although parts of the PEIS considered potential conflicts between oil shale development and conventional natural gas operations in the Piceance basin, the analysis did not look at potential symbiotic relationships. For example, the natural gas industry produces excess water which then must be either be treated and discharged (a difficult and controversial process) or removed from the area and evaporated from collection ponds. The potential use of this non-tributary water for the needs of a commercial oil shale industry needs to be considered at the PEIS level as an option for reducing water consumption by a commercial oil shale industry.

#16) > <(**#17** [6.3.2.1] We also feel that the use of outdated water information in the PEIS for its basic analysis is flawed. The Phase 1 Energy Development Water Needs Assessment report (Colorado, Yampa, and White River Basin Roundtables Energy Subcommittee 2008), estimated water requirements for the extraction and production of natural gas, coal, uranium, and oil shale through 2050. Since the release of that report, the Colorado and Yampa-White Basin Roundtables have refined water demand estimates for oil shale development through Phase 2 of the Energy Study. That report also includes recent work completed to address water requirements for oil shale development (Colorado, Yampa, and White River Basin Roundtables Energy Subcommittee 2010).

The water needs for oil shale addressed in these studies have factored in recent information developed by the Colorado and Yampa-White Basin Roundtables' Energy Subcommittee that considered the amount of produced water that will be made available during shale processing. In addition, work by the subcommittee has shown that electrical energy needed for the development of oil shale could be produced by combined cycle gas turbines, not the coal-fired power plants cited in the 2012 draft OSTs PEIS. One result of this work by the roundtable is to reduce previous estimates of oil shale water demands. Their current estimate is that an oil shale commercial operation in Rio Blanco County producing 550,000 barrels of oil per day in 2050 would require only 37,900 to 42,000 acre-feet of water a year.

#17) > <(**#18** [3.4.1] The Phase 1 Energy Development Water Needs Assessment report also noted that compact entitlements in the Colorado River Basins are not fully utilized and that those basins (Colorado, Gunnison, Southwest, and Yampa-White) have water supplies that are legally and physically available for development given current patterns of water use.

However, the Yampa-White River Basin population, under medium economic development assumptions, is projected to increase by about 2.6 times between 2008 and 2050, from about 45,000 to about 117,000 residents. Mining jobs in the basin are expected to grow by over 400 percent between 2007 and 2050. According to the Yampa White needs assessment report, without 100% success in constructing storage projects there is a gap of 51,000 acre feet in 2050 at the 550,000 bopd-level commercial production from oil shale. Their model considers

consumptive and non-consumptive needs for agriculture, recreation, environment, endangered species, mining & industry and energy development.

The Rio Blanco County Commissioners feel that for a commercial oil shale industry to have an opportunity to prove its economics, informed and unbiased water planning is critical. This water must remain allocated for industrial use in our basin rather than be seen available for other uses in other areas. Since the 2008 OSTs PEIS ROD has been questioned and the process reopened, then this information should be used in the revision of the PEIS.

#18])> <([#19 [3.10.1] 4. Comments specific to socioeconomics

Consideration of humans as part of the environment

: the lack of focus on the impact of development on those residents within the Region of Impact (ROI), their economies, infrastructure and way of life seems inappropriate. The data used is very dated, the modeling is very general and not customized to the ROIs, and the lack of consideration of alternatives, in the level of detail seen in other parts of the PEIS, for the mitigation of these impacts is truly short-sighted and inappropriate for the scale of potential impacts.

2012 OSTs PEIS Socioeconomics Chapter 4 **#19])>**

<([#20 [3.10.1] 4.12 SOCIOECONOMICS

Many statements here questioning the assumptions of what is local in a ROI. For Colorado, the distribution of RDD leases is a strong indicator of where any future commercial development will occur: the Piceance Creek area in Rio Blanco County. While social impacts will occur throughout the ROI designated in this study the geography and transportation networks insure that the direct extraction impacts occur in the immediate area. When impacts are thus “averaged” over a large geographical area where the population is concentrated far from the site of the extraction the impacts appear to be far less significant than they are in the immediate area where the extraction activity is occurring.

#20])> <([#21 [3.10.2] Also, we repeat our concern over the PEIS analysis’ failure to consider the BBC/AGNC/DOLA study on regional impacts in Colorado which was released in April, 2008. This study is based on considerably more recent data and provides far greater detail, within its limited scope, than is available in the draft 2012 OSTs PEIS documents.

Key assumptions: (expressed in section 4.12)

#21])> <([#22 [3.10.1] Material and equipment procurement: construction phase, 15% local purchase seems high given the recent natural gas boom in Rio Blanco County. While the analysts may consider purchases in Grand Junction as local purchases within the ROI, such purchases do nothing for the economy of Rio Blanco County. The aforementioned natural gas boom saw pre-fabricated modular temporary housing purchased from outside the ROI as the dominant employer-provided housing and thus 25% locally-purchased materials is far too large an estimate. **#22])>**

<([#23 [3.10.1] Wages and salary spending: In line with the temporary housing mode noted above, the estimates of 75% wages spent in ROI and 25% income used on existing expenses seems very considerably high. Many of these skilled workers, both in natural gas and oil shale RDD, were living in temporary living quarters (TLQ) in Rio Blanco County, leaving their families at home in other states, and spending none of their wages locally. **#23])>**

<([#24 [3.10.2] Worker housing:

the final paragraph of this section correctly identifies employer-provided TLQs as the most effective way to minimize community impacts. However, it misses other key problems in the Piceance Creek area. (1) All potable water must be trucked into the area as groundwater, of the quality needed for human consumption, is very limited. These water-haulers are making trips in

excess of 50 miles one-way with quantities likely to be in the tens of thousands of gallons per day over a winding & congested road subject to flash flooding in summer and icy conditions in winter. (2) There is the associated problem of human waste from these TLQs. Since the BLM has chosen not to permit TLQs on public lands they are forced onto the limited private land which lies mainly along drainage bottoms and where the soils have limited percolation capacity. Pump and haul operations along the same road and conditions described above are an even greater concern as this area is in the Source Water Protection area for the Town of Rangely. #24))>

<([#25 [3.10.1] 4.12.1.1 Economic Impacts

Noting once again the very dated (1984) nature of the underlying numbers used in the IMPLAN analysis, it appears that there are only four numbers in Appendix G which represent the employment data. Further, given the constraints of geography and roadway adequacy, we would question the relevance of a linear distance weighting in the gravity model as opposed to a weighted lane-road-mile distance with consideration of congestion factored in. #25))>

<([#26 [3.10.2] The break points between small, moderate, and large impacts being set at 5% and 10% do not seem consistent with markers used by other demographers. For example, the fastest growth in Colorado during the past decade was in Douglas County, averaging 6.24% per year and was considered booming metropolitan growth. Noting the impacts seen in the BBC/AGNC/DOLA study in Garfield and Mesa counties in Colorado during the recent natural gas boom one can contrast that with the 2.88% and 2.62% annual growth seen in those counties over that same decade. This actual growth would fall into the middle of small impact growth by the measures set forth in this document. One can but wonder if the cooperators from this area view this as small impact growth. For perspective, the BBC study anticipated a growth of 500% over 30 years for Rio Blanco County from 6,000 to 39,000 residents for a 50,000 bopd commercial oil shale industry. #26))>

<([#27 [3.10.2] 4.12.1.2 Social Impacts

Although it is, to some degree, understandable that the PEIS take a “100,000 ft view” of the overall ROI, the coarseness of the data used in the region is once again very misleading as to the impacts. For example, on 4-173 a statement that an in situ facility would require between 5 and 18 local employees during the construction phase with an increase of between 0.2% and 0.5% increase in expenditures for local public service provision sounds pretty benign over a 3-state ROI. Making the not unreasonable assumption that the in situ operation was in Rio Blanco County this would equate to, based on a \$30M county budget, an increased expenditure of \$60K-\$150K. The experience of the recent natural gas boom would indicate that our county alone might need to add 5 employees (building, planning, road & bridge and law enforcement) and the associated impacts to infrastructure would make the annual increase in expenditures easily ten times the amount predicted herein. These predictions may appear useful at the federal level but at the local level they are less than worthless: they are misleading and engender complacency that the impact to the public and communities is small and can be ignored. #27))>

<([#28 [3.10.2] 4.12.1.8 Transportation Impacts

The concern with upgrading and designing of access roads is well founded. Engineering estimates for County Road 5, the only paved public access to the heart of the Piceance basin, is over \$140M. The engineering redesign for this corridor, including stronger, wider bridge structures is just now being completed. There are many other major projects which must also be designed and constructed to provide safe, reliable, and efficient road access into the Piceance Creek area from major highway networks and regional supply and population centers. Attempting to construct these upgrades during the rush to build the facilities needed for a

commercial shale oil facility in this area would create severe traffic flow problems, major delays on ingress and egress times, and endanger lives needlessly. #28]>

<[#29 [3.10.2] [5] 4.12.2 Mitigation Measures

The statement here is correct in that mitigation measures will be required. The list of options includes many uses of could and it is possible which, while true, are of little value in actually establishing appropriate mitigation measures. Most of the measures listed are already in place as well as others, such as springtime load restrictions, which are not included. Others, such as operator support for health screenings and libraries are so tangential to the core impacts as to be viewed as filler. Project-scale and site-specific analyses will be required of all plans for development of commercial leases along with mitigation measures.

There are a few key areas which are completely missing but sorely needed:

1. Recommendations, to be included in each of the alternatives, for developing a realistic strategy for each ROI based on where the facilities will be developed, the timeline for construction, the size and scale of such facilities, and the details of the individual socioeconomic sub regions of the ROIs. We are asking for a call for a detailed socioeconomic study in each ROI at the time of commercial leasing coupled with a strategy for implementing the mitigation measures in a timely fashion. #29]>

<[#30 [10.5] 2. Taking a “100,000 ft view” consistent with the draft, there needs to be a recommendation to the U.S. Congress and to the state legislatures of each of the three states for providing a distribution of leasing bonus and royalty payments, state severance tax revenues, and credits for operator-supplied mitigation which provides for the adequate funding of these mitigation measures, both up front of the commercial development and ongoing during the extraction and reclamation phases. Such measures would provide for socioeconomic justice to the public in the ROI, a system whereby operator participation in mitigation is rewarded and encouraged, where then the citizens of the three states and the United States see fair and reasonable return on their extracted resources.

#30]> <[#31 [5] The lack of an explicitly expressed call for regional mitigation planning and coordination is a major shortcoming in the draft PEIS. Remember, humans are a part of the environment, too.

#31]> <[#32 [3.13] 4.14.1 Common Impacts (HAZARDOUS MATERIALS AND WASTE MANAGEMENT)

Page 4-188, lines 33-34. The stated assumption is that wastewaters would be treated on site isn't consistent with BLM policy which has generally forced facilities onto private land and/or made pump & haul the only viable disposal methodology.

#32]> <[#33 [3.13] Page 4-189, lines 27-28. Again, collection of pyrolysis water in lined ponds and then released would not seem to be consistent with BLM policy. BLM has not permitted lined ponds on public lands to evaporate produced water from natural gas wells and permits for releasing treated formation waters are difficult if not impossible to obtain. #33]>

<[#34 [13] 2012 OSTs PEIS Socioeconomics appendix G

The paucity of actual numerical estimates for any ROI or sub region is concerning. The reader has difficulty evaluating the assessments being made when they are couched in the most general, qualitative way. To indicate elsewhere in the PEIS that details on methodology, modeling, and results are given in Appendix G are, at the best, misleading. #34]>

<[#35 [3.10.1] G.1.1 Direct Employment Data

The sources are pretty dated (1973, 1977, 1982, 1983). This was an era dominated by room and pillar mining with surface retorting. This might be somewhat applicable, though dated, to the

deposits in UT or WY but it has no relation to the in-situ RDD processes being researched in Rio Blanco County, CO. **#35])>**

<([#36 [6.2.1] G.1.1.3 Power Plants and Coal Mines

Although this data is far more current than the direct employment data it seems unrelated to the current situation in Colorado. The Colorado Legislature and environmental activists make it quite unlikely that a new coal-fired power plant would be constructed in this state as was seen in the passage of HB11-1365 by the Colorado Legislature. The price and availability of natural gas in the ROI, coupled with the work of the Yampa-White Basin roundtable makes combined cycle natural gas power plants far more likely.

#36])> <([#37 [3.10.1] G.1.2 Temporary Housing Construction Data

The criticism here again is that the data is very dated (1973). Experiences with Temporary living quarters during the recent gas boom might provide better insight into how such facilities are being constructed, located and serviced.

#37])> <([#38 [3.10.1] G.1.3 Economic Multipliers

Although unfamiliar with the internal structure of IMPLAN software, the applicability of its balance and weighting of parameters should be reviewed for relevance within the oil shale ROI. In this region of abundant federal lands, long distances, few roadways, and widely dispersed regional centers it doesn't seem likely that the balance of parameters would be the same as, for example, the Midwest. Our economies are seldom in sync with state and national economies as different factors dominate.

#38])> <([#39 [3.10.1] G.2.1 Population (SOCIAL IMPACTS)

On page G-7 there is a need to check the veracity of the reference to Section 4.11 on per capita expenditures. Section 4.11 in the draft 2012 OSTs PEIS relates to Indian Tribal Concerns.

#39])> <([#40 [3.10.2] G.2.4 Social Disruption (SOCIAL IMPACTS)

The statement "Because population increases are likely to be rapid, and in the absence of adequate planning measures, local communities may be unable to quickly cope with the large number of new residents; social disruption and changes in social organization are likely to occur." highlights one of the great weaknesses of the PEIS: None of the alternatives addresses or makes any attempt at addressing one of the truly significant impacts of oil shale development. It is deeply ironic that the BLM can offer alternatives to protect environmental assets on our public lands but cannot do so to protect the public being directly impacted.

This section repeatedly expresses the belief that "community planning" can mitigate social problems and adjustments necessary during boom and bust parts of the economic cycle. I have considerable doubt as to whether the authors of this study have ever been resident in a community of two or three thousand when these cycles are being acted out. Planning can certainly help but resources, financial and otherwise, are equally important. So is the luxury of having time and resources to plan for these cycles comfortably in advance of their onset. It is a matter of shame that this process is so strongly geared toward the admittedly important task of assessing and mitigating the impacts on the natural environment yet so superficial and cavalier in its treatment of the people and communities who are directly impacted. **#40])>**

<([#41 [3.10.3] Additional note: Table 3.11.2-7 (Pg 253, Volume I) concerning population & income in the ROI includes several cities (ie Del Norte, Monte Vista, South Fork) which are not in the ROI but several hundred miles away in the San Luis Valley. This casts some doubt as to how familiar the authors were with the ROI.

#41])> <([#42 [1.5] Summary:

The Rio Blanco County Board of County Commissioners have deep concerns that the 2012

OSTS PEIS is not following an open and unbiased process as required by FLPMA and NEPA. We are concerned that the process is expending taxpayer funds in a manner contrary to the direction of the U.S. Congress. #42)) <([#43 [2.1.1] [2.4.1] We are also concerned that the Preferred Alternative expressed in the draft 2012 OSTs PEIS was not properly vetted through the cooperating agencies. The Commissioners are supportive of the No Action Alternative or, if that is not to be chosen, then they would support Alternative 4. #43)) <([#44 [2.2] The Preferred Alternative should be rejected. #44))>

Thank you for your consideration and review of these comments.

Sincerely,

Rio Blanco County Board of County Commissioners

Submission Text

<([#1 [3] Comments to BLM on Tar Sands This PEIS as well as the BLM notes in the Federal Register have noted that the methods for extracting oil shale and tar sands are unproven, cause long-term ecological damage and use exorbitant quantities of water. It seems to me that there will be great cost for uncertain benefit, and potentially irrevocable harm to the areas in question. The Carbon and Uintah county areas are most familiar to me. There is much pristine wilderness there, as well as abundant wildlife and recreation areas that could be harmed. There is already concern about stretched water resources in this area, particularly in light of the proposed Blue Castle nuclear power plant on the Green River. #1)) <([#2 [10.6.1] The Energy Policy Act of 2005 was and is heavily weighted in favor of fossil fuels. Given more recent information about global warming and drought, and the falling price of renewables per kilowatt hours, it would be prudent to withdraw tacit support for any oil shale and tar sands development, in favor of methods that cause only temporary disruption or actual benefit to the environment and present long-term economic development opportunities for the areas in question. #2)) <([#3 [2.5] I respectfully request that the areas in the state of Utah be removed for consideration for oil shale and tarsands development. #3))>

COLORADO DEPARTMENT OF PUBLIC HEALTH AND ENVIRONMENT

BLM Oil Shale and Tar Sands Resources Leasing Programmatic EIS

Argonne National Laboratory

9700 S. Class Avenue EVS/240

Argonne, Illinois 60439

RE: Comments on Programmatic Environmental Impact Statement and Possible Land Use Plan Amendments for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah, and Wyoming

The Colorado Department of Natural Resources (DNR) and the Colorado Department of Public Health and Environment (CDPHE) respectfully submit the following comments regarding the Department of the Interior, Bureau of Land Management's (BLM) intent to draft a Programmatic Environmental Impact Statement (PEIS) and Possible Land Use Plan Amendments for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah, and Wyoming.

<([#1 [2.2.1] The prospect of a new PEIS raises important issues for Coloradans, and all Americans, with respect to energy supplies, environmental protection, socioeconomic impacts, and national security. If BLM were to authorize a commercial oil shale industry in Colorado, such a development would likely constitute the largest industrial development in the State's

history with enormous implications for all of Northwest Colorado and for the State.

For Colorado, there is much at stake in the outcome of this program. Colorado recognizes the importance of oil shale resources to the country and, in our uncertain world, reliable, sustainable domestic oil-based resources are increasingly important. But equally important, from Colorado's perspective, is protection of the State's exceptional environment including our wildlife and water resources.

The State continues to believe that the research and development program authorized by BLM must be developed, tested, and monitored. Colorado is host to seven of the nine federal research and development sites and we are confident these programs will yield the necessary information upon which rules and regulations and commercial leasing can be based. Because oil shale development will likely utilize untested technology with potential long-term impacts to Colorado's communities and the environment, the State has consistently opposed plans to commercialize leasing or production of federal oil shale resources prior to a meaningful evaluation of the results of the research and development projects.

For these reasons, DNR and CDPHE support the Preferred Alternative.

#1))>

<([#2 [3.10.3] Northwest Colorado

Any future commercial leasing for oil shale would be in Northwest Colorado. Northwest Colorado is blessed with a remarkably diversified economy in which agriculture, tourism, recreation, hunting & fishing, natural gas & mineral development, retirement communities, and their economic drivers co-exist in a relatively balanced and supportive way. Within the Piceance Basin, Colorado is the beneficiary of some of the nation's most important wildlife resources, including robust elk populations and the largest migratory mule deer in North America. These wildlife treasures, the envy of other states, have gradually evolved and grown over the past century to the exceptional levels of today.

The Piceance Basin is home to the largest migratory mule deer herd in North America, a robust migratory elk population, one of only six greater sage-grouse populations in Colorado, populations of Colorado River cutthroat trout, and a host of other wildlife species. These wildlife resources have been built up over millennia and are of long-term statewide and national economic, ecological, and aesthetic importance. Colorado's future is reliant on these resources remaining strong and healthy.

Northwest Colorado is also the home to world-class hydrocarbon resources, holding trillions of cubic feet of clean-burning natural gas, which are currently undergoing an unprecedented gas development boom. As a result of its abundance of natural resources, Northwest Colorado is experiencing extraordinary growth in population and associated challenges. Housing affordability is a significant challenge to these local communities, and the capacity of local communities to absorb growth is already largely consumed. Much of the transportation infrastructure in these communities is in disrepair and is being severely stressed by growth pressures. The costs to repair infrastructure will require up-front financing, before revenues become available from traditional sources such as severance taxes, property taxes, sales taxes, and federal royalties.

This region is thus vitally important to Colorado's future. It is in a precarious balance in the face of extraordinary pressures precipitated by possibly the largest industrial development in the history of the state. Everything state and federal policy makers do with regard to Northwest Colorado must protect the resources, values, and diverse economies and interests found there, and we cannot simply think of this region as an area to be sacrificed for any one purpose. Yet another boom and bust cycle for energy development will be dire for Northwest Colorado, a region that retains considerable skepticism and frustration over the collapse of the oil shale boom of the 1970s. Another failed attempt at oil shale development could preclude development of this nationally significant resource for decades.

#2])>

<([#3 [3.7.3.1] [3.7.3.6] [3.7.4.1] Areas of Concern

Wildlife:

Given current information regarding extraction methodology, it is difficult to accurately depict impacts to wildlife populations in association with oil shale development.

The Piceance Basin contains unique and, in many cases, irreplaceable habitats for a host of wildlife species such as Greater sage-grouse, movement corridors for big game species, winter range for North America's largest migratory mule deer herd, a large and economically important elk population, raptors, and waters containing native cutthroat trout and endangered fish. The primary concern for wildlife due to oil shale development is the overall loss and fragmentation of valuable wildlife habitat, the feasibility of reclamation of disturbed areas, and the damage that would accrue to wildlife populations. The PEIS should include baseline wildlife monitoring and specific conservation measures for deer, elk, sage- grouse, and Colorado River cutthroat trout.

The PEIS should allow for an accurate and complete assessment of the direct, indirect, and cumulative impacts to wildlife habitats and populations both on-site and off-site that will occur from commercial-scale oil shale projects. BLM's analysis should include the impacts to big game in the event they are forced to occupy alternate winter range habitats and the effects of oil shale development on water quality and quantity in critical habitat for threatened and endangered aquatic species.

The assessment should not only factor in the direct effects of oil shale development, but also consider wildlife impacts from existing and new coal extraction areas and power plants needed to supply power to the oil shale operations and associated development, including pipelines, power lines, roads, man camps and other infrastructure.

#3])>

<([#4 [3.10.4] The economic impacts from any anticipated loss of wildlife, hunting and fishing opportunity, recreation and tourism on state agencies and local communities should be reviewed in depth. All wildlife issues previously identified in the March 20, 2008 State of Colorado comment letter submitted for the 2008 Oil Shale and Tar Sands Draft PEIS are still applicable and should be included in the updated PEIS. #4])>

<([#5 [3.4.1] Water Supply:

The State is rapidly approaching full allocation of its Colorado River entitlements. It is not clear how much water would be needed for oil shale development, which probably depends on the prevailing technology. Nevertheless, if oil shale were to consume vast quantities of water, there would be corresponding impacts to the State's agricultural, recreational, and other energy sectors on the West Slope, the Front Range and even along the Eastern Plains. Hence, the State is very concerned that the water implications of this industry be understood prior to decisions regarding commercialization.

According to the Colorado Statewide Water Supply Initiative, water demands from industrial, municipal uses, even with conservation, are expected to increase 55% to 83% from 2008 levels by 2050. This forecast does not include uses for oil shale such that the PEIS should assess water needs for oil shale in the context of the state's increasing water demands.

#5)>

<([#6 [3.4.1] Water Quality:

There is tremendous uncertainty regarding the environmental impacts on both surface water and ground water quality due to commercial oil shale operations. The PEIS should include baseline ground and surface water quality monitoring and address the impacts of additional growth on water and wastewater infrastructure in nearby communities. The PEIS should also address potential impacts of water withdrawals on flows upstream of wastewater facilities, and the concomitant reduction in permit limits that might result for these facilities.

#6)>

<([#7 [3.5.3] [3.5.8] [3.5.7] [9.3] Air Quality:

The PEIS should include information about potential levels of Mercury, Ozone precursors, and Hazardous Air Pollutants occurring from oil shale development.

The PEIS should include an assessment of the air quality impacts from energy development for electricity generation that is needed for future commercial oil shale development. This assessment should include impacts to visibility and public health.

The PEIS should document the large amount of information about baseline air monitoring being conducted in Colorado. The BLM should commit to conducting the monitoring studies needed in the future to assess baseline air quality conditions. This would include, for example, monitoring in both the Piceance Basin and the Flat Tops Wilderness Area.

#7)>

<([#8 [3.14] Health:

The PEIS should present sufficient data to assess potential degradation of the human environment and resulting health impacts to the affected public, potentially resulting from direct or indirect exposure to contaminated media.

#8)>

<([#9 [6.2.1] Energy Needs:

According to BLM's analysis in the 2008 PEIS, a 100,000 barrel per day oil shale operation would require all of the electricity from a 1,200 megawatt power plant. The PEIS should include

an analysis of options for meeting power demands for oil shale development in a manner consistent with Colorado's renewable energy standard. The PEIS should also provide for comprehensive planning of energy development on a basin-wide scale in order to adequately assess cumulative impacts.

#9])>

<([#10 [3.10.2] Infrastructure:

Because the areas of the Green River Formation are relatively sparsely populated, boom and bust cycles associated with oil shale could have disastrous effects on the communities, stressing existing infrastructure with increased population and associated needs. The PEIS should assess the needs and impacts of an industrial complex significantly greater than the infrastructure that exists today.

The Report by BBC Consulting for the Associated Governments of Northwest Colorado notes that baseline population projections already strain most municipalities such that oil shale development will cause existing towns to reach capacity and new towns may have to be built. The report further concludes that growth related capital costs are forecasted to exceed energy revenues by approximately \$1.3 billion, some (but not all) of which may be covered by grant funds. The PEIS should include an assessment of how capital costs will be covered. It should include baseline data for community infrastructure capacity that can be used to assess what additional infrastructure will be required to support oil shale development. It should also include a thorough housing analysis incorporating local constraints including buildable land and infrastructure. #10])>

<([#11 [4.1] Cumulative Impacts:

The PEIS should include carrying capacity thresholds which have been in place for over two decades and impose objective standards to guard valuable and imperiled public resources from the cumulative impacts of oil shale development. As examples, the BLM should analyze data on the current populations of wintering mule deer and elk and update, if necessary, the number that must be supported for the benefit of the species. Likewise, the BLM should assess the likely socioeconomic impact of a significant new industry in the oil shale region, in conjunction with the current localized natural gas industry. The agency should also reevaluate the carrying capacities for air and water quality in order to assess whether they are currently adequate to protect these vitally important public resources.

Further, we reiterate that the State of Colorado is currently experiencing an unprecedented energy boom in many portions of our state. In particular, the areas that the BLM proposes to make available for application for commercial oil shale leases are experiencing rapid natural gas development. In addition, the areas the BLM proposes to make available for application for oil shale leasing are seeing increased tourism and recreation opportunities. Any oil shale leasing on top of this existing network of energy development and changing land uses must be evaluated in a cumulative fashion.

Thus, it is vitally important to the Departments and to the State of Colorado that the BLM

proceeds cautiously and moves forward thoughtfully with the development of a commercial oil shale leasing program that truly looks at the cumulative impacts in a programmatic way. As the epicenter of the developable oil shale resource in the United States, Colorado has much to gain if this resource is developed responsibly, and much to lose if the risks are not assessed and managed appropriately.

#11])>

<([#12 [6.1.2] [9.7] Proven RD&D

Northwest Colorado is home to extraordinary oil shale resources, among the richest in the world, yielding 25 gallons of oil or more per ton of rock and estimated to hold nearly 500 billion barrels of recoverable oil shale, which is more than double the proven reserves of Saudi Arabia.

Successful development of this resource could provide a substantial new source of domestic oil for the United States, which would have positive implications for our national energy policy and national security.

Given the significant oil shale resource and exigent national energy interests, Colorado is committed to seeing ongoing oil shale research and development move forward. Colorado officials have assisted BLM in reviewing applications for federal research and development leases, and the State currently hosts five of the six “first round” federal research and development leases issued in 2006 and two of the three additional “second round” research and development leases currently under BLM consideration. If successful, these research and development projects could set the foundation for a subsequent commercial oil shale industry. Because oil shale development will likely utilize untested technology with potential long-term impacts to Colorado’s communities and the environment, the State has consistently opposed plans to commercialize leasing or production of federal oil shale resources prior to a meaningful evaluation of the results of the research and development projects.

#12])>

Conclusion

<([#13 [2.2] Colorado recognizes that oil shale development may offer the potential to supplement the nation’s energy supplies. Colorado’s goal is that commercial oil shale development be done right – in a manner that avoids unacceptable and irreparable impacts on Colorado’s land, air, water, wildlife resources, and communities and that minimizes those adverse environmental and socioeconomic impacts that would result from such development through front-end planning and financing and long-term monitoring and mitigation.

As BLM notes in the PEIS, the magnitude of the impacts cannot be quantified at this time because key information about the location of commercial projects, the technologies that may be employed, the project size or production level, development time lines, and mitigation that might be employed are not known.

Therefore, the State places great importance on a thoughtful, comprehensive PEIS, through which federal, state and local decision-makers will have the necessary tools in hand to evaluate what type of federal program makes the most sense. DNR and CDPHE remain convinced that BLM must gain critical answers to many questions before any commitment to commercial leasing occurs. BLM must similarly gain answers to such questions before any rules and

regulations for commercial oil shale development can or should be finalized. #13]>

<([#1 [10.6.1] It is imperative that potential environmental problems not be restricted to the physical pipeline, but related also to the requisite functioning of that pipeline. Only if tar sands and shale oil from Canada was used would the pipeline be needed. That source of oil is in itself hazardous to our living because of the great amount of global warming it would create. The pipeline should not be built because it would almost guarantee that negative climate change would occur as a function of its need to operate. The science of climate change must be the major criterion guiding this decision.

<([#1 [12.3] I am greatly concerned about and opposed to the leasing of additional public lands at this time for the development of oil shale and tar sands. It is my understanding that industry already has available to it thousands of acres of public land for this purpose (as well as much private lands). This country needs to get serious about and invest in cleaner, sustainable energy systems, versus fossil fuels!! Thank you

Submission Text

Dear Secretary Salazar:

Outdoor Alliance, a coalition of six national, member-based organizations includes Access Fund, American Canoe Association, American Hiking Society, American Whitewater, International Mountain Bicycling Association, and Winter Wildlands Alliance, represents the interests of the millions of Americans who hike, paddle, climb, mountain bike, ski, and snowshoe on our nation's public lands, waters, and snowscapes. The Bureau of Land Management's Draft Programmatic Environmental Impact Statement and Possible Land Use Plan Amendments for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah, and Wyoming (DPEIS) involves geographies and outdoor recreational resources that are critically important to our members and the human powered outdoor recreation community at large. Enclosed are our comments to BLM that provide

recommendations as to how BLM can harmonize the important goals of the DPEIS with other sustainable uses of our public lands, especially human powered outdoor recreation.

<([#1 [2.3.1] As you know, BLM is considering the potential for oil shale and tar sands development on

2,431,000 acres of public land in Colorado, Wyoming, and Utah, a region which boasts one of the most popular tourist economies in the country thanks to several national parks and iconic landscapes such as the San Rafael Swell, Dirty Devil River, and Desolation Canyon. These are places that many of our members live and many more visit to recreate. While the Outdoor Alliance supports sustainable and responsible energy development on our public lands, the region's longstanding recreational opportunities and associated economic benefits must not be harmed by the development of oil shale or tar sands. Indeed this little known, potentially large scale, extractive experiment on our public lands could put at risk sensitive and over-used water resources and threaten other important values such as clean air, wildlife habitat, cultural resources and undermine the vitality and character of rural communities.

Before the BLM permits any new commercial leases for oil shale or tar sands, research must demonstrate that proven technologies can develop oil resources without harming the resources that currently support stable, long-term economies and healthy communities. Accordingly, Outdoor Alliance supports Alternative 3 as identified in the DPEIS. Alternative 3 appropriately recognizes the need for additional research, development, and demonstration, and takes a precautionary approach toward the expansion of unproven industrial developments that have the potential to seriously undermine popular, world-class outdoor recreation, which is vital to local and regional economies and contributes to the region's quality of life.

You have been a tireless champion for President Obama's America's Great Outdoors Initiative (AGO), which seeks to reconnect Americans to their open spaces in meaningful ways and to also conserve and steward these places. Because the geographies in play with the DPEIS are highly relevant to the goals of AGO we encourage you to take the same into account when refining alternatives for a Final Programmatic EIS for oil shale and tar sands in Wyoming, Colorado, and Utah. We have confidence that a proper balance will be found between carefully and conservatively developing our energy resources on public lands and protecting these landscapes for their experiential, habitat and associated economic value.

#1])>

Thank you for considering our perspectives on this matter.

Dear Reviewers:

Outdoor Alliance, a coalition of six national, member-based organizations includes Access Fund, American Canoe Association, American Hiking Society, American Whitewater, International Mountain Bicycling Association, and Winter Wildlands Alliance, and represents the interests of the millions of Americans who hike, paddle, climb, mountain bike, ski, and snowshoe on our nation's public lands, waters, and snowscapes. These lands include those affected by this Draft Programmatic Environmental Impact Statement and Possible Land Use Plan Amendments for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah, and Wyoming (DPEIS). Collectively, Outdoor Alliance has

members in all fifty states and a network of almost 1,400 local clubs and advocacy groups across the nation. We prepared these comments to assist the BLM in harmonizing the important goals of the DPEIS with other sustainable uses of our public lands, particularly human-powered outdoor recreation.

The Outdoor Alliance has a significant interest in this DPEIS because our members recreate and live in close proximity to the areas identified for oil shale and tar sands leasing (see below and attached maps). While we certainly support the prudent development of energy resources on our public lands, we are concerned that the longstanding recreational opportunities and associated economic benefits¹ established in this DPEIS planning area could be irreparably harmed by the large-scale development of oil shale or tar sands. This destructive and poorly-understood extractive development experiment could also put at risk sensitive and over-used water resources and threaten other important values such as clean air, wildlife habitat, cultural resources as well as the cultural vitality of rural communities.

The scope of federal public lands that could eventually be leased for oil shale and tar sands development through the Final PEIS (FPEIS) is simply too large. All told, the BLM is considering the potential for oil shale and tar sands development on 2,431,000 acres of public land in Colorado, Wyoming, and Utah, a region which boasts one of the most popular tourist economies in the country thanks to several national parks and iconic landscapes such as the San Rafael Swell, Dirty Devil River, and Desolation Canyon. These unique resources must be 2

conserved for the region to progress towards a diversified and sustainable economy. Before the BLM permits any new commercial leases for oil shale or tar sands, critical research must demonstrate that proven technologies can develop oil resources without harming the resources that currently support stable, long-term economies and healthy communities.

<([#2 [2.3.1] Because oil shale and tar sands development remains economically speculative with many as-yet unknown environmental impacts, Outdoor Alliance supports Alternative 3 identified in the DPEIS. Alternative 3 appropriately recognizes the need for additional research, development, and demonstration (RD&D), and takes a precautionary approach toward the expansion of risky and unproven development in an area with existing, world-class outdoor recreation. #2])>

COMMENTS

<([#3 [2.3.1] The Outdoor Alliance supports the focus of this DPEIS on RD&D of the viability of oil shale and tar sands technology. The lands affected by this planning area are internationally significant recreation areas that sustain robust local economies and promise long-term economic benefits² from activities such as mountain biking, rock climbing, hiking, canyoneering, and boating. The DPEIS provides a partial listing of the many recreational areas located within an approximately 50-mile radius of the oil shale and tar sands resources to demonstrate the overall importance of recreational land use and the large variety of recreation areas in the region. Many more important recreation areas are located in the DPEIS planning areas and are noted below.

Several important questions remain about the economic viability of producing oil from oil shale

and tar sands, much less whether it can be done without negatively impacting the recreation assets and other important values in the planning area. The 2008 BLM PEIS, which this initiative will update, noted then that:

The current experimental state of the oil shale and tar sands industries does not allow this PEIS to include sufficient specific information or cumulative impact analyses to support future leasing decisions within these allocated lands ... [nor] for land use plan amendments to include sufficient site-specific information or cumulative impact analysis to support issuance of a lease.

Much new information has emerged since the BLM's 2008 PEIS that underscores the point that many known problems and uncertain outcomes remain with experimental oil shale and tar sands development. These problems are well-documented in the current DPEIS and other sources and include:

? Production of oil shale and tar sands would necessitate massive mining operations and developed infrastructure causing significant impairment to world-class visual resources and soundscapes. Significant visual resource degradation will negatively affect the rural character of local communities and fundamentally ruin the experience at the many popular recreation areas adjacent to potential leases.

? High energy needs for oil shale and tar sands development requires the consumption of large quantities of scarce water resources and will degrade air quality, causing long term negative impacts to local communities and recreation viewsheds.

? No extraction technology has proven commercially successful for Utah's "oil-wet" tar sands resource.

? Oil shale development creates more than three times the carbon footprint of conventional oil production, contributing significantly to climate change.

? Oil shale development in Colorado, Wyoming, and Utah would require massive water consumption, affecting one of the country's driest regions. This consumption will divert water from traditional agricultural uses, undermine the rural character of many local communities in the planning area, and threaten the ability of rivers and streams to sustain water-based recreation.

Outdoor Alliance supports Alternative 3 which outlines the most conservative and responsible approach to protecting the famous public landscapes and productive recreation economies of Wyoming, Colorado, and Utah. Alternative 3 requires development proponents to demonstrate conclusively—through comprehensive RD&D—that oil shale and tar sands development will not harm the established economies and unique, sensitive resources in the planning area.

We support the direction under Alternative 3 (Oil Shale Research Lands Focus for Oil Shale) which limits any new lands available for commercial oil shale leasing to existing RD&D leases at the time the FPEIS is signed (a total of 32,640 acres available for potential oil shale leasing). Furthermore, Alternative 3 would also analyze foregoing the leasing of tar sands entirely except for one tar sands lease currently under consideration and covering approximately 2,100 acres.

Significantly, Alternative 3 requires subsequent NEPA analyses for any pre-existing lease proposals and reduces the risk of damage from experimental oil shale and tar sands development by over 2.4 million acres. This leaves an appropriate amount of acreage available to research and demonstrate whether these technologies are feasible. #3])>

<([#4 [3.1.1] I. RECREATION ASSETS LOCATED IN THE DPEIS PLANNING AREA

World class recreational opportunities are found throughout DPEIS planning area. These include famous paddling opportunities in Desolation and Gray Canyons on the Green River; climbing, boating, pack-rafting, and canyoneering in the San Rafael Swell; canyoneering and mountain biking in the Tar Sands Triangle; and climbing, mountain biking, and canyoneering in the White Canyon area. Intensive extractive development of the region will irrevocably harm the unique recreational opportunities found only at these places and severely compromise the robust recreation economy that thrives across the PEIS planning area.⁷ Under any planning alternative, all of these valuable recreation areas, and their associated viewsheds and watersheds, should be excluded from oil shale and tar sands leasing consideration in order to preserve their recreational and scenic qualities and their contributions to local and regional economies.

Given the extensive and varied recreational activities that take place in the areas covered by this DPEIS, and the already extensive amendments being made to ten local Resource Management Plans through this PEIS, the BLM should also consider Extensive Recreation Management Area 4

(ERMA) designations at the locations discussed herein. Appropriate ERMA designations could help to ensure that subsequent NEPA analyses and leasing decisions authorized under this PEIS give due consideration to existing recreational uses and visitor health and safety. Additionally, BLM should evaluate whether to expand Area of Critical Environmental Concern (ACEC) designations in the planning area to protect the fragile watersheds and other sensitive resources that play a central role in many of the recreational activities that occur throughout this vast area.

A. Tavaputs Plateau (Roan Cliffs/Book Cliffs) – Potential Oil Shale Development Area

? Paddling on the Desolation and Gray Canyons of the Green River

The Green River through Desolation and Gray Canyons is a popular multiday float trip, highlighted by gentle whitewater, idyllic beach camping, spectacular scenery, and compelling historic landmarks. The Utah Preferred Leasing Footprint for oil shale will impact the famous and unique Desolation and Gray Canyons. An enormous area immediately upstream on both the Green and White Rivers from this remote, world-famous area could be available for leasing under the BLM's preferred Alternative 2(b) in the DPEIS. Large scale oil shale development in this area would cause severe water overconsumption issues and water quality and air quality degradation, affecting everything downstream on the Green and Colorado Rivers. Additionally, the Wyoming Preferred Leasing Footprint is bisected by the Green River and lies entirely within its drainage. Negative impacts to water quality and availability must not be permitted to imperil the recreational value of the peerless resources downstream, including the commonly floated sections of the Green River between Flaming Gorge and Lodore; the Gates of Lodore section;

and Desolation and Gray Canyons. The scenic and fragile Desolation and Gray Canyons attract large numbers of private boaters and commercial clientele. This highly valued public use and commercial activity will be lost if experimental oil shale development impairs water quantity and quality in this world-class recreational resource.

? Paddling on the White River (Colorado and Utah)

The 100-mile stretch on the White River between Rangely, Colorado and the Green River near the head of Desolation Canyon is valued by boaters for its high desert scenery, geology, historic resources, wildlife, hiking, and solitude.⁸ Some have called the White River above Desolation Canyon the best canoeing in Utah. Many streams within the DPEIS's Colorado Preferred Leasing Foot print are direct tributaries to the White River. All of the concerns regarding Utah Preferred Leasing Footprint apply to concerns with experimental oil shale development in the Colorado Preferred Leasing Footprint because impacts will affect much of the same river basin.

? Paddling on the Yampa River (Colorado and Utah)

The Yampa is one of the country's most classic multi-day whitewater float trips and is popular with commercial outfitters and private boaters. Most paddlers spend three to five days floating the Yampa and Green Rivers through Echo Park and into Dinosaur National Monument. Paddlers put in near the east edge of Dinosaur National Park and float more than 70 miles to the most common takeout at Split Mountain Campground near Vernal, Utah. Through this section, 5

paddlers enjoy spectacular scenery and gentle whitewater. The canyon contains pictographs, petroglyphs, and cliff ruins from multiple cultures, and the canyon is home to Peregrine Falcons, Bald Eagles, Colorado Pikeminnow, and Razorback Sucker. The canyon is believed to be the last remaining breeding grounds for the Colorado Squawfish, and the Yampa is the longest free-flowing river remaining in the Colorado Basin. The Wyoming Preferred Leasing Footprint encompasses streams that are direct tributaries to the Yampa River. This highly valued public use and commercial activity⁹ will be lost if experimental oil shale development impairs the water quantity and quality in the Yampa River basin.

B. San Rafael Swell Special Tar Sand Areas

The PEIS states that "in situ" mining methods would be the preferred methods of production for the San Rafael Swell Special Tar Sands Area because the overburden is too great for recovery of the bitumen by surface mining. We anticipate that visits by climbers, campers, and hikers (and their economic contributions to local and regional economies) would plummet if a large-scale tar sands leasing area is developed. The FEIS efforts in the region must ensure RD&D proving that tar sands development causes no water quality or quantity impacts from "in situ" mining methods that could affect the world class boating and canyoneering routes in the San Rafael River and Muddy Creek tributaries to the Dirty Devil River. Likewise, the PEIS must ensure infrastructure and associated industrial machinery does not degrade the world class scenery in this region, which is very popular with climbers and frequented by hikers, river runners, and mountain bikers. The following recreation resources are among those found in the larger San Rafael Swell area:

? Climbing: San Rafael Swell North

The San Rafael Swell is a large anticline that is split in two by Interstate 70. Much of the documented climbing north of I-70 is concentrated within a few miles of the BLM campground at the junction of Cottonwood Wash Road and the Mexican Mountain Road. Climbing areas in the north San Rafael Swell area include Assembly Hall Peak, Bottleneck Peak, Dylan Wall, Eagle Canyon, Head of Sinbad North, Lower Buckhorn Wash, Pine Canyon, Tiki Tower, the Weasel Formation, and Window Blind Peak, among others.¹⁰ The largest concentration of routes in this northern section is the Dylan Wall, two miles east of the campground on the north side of the river. This popular climbing area, popular partly because of its convenience to Salt Lake City, is valued for its challenging climbs, expansive views, and sense of seclusion. Climbers at San Rafael Swell North would also look directly into a significant Special Tar Sands Area (STSA) Preferred Leasing Footprint where the viewshed, soundscape, and air quality would be significantly and possibly permanently degraded.

? Climbing: San Rafael Swell South

The San Rafael Swell South area also lies within a STSA Preferred Leasing Footprint. This area includes climbing areas such as Back of the Reef, Eastern Reef Slabs and Walls, Factory Butte, Head of Sinbad South, Little Spotted Wolf Canyon, San Rafael Knob, Swaseyland, Upper Muddy Creek, and Viewfinder Towers.¹¹ The southern San Rafael Swell is a huge area with big slabs on the San Rafael Reef, isolated towers and domes, and long, large walls. Currently there are well over a hundred routes in this area with potential for many more.

? Paddling on the Escalante River, Escalante to Lake Powell

The Escalante River downstream from the town of Escalante to Lake Powell has been described as “the most impressive 73 miles of creek in all of Utah.” Often a trip of seven days or more, the water quality of this pristine, one-of-a-kind drainage must be protected from impairment by mining activity at the Circle Cliffs site, part of the identified Special Tar Sand Areas.

? Paddling on the San Rafael River, Fuller Bottom to San Rafael Campground (Little Grand Canyon)

The San Rafael Swell STSA Preferred Leasing area is also likely to negatively affect the water quantity and quality of the San Rafael River, including the popular pack rafting and kayaking adventure known as the Little Grand Canyon. This upper stretch of the San Rafael River is attractive to paddlers wanting a relatively easy float through a fantastic canyon offering outstanding camping, spectacular side hikes, and fascinating pictographs. Negative impacts to the San Rafael River from experimental tar sands development will also affect the popular Dirty Devil River downstream.

? Paddling and Canyoneering on the San Rafael River, Bridge at San Rafael Campground to I-70 (Black Boxes 1 & 2)

The Black Boxes section of the San Rafael cuts through an amazing canyon that provides excellent exposure to the geology of the San Rafael Swell. Typically run in two days, the Black Boxes section of the San Rafael is one of the highlights of whitewater paddling in the Southwest, featuring spectacular scenery with challenging, accessible, and intermediate-to-advanced whitewater. As with many runs in the Southwest, finding sufficient flow can be a challenge, and any chosen alternative with regard to resource development must ensure maintenance of water levels necessary for recreational activity in the smaller watersheds throughout the areas covered by this PEIS such as the San Rafael River.

? Boating and Canyoneering Muddy Creek

Muddy Creek, another important tributary to the Dirty Devil River, has been described as “the quintessential beginner slot canyon run” because it provides a rare opportunity where novice kayakers and rafters can experience a world class canyoneering float trip of as long as seventy-two miles through a superlative landscape. Most put in off of I-70, traveling to a takeout near the town of Hanksville, Utah. Any permitted activity in the San Rafael Swell area should ensure continued water quantity and quality for this spectacular river.

? Hiking and Canyoneering in the San Rafael Swell

Several hiking and canyoneering areas are popular in the San Rafael Swell, including Devils Canyon, Eagle Canyon, Upper San Rafael River Gorge, the Black Boxes, Swazy’s Leap, Black Dragon Canyon, Lower San Rafael River, the San Rafael Reef, Eardley Canyon, Straight Wash, Crack and Chute Canyons, Bell and Little Wild Horse Canyons.¹²

? Mountain Biking in the San Rafael Swell

Mountain Biking in this area is popular at 5 Miles of Hell, Black Dragon Canyon, Buckhorn Wash, Good Water Rim Trail, June’s Bottom Trail, Nefertiti Trail, Bull Bottom Trail, Horseshoe Bend, Temple Mountain, Three Fingers Canyon, and The Wikiup.¹³ These trails are used for two annual mountain bike festivals sponsored by the Mecca Mountain Bike Club in Emery County. The festivals are also supported by Decker’s Bicycle shop in Price. Both participants in the festivals and revenues to the bikes shop have climbed steadily since the inception of the festivals. As the areas reputation for backcountry cycling opportunities grows, visitation from around the country increases. If the pristine nature of the area is compromised, visitors will choose other locations.

C. Tar Sand Triangle - Special Tar Sand Areas

The PEIS notes that the “Tar Sand Triangle deposit may be technically suitable for surface mining; however, the remoteness of the area and other considerations could limit this potential.” It is the remoteness of this area that attracts hikers, mountain bikers, climbers, and paddlers along the Dirty Devil River. Surface mining, especially given the uncertainties of this area’s economic potential for tar sands, indicates that the BLM should not allow any tar sands leases in this area in order to ensure that the remote and unique character is maintained. The following are among the recreational attractions located in or potentially affected by tar sands development of the Tar

Sands Triangle.

? Paddling on the Dirty Devil River

The Dirty Devil, from its beginning at the confluence of the Fremont River and Muddy Creek to a takeout at Lake Powell, offers a wilderness float trip with fantastic scenery and side hikes. Because much of the water from the Fremont River and Muddy Creeks is withdrawn for agricultural and domestic use, leaving the Dirty Devil largely dependent on flows from side streams along its length, this first-class, seventy-five mile, multi-day float trip is exceedingly vulnerable to disturbances in water quantity and quality stemming from mining activity in the Tar Sands Triangle area. The FEIS should ensure no water quality or quantity impacts to the sensitive region from experimental tar sands development.

? Hiking and Canyoneering in the Tar Sands Triangle: Happy Canyon and Environs

Happy Canyon is a spectacular and remote canyon south of Robbers Roost Country. A major tributary to the Dirty Devil River, Happy Canyon is a very large drainage basin and offers spectacular hiking and technical canyoneering.¹⁴

D. White Canyon - Special Tar Sand Areas

The DPEIS notes that the lack of site-specific data precludes any consideration of mining methods for the White Canyon deposit. The data available on the quality of the deposit suggest that it is not of commercial grade because it may be too heavily jointed for in situ methods, and the heavy overburden appears to be unfavorable for surface mining.¹⁵ Because of this uncertainty about the viability of mining tar sands and the following exceptional and popular recreation resources in this area, under any planning alternative the BLM should remove the White Canyon area from consideration for tar sands leasing

? Canyoneering at White Canyon: Lower White Canyon (Black Hole)

White Canyon is a spectacular slot canyoneering adventure with 400-foot Cedar Mesa sandstone walls and required bouldering and swimming pools. The Black Hole offers one of the longest and coolest swims of the Colorado Plateau and most use a rope and require advanced route-finding skills.¹⁶

? Climbing: Jacob's Chair

Jacob's Chair, also in the White Canyon STSA, is a prominent Wingate Sandstone landmark and climbing destination just north of Fry and White Canyons. Jacob's Chair was first climbed in the 1970s and climbers still go here and the neighboring "Cheesebox" for a remote wilderness climbing experience.¹⁷

#4])>

III. ADDITIONAL ISSUES THAT MUST BE ADDRESSED IN THE FINAL PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

<([#5 [1.5] In addition to analyzing socio-economic impacts such as whether the recreation resources and the associated economy of the region will be threatened by these developments, the BLM should include in the Final PEIS language that addresses the following:

REQUIRED NEPA PROCESSES SUBSEQUENT TO THE FEIS

Because the BLM will defer NEPA analyses on individual development proposals until specific leases are considered, this FPEIS should define the scope of these NEPA studies, including how it will analyze cumulative impacts and define mitigation actions. Affects to the regional recreation economy should be addressed in a cumulative fashion. #5)>

<([#6 [3.4.1] In addition to analyzing socio-economic impacts such as whether the recreation resources and the associated economy of the region will be threatened by these developments, the BLM should include in the Final PEIS language that addresses the following:

WATER DEMAND AND QUALITY

We are encouraged that the BLM through this DPEIS seeks to gain a clearer understanding of the implications of development of oil shale for water quality and quantity. These impacts are particularly significant to those local communities that rely on these water sources and regarding those rivers where the public recreates in the PEIS planning area. The State of Utah has noted that limited quantities of water are available for new energy development and that much of Utah is already closed to new consumptive appropriations. “Given Utah’s population growth and projected economic growth over the next decade, the possibility of increased drought, and with limited new water resources available, water consumption of energy resources should be given careful consideration.”¹⁸ Accordingly, this FPEIS should require a rigorous analysis of the impacts of utilizing water for oil shale and tar sands on local communities (especially municipal, agricultural, and recreational needs), in particular accounting for existing and prospective water demands and water rights. The FPEIS should also require adequate research that documents impacts to water quality and how any proposed project would avoid degrading water quality. Recreational users will not be interested in visiting areas with water quality concerns; private boaters, commercial outfitters, and dependent local economies will all suffer from degraded water quantity and quality.

#6)>

<([#7 [3.1.1] In addition to analyzing socio-economic impacts such as whether the recreation resources and the associated economy of the region will be threatened by these developments, the BLM should include in the Final PEIS language that addresses the following:

WILD AND SCENIC RIVERS PROTECTION

The Outdoor Alliance supports management proposals common to all DPEIS alternatives that all areas eligible for Wild and Scenic River (WSR) designation be protected from oil shale and tar sands development.¹⁹ Per the BLM Manual, the Bureau “shall afford protective management to all eligible river segments as necessary to ensure that the existing qualities upon which their eligibility is based are not degraded.”²⁰

Given the uncertainty surrounding potential impacts from prospective resource development in the planning area, the FPEIS should address protections for eligible river segments in a basin-wide fashion. Given the potential impacts of oil shale and tar sands development on water quantity and quality, including effects to groundwater resources, protecting only a 1/4 mile buffer surrounding eligible WSR segments is simply inadequate to address the nature of potential threats. Eligible rivers identified above in the DPEIS planning area include the Dirty Devil River, Escalante River, Fremont River, Green River, Muddy Creek, San Rafael River, White Canyon Creek, and the White River. At minimum, BLM, through the PEIS process, should demonstrate conclusively that any decision regarding buffer protections is adequate to ensure that these eligible river segments are not degraded. #7])>

<([#8 [3.5.4] In addition to analyzing socio-economic impacts such as whether the recreation resources and the associated economy of the region will be threatened by these developments, the BLM should include in the Final PEIS language that addresses the following:

AIR QUALITY

The DPEIS fails to adequately analyze air quality impacts. Air quality is already compromised in Utah, Colorado, and Wyoming from oil and gas development, and oil shale and tar sands development would exacerbate air quality degradation in the region. Because a recreation economy cannot thrive or be sustained in an environment where air quality is degraded (not to mention threats to the health of local communities), the FPEIS should ensure the completion of 10

adequate research documenting any impacts to air quality from oil shale and tar sands development and how lessees will be required to prevent and mitigate impacts from any development if leases are considered by the BLM.

#8])>

<([#9 [3.5.4] In addition to analyzing socio-economic impacts such as whether the recreation resources and the associated economy of the region will be threatened by these developments, the BLM should include in the Final PEIS language that addresses the following:

VISUAL RESOURCES

Oil shale and tar sands development will degrade already-affected Class 1 and Class 2 visual resource areas. In Colorado, Utah, and Wyoming, the BLM has concluded that oil and gas development would further affect Class 1 air-sheds and that oil shale and tar sands development activities will make matters worse at these locations, both in terms of on-the-ground disturbance and emissions from new power plants needed to support increased industrial activity. The FPEIS should address this problem by requiring research that demonstrates the impact industrial development would have on the air quality of the region.

#9])>

* * *

Environmental protection and the conservation of key recreation areas serve as an important

economic driver in Utah, Colorado, and Wyoming. More diversified recreation economies have taken the place of areas that were formerly dependent on resource extraction.²¹ Furthermore the America's Great Outdoors Initiative specifically recognizes the economic value in protecting these lands for recreation.²² It is critical that this initiative be mindful of the extremely valuable recreation resources found in the PEIS planning area and that the FEIS include restrictions so that any future oil shale and tar sands development does not irreparably harm recreation resources and their viewsheds. We look forward to being included in this process, and welcome additional consultation or opportunities for public comment related to this important issue.

Best regards,

Submission Text

Dear Reviewers:

We the Friends of Northwest Colorado a community group representing citizens concerned about the long term economic and environmental sustainability of the communities of Northwest Colorado. The mission of the members of the Friends of Northwest Colorado (hereafter known as the “organization” or the “membership”) is to protect, preserve and conserve our unique local natural resources so that all generations, present and future can experience, enjoy, and be nurtured by them. Additionally, our mission is to educate and to be a voice for people who believe in the inherent value of wildlife, water, air, wilderness, and the natural landscape. We appreciate the opportunity to comment on the Draft Programmatic Environmental Impact Statement for Oil Shale and Tar Sands (DPEIS or the plan).

<([#1 [1.5] It is our collective view that this draft environmental impact statement is woefully inadequate. It does not let the reader fully understand what the impacts of oil shale development will actually be. As written, we say to the BLM, “go back and do a complete environmental assessment of the impacts. Where you don’t have data, tell the reader you do not have data.”

#1])>

<([#2 [2.5] In light of the lack of detail in the PEIS, we would like to see the BLM add and then adopt a NO ACTION Alternative to the Final PEIS. In the following pages we will argue that a NO ACTION Alternative 2B best supports

- the BLM’s multi-use mission,
- the necessary time for industry to prove technologies that would make extraction of the resource commercially viable,
- allowing communities to adjust to growth already being experienced from oil and natural gas development,
- allowing time for mitigation of socio-economic hardships likely to results from combined natural gas and oil shale/tar sands development,
- reflection of where development fits within the public lands framework
- by providing the public a better chance of receiving fair compensation for the use of its land and purchase of the resource and
- protections to our biological and cultural resources.

#2])> <([#3 [8] **PEIS does NOT support the BLM Multi-Use Mission**

The PEIS on Oil Shale and Tar Sands does not support BLM’s multi-use mission. To quote from the plan:

- *Shale development would likely preclude other mineral development activities on leased lands. PEIS*
- *Temporary or long-term reductions in authorized grazing use may be necessary because of loss of a portion of the forage base. PEIS*

- *Commercial activities are largely incompatible with recreational land use.... Including hiking, biking, fishing, bird watching, OHV use, and camping. PEIS*
- *Direct & Indirect impacts would include: Industrialization of the landscape; declines in the value of private ranches/residences adjacent to oil shale developments or rights of way because of perceived noise, human health, and aesthetic concerns; noise and visual impacts; increased traffic; increased access to previously remote zones; conversion of land in and around local communities from existing agricultural, open space, or other uses to provide services and housing for employees and families that move to the region in support of shale development; loss of available lands to new industrial structures. PEIS*

Agency regulations and federal law require that the BLM manage its lands for multiple uses, yet the agency admits that oil shale development will displace every other public use of public land to benefit private companies. A No Action Alternative would be more in keeping with the federally mandated mission of the BLM.

#3])>

<([#4 [9.7] **Commercial Viability is NOT Feasible**

The PEIS had been developed before viable technology for the commercial development of this resource. To quote from industry sources,

“For decades, energy companies have attempted to unlock the large, domestic oil shale resources of northwestern Colorado’s Piceance (pronounced “Pee-ance”) Basin. For more than a quarter of a century, Shell has conducted laboratory and field research on its promising, In situ (in-ground) Conversion Process to recover oil and gas. Shell’s research, thus far, has shown great promise. We are committed to doing oil shale the right way through a responsible and thorough research program. This research program will answer some of the few remaining questions to determine if oil shale can responsibly increase domestic energy supplies. We hope to make a decision on a commercial project early in the next decade”
 (http://www.shell.com/home/Framework?siteId=us-en&FC2=&FC3=/us-en/html/iwgen/shell_for_businesses/exploration_production_shared/mahogany_shared/dir_mahogany.html, visited March 17, 2008).

Chevron’s RD&D will not be completed until 2016, according to the Oil Shale Research, Development & Demonstration Project Plan of Operations submitted to the BLM in 2/15/2006. EGL is between 3-10 years out from production depending upon RD&D (<http://www.egloilshale.com/>). It will be years before companies developing oil shale technology will know if it is technologically or economically feasible.

Since oil shale/tar sands development appears to be many years down the road, and the requirements for water and energy appear to make cost-effective development most unfeasible, we fail to see why there is such a rush to lease this land. It raises strong suspicions of ulterior motives

We must know more about the technologies that would be used in extracting energy from our particular types of Tar Sands. We must ensure that the Oil Shale RD&D process has allowed us

to assess the impacts of experimental extraction technologies on energy consumption and water use before proceeding with a plan for wide-scale commercialization. A NO ACTION alternative would provide the necessary time for industry to prove technologies that would make extraction of the resource commercially viable.

#4)>

<([#5 [3.10.3] Human Impacts of Proposed Development

The development envisioned by the study would come at a time when our land is already experiencing severe pressure from the current energy boom and significant population growth across the West. Oil Shale/Tar Sands development will create additional strain. To quote from the plan:

- *“The number of new residents lured by commercial development of oil shale will substantially change demographics and social fabric of rural communities. Quality of life will be changed. Transition will occur away from traditional agricultural way of life. Small isolated, close-knit, homogeneous communities with a strong orientation toward personal and family relationships will become more urban, with increasing cultural and ethnic diversity and increasing dependence on formal social relationships within the community”.* PEIS

- *Because of the relative economic importance of oil shale developments in small rural economies and the lack of available local labor and economic infrastructure, large-scale oil shale developments are likely to cause a large influx of temporary population.* PEIS

- *Oil Shale development will likely steal jobs from the service industry.* PEIS

- *Local communities may be unable to absorb new residents.* PEIS

- *Colorado impacts will include the loss of recreation -- hunting, fishing and tourism income -- for example: 10% reduction in recreation employment would be a loss of 1,415 jobs and \$18.3 million lost in income, w/ 20% reduction 2,830 jobs would be lost and \$36.5 million lost in income.* PEIS.

- *Property value impacts could be substantial as a result of deterioration in aesthetic quality, increases in noise, real or perceived health effects, congestion, or social disruption.* PEIS #5)>

<([#6 [6.2.1] The PEIS also states an additional 2,400 megawatts of electrical energy will be needed when commercial levels of development are reached. It states that new, coal fired generation plants will be built. While no specifics are given on siting, some general questions are: will any new coal-fired plant must utilize the very latest low impact, low carbon footprint, technology. Where will the coal come from? A new local mine? New rail line or coal transport? Who will build and operate these new facilities?

#6)>

<([#7 [1.5] The PEIS has the BLM finding itself again in favor of development of the public lands, adding to its history of financing development, and promising to make development compliant with this country’s environmental protection laws. The BLM will never find a new energy development plan in non-compliance. Never. And we the public ask why? We the public have known why for some time. Six long standing reasons follow, and all must be investigated and brought into the most basic public democratic reasoning of lawfulness and accountability in the revised PEIS.

1. A review, has been over looked, of the Congressional debate and law which established the

federal public lands system, and so has research been overlooked into whether such lands have ever yet been truly public and whether the Congress has ever yet investigated the mandate that such land be preserved in a condition fit for the time when the public will finally access them for sustenance of healthy economic and cultural survival.

2. The ability of the Federal Government and its land agency the BLM to thus far avoid public knowledge and understanding of the full factual picture of how energy development of the public lands subsurface fuels and minerals fragments the land's habitat – from its near paper-thin soil crust to its largest ungulates, carnivores, birds of prey – until its natural systems of balance and rebalance are instead now excessive, and relenting adaptations and lost ability of adaptations resulting in closer and closer conditions of ecosystem collapse.

3. The ability of the Federal Government, its land management agency the BLM and its corporate users of our public lands nearly free resources to bury from public sight or weaken with false science or fears of American economic regression the economic facts in an as-yet unchallenged history of accessing the public's resources for private wealth and power. This burying from public knowledge of the stages of accessing eventually all known public lands profitable resources for private gain includes the following: persistent de-regulation of corporate behavior – both physical on-ground and market behavior; subsidies from the public's taxes to underwrite R&D of resource extraction; and an assumption that the public will never grasp the economics of the corporate free market system that either doubts itself or privately manipulates its own system to guarantee itself greater and greater profits – profits not from its system's adequate rational and success, but from the public's collective resources.

4. The ability of the Federal Government and its BLM agency to cover the fact and knowledge that the public's land is being privatized, so that they will less and less have to be made accountable for their health and sustainability until the eventual time in our public history when they – the public's land – are handed back over to the public in near useless condition.

5. The ability of the Federal Government and its land management agency the BLM to inhibit thus far the actualization, in dollar figures, for the public of the loss in market value of the public land's sustainable, renewable resources.

6. The ability now, in the current systemic financial uncertainty, of the Federal Government to confer the exploiting and marketing of the public lands remaining resources as collateral to the very capitalizing and marketing banking industries that have so thoroughly amassed the public's welfare, labor, taxes, and resources for private gain.

#7])>

<([#8 [2.5] It is difficult to understand why the BLM is rushing toward a commercial leasing program without even knowing if oil shale development is feasible economically. In light of that, it's even more difficult to understand why the BLM seems so anxious to give oil shale development priority over other uses on our public lands as shale development would likely preclude all other activity, including natural gas development in priority areas. A No Action Alternative allows communities to adjust to growth already being experienced from oil and natural gas development. A No Action Alternative would allow communities to mitigate socio-

economic hardships likely to result from combined natural gas and oil shale/tar sands development. And a No Action Alternative would allow full review and community discussion of the place of development on public lands.

#8])>

<([#14 [4.2] Environmental Impacts of Development

This plan proposes development in some of the best hunting, fishing, and recreation areas in Colorado, Wyoming, and Utah. We can and should protect these areas from adjacent impacts such as diminished air quality and habitat fragmentation. The cumulative impact of this massive development will negatively affect our air, water, wildlife and communities in Colorado, Wyoming, and Utah. To quote from the plan:

· *In Colorado, 10,789.7 acres of Areas of Critical Environmental Concern (ACEC's) are included in areas designated for commercial oil shale leasing. PEIS*

· *Direct and indirect impacts of commercial oil shale development will include: wildlife displacement and mortality (including threatened and endangered species), industrial noise across the landscape, visual transformation of the landscape, increased traffic, new roads, increased access to currently remote areas, industrialization of agricultural and undeveloped landscapes, sprawl, as agricultural and open lands near existing communities are converted to new housing and new development necessary to support increasing populations, loss of available land for other new (clean?) industries, loss of threatened/endangered plant species, new rights of way stripped of and maintained w/out major vegetation, decreased property values for adjacent landowners due to noise human health, and aesthetic concerns, degradation or loss of cultural sites. PEIS*

· *“There is a potential for commercial oil shale development projects to adversely affect most of the threatened, endangered, and sensitive species that occur in the counties where development could occur.”*

· *Additional likely impacts include:*

- o *Habitat loss, alteration, fragmentation, and resulting changes in habitat use*
- o *Disbursement and displacement – habitat modification, noise, fire, lights, etc.*
- o *Mortality – collisions with structures and vehicles, changes in predator populations, and chronic or acute toxicity from herbicides, hydrocarbons, or other contaminants*

o *Increased accessibility – human infiltration of previously remote habitat DPEIS 4.66 #14])>*

<([#9 [3.4.1] Water

Water is finite. Almost all of the water in the Colorado River Upper Basin is appropriated by the 1922 Interstate Colorado River Compact. In addition, the Navajo Nation is asserting a claim for up to 800,000 acre feet. It is our view that they will prevail. In the State of Colorado, where will the oil shale developers obtain enough senior water rights to develop oil shale under present technology? Ranchers and municipalities own most of the senior rights. The municipalities are not going to sell their water rights. If ranchers sell their rights, they are out of business. How will the oil shale developers reclaim the water they have used? This must be a high priority to render the used, polluted, water potable so that this water can be returned to the river from where it came.

#9])> <([#10 [3.7.4.1] Fish and Wildlife

Our first concern is five species of fish that are already listed on the Endangered Species list and

the one species awaiting listing. The species listed as Endangered are the pike minnow, razorback sucker, boney tail sucker and the humpback chub. The Colorado River Cutthroat Trout (CRCT) has been petitioned for listing. The Endangered Species Act of 1973 states that it is unlawful to modify or remove habitat of listed species. Water from warm water streams, such as the White River, are within the range of the 4 species listed as Endangered. Streams, such as Trapper's Creek, contain viable populations of CRCT.

#10)> <([#11 [3.7.5.1] Fish and Wildlife

Our second concern is disruption, or loss, of sagebrush, *Artemisia tridentata*, subsp. This loss will have adverse effects on greater sage grouse, *Centrocercus urophasianus*, which is under a federal court order for the Fish and Wildlife Service to reevaluate for listing on the ESL. If there is substantial removal of sage grouse habitat as would be the case in the current plan then, listing of this species would probably be one end result.

#11)> <([#12 [3.7.3.4] [3.7.3.6] Fish and Wildlife

Another concern is the impact to our big game populations. Deer and elk were prevalent in the Rifle, CO, area prior to oil and gas development. Hunting is now a sport of the past in that area, due to, in part, the development. Should development occur, big game loss could occur simply by drinking unprotected, polluted water. These impacts upon the land are just unacceptable. We urge the BLM to consider these and the likely cumulative effects of this industry on wildlife habitat and protected areas across the West.

#12)>

Conclusion

<([#13 [2.5] After more than \$23 billion spent on research, oil shale technology is still experimental. Yet the Bush and Obama administration are rushing to create a massive federally driven oil shale development program before anyone knows if the technology will work, let alone what cost it will exact on our air, water, wildlife and communities. The government should force industry to prove they can develop oil shale without wrecking the environment through research-scale projects before anyone talks about commercial leasing or production. There are just too many unknowns in the PEIS. It is ill-prepared and inconclusive. As presented, we must conclude that the *No Action* alternative be the only alternative that is reasonable and prudent. Western Colorado has already suffered through decade-long economic calamity prompted by the collapse of the last oil shale scheme on Black Sunday. The administration's unseemly haste to lock in a massive oil shale program before anyone knows if it works shows a negligent disregard for western Coloradans and the state's future.

#13)>

Sincerely On behalf of Friends of Northwest Colorado and Citizens of the West,

Jane & Larry Yazzie Genevieve Yazzie

Submission Text

Dear Bureau of Land Management,

<([#1 [2.2.1]

We are writing to express our support for the approach that is being taken in the Bureau of Land Management's recently released Draft Programmatic EIS (PEIS) for oil shale and tar sands, which defines the terms of potential future leasing of oil shale and tar sands deposits on federal lands in Colorado, Utah and Wyoming. As elected officials in these states, we believe it is essential that the final plan ensures that key questions are answered before opening public land to commercial development. Given that a commercial industry does not yet exist, it is smart to require that research and development of oil shale and tar sands technologies be completed and the impacts analyzed before moving forward with a commercial leasing program. The final plan should reflect a common sense approach that puts the prosperity of our region first.

Our public lands are enormous economic drivers in the Intermountain West. Tourism, recreation, hunting and fishing, ranching, and other industries provide billions of dollars of revenue and hundreds of thousands jobs throughout the three-state region. Our public lands also contain the headwaters to critical western water supplies, the economic backbone of our economies. The BLM has acknowledged in the Draft PEIS that the potential impacts of development on communities, water and air are largely unknown but potentially significant. We do not know, for instance, if either industry would produce significant revenues, but we do know that development would divert critical water resources from existing and future uses and require trade-offs that may be substantial, but which we cannot yet assess. We thus strongly urge the BLM to prioritize research and development in the final PEIS, to ensure that impacts are analyzed and we can make smart decisions about commercial leasing.

These lands are our heritage, and for many, our livelihoods. As representatives of communities across the three-state region, we have a responsibility to work to protect those values. It is critical that we know more about the impacts of oil shale and tar sands development before putting

communities, water and air at risk.

Submission Text

Dear Bureau of Land Management, <([#1 [2.3.1] I am writing to submit comments on the Oil Shale and Tar Sands Draft Programmatic Environmental Impact Statement (PEIS). I am very concerned about the possible impacts of oil shale development on Glen Canyon, Grand Canyon, and the Colorado River. I believe that we need more research on the potential impacts of oil shale and tar sand development before allowing leasing of our public lands for this use. Such development could have serious and irreversible impacts, including on water supplies and quality, air quality, native ecosystems and wildlife, and recreational uses. I strongly urge you to choose Alternative 3, Research Only, as the BLM's Preferred Alternative in the Final PEIS. This is essential to ensure that we have the best possible information before considering opening our natural open spaces and ecosystems to the development of oil shale and tar sand resources. #1])>

<([#2 [3.4.1] Here are some of my specific concerns regarding the Draft PEIS: * The Draft Programmatic EIS needs to ensure water quality will not be adversely effected by development of oil shale and tar sand resources. The water usage for oil shale production far outstrips the amount of oil produced, even prior to the refinement process. Water resources in the West are already overused and the effects of climate change and increased population will only add further strain to an already depleted system. #2])>

<([#3 [3.4.1] * The Draft Programmatic EIS should be conducted in such a way to address issues of dust, noise, and pollution in the affected areas. Heating oil shale in the ground can contaminate vital groundwater supplies. High salt concentrations in groundwater restricts water available to native plants and is harmful to agricultural production as well. The Colorado River Basin already spends millions of dollars annually on damages caused from high salinity. #3])>

<([#4 [3.1.1] * The Draft Programmatic EIS should address the potential encroachment on protected areas and National Parks such as Glen Canyon Recreation Area and Canyonlands National Park. This includes a thorough analysis of the damage to these priceless parks by oil shale and tar sands development. #4])>

<([#5 [2.3.1] This EIS should ensure that all alternatives seriously assess the issues outlined above. Considering the present lack of adequate information and the tremendous risks of misguided development, the only reasonable alternative at this point is Alternative 3, Research Only as outlined in the PEIS. #5])>

<([#6 [3.10.4] I and my family for years have been visiting and hiking in National Parks, wilderness areas, proposed wilderness areas, primitive areas and national monuments in southern and eastern Utah. We spend money on these trips and help

support the economy of Utah. Oil shale and tar sands development in or near these areas will destroy the various features which attract us and millions of other tourists per year from all over the world. #6])> <([#7 [10.6.1] Further, I and my family own 3 hybrid cars. Our next car will be all electric, and we are moving to solar power generation at our home so that our electric car can be re-charged by solar energy. We are making all these changes because we support the reduction and ultimately the complete cessation of the burning of fossil fuels. Mass extraction of oil from shale and tar sands is a move by our nation in the wrong direction entirely. What will all do when the world runs out of fossil fuels, which is inevitable, and our climate has been irreversibly altered? We must move now to develop clean, renewable sources of energy to meet all our energy needs as quickly as possible. #7])> Thank you for the opportunity to comment on the Draft Programmatic EIS. Sincerely, David Rodgers Santa Clarita, Calif.

Submission Text

Dear Reviewers:

The following comments are submitted on behalf of Sportsmen for Responsible Energy Development (SFRED) and its founding partners the National Wildlife Federation, the Theodore Roosevelt Conservation Partnership, and Trout Unlimited. In addition, the Wyoming Wildlife Federation and the Colorado Wildlife Federation, also members of the SFRED coalition, join in these comments.

SFRED is a coalition of more than 500 businesses, organizations and individuals dedicated to conserving irreplaceable habitats so future generations can hunt and fish on public lands. The coalition is led by the Theodore Roosevelt Conservation Partnership, Trout Unlimited and the National Wildlife Federation.

As an organization, the National Wildlife Federation (NWF) represents the power and commitment of four million members and supporters joined by affiliated organizations in 48 states and territories. NWF and its affiliates have a long history of working to conserve the wildlife and wild places on federal public lands in the West. Many members of NWF and its affiliates use the lands and resources that could be impacted by oil shale and tar sands extraction (In addition to these comments, NWF joins in those filed by Western Resource Advocates while supporting Preferred Alternative 2(b)).

The Theodore Roosevelt Conservation Partnership is a national non-profit conservation organization that is dedicated to guaranteeing every American places to hunt or fish.

Trout Unlimited is a private, non-profit conservation organization that has more than 150,000 members nationwide dedicated to conserving, protecting, and restoring North America's trout and salmon fisheries and their watersheds. Since 1959, Trout Unlimited (TU) has dedicated staff and volunteers toward the protection of sensitive ecological systems necessary to support robust native and wild trout and salmon populations in their respective ranges. TU recognizes that the value of public lands is unparalleled in providing habitat to coldwater fisheries, drinking water and wildlife habitat. TU's expanding conservation program includes a public lands initiative that recognizes the importance of protecting public lands for the survival and restoration of wildlife and fisheries. TU's public lands initiative is not limited to anglers; TU recognizes that many people who fish also utilize public lands for hunting or wildlife viewing opportunities. TU believes that actions taken on public lands are ultimately reflected in the quality of fish and wildlife habitat and populations.

In the tri-state region where oil shale and tar sands development could occur, TU has over 12,000 members who actively utilize and enjoy the resources of the Upper Colorado River basin, including the White River hydrologic basin in Colorado, the Uinta basin in Utah, and the Green River basin in Wyoming. TU believes the impacts from the development and production of oil shale and tar sands would adversely affect its members, as well as non-members, who hunt, fish, recreate, and do business in and around the Upper Colorado River basin.

The Colorado Wildlife Federation (CWF) is Colorado's oldest statewide wildlife conservation organization, a 501(c)(3) nonprofit whose members consist of hunters, anglers and other wildlife enthusiasts. CWF's mission is to promote the conservation, sound management, and sustainable use and enjoyment of Colorado's wildlife and habitat through education and advocacy. CWF understands that wildlife habitat is critical to conserving Colorado's unique wildlife, hunting and fishing heritage, and wildlife viewing opportunities. These wildlife-related recreation pursuits enrich the well-being of residents and visitors and form a substantial segment of Colorado's economy. CWF's members hunt, fish, and recreate on federal public lands in Colorado and elsewhere in the Rocky Mountain region that could be developed for oil shale or tar sands production.

The Wyoming Wildlife Federation (WWF), established in 1937, is celebrating its 75th anniversary. With a membership of 5,000, WWF is Wyoming's oldest and largest statewide sportsmen/conservation organization. WWF works for hunters, anglers, and other wildlife enthusiasts to protect and enhance habitat, to perpetuate quality hunting and fishing, to protect citizens' right to use public lands and waters, and to promote ethical hunting and fishing. Members of WWF use lands and resources that could be adversely impacted by oil shale and tar sands development.

We thank you for the opportunity to review and provide comment on the *Draft Programmatic Environmental Impact Statement and Possible Land Use Plan Amendments for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah, and Wyoming (2012DPEIS)*.

<([#1 [2.2] Our organizations continue to oppose opening federal public lands for commercial oil shale and

tar sands development. Research must precede any consideration of commercial leasing, and that research must demonstrate that extraction technologies exist that will protect clean air and water, conserve fish and wildlife, and sustain the western economies that depend on those resources.

For that reason, we are encouraged to see that under the Preferred Alternative 2(b) identified in the 2012DPEIS, operators will only be able to secure commercial development rights after

fulfilling the terms of a Research, Development and Demonstration (RD&D) lease. By requiring companies to first prove their technologies and assess the impacts to communities, human health, and fish and wildlife, Alternative 2(b) helps ensure that commercial oil shale and tar sands development will only be initiated following a fuller understanding and evaluation of its impacts. Preferred Alternative 2(b) also places off-limits areas containing important environmental and ecological values, including fish and wildlife habitats. This is an important step forward because, while the full impacts of commercial-scale oil shale and tar sands development are not yet understood, we do know that such development, using current technology, is incompatible with conservation of fish and wildlife habitats. All of the current extraction technologies being tested require operators to remove existing vegetation and either mine or re-grade the entire surface of the leased site, completely destroying habitat values. We, therefore, support the determination, reflected in the Preferred Alternative, to exclude oil shale and tar sands development within vital habitats such as crucial winter ranges for big game, breeding habitats for Greater sage-grouse, and native trout streams.

Finally, while Preferred Alternative 2(b) represents a more rational and measured approach to oil shale and tar sands development, we continue to believe that no additional public lands should be devoted to this use until the RD&D leases already issued have produced tangible results and an analysis of their impacts has been conducted. We believe that analysis is critical to the development of standard provisions regarding any conversion of RD&D leases to commercial leases. Alternative 2(b) rests on the proposition that BLM can define the standards and procedures the agency will use in determining whether technologies are appropriate for commercial development. We believe that BLM will be in a better position to do so with whatever information is produced by the existing RD&D leases. #1])>

<([#2 [1.5] I. THE LEGAL FRAMEWORK

A. The National Environmental Policy Act

The National Environmental Policy Act (NEPA) does not specifically address programmatic environmental impact statements (EISs). Council on Environmental Quality (CEQ) regulations at 40 CFR §1502.4(b) refer to EISs for broad actions. However, CEQ regulations and guidance discuss this topic only briefly and in very general terms. Courts, therefore, have played a significant role in fleshing out these concepts over time. While many major unresolved issues remain regarding the precise components of programmatic NEPA documents, there is a legal consensus that these EISs perform at least two important functions. First, programmatic EISs, by taking a broad view avoid segmenting environmental analyses of common concerns by analyzing them in the entire program or suite of related or similar actions. Second, programmatic NEPA documents can also be the most effective tool for addressing cumulative environmental impacts. Unfortunately, the 2012DPEIS cannot perform either of these programmatic functions, particularly with respect to its treatment of the potential fish and wildlife impacts of opening two million acres of public land to oil shale and tar sands development. As BLM itself admits, the 2012DPEIS contains no discussion of the cumulative impacts of the potential loss of these lands to fish and wildlife.

In 2008, when it issued its *Final Oil Shale and Tar Sands Programmatic Environmental Impact Statement* (2008FPEIS), BLM understood that due to the experimental state of both oil shale and tar sands technologies, the agency lacked the necessary information to meet Congress's directive in the Energy Policy Act of 2005 to develop a programmatic environmental impact statement (PEIS) that could support commercial leasing. As the agency acknowledged then:

The BLM originally intended the PEIS to support the amendment of land use plans to

allocate areas open to commercial leasing and development of oil shale and tar sands, *as well as to support the issuance of such leases*. However, in consultation with the cooperating agencies, it was determined that the analysis to support immediate leasing decisions *would require making speculative assumptions regarding potential, unproven technologies*, and, consequently, the decision to offer specific parcels for lease was dropped from consideration in the PEIS (2008FPEIS at ES-3 (emphasis added)). Nevertheless, BLM amended 12 land use plans and made available for leasing more than 2 million acres of public lands. We believe that decision was premature and we applaud BLM's resolution to revisit it.

Unfortunately, in 2012, BLM faces much the same challenge. The technologies are no more advanced than they were in 2008 (2012DPEIS at 1-20). Land use decisions and supporting NEPA analyses made

without the benefit of additional research will continue to suffer from the same fundamental flaws BLM encountered when it issued the 2008FPEIS. The agency cannot make an informed decision to dedicate public lands to commercial oil shale or tar sands development. As the agency admits, it does not yet have sufficient information to conduct a cumulative impacts analysis, one of the cornerstones of NEPA (42 U.S.C. §§ 4321-4370f): "[t]he current experimental state of the oil shale and

tar sands industries does not allow this PEIS to include sufficient specific information or cumulative impact analyses to support future leasing decisions within these allocated lands" (2012DPEIS at 1-2).

We note that, while the 2012DPEIS provides a substantially better selection of alternatives than that which was provided in the 2008FPEIS, it still lacks a substantive analysis and comprehension of the likely impacts to fish and wildlife resources and of the economic value of these resources. However, by requiring companies to complete their research, evaluate the impacts of their extraction technologies, and design effective mitigation measures prior to obtaining a commercial lease, BLM hopefully will have the opportunity to secure good, current, independently-verifiable data to support the agency's land use decisions before large tracts of public land are committed to development. Nevertheless, due to these challenges, the 2012DPEIS remains deficient as a NEPA document. Because of the incomplete state of the technology and the corresponding limitations of this PEIS, subsequent NEPA analyses will be required before any commercial leases are issued, including those that arise from an existing RD&D project. These analyses should include either another PEIS or require lessees to conduct full environmental impact statements (BLM must ensure that any subsequent NEPA documents include a robust examination of landscape-level cumulative impacts and avoid a piecemeal approach to authorizing this new and potentially destructive use of public

lands). Environmental assessments at the leasing stage would not

sufficiently address the legal and other deficiencies contained in this 2012DPEIS.

Given that BLM must delay a full and complete cumulative impacts analysis, the final PEIS should focus instead on three important components of its oil shale and tar sands program:

1. defining the scope of the subsequent NEPA analysis, including the scope of the cumulative impacts analysis;
2. evaluating any available mitigation actions and directing the adoption of effective mitigation; and
3. establishing terms, including stipulations, of RD&D leases and criteria for conversion of

RD&D projects to commercial development leases.

#2)] <([#3 [4.1] 1. Defining the scope of subsequent NEPA

As we noted above, the 2012DPEIS fails to address the cumulative impacts of commercial-scale oil shale and tar sands development on fish and wildlife. In order to do so, subsequent NEPA documents must articulate a reasonably foreseeable development scenario for oil shale and tar sands extraction projects and, at a minimum, address all:

1. activities leading to soil and vegetation disturbance;
2. activities leading to changed habitat structure;
3. activities leading to habitat fragmentation; and
4. activities leading to loss of water quantity or quality (Subsequent NEPA analyses must fully address climate changes, including shifts in the vitality and habitat range of fish and wildlife species. *See, e.g.*, Greater sage-grouse discussion *infra* at 16).

The final PEIS should clearly state that this analysis must be completed before commercial leases will be issued or commercial development permitted.

In addition to the cumulative impacts of oil shale and tar sands extraction, BLM must also address the fact the area identified within the 2012DPEIS as containing oil shale or tar sands also includes lands that hold oil, gas, and other minerals. Many of these lands already have producing wells. Yet, the 2012DPEIS contains little information on the combined impact of oil shale and tar sands extraction and oil and gas drilling on fish and wildlife populations. Subsequent NEPA documents must assess the cumulative impacts of all minerals development as well as other human activities on both public and private lands within the region that provide habitat for fish and wildlife.

#3)] <([#4 [5] 2. Evaluating available mitigation measures and directing the adoption of effective mitigation

NEPA is intended to help public officials make decisions that are based on an understanding of environmental consequences, and to take actions that protect, restore, and enhance the environment (*See* 40 C.F.R. § 1500.1(b)).

Federal agencies are required, to the fullest extent possible, to use all practicable means consistent with the requirements of NEPA to “restore and enhance the quality of the human environment and avoid or minimize any possible adverse effects of their actions upon the quality of the human environment” (*Id.* at 1500.2(f)). A crucial element in meeting this mandate is developing and implementing mitigation measures.

The Council on Environmental Quality (CEQ) regulations define mitigation as:

1. avoiding the impact altogether by not taking a certain action or parts of an action;
2. minimizing impacts by limiting the degree or magnitude of the action and its implementation;
3. rectifying the impact by repairing, rehabilitating, or restoring the affected environment;
4. reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action; and
5. compensating for the impact by replacing or providing substitute resources or Environments (40 C.F.R. § 1508.20).

In January 2011, CEQ issued new guidance regarding mitigation (76 Fed. Reg. 3843 (January 21, 2011)). This guidance provides that mitigation measures must be “explicitly described as ongoing commitments and should specify measurable performance standards and adequate mechanisms for implementation, monitoring, and reporting” (*Id.*).

Pursuant to CEQ’s rules and guidance, the discussion of wildlife mitigation in the 2012DPEIS is

wholly inadequate. First, it consists of little more than a list of measures that might be employed (*See* 2012DPEIS at 4-129).

Second, these measures simply are not up to the task of mitigating the impacts of oil shale and tar sands development on fish and wildlife. With respect to the impacts of human activities on big game, for example, BLM traditionally has relied on seasonal restrictions such as limiting human access to winter ranges from mid-November to the end of April. However, limiting the construction activities associated with oil shale and tar sands projects to the summer months provides no protection for big game. When the animals return to the winter range in November, they will find their habitat has been hauled away, is covered with waste shale, or is devoid of vegetation (Timing limitations also are only applied to exploration and development activities, as described in most BLM land use planning documents; long-term production activities continue to occur during sensitive winter periods).

Seasonal restrictions have also been used with respect to sage-grouse brooding habitats and winter concentration areas (*Id.* at F-20). Given the current imperiled status of Greater sage-grouse

populations, we do not believe such restrictions provide a responsible approach to wildlife conservation and BLM's obligation to manage its lands for multiple uses. Sage-grouse habitats must be protected year-round from the destructive impacts of oil shale and tar sands extraction. The 2012DPEIS also references the *Recommendations for Development of Oil and Gas Resources within Crucial and Important Wildlife Habitats* prepared by the Wyoming Fish and game Department (*Id.* at 4-129).

While we welcome BLM's recognition of these *Recommendations*, they are directed primarily at limiting the surface disturbance associated with oil and gas development. They include such measures as directional drilling and clustering associated infrastructure in order to reduce the footprint of oil and gas development on fish and wildlife habitat. Yet, BLM assumes that most oil shale and tar sands operations will either drill or mine 100 percent of the surface of the leased area. There simply is no "effective" mitigation *other than avoidance* for the habitat losses resulting from oil shale and tar sands development. For example, BLM states in the Final Environmental Impact Statement for the Jack Morrow Hills Coordinated Activity Plan (JMHCAP FEIS) that it may be impossible to reclaim some sagebrush habitats (footnote: U.S. Department of the Interior, Bureau of Land Management. 2000. *Jack Morrow Hills Coordination Activity*

Plan for Public Lands Administered by the Bureau of Land Management, Rock Springs Field Office, Rock Springs:

Environmental Impact Statement, p. 4-74; *see also* U.S. Department of the Interior, Bureau of Land Management.

2008. *Proposed Resource Management Plan and Final Environmental Impact Statement for the Pinedale Resource*

Area, p. 4-297: Although reclamation of some disturbed sites would occur, the level of habitat diversity and quality that existed prior to disturbance would likely not be achieved for several decades and may never return to predisturbance conditions. This would likely result in permanent reductions in wildlife populations and impairment of water quality and vegetation communities in some areas).

Migration corridors for big game have been lost permanently to development. Animals are driven off of crucial ranges onto lands that will not sustain them (*See* Comments submitted by A. William Alldredge on 2008FPEIS).

We therefore support the determination expressed in Preferred Alternative 2(b) to mitigate impacts on fish and wildlife by following CEQ's first rule of mitigation – avoidance – and excluding some vital habitats from development.

We do not believe other measures are currently available to mitigate the terrestrial impacts of oil shale and tar sands development on vital fish and wildlife habitats. Given the nature of oil shale and tar sands extraction and the fragile environments at risk, we doubt mechanisms other than avoidance will ever prove effective.

Mechanisms may arise as extraction technologies are researched to reduce impacts on water quality and quantity which are also important to fish and wildlife conservation. Those measures must be tied to the specific technologies used and other contemporary water demands. We encourage BLM to use existing RD&D opportunities to examine whether water usage and pollution can be minimized.

#4)> <(#5 [9.2.6] 3. Defining stipulations and reporting requirements in RD&D leases

The final PEIS should clarify that, in addition to standard environmental analyses, all future RD&D lessees will be required to provide a quantifiable analysis of the water and energy demands of their extraction technologies, water quality impacts, air impacts, and other effects on fish and wildlife habitats. This is consistent with the terms specified in the second round of oil shale RD&D lease terms. For example, following completion of research activities, RD&D lessees should be required to specify how much water a commercial-scale operation would require and the impacts of that water demand on other uses, including instream flows and peak flows.

Under these terms, approval of any commercial leases would only be granted upon an adequate analysis of those impacts, and clear and detailed plans for mitigating such impacts (In Preferred Alternative 2(b), portions of three of the five Preference Right Lease Areas for the existing Colorado

RD&D leases are no longer identified as available for application for commercial leasing. These lands include vital

winter ranges for big game. We urge BLM to evaluate whether alternative sites might be more appropriate should

the lease holders complete their projects and apply for approval to expand into commercial development).

BLM can

also, in appropriate circumstances, rely on the broad discretion it has under FLPMA to deny commercial oil shale and tar sands leases without completing the NEPA process (*See, e.g., U.S. Department of Energy. October 2011. Supplement to the Draft Programmatic Environmental Impact Statement for Solar Energy Development in Six Southwestern States*).

#5)> <(#6 [9.4] B. The Federal Land Management and Policy Act and Resource

Management

Planning

According to BLM “a plan-level decision to open the lands to mineral leasing represents BLM’s determination, based on the information available at the time, that it is appropriate to allow development of the parcel consistent with the terms of the lease, laws, regulations, and orders, and subject to reasonable conditions of approval” (BLM Handbook H-1601-1, Appendix C at 24).

However, the 2012DPEIS contains

no such determination with respect to oil shale and tar sands. BLM's current guidance on oil shale leasing and land use planning requires its Resource Management Plans (RMPs) specifically to identify the following:

1. Areas open to leasing, subject to existing laws, regulations, and formal orders; and the terms and conditions of the standard lease form.
2. Areas open to leasing, subject to moderate constraints such as seasonal and controlled surface use restrictions. (These are areas where it has been determined that moderately restrictive lease stipulations may be required to mitigate impacts to other land uses or resource values.)
3. Areas open to leasing, subject to major constraints such as no-surface occupancy stipulations on an area more than 40 acres in size or more than 0.25 mile in width. (These are areas where it has been determined that highly restrictive lease stipulations are required to mitigate impacts to other lands or resource values. This category also includes areas where overlapping moderate constraints would severely limit development of fluid mineral resources.)
4. Areas closed to leasing. (These are areas where it has been determined that other land uses or resource values cannot be adequately protected with even the most restrictive lease stipulations; appropriate protection can be ensured only by closing the lands to leasing.) Identify whether such closures are discretionary or nondiscretionary; and if discretionary, the rationale.
5. Resource condition objectives that have been established and specific lease stipulations and general/typical conditions of approval and best management practices that will be employed to accomplish these objectives in areas open to leasing.
6. For each lease stipulation, the circumstances for granting an exception, waiver, or modification. Identify the general documentation requirements and any public notification associated with granting exceptions, waivers, or modifications. 4
7. Whether the leasing and development decisions also apply to geophysical exploration.
8. Whether constraints identified in the land use plan for new leases also apply to areas currently under lease.
9. Long-term resource condition objectives for areas currently under development to guide reclamation activities prior to abandonment (BLM Handbook H-1601-1, Appendix C at 23-24).

The RMP amendments proposed in the 2012DPEIS contain none of this information. In fact, there is no description of commercial lease terms at all because those decisions have been deferred (2012DPEIS at 1-21).

Of course, it is understandable that BLM is unable to make these determinations at this time since it lacks the relevant information to do so. For example, in 2008, after consulting with cooperating agencies, BLM concluded that, because it lacked sufficient information regarding the commercial viability of extractive technologies for both oil shale and tar sands, trying to anticipate a certain level of development would be too speculative (In 2012, no "Reasonably Foreseeable Development Scenario" has been prepared because, unlike oil and gas drilling, oil shale and tar sands extraction is not a "mature" technology. 2012DPEIS at 1-14). However, a detailed description of Reasonably Foreseeable Development (RFD) is precisely what is required by BLM's own land use planning guidance before RMPs can be adopted that open lands to mineral leasing (*See, e.g.*, BLM Handbook H-1601-1, Appendix F-4 at 18 (In the chapter on environmental consequences, draft

and final RMPs/EISs must include “reasonably foreseeable development scenarios” for all uses.)).

Without any information on the level of oil shale or tar sands development the opening of these lands will set in motion, it is impossible to determine whether the other management goals set forth in these RMPs can be met. Resource Management Plans, however, are required to provide adequate information not just on the plan’s objectives but also on how those objectives will be reached. BLM’s Land Use Planning Handbook states that “[l]and use plan decisions establish goals and objectives for resource management (i.e. desired future conditions), the measures needed to achieve those goals and objectives, and the parameters for using BLM lands. They identify lands that are open or available for certain uses, including any applicable restrictions, and lands that are closed to certain uses” (BLM Handbook H-1601-1 at 11).

Land use plans

must also “identify the actions needed to achieve desired outcomes, including actions to maintain, restore or protect land health” (*Id.* at 13).

The RMPs amended by this document cannot meet these requirements. Therefore, no commercial leasing of oil shale and tar sands resources in appropriate at this time.

#6)> II. WHAT IS AT STAKE

<([#7 [3.10.4] While oil shale and tar sands proponents extol the potential economic value resulting from largescale

development, they often downplay or ignore the economic value such development could damage. Yet, the quality of the natural environment and fish and wildlife habitats is a critical economic asset in this region (*See Sportsmen for Responsible Energy Development/Southwick Associates. 2012. Conserving Lands and Prosperity* available at www.sportsmen4responsiblenergy.org).

A September 2008 report prepared for the Colorado Division of Parks and Wildlife concluded that the 2007 direct annual expenditures in Colorado from hunting and fishing alone were approximately \$1.1 billion (BBC Research & Consulting, *The Economic Impacts of Hunting, Fishing and Wildlife Watching in Colorado, Final Report*, revised September 18, 2008, report prepared for Colorado Division of Wildlife, p. 1. Main report web page: <http://wildlife.state.co.us/About/Reports/EconomicImpacts/>; report-specific web page: <http://wildlife.state.co.us/SiteCollectionDocuments/DOW/AboutDow/Revised2004DOWEconomicImpactReport.pdf> f.).

Secondary impacts of the dollars re-spent within the economy in 2007 are estimated to be \$767 million, for a total economic impact of more than \$1.8 billion. The same study found wildlife-watching yields an additional total economic impact of \$1.2 billion annually. Wildlife plays a similarly important role in Utah and Wyoming.

Even under Preferred Alternative 2(b), BLM admits that oil shale, tar sands and ancillary facility development “may fragment or destroy wildlife habitat and affect the behavior of migratory big game species such as elk and mule deer, which form an important basis for recreational activities in many parts of each [Region of Influence]” (2012DPEIS at 4-176).

The 2012DPEIS identifies “172,339 acres of mule deer winter habitat, 11,470 acres of mule deer summer habitat, 159,205 acres of elk winter

habitat, and 11,465 acres of elk summer habitat overlap lands that would be available for oil shale leasing” (2012DPEIS Table 2.6-1 at 2-96). In Utah, for tar sands alone, “57,708 acres of mule deer winter habitat, 17,110

acres of mule deer summer habitat, 52,361 acres of elk winter habitat, and 17,170 acres of elk summer habitat overlap lands that would be available for tar sands leasing” (2012DPEIS Table 2.6-2 at 2-121).

Oil shale and tar sands development will diminish tourism and recreational opportunities. Outdoor recreation, including hunting and fishing, would decline. In Colorado, oil shale would result in a loss of up to 2,830 jobs and \$36.5 million in income annually in the Regions of Influence (ROIs). In Utah, 1,552 jobs and \$12.6 million in income would be lost from oil shale and tar sands in the ROIs. In Wyoming 2,719 jobs and \$14.4 million in income would be lost. Additional economic impacts would be felt elsewhere. Impacts from the development scenarios considered in Alternatives 1 and 4 would be significantly greater. #7])>

<([#31 [2.2.1] Because resources important to both traditional western values, such as hunting and fishing, and

emerging new economies are at stake, the cautious and measured approach to commercial oil shale and tar sands development outlined in Preferred Alternative 2(b) is both appropriate and necessary.

#31])> A. Water Resources

<([#8 [3.4.1] [3.10.2] [6.3.2] Water resources in the West are scarce and are under increasing pressure from development.

Water resources are also extremely important to western economies. In Colorado alone, nonconsumptive

water-related activities contribute between \$7 billion and \$8 billion to the state’s economy and employ 85,000 people (<http://cwcb.state.co.us/environment/non-consumptive-needs/Pages/main.aspx>).

It is therefore imperative that subsequent NEPA analyses evaluate the impact diverting water for oil shale and tar sands development would have on these industries.

Since 2008, however, little new and verifiable data on the precise water demands of oil shale and tar sands extraction technologies has been generated. For example, the Government Accounting Office’s (GAO’s) October 2010 report on oil shale and water, “Energy-Water Nexus: A Better and Coordinated Understanding of Water Resources Could Help Mitigate the Impacts of Potential Oil Shale Development” (General Accounting Office, October 2012. *Energy-Water Nexus: A Better and Coordinated Understanding of Water Resources Could Help Mitigate the Impacts of Potential Oil Shale Development* [hereinafter GAO Report]),

concluded that oil shale would likely require 4-to-5 barrels

of water for every barrel of oil produced from shale, higher than BLM’s projections in the 2012DPEIS (*Id.* GAO concluded the range of water-to-oil is 1:1 to 20:1. The report further stated 4-5 barrels of water to oil was a good working figure).

According to GAO:

The unproven nature of oil shale technologies and choices in how to generate the power necessary to develop this resource cast a shadow of uncertainty over how much water is needed to sustain a commercially viable oil shale industry....These nascent efforts do not adequately define current baseline conditions for water resources in the Piceance and Uintah Basins, nor have they begun to model the important interaction of groundwater

and surface water in the region (*Id.* at 44-45).

Water is likely to be available for the initial development of an oil shale industry, but the size of an industry in Colorado or Utah may eventually be limited by water availability. Water limitations may arise from increases in water demand from municipal and industrial users, the potential of reduced water supplies from a warming climate (Climate changes may increase the challenges states will face. As the 2012DPEIS makes clear, by 2050, water in

the Colorado River Basin could be reduced by 6-20%. 2012DPEIS at 4-36 to 4-37. Such reductions would further

stress existing resources, compounding the problems posed by large development projects such as oil shale and tar sands extraction),

fulfilling obligations under interstate water compacts, and the need to provide additional water to protect threatened and endangered fishes (GAO Report at 44-45).

The 2012DPEIS makes clear that water requirements for commercial development could be substantial. It also projects how much water might be available for oil shale and tar sands development and the impacts of using large quantities of water on existing demand and future uses (though the data is often based on dated materials). Based on these projections, the 2012DPEIS concludes in Tables 3.4.1-2 and 3.4.1-3 and the corresponding text that demand in the Upper Basin could exceed what is legally available to these states.

Moreover, acre-feet of surface water demand is not the only question that must be answered. Much if not most of the water required by oil shale and tar sands development would need to be stored in reservoirs. Big flows only happen in the spring, yet industry would need water all year round. The impacts of storage projects on endangered and native fish species and healthy river systems must be evaluated as well. The 2012DPEIS fails to adequately analyze these impacts.

#8])>

<([#9 [3.4.2] There are also significant concerns regarding the major alteration of aquifer hydraulic

characteristics, flow patterns and subsurface water quality over large areas, due to extraction mining and/or *in-situ* processing of oil shale and tar sands resources. Included in these impacts are the drilling, de-watering, isolation, reclamation, waste disposal and excavation activities associated with resource extraction and processing. In addition, because the processes associated with *in situ* extraction techniques, which will affect geological formations including aquifers, may be thermal, chemical and physical, a detailed analysis of these technologies once identified is required in order to evaluate “down-hole” impacts and suitable mitigation measures. The 2008FPEIS failed to provide this analysis and the 2012DPEIS still does not contain sufficient information to support credible conclusions or recommendations regarding oil shale and tar sands development.

The impacts of waste discharges from oil shale processing facilities, power generation, and other processes associated with the exploitation of the oil shale and tar sands resources remains a high concern and the 2012DPEIS lacks an in-depth assessment of such impacts to water resources.

For example, it does not describe and evaluate the quantity and quality of leachate water and runoff from spent tar sands or oil shale spoils and tailings and all areas altered by extraction activities so that appropriate mitigation measures can be identified and implemented. This gap remains and must be addressed.

Impacts resulting in increased concentrations and loadings of selenium and salinity in the Colorado River and its tributaries are likely to occur, as acknowledged in the 2008FPEIS and the 2012DPEIS. However, the 2012DPEIS does not address how they may be mitigated or avoided. Such impacts are particularly troubling because they have long been identified as special concerns under existing conditions and could be greatly exacerbated by oil shale and tar sands development.

#9]) <([#10 [3.4.2] [4.2] The 2012DPEIS does not rigorously address the impacts of alterations in river water quality on endangered species. This is of particular concern with respect to the Endangered Fish Recovery Implementation Program, for which major efforts and expenses have already been incurred in the Colorado River Basin.

The 2012DPEIS also fails to provide adequate data on the significance of groundwater in the three affected states (Much of the groundwater data in the 2012DPEIS is extremely dated. For example, water use estimates within the

Green River Basin are from 1990. This data does not take into account existing oil and gas drilling operations which

have expanded over the past 20 years the area, nor does the 2012DPEIS make any attempt to consider the

cumulative impacts posed by proposed but not yet operating oil and gas development projects, such as the Hiawatha

Project located within the Washakie Basin. BLM provided 1984 groundwater data for the tar sands analysis section

in the 2012DPEIS).

BLM admits that much is unknown regarding groundwater availability

and significance. Yet, many areas, such as the Green River and Washakie Basins, rely entirely on groundwater as the sole source of drinking water. Groundwater recharge also plays a major role

for important streams and habitat for sensitive fish and wildlife species. Major groundwater contamination concerns have been identified, including the burden of spent shale which has significantly higher salt levels than raw shale and may yield other toxic substances (Bartis, Jim.

2005. *Oil Shale Development in the United States: Prospects and Policy Issues*. RAND publication).

However, very little analysis of the potential impacts on other resources or effective mitigation measures (Relying on Best Management Practices (BMPs) through BLM land use plans is not sufficient. There are ample examples of poor BMP implementation and lack of effective monitoring of energy impacts currently within the three-state region).

is provided in the 2012DPEIS. It is clear that, prior to any leasing or development of oil shale and tar sands resources, much more extensive groundwater analyses must be conducted. **#10])>**

B. Fish and Wildlife Values

<([#11 [3.7.3.1] [3.7.3.9] [3.7.4.1] According to the 2012DPEIS, most oil shale and tar sands projects will disturb 100 percent of the leased surface (See 2012DPEIS at 4-3 to 4-11).

In other words, these projects will completely eliminate the value of those

lands as wildlife habitat. In the arid environs where oil shale and tar sands development is being proposed, “[r]eclamation to functional systems similar to that found pre-disturbance will take in excess of 50 years (Baker 2006)” (Comments submitted by A. William Alldredge, Ph.D. on the 2008FPEIS at 4).

Therefore, habitats disturbed by oil shale and tar sands development would be unavailable for decades even after reclamation has been initiated” (*Id.*). Moreover, impacts on most wildlife are not proportional to the amount of habitat lost (*Id.*).

“Habitat

is not all created equal, some areas of habitat are simply more valuable than others” (*Id.*). Winter range, for example, is considered a limiting factor for big game species. According to the 2012DPEIS, at least 735,000 acres of mule deer winter habitat, including 78,093 acres of mule deer critical winter range; 31,479 acres of mule deer migration corridors; 649,700 acres of elk winter habitat; and 190,478 acres of elk production area is at risk (*See, e.g., 2012DPEIS at 6-18; see also Comments submitted by the Colorado Department of Natural Resources on the 2008FPEIS*).

Displacement of big game

from high value and important habitat to other, often lesser quality habitat, places additional stressors on these animals (Sawyer, Hall, *et al.* 2006. *Winter Habitat Selection of Mule Deer Before and During Development of a Natural Gas Field*. *Journal of Wildlife Management* 70:396-403; Sawyer, Hall, *et al.* 2009b. *Influence of well pad activity on the winter habitat selection patterns of mule deer*. *Journal of Wildlife Management* 73:1052-1061).

Since big game already is being impacted by the oil and gas

development activities underway in many critical winter range areas in all three states, losing more habitat (and furthering concentrating big game populations into smaller and smaller areas) could lead to unacceptable losses.

Over half a million acres of identified sage-grouse habitat is also at risk. Sage-grouse are on the verge of requiring listing under the Endangered Species Act. They have declined precipitously range-wide. Declines have been estimated at over 50% in occupied area and up to 80% decline in bird abundance, with complete extirpation in several states. A federal court recently concluded that energy development in the eastern reaches of sage-grouse range, including Wyoming and Colorado, poses a significant threat to sage-grouse (*Western Watersheds Project v United States Fish and Wildlife Service*, No. CV-06-277-E-BLW, slip op. at 13 (D. Id. December 4, 2007)).

Leks, nesting habitat, and winter

concentration areas are all vital to the continued viability of sage-grouse.

Based upon the information that is contained in the 2012DPEIS, oil shale and tar sands development poses a huge threat to fish and wildlife, including species that already are on the verge of disappearing. Hundreds of thousands of acres of vital wildlife habitats may be “occupied” by oil shale and tar sands projects to the exclusion of all other uses, including fish and wildlife, perhaps for generations. Reclamation does not address this loss because habitat functions will not be restored for decades. Moreover, none of the other mitigation measures discussed in the 2012DPEIS will reduce the impact of this loss because none of the measures currently in BLM’s toolbox were designed to redress a use that destroys and then occupies such vast amounts of land surface.

#11)> 1. <([#12 [3.7.5.1] Greater sage-grouse (As a keystone species, the health of Greater sage-grouse populations is a good indicator of overall ecosystem health for the sagebrush ecosystem. Landscape-scale conservation strategies targeting the sage-grouse also benefit dozens of additional sagebrush obligate wildlife species, from pronghorn to BLM Sensitive songbirds). Since the 2008 FPEIS was issued, the United States Fish and Wildlife Service (USFWS) determined that listing the Greater sage-grouse as threatened or endangered rangewide is “warranted but precluded by higher priority listing actions.” As the agency cautions, “[e]vidence

suggests that habitat fragmentation and destruction across much of the species' range has contributed to significant population declines over the past century. If current trends persist, many local populations may disappear in the next several decades, with the remaining fragmented population vulnerable to extinction" (<http://www.fws.gov/mountain-prairie/species/birds/sagegrouse/> (last accessed March 29, 2012)).

The USFWS also found that southwestern and

central Wyoming and northwestern Colorado are strongholds for sage-grouse, with some of the highest estimated densities of males anywhere in the remaining range of the species. The USFWS identified this "high-density sagebrush area as one of the highest priorities for conservation consideration as it comprises one of two remaining areas of contiguous range essential for the long-term persistence of the species" (75 Fed. Reg. 13910, 13950 (March 23, 2010) (citing Wisdom *et al.* (in press, p. 23)).

The sage-grouse "stronghold" identified by USFWS overlaps with areas proposed for oil shale and tar sands development. Such development would eliminate all grouse habitat on the lease, and likely render adjacent habitat unsuitable as well causing abandonment by near-by sagegrouse populations due to industrial activity on the lease. For this reason, we strongly urge BLM to place all identified sage-grouse Core Areas within Wyoming and all sage-grouse habitat in Colorado and Utah off limits to oil shale and tar sands extraction (BLM currently is in the process of amending all applicable land use plans to improve the agency's sage-grouse conservation efforts and identify priority sage-grouse habitats. To ensure consistency with those new plans, BLM

should take no action that might result in the potential loss of sage-grouse habitat. The Preferred Alternative 2(b)

calls for protection of "priority sage-grouse habitats." However, those habitats have yet to be delineated and we

encourage BLM to err on the side of caution until range-wide conservation measures are in place).

The maintenance of high-quality sagebrush steppe habitats, particularly nesting and wintering habitats, is necessary to maintain viable sage-grouse populations (To ensure viable sage-grouse populations, it is important to consider nesting, brood-rearing, and winter habitats. Holloran and Anderson found that 64% of sage-grouse females nested within 5 km of a lek. Holloran, M.J., and S.H.

Anderson. 2005. *Spatial distribution of greater sage-grouse nests in relatively contiguous sagebrush habitats.*

Condor 107:742-752).

Large sage-grouse Core

Areas like South Pass and the Kinney Rim/Vermillion have been proposed for protection from future oil and gas leasing under BLM's Wyoming sage-grouse plan amendment. Populations in Colorado and Utah are generally more compromised and at-risk than Wyoming; special care must be taken to appropriately scale conservation efforts to states with smaller populations (Connelly proposed comprehensive guidelines regarding the management of sage-grouse, focused around the

conservation of breeding/nesting habitat, late summer brood-rearing habitat, and wintering habitat. Connelly, J.W.,

M.A. Schroeder, A.R. Sands, and C.E. Braun. 2000. *Guidelines to manage sage-grouse populations and their*

habitats. Wildl. Soc. Bull. 28:967-985).

Additionally, Colorado, Utah and Wyoming sage-grouse populations are genetically connected. Impacts from development to the populations in one state are likely to negatively influence populations in the other states. Corridors and genetic connections between different populations and across state lines must inform decision-making. Additional habitat fragmentation and infrastructure impacts that further isolate populations must be avoided.

In December 2011, BLM issued *A Report on National Greater Sage-Grouse Conservation Measures*. This report by the BLM's sage-grouse National Technical Team (NTT) establishes that BLM's objective is "to develop new or revised regulatory mechanisms, through Resource Management Plans (RMPs), to conserve and restore the greater sage-grouse and its habitat on BLM administered lands on a range-wide basis over the long term" (Department of the Interior, Bureau of Land Management. December 2011. *A Report on National Greater Sage-Grouse Conservation Measures*, p. 4).

With the NTT and the sage-grouse plan amendments, BLM is taking steps to achieve its goal to "maintain and/or increase sage-grouse abundance and distribution by conserving, enhancing or restoring the sagebrush ecosystem upon which populations depend in cooperation with other conservation partners" (*Id.* at 6).

The NTT further provides that "[u]ntil such time as more specific conservation objectives relative to sage-grouse distribution or abundance by sage-grouse management zone, state, or population are developed, BLM will strive to maintain or increase current distribution and abundance of sage-grouse on BLM administered lands in support of the range-wide goals" (*Id.*).

As BLM finalizes a new policy based on the NTT's recommendations that will ensure the longterm viability of the species, and the USFWS moves toward reconsideration of its warranted but precluded finding, it is important that current sage-grouse habitat be preserved. Additionally, BLM needs to address whether adjacent lands may warrant protection because they are likely to provide important habitat in the future, as climate change results in shifting habitat types and ecosystem conditions. #12])>

2. <([#13 [3.7.3.1] Mule deer

Properly managing mule deer dramatically benefits local rural communities. The Western Association of Fish and Wildlife Agencies' Mule Deer Working Group explains why mule deer are important to sportsmen and small towns:

In a 2006 survey of outdoor activities, USFWS reported that nearly 3 million people hunted in the 19 western states (USFWS 2007). In 2006 alone, hunters were afield for almost 50 million days and spent more than \$7 billion in local communities across the West on lodging, gas and hunting-related equipment. Although this included hunters that pursued other species, mule deer have traditionally been one of the most important game animals in the West. According to the same 2006 survey, 25.6 million residents in 19 western states spent more than \$15.5 billion that year "watching wildlife" (Lutz *et al.* 2010. *Oil/gas, wind, and solar energy development guidelines for mule deer*. Western Association of Fish and Wildlife Agencies Mule Deer Working Group).

Total hunting and fishing sales and revenue for 2010 in project area (USFWS, iFAIMS database at www.fws.gov).

Hunting Fishing Total

Licenses/Revenue Licenses/Revenue Licenses/Revenue

Colorado 538,734/\$56,200,410 1,039,177/\$15,112,929 1,577,911/\$71,313,339

Utah 292,695/\$12,005,639 466,098/\$10,084,698 758,793/\$22,090,337

Wyoming 278,632/\$25,267,335 370,313/\$5,366,360 648,945/\$30,633,695

Total Sales/Revenue 2,228,407/\$1,240,373,371

Yet, mule deer are struggling across the West. They are declining in population in many areas, including Colorado, Utah, and Wyoming (See Theodore Roosevelt Conservation Partnership. April 2011. *Mule Deer and Energy: Federal Policy and Planning in the Greater Green River Basin* available at

http://www.trcp.org/assets/pdf/TRCP_Mule_Deer_and_Energy_in_the_GRB.pdf ; Ellenberger, J., A.G Byrne. 2011.

Population Status and Trends of Big Game and Greater Sage- Grouse Along the Colorado/Wyoming State Line. A

Report prepared for the National Wildlife Federation available at

http://www.ourpubliclands.org/sites/default/files/files/Executive_Summary.pdf).

Deer face a number of stressors, but most significant

is that their habitat is changing and disappearing. The causes of these habitat losses include but are not limited to suburban and rural sprawl, livestock management, fire suppression, invasive species and traditional and renewable energy development.

During the last decade, as energy production has expanded on western public lands, scientific understanding about the impacts of energy production on fish and wildlife populations has expanded as well, with much being learned about how mule deer respond. For example, a series of studies on the Pinedale Anticline show that drilling and production of natural gas on crucial winter range significantly affect mule deer, with dramatic decreases in wintering populations within the developed area. In 2007, Sawyer *et al.* published research that attributed 27 percent of the decline in mule deer on the Pinedale Anticline to energy development. In 2010, monitoring reports show a 60-percent loss in mule deer since development began in 2001. Many wildlife experts are now concerned that the dramatic increase in energy production on public lands represents the most significant threat to mule deer populations as a result of both direct loss of crucial habitat and disruption. Oil shale and tar sands development further threatens mule deer habitat and populations. #13)>

<([#14 [3.7.3.1] [5] [3.7.3.9] BLM's existing mitigation measures have proved insufficient to address big game impacts even

from more traditional forms of oil and gas development. New data from Sawyer *et al* (Sawyer, Hall, *et al.* 2006.; Sawyer, Hall, *et al.* 2009b.) illustrate

that timing limitations, for example, should no longer be considered as adequate oil and gas mitigation lease stipulations. This research, based on extensive study within oil and gas development fields in Wyoming, indicates that the standard stipulations BLM routinely and traditionally imposes are ineffective as currently implemented. Timing limitations typically apply only during the exploration and construction phases of oil and gas extraction; they provide no protection during production. Moreover, timing stipulations do not address the loss of habitat once an area can be accessed and disturbed when the seasonal restrictions expire. Current science supports the use instead of No Surface Occupancy stipulations in vital big game habitats such as critical winter range. Critical winter ranges contain the important cover, forage, and security that assure the survival of mule deer and elk herds, even in the worst of winters. Any direct habitat loss to these important lands compromises the ability of populations to survive when snowpack

is at a maximum and temperatures are coldest. As mentioned above, Sawyer's research, among others, demonstrates the impacts of oil and gas developments over a 10 year period on mule deer in western Wyoming: a 46% decline in use on critical winter range and a 60% decline in population abundance are directly attributable to the impacts from energy development **and relaxing the timing restrictions** (Sawyer, Hall, R. Nielson. 2010. *Mule Deer Monitoring in the Pinedale Anticline Project Area: 2010 Annual Report*. Presented to the Pinedale Anticline Planning Office, Pinedale, Wyoming).

Changes in habitat selection and use by mule deer were immediate and little to no acclimation to well pads was evidenced after 10 years of monitoring (Sawyer, Hall, *et al.* 2006; Sawyer, Hall, *et al.* 2009b).

We urge BLM to include additional review of migration corridor studies that illustrate the importance of maintaining big game migration corridors and their proximity to energy development facilities. Sustaining migratory populations of mule deer requires the maintenance and protection of suitable seasonal ranges and maintaining functional uses of migration routes (Sawyer, Hall. 2007. *Final Report for the Atlantic Rim Mule Deer Study*. Prepared for Anadarko Petroleum, BLM, and the Wyoming Game and Fish Department. April 2007).

Distinguishing between high use areas (which may concentrate deer on key forage habitat and create slow movement through an area) and lower-use areas (which provide faster corridor movement and connectivity between high use areas) can provide mitigation opportunities including facility and road development structure, avoiding fragmentation, and ensuring deer have safe access between areas (Sawyer, Hall, M. Kauffman. 2008. *Identifying Mule Deer Migration Routes Along the Pinedale Front*. Report prepared for the Wyoming Wildlife and Natural Resources Trust. May 2008; Sawyer, Hall *et al.* 2009. *Identifying mule deer migration routes to and from the Pinedale Anticline Project Area*. Report prepared for University of Wyoming School of Energy Resources, Laramie, WY. November 2009). **#14])>**

<([#15 [3.7.3.12] Finally, the 2012DPEIS fails to mention the recent Western Governors' Association's

recommendation and review of wildlife critical habitat and migration corridors, as required under BLM IM 2012-039. This IM ("*Identification and Uniform Mapping of Wildlife Corridors and Crucial Habitat Pursuant to a Memorandum of Understanding with the Western Governors' Association*") was issued December 21, 2011, and provides guidance to all BLM field offices in identifying wildlife corridors and crucial habitat using the newly developed Western Wildlife Crucial Habitat Assessment Tool (CHAT). This multi-dimensional effort is designed to coordinate information about priority habitat areas existing across political jurisdictions in specific regions of the West. The timeframe for implementing the use of CHAT is immediate, according to the IM. We urge BLM to employ CHAT as another habitat analysis tool under the 2012DPEIS. **#15])>**

<([#16 [2.2.1] We support the determination in Preferred Alternative 2(b) to place many vital big game habitats

off limits to oil shale and tar sands development, including crucial winter ranges. However we also encourage BLM to continue to assess whether additional habitat protections for big game may be necessary. In particular, we urge the agency to collect additional data on migration corridors and the importance of transitional ranges to mule deer, elk, and other big game species.

#16])> 3. Fish

<([#17 [3.7.1.1] [3.7.4.1] The discussion of aquatic resources in the 2012DPEIS is improved

over that included in the 2008FPEIS; however, it still does not provide sufficient consideration of potential impacts to Colorado River fish species and associated aquatic habitats. Though native trout and native fishes are mentioned, there is little recognition of their specific locations and importance within the various watersheds that could be impacted by oil shale and tar sands development. This is particularly noticeable with respect to Colorado River cutthroat trout (CRCT). For example, within the Green River Oil Shale Basin, numerous tributaries to the Green River contain CRCT populations. This includes the eastern portion of the Green River Oil Shale Basin between Flaming Gorge and Wyoming Highway 191. Here, within what is known as the Greater Little Mountain Area, populations of CRCT exist in small, often isolated sagebrush ecosystems. Trout Creek, Gooseberry Creek, Sage Creek, and Currant Creek are important waters for CRCT populations. Considerable time, effort, and money has been spent restoring riparian habitats, improving watershed conditions, and preventing further degradation to these sensitive watersheds. Numerous partners have contributed to the restoration efforts over the last 20 years, including BLM. #17)>

<([#18 [3.1.2] The 2012DPEIS contains almost no discussion of the importance of the watersheds to recreational anglers. Though briefly mentioned in a single paragraph describing the affected environment in the Piceance Basin, no similar discussion of recreational fisheries is included in sections on the Uinta Oil Shale Basin, the Washakie Oil Shale Basin, or the Green River Oil Shale Basin. Angling and hunting within these areas are important economic and tourism drivers. Within the Green River Oil Shale Basin alone, two major reservoirs (Flaming Gorge Reservoir and Fontenelle Reservoir) exist which provide thousands of annual recreational days for boating, angling, picnicking, and hunting activities.

#18)> Finally, <([#19 [3.7.4.3] the Wyoming Game and Fish Department has recently completed updates to the state's Strategic Wildlife Action Plans (SWAP) in 2010. This re-evaluation of the Species of Greatest Conservation Need from 2005 includes a new evaluation system for conservation prioritization. Like Utah, Wyoming applies a tier ranking system. For purposes of the 2012DPEIS, the bluehead sucker, flannelmouth sucker, roundtail chub, and the CRCT all are designated as Tier I species (having the highest priority ranking). A more detailed assessment of impacts to these high priority species must be conducted prior to any oil shale and tar sands leasing or development.

#19)> a. <([#20 [3.7.1.2] [3.7.4.1] **Colorado River cutthroat trout.**

The potential oil shale and tar sands development area encompasses five native trout conservation populations; one is in a tributary to the Green River just above Flaming Gorge Reservoir, while the other four are located across the divide in headwater tributaries to the Colorado River. Ensuring the future viability of these populations is critical given the extent of extirpation that has already occurred and the tenuous nature of the remaining populations. BLM, through its Colorado, Wyoming and Utah State Directors, is a participant in the CRCT Conservation Team and a signatory to the Team's Conservation Agreement, which *obligates the BLM to ensure implementation of CRCT conservation actions* detailed in the Team's Conservation Strategy. The 2012DPEIS mentions the Conservation Agreement and its obligations yet it provides no discussion as to how BLM would protect both current *and* potential cutthroat trout habitat. In fact, there is no discussion of the potential CRCT habitat which exists in all three states within the oil shale and tar sands development area.

Strategies for conserving this sensitive species call for securing and enhancing individual populations of CRCT. One of the most challenging needs for CRCT is the reestablishment of large, interconnected habitat areas where fluvial and adfluvial populations can exist free of nonnative

trout species. Headwater streams typically provide habitat for CRCT populations and these stream reaches are typically small with stream widths less than 15 feet and depths less than three feet. Due to the small stream reaches, any degradation or catastrophic event will have immediate and long-term consequences to the fisheries population, and typically result in total fish loss. Such an event was witnessed in a tributary of LaBarge Creek in the 1970's by the Wyoming Game and Fish Department, when an oil spill into the stream killed all CRCT. This population never recovered (Binns, Allan. 1977. Wyoming Game and Fish Internal Report). CRCT populations are not tolerant of sediment loads which can occur with road traffic, air pollution, construction activities, sudden weather events, spills, steep slopes, etc. Such erosion events can cover eggs from spawning, literally wiping out the following year's age class of fish. Oil shale and tar sands development, as described in the 2012DPEIS, creates tremendous potential for heavy surface impacts which could affect coldwater fisheries. The increase in roads, truck traffic, construction activities, toxic spill potential, *in-situ* and open pit operations, and loss of water due to dewatering of streams and groundwater systems all spell potential impacts to CRCT. Like oil and gas drilling, the oil shale and tar sands extraction will result in accidental spills. Most energy development involves high risk to the environment; each of the three states (especially Colorado) has a history of hazardous spills or discharges into coldwater streams in accidents ranging from diesel truck turnovers to uncontrolled discharges of hazardous fuels. Consideration of these impacts must be included in any NEPA analysis.

b. Nongame native fish species.

Since so many nongame native warmwater fishes are concentrated within the potential oil shale and tar sands development area, we recommend avoidance of all disturbance to streams and riparian zones. Maintaining these species' habitats in quality condition will prevent the future listing of additional nongame native fish and conserve those species already listed as federally endangered.

#20] > 4. <([#21 [3.7.3.1] [3.7.4.9] Alternative C and wildlife

In the 2008FPEIS, Alternative C is presented as BLM's attempt to identify those lands that would be excluded from oil shale or tar sand development on the basis of existing land use plan decisions. BLM made the determination that the most effective means of identifying lands that should be excluded on this basis was to exclude those lands within each field office where stipulations for no surface disturbance or seasonal limitations are in place for oil and gas leasing. While we welcome BLM's incorporation of these exclusions in its Preferred Alternative for the 2012DPEIS and agree that the lands identified should be off-limits to commercial oil shale and tar sands leasing, the list of lands is incomplete. Resource managers and the public have had no opportunity to consider whether oil shale or tar sands extraction would be incompatible with other land management objectives. With respect to sage-grouse, much of the vital habitat has not been identified and mapped by either BLM or state wildlife agencies. With respect to many other wildlife species, there is simply no usable data regarding the location and condition of important habitats (There are several efforts underway to collect and standardize landscape-level data on fish and wildlife habitats and populations. These include the Department of the Interior's Landscape Conservation Cooperatives, BLM's Rapid Ecological Assessments, BLM's sage-grouse conservation planning effort, and WGA's wildlife corridors initiative. We urge BLM to

await the outcome of these efforts before moving forward with any additional oil shale and tar sands leasing or development).

As for big game, winter range traditionally has been considered the limiting factor, however, significant losses of summer and/or transitional ranges as a result of oil shale and tar sands projects could also pose threats to the continued vitality of big game populations. Because the 2012DPEIS still contains no information regarding the migration and use patterns of big game herds, it is impossible to estimate those impacts. *See* Comments submitted by A. William Alldredge. However, conservation of big game populations and distributions may require additional ranges be set off-limits. We, therefore, encourage BLM to address these habitats in future NEPA documents.

#21])> C. <([#22 [3.1.1] Areas of Critical Environmental Concern (ACECs) and Other Special Designation Lands

1. ACECs

FLPMA defines ACECs as “areas within public lands where special management attention is required to protect and prevent irreparable damage to important historic, cultural, or scenic values, fish and wildlife resources, or other natural systems or processes, or to protect life or safety from natural hazards” (43 U.S.C. § 1702(a)).

Under FLPMA, BLM is obligated to “give priority to the designation and protection of areas of critical environmental concern” (43 U.S.C. § 1712(c)(3)).

In the 2008FPEIS, BLM

opened all ACECs to application for commercial leasing, except for lands where mineral development is not currently allowed. This commitment to protect only a portion of ACECs was insufficient.

The 2012DPEIS, through Preferred Alternative 2(b), improves upon the 2008 decision by excluding from commercial development all ACECs, including those areas under consideration for designation under current planning processes (2012DPEIS at E-S 6 and 2-28).

We support those additional protections and

urge their inclusion in the final PEIS. As the 2012DPEIS makes clear, BLM would not be able to prevent undue degradation to important values for which ACECs were designated should oil shale or tar sands development proceed:

Oil shale and transmission or pipeline development on any ACEC would result in a loss of all or a part of the resources or values for which the area was originally designated. Oil shale development within the viewshed of these areas may also result in adverse impacts on scenic values of these areas (2012DPEIS at 4-21).

Given the relatively small number of acres of designated ACECs that overlap prospective oil shale and tar sands development areas (ACECs that are not closed to mineral leasing include approximately 44,000 acres and are shown in Table 6.1.1-1. Should oil shale development occur in these areas, the values within these designated ACECs would be lost. 2012DPEIS at 6-5), all ACECs should be closed to oil shale and tar sands

development, even those that currently are open to mineral development. At the time of designation, it was assumed that the sensitive resources within these ACECs could withstand some level of disturbance from oil and gas drilling or other human activity. Oil shale and tar sands development represents quite a different level of surface disturbance, one that is irreconcilable with the protection of most other resource values.

#22])> 2. <([#23 [9.2.1] [3.1.1] Lands with wilderness characteristics

Because roadless and undisturbed lands provide important fish and wildlife habitat and unique opportunities for outdoor recreation, including hunting and fishing, we support the determination in Preferred Alternative 2(b) to place lands with wilderness characteristics off limits to oil shale and tar sands development. The congressional funding limitation for fiscal year 2011 limiting implementation of Secretarial Order 3310 regarding “wild lands designations” does not prohibit BLM from considering wilderness as part of this PEIS or relieve BLM from its continuing statutory obligation to inventory and manage federal lands for wilderness values (FLPMA requires BLM to “maintain on a continuing basis an inventory of all public lands and their resource and

other values (including, but not limited to, outdoor recreation and scenic values), giving priority to areas of critical environmental concern. This inventory shall be kept current so as to reflect changes in conditions and to identify new and emerging resource and other values.” 43 U.S.C. § 1711(a)). **#23]>**

<([#24 [3.1.1] 3. Wyoming: other lands to be protected

a. Adobe Town

Adobe Town has been called the crown jewel of the Red Desert, encompassing irreplaceable ecological, geological, historical, and recreation values. At 180,910 acres, Adobe Town is Wyoming’s largest and most spectacular desert wilderness. Stretching 26 miles north to south and 19 miles east to west, this area is one of the last places in Wyoming where visitors can take in views of pristine landscape that stretch from horizon to horizon. The landscape ranges from banded badlands to mazes of arches, pinnacles, and spires, offering spectacular scenic vistas and important wildlife habitat.

Following the issuance of the 2008FPEIS, the State of Wyoming designated the Adobe Town area as Very Rare or Uncommon under the state Environmental Quality Act. We are encouraged to see that BLM is proposing to protect the Adobe Town area from development in the Preferred Alternative 2(b). We strongly support this decision and urge BLM to include such protections in the final decision in order to ensure consistency with “state plans and policies” under FLPMA (In the 2008FPEIS, only lands designated as WSA within Adobe Town were protected from commercial

development. All of Adobe Town as a State of Wyoming Very Rare and Uncommon area, not just the WSA, should be excluded from oil shale development).

Adobe Town has a host of sensitive wildlife habitats that are crucial or vital to meeting the very rare or uncommon designation criteria. These habitats include sage-grouse leks and big game crucial winter ranges. The cliffs and pillars found throughout Adobe Town provide ideal nesting habitat for raptors. There is a desert elk herd, known to the Wyoming Game and Fish Department as the Petition Herd, which is one of the few true desert elk herds in North America, spending the entire year in the Red Desert. **#24]>**

<([#29 [3.1.1] 3. Wyoming: other lands to be protected

b. Little Mountain area, including Greater Red Creek ACEC, Red Creek WSA, and Sugarloaf Basin SMA

These areas were established under the Green River RMP and constitute an outstanding big game hunting resource and CRCT trout habitat. According to the Wyoming Game and Fish Department, the elk hunt in this area is the single most sought-after tag in the entire state. Some of the most important mule deer, elk, pronghorn, and sage-grouse high value habitat exists within

this ACEC complex. Oil shale activities would effectively remove wildlife species, including elk and mule deer, destroying the recreational quality of this area. CRCT populations within this ACEC complex exist in drainages with extremely sensitive soils making these isolated populations vulnerable to extirpation. Important springs help maintain the high water quality necessary for CRCT to exist. #29]>

<([#30 [3.1.1] **3. Wyoming: other lands to be protected**

c. Jack Morrow Hills planning area

The “most prospective” oil shale area in Wyoming includes portions of the Jack Morrow Hills planning area, a subset of the Rock Springs Field Office set aside from the Green River Resource Management Plan in the 1990s for special planning due to its outstanding wildlife and cultural resources. The results of that planning effort should not be undermined by opening the area to oil shale development. This is an area highly important for both dispersed recreation and elk hunting. It also contains the Boars Tusk and White Mountains Petroglyph Site, both of which are culturally important to Native American tribes. #30]>

4. <([#25 [3.1.1] Colorado: other lands to be protected

a. State Wildlife Areas

Colorado State Wildlife Areas (SWAs) should be protected from oil shale development. Six SWAs abut BLM lands or overlap with BLM managed subsurface resources opened for oil shale development in 2008. These areas include:

? Shell Oil SWA – hunting lease

? Yellow Creek Unit

? Square S Summer Range Unit

? Square S Ranch Unit

? Little Hills Unit

? North Ridge Unit of the Piceance SWA

These areas all provide important habitat for fish and wildlife, as well as recreational opportunities and an economic draw for local communities. These areas must be protected from both direct and indirect impacts associated with oil shale development. #25]>

<([#26 [3.1.8] [3.7.1.1] [3.7.4.1] **b. ACECs**

(1) East Fork Parachute Creek (It appears that BLM will revisit and correct the illegal decision made in the 2008FPEIS and corresponding Record of Decision to open Naval Oil Shale Reserves (NOSRs) Nos. 1 and 3 to oil shale leasing. That 2008 decision ignored a withdrawal on the NOSRs preventing those lands from being leased for oil shale development. *See* 2012DPEIS at 3-7. BLM must identify the NOSRs as unavailable for application for commercial oil shale leasing in any final PEIS barring issuance of an opening order. Such a decision would eliminate the threat of commercial oil shale development in the East Fork of Parachute Creek).

East Fork Parachute Creek provides year-round habitat for CRCT, the only native trout in the Colorado River basin (U.S. Department of Agriculture, Forest Service. 1996. *Conservation Status of Colorado River Cutthroat Trout*, p. 1, available at:

http://www.fs.fed.us/rm/pubs_rm/rm_gtr282.pdf).

East Fork Parachute Creek is identified as one of the five areas containing conservation populations by the *Conservation Agreement and Strategy for Colorado River Cutthroat Trout in the States of Colorado, Utah, and Wyoming* (Available at: <http://www.USFWS.gov/mountain-prairie/species/fish/crct/CRCT/>)

The Conservation Agreement gives highest

priority for management and protection to streams identified as containing conservation

populations (These populations also meet the BLM's own criteria for a conservation population. A conservation population is defined as: “[a] reproducing and recruiting population of native cutthroat trout that is managed to preserve the historical genome and/or unique genetic, ecological, and/or behavioral characteristics within a specific population and within geographic units.” See U.S. Department of the Interior, Bureau of Land Management. 2008. *Roan Plateau Planning Area Proposed Plan/Final Environmental Impact Statement*, pp. 3-114).

Populations of CRCT in East Fork Parachute Creek are at least 90% genetically pure (U.S. Department of the Interior, Bureau of Land Management. 2002. *Roan Plateau Resource Management Plan Amendment*, p. 20).

The importance of these trout populations is clear. This area must be protected from oil shale development in order to ensure the subspecies continues reproducing and recruiting. Oil shale development will likely result in increased sedimentation, reductions in water quantity and quality, ground water flow alteration, and increased likelihood of water contamination with toxic byproducts. These impacts will add stresses to CRCT populations and, in so doing, may undermine one of the values this ACEC was designated to protect.

BLM considers the entire watershed to be important to the long-term functionality of vital ecosystem processes that maintain upland and stream habitats important to these fishes (*Id.*).

According to BLM, “these streams are regionally and nationally important producers of native, genetically pure and naturally reproducing Colorado River cutthroat trout,” going on to proclaim that these streams should be given the “highest priority for management and protection” (*Id.*).

(2) Trapper/Northwater Creek ACEC (Trapper/Northwater ACEC is also almost entirely within the NOSR and cannot be available for oil shale development absent issuance of an opening order reversing the withdrawal that currently applies to the area. See 2012DPEIS at 3-4). Trapper and Northwater Creeks are tributaries to the Colorado River, and the creeks provide year-round habitat for CRCT. This ACEC is a critical conservation area for CRCT. Three of the five conservation populations of CRCT that exist atop the Roan Plateau are found within this ACEC. Included in these are “core conservation populations,” identified by a genetic purity of 99% or higher (*Id.* at 3-116).

We also urge BLM to preclude oil shale development on upper reaches of Trapper and Northwater Creeks that are not included in the Trapper/Northwater Creek ACEC. Industrial development higher up in these watersheds has the potential to impact downstream values, including the values for which the ACEC was designated. At risk, in this case, would be nearly all of the Northwater Creek and a significant portion of the Trapper Creek populations of CRCT.

#26])> 5. <([#27 [3.1.1] [3.7.1.1] Utah: other lands to be protected

a. White River ACEC

The Vernal RMP included a potential ACEC of 47,130 acres surrounding the deep canyon of the White River. This potential ACEC would have protected “unique geologic formations with spectacular vistas and the high-value river riparian ecosystem” (U.S. Department of the Interior, Bureau of Land Management. 2008. *The Vernal Field Office Proposed Resource Management Plan and Final Environmental Impact Statement*, p. 4-433).

The White River “provides critical habitat for the endangered Colorado pikeminnow, as well as habitat for other threatened, endangered, and sensitive species, including the razorback sucker, flannel mouth sucker, roundtail chub, Yellow-billed Cuckoo, Peregrine Falcon, and Bald Eagle” (*Id.*).

#27])> D. <([#28 [3.1.2] [3.10.4] Economics and Recreational Values

Public lands and their fish and wildlife resources are increasingly important from an economic standpoint and continue to be a wise long-term investment (*American Landscapes*. Newsletter, Fall 2009. “*Conservation and the Economy: the Economic Benefits of Public Lands*.”).

Recreation has become one of the

most important uses of our nation’s public lands, providing benefits beyond hunting and fishing (Collins, Sally, and H. Brown. Discussion Paper, 2007. *The Growing Challenge of Managing Outdoor Recreation*, *Journal of Forestry* 105(7)[Oct/Nov] 371-375)).

Outdoor recreational opportunities sustain an annual \$730 billion contribution to the U.S. economy (Outdoor Industry Foundation. 2006. *The Active Outdoor Recreation Economy* available at

<http://www.outdoorindustry.org/images/researchfiles/RecEconomypublic.pdf>).

For lands managed by the Department of the Interior (which include those BLM lands within the potential oil shale and tar sands development area) more than 437 million recreational visits in 2010 supported more than 388,000 jobs nationwide and contributed over \$44 billion in economic activity, including 9,000 jobs in Colorado, 15,000 jobs in Utah, and 14,000 jobs in Wyoming (U.S. Department of the Interior. June 2011. *The Department of Interior’s Economic Contributions*).

In Colorado, Utah, and Wyoming, close to 3 million people participated in fishing activities in 2006. This amounted to more than \$1.3 billion in expenditures to these three states. More than 523,000 hunters participated in some form of big game hunting in these same three states, contributing approximately \$900 million in hunting expenditures (USFWS. 2006. *National Survey of Fishing, Hunting and Wildlife-Associated Recreation: State Overview*).

Ranging from mule deer

hunting in Utah’s Bookcliffs to elk hunting in Wyoming’s Greater Little Mountain area to fishing wild trout streams in Colorado, the fish and wildlife resources at stake should oil shale and tar sands development proceed are important to sportsmen and to the businesses and families that depend on the renewable economic contribution sportsmen make each year to rural communities. Conserving public lands is essential to maintaining hunting, fishing and outdoor recreation and the western economies that are sustained by them (SFRED’s own recently released study concludes that sustainable industries on public lands such as hunting, fishing, and outdoor recreation are important to the continued economic vitality of rural western communities. Sportsmen for Responsible Energy Development/Southwick Associates. *Conserving Lands and Prosperity* available at www.sportsmen4responsiblenergy.org).

We urge BLM not to overlook these values of the lands it manages in trust for all Americans.

#28]> III. CONCLUSION

We are not opposed to the development of energy resources on our nation’s public lands. We understand that energy is vital to America and that, given the volatility of global markets, it is imperative that we reduce our reliance on foreign sources. However, because other important values are also at stake, such as fish, wildlife, and water, BLM must ensure that its decisions regarding the use of public lands are responsible and undertaken with a level of care commensurate with the trust that has been placed in its hands. Decisions to make public lands available on a commercial scale for unproven technologies at what could be terrible costs to other valued resources would be irresponsible at this juncture.

Sincerely,

Sportsmen for Responsible Energy Development, the National Wildlife Federation, the Theodore

Roosevelt Conservation Partnership, Trout Unlimited, the Colorado Wildlife Federation and the Wyoming Wildlife Federation. See Attachment.

Submission Text

The Coalition of Local Governments (CLG) hereby submits its comments on the Oil Shale and Tar Sands Programmatic Draft Environmental Impact Statement (OS/TS PDEIS). The Coalition is an organization of Wyoming local governments including Little Snake River Conservation District, Lincoln County, Lincoln Conservation District, Sublette County, Sublette County Conservation District, Sweetwater County, Sweetwater County Conservation District, Uinta County and Uinta County Conservation District. The Coalition members are cooperating agencies on the PDEIS.

CLG members established this organization to ensure that federal land decisions were consistent with the local governments' plans and policies and to pool their expertise and resources. The Coalition members have more than eight years of experience as cooperating agencies and have worked on more than 25 projects and land use plans, including numerous energy projects. CLG members are currently working on the sage grouse Resource Management Plan (RMP) revisions in Wyoming.

<([#1 [1.1.1]) As an initial matter, the Coalition notes that the due dates for these comments were poorly stated. The Notice of Availability for the Oil Shale Tar Sands PDEIS was published on February 3, 2012 by the Environmental Protection Agency, 77 Fed. Reg. 5513 (2012) and by the BLM on February 6, 2012. 77 Fed. Reg. 5833 (2012). The BLM notice provided that comments were due within 90 days of the EPA publication, which would be May 3, 2012. The EPA notice, however, incorrectly states that the comments were due May 2, 2012. To further confuse matters, the BLM web site states that the comments are due May 4, 2012. Several local governments formally requested additional time but in the absence of a response from BLM, the Coalition is filing these comments on May 4, 2012.

#1)> 1. <([#2 [2.1.1]) WYOMING LOCAL GOVERNMENT ALTERNATIVE

The Wyoming local governments support the land allocations in Alternative 1 for the oil shale program in Wyoming. Because Wyoming does not have an RD&D lease, it may well be appropriate for initial projects to start with and RD&D to determine which of the several proprietary techniques will work best. The local governments also assume that

the lease stipulations that have been applied for oil and gas to protect soils, water, vegetation and fish and wildlife will also apply. In addition, the reclamation standards should also be similar given the amount of effort that has gone into Wyoming specific reclamation.

Much of the affected land is located within the boundaries of the Rock Springs Field Office (RSFO) which is currently revising its RMP. As currently postured, the designations identified in the preferred alternative for the OS/TS PDEIS will conflict with many pending RMP decisions, such as lands with wilderness character (LWCs), Areas of Critical Environmental Concern (ACECs) and other special designations. It would make more sense to allow the RSFO to handle this issue as an integral part of its energy development and land use planning in the ongoing plan revision process.

The rest of the high potential area in Wyoming is covered by the Kemmerer RMP, which was final in 2008. The OS/TS PDEIS does not provide any factual basis to revise the RMP decisions as they apply to oil shale development. The Kemmerer RMP adopted the Wyoming sage grouse strategy to protect core area habitat.

CLG members object to the effort to revise these land use plans through the back door without the data or information that was used or being used to write the land use plans. This is especially confusing for the public lands in the RSFO. The land allocations in Alternative 1, even if only for Wyoming, should be retained especially in light of the insufficient data found in the OS/TS PDEIS.

Under the 2008 rules, 43 C.F.R. Parts 3900, 3920, 3930, Research Demonstration and Development (RD&D) leases were issued before commercial lease rules were adopted. 43 U.S.C. §15927(e). The OS/TS PDEIS would expand RD&D without any commercial leasing.

The BLM signed a settlement agreement proposes amendments to the Oil Shale Final Rule. The proposed amendments require BLM to expressly state that it has discretion to deny an application converting an RD&D lease to a commercial lease based on environmental and other resource considerations and that BLM has discretion to reject an oil shale commercial lessee's proposed plan of development based on environmental or other resource considerations. This would add additional requirements under 43 C.F.R. §3926.10.

The proposed amendments require BLM to only consider issuing a commercial oil shale lease upon application for a conversion from an RD&D lease to a commercial lease, or after BLM issues a call for expression of leasing interest. The proposed amendments also require BLM to not issue any commercial lease unless it is shown that operations can be done without unacceptable environmental risk. Finally, the proposed amendments require plans of development for oil shale commercial leases to include watershed and groundwater protection plans, and environmental protection and mitigation plans, including defined standards for each of these requirements. BLM acknowledged that approval of any conversion to a commercial lease must be preceded by a NEPA analysis.

These changes, when coupled with the discontinuous parcels made available for RD&D leasing in the OS/TS PDEIS alternatives, other than Alternative 1, will not provide the necessary assurance to industry that it will realize a return on investment. Any land configuration needs to be sufficiently contiguous that a company can recover the multimillion dollar investment that even an RD&D project requires. Alternatives 2 - 4 do not

achieve that objective. #2)>

2. <([#3 [9.2.2] OS/TS PDEIS DOES NOT CONFORM TO SECTION 369 OF THE 2005 ENERGY POLICY

ACT

In 2005, Congress directed BLM to establish a commercial program for development of oil shale and tar sands. Section 369 of the Energy Policy Act (2005 EP Act) adopted on August 8, 2005 relates to “Oil Shale, Tar Sands, and Other Strategic Unconventional Fuels.” 42 U.S.C. §15927. That title declared it to be the United States’ policy that “oil shale, tar sands, and other unconventional fuels are strategically important domestic resources that should be developed to reduce the growing dependence of the United States on politically and economically unstable sources of foreign oil imports.” 42 U.S.C. § 15927(b)(1). Congress also directed that it be United States policy that commercial development of oil shale “be conducted in an environmentally sound manner, using practices that minimize impacts.” 42 U.S.C. §15927(b)(2).

The 2005 EP Act required that the Interior Secretary promptly follow the completion of the programmatic EIS with regulations establishing a commercial oil shale and tar sands leasing program. 42 U.S.C. §15927(d)(2) (“Not later than 6 months after the completion of the [PEIS] under this subsection, the Secretary [of the Interior] shall publish a final regulation establishing such [commercial oil shale and tar sands leasing] program.”). Section 369 directs the Department of the Interior (DOI) to issue commercial oil shale leases 180 days after the final rules are promulgated. *Id.* Lease sales are to include consultation with states, local governments, tribal governments and others to determine the level of interest. *Id.* DOI promulgated the final rules in November 2008. 73 Fed. Reg. 69414 (2008). Rather than follow the law, DOI suspended all oil shale leasing in 2009 and has ignored its Task Force reporting obligations. 42 U.S.C. §15927(h).

While DOI is required to file reports with Congress each year, none has been prepared since 2008. <http://www.unconventionalfuels.org/publications.html>. The only reports now prepared are on “Secure Fuels.”

The extent of Congress’ commitment to unconventional fuels including oil shale and tar sands is also found in the establishment of a Task Force. 42 U.S.C. §15927(h).

Department of Energy is to create commercial strategic fuel development program and to coordinate with state and local governments. DOI was to prepare a new assessment of priority areas in the Green River Region, which includes Wyoming, Utah and Colorado. *Id.* at §15927(m)(B). The heavy oil assessment was also to be updated. *Id.* §15927(p).

BLM proceeded to implement the direction by preparing a programmatic EIS that addressed the environmental impacts of oil shale and tar sands development and identified the public lands with the best potential. Based on the two considerations, BLM identified about two million acres of public land in Wyoming, Utah and Colorado as suitable and available for oil shale and tar sands development. ROD, 2008 OS/TS PFEIS at 1-4. BLM also promulgated rules to implement the commercial leasing program. 43 C.F.R. Parts 3900, 3920, 3930, 3936.

The OS/TS PDEIS is intended to analyze the impacts of a commercial leasing program, not the RD & D program authorized in subsection (c). 42 U.S.C. §15927(c). The 2008 PFEIS accomplished this mandate but the OS/TS PDEIS does not. Instead, its identification of land omits high potential land and limits development to small and

scattered areas that it makes a commercial program less feasible and is calculated to discourage commercial development. The OS/TS PDEIS admits this when it claims the changes are needed to conduct additional research. OS/TS PDEIS at 1-5. The law authorized RD&D separately and did not give the Secretary the discretion to substitute a commercial leasing program with another RD&D leasing program which applies to 25% of the land previously classified as suitable and available. #3]>

3. <([#4 [9.5] OS/TS PDEIS FAILS TO CONFORM TO RMP PROCEDURES

a. OS/TS PDEIS Supersedes RMP Decisions Without Adequate

Rationale

The preferred alternative will remove from development lands with alleged wilderness character, notwithstanding a congressional prohibition on changing management to protect these lands. [Continuing Appropriations Act 2011, Pub. L. 112-10 (2011CR); Continuing Appropriations Act 2012, Pub. L. 112-36 (112th Congress) H.R. 2608, 10/05/11] The OS/TS PDEIS also proposes to exclude ACECs and other areas nominated by special interest groups, including groups that sued BLM in 2009, from oil shale or tar sands leasing. In many cases, the preferred alternative vetoes recent land use planning decisions, such as those for the Kemmerer RMP. In the case of the Rock Springs RMP, the OS/TS PDEIS will essentially make decisions that bind the plan revision process, without the requisite analysis or data.

The preferred alternative excludes more than 75% of the lands previously determined to be available for oil shale or tar sands leasing. This occurs even though much of the same land area is still classified as suitable and available for oil and gas leasing.

The OS/TS PDEIS purports to override the local land use planning process by designating LWCs, proposed ACECs and other protective sites, including the evergrowing Adobe Town area. Programmatic decisions cannot override the RMP process and as such, BLM is running roughshod over the rules and procedures established for land use decisions by implementing the resource allocations well ahead of information and analysis.

The Rock Springs Field Office initiated its plan revision in Spring of 2011. Much of the Wyoming high potential area is located in the Rock Springs Field Office but the OS/TS PDEIS appears to use proposed LWCs and ACECs that have not yet been fully addressed within the cooperating agency process, let alone a DEIS. CLG members cannot even comment in this process because it would violate the confidentiality agreement that it signed with BLM. This dilemma illustrates the flaws in BLM's efforts to impose top down decisions on LWCs and ACECs as well as the Adobe Town area, when those issues are still being addressed among the cooperating agencies. If BLM proceeds on this time table, it will eviscerate the land use planning process. This situation also suggests that national BLM has chosen to proceed without regard to its obligation to coordinate with local governments. For instance, Sweetwater County went on record a year ago as only supporting special management for the Adobe Town area within its wilderness study boundaries. The OS/TS PDEIS protects a much larger area even though the Wyoming Rare and Uncommon Area classification only prohibits noncoal surface mining and allows all other forms of mineral development. Wyo. Stat. 35-11-112(a)(v); Environmental Quality Commission rules, Chapter VII.

#4]> b. <([#5 [9.2.4] Sage Grouse Management

The State of Wyoming has been aggressively developing a sage grouse strategy for

management since 2004. By 2008, the sage grouse core areas had been defined and management guidelines developed. Wyoming Gov. E.O. 2008-2, 2010-4; 2011-5. Wyoming BLM largely adopted or followed these guidelines in the RMP revisions for the Kemmerer, Pinedale and Rawlins Field Office. Thus, the candidate status of the sage grouse is not a basis to remove these lands from oil shale and tar sands development, especially in light of the significant restrictions already in place. The OS/TS PDEIS omits these entirely.

Wyoming BLM initiated a statewide RMP amendment for the sage grouse to address the 2008 executive order in fall of 2008. [BLM IM 2010-012 Sage Grouse Habitat Management, December 29, 2009; IM 2010-013 Oil and Gas Leasing Screen for Greater Sage Grouse, December 29, 2009] CLG members are cooperating agencies and this process is well along. #5]>

4. IMPLEMENTATION OF LWC CLASSIFICATIONS IN RMPS IS UNLAWFUL

A significant percent of the excluded acreage in the OS/TS PDEIS is justified on the basis that the LWCs must be protected. OS/TS PDEIS at 1-5, 2-12, 2-21, 2-52.

a. <([#6 [9.2.1] [3.1.3] OS/TS PDEIS violates Congressional Funding Freeze on LWC Identification and Management

On December 22, 2010, Secretary Salazar announced a new initiative to identify and manage public lands with wilderness character. Secretarial Order No. 3310 Protecting Wilderness Characteristics on Lands Managed by the Bureau of Land Management (Dec. 22, 2010) [The Wild Lands Policy and IM 2011-154 contradict the commitments made to the State of Utah, the U.S. Congress and the public when the Secretary stated that he would honor the Settlement Agreement between Utah and DOI (Answering Yes to the question from Senator Bennett “Do you agree that currently the Department has no authority to establish new WSAs (Post-603 WSAs) under any provision of law, such as the Wilderness Act of [sic] Section 202 of FLPMA?”) The Secretary also stated BLM had no authority to impose nonimpairment management on non-WSA lands].

This action was followed with the adoption of manuals to guide BLM employees in the implementation of the extra-wilderness designation process. The resulting controversy and outcry, not to mention Director Abbey’s admission that no specific section of Federal Land Policy Management Act (FLPMA) authorized the identification of lands with wilderness character outside of Section 603, led Congress to defund the entire initiative. [Continuing Appropriations Act 2011, Pub. L. 112- 10 (2011CR); Continuing Appropriations Act 2012, Pub. L. 112-36 (112th Congress) H.R. 2608, 10/05/11]

BLM has long contended that a mere inventory of wilderness character falls within its authority, citing 43 U.S.C. §1711(a). But FLPMA is equally clear that BLM cannot change land management based on an inventory unless and until the land use plan is amended. *Id.* The OS/TS PDEIS uses an undisclosed wilderness inventory and then proposes to change the management of these areas to protect the alleged wilderness character without disclosure of the basis for BLM’s determination. This is exactly what S.O. 3310 directed BLM to do. When Congress froze all funding for it, two months after the *Colorado Environmental Coalition v. Salazar* (09-0085, 09-0091) settlement, BLM’s hands were tied. The apparent decision to proceed regardless of the funding freeze is in contempt of Congress and unlawful. 31 U.S.C. §1341.

Calling these areas LWCs does not change the result. These areas are allegedly

wilderness suitable and BLM proposes to manage them in the same manner as it would have had Congress not shut down all funding related to S.O. 3310. Changing the name from “Wildlands” to “LWCs” does not make the action any more lawful. Apparently, BLM acknowledges the difficulty and has assiduously avoided any kind of public rulemaking process to implement the switch from S.O. 3310 to IM 2011-154.

The OS/TS PDEIS contradicts Congress’ clear direction that BLM cease and desist from implementing the provisions of S.O. 3310. The fact that BLM put the implementing manuals in abeyance but issued Instruction Memorandum (IM) 2011-154 that implements the Order does not excuse BLM from the clear violation of Congress’ edict [The Antideficiency Act provides that “an officer or employee of the U.S.

Government may not make or authorize an expenditure or obligation exceeding an amount available in an appropriation or fund for the expenditure or obligation; involve the government in a contract or obligation for the payment of money before an appropriation is made unless authorized by law . . .” 31 U.S.C. §1341. The act imposes criminal penalties for violation, *Id.* at §1350, and authorizes adverse personnel action for employees that violate the law. *Id.* at §1349].

IM 2011-154 suffers from procedural deficiencies as well. It was issued without coordinating with local governments, public comment or in accordance with rulemaking procedures. Thus, it independently violates Federal Land Policy and Management Act (FLPMA) mandate that its provisions be implemented through rulemaking, 43 U.S.C. §1740.

An instruction memorandum issued by BLM in order to evade the funding and implementation freeze on S.O. 3310 enjoys little or no presumption of legality. *United States v. Mead Corp.*, 533 U.S. 318 (2001) (holding that the court owes little deference to agency guidelines). By implementing the IM, BLM runs a serious risk that the OS/TS PDEIS will be set aside.

B. NO LEGAL AUTHORITY TO IMPLEMENT SECRETARIAL ORDER 3310 OR SIMILAR DIRECTION

Unlike the definition of multiple use for National Forests, 16 U.S.C. §529, FLPMA does not include wilderness as one of the statutory multiple uses. 43 U.S.C. §1702(c).

Wilderness has its own definition, which is limited to Section 603. (“(i) The term ‘wilderness’ as used in section 1782 of this title shall have the same meaning as it does in section 1131(c) of Title 16.” *Id.* §1702(i). The term ‘wilderness’ is found only in the definition section, 43 U.S.C. §1702(i) and the wilderness review provisions of Section 603, 43 U.S.C. §1782; 43 C.F.R. §1601.0-5(i). Section 603 is the only provision in federal law that authorizes the identification, study and recommendation of public lands for wilderness designation by Congress. Thus, BLM is not at liberty to add wilderness to other provisions in FLPMA when Congress so clearly chose not to.

Only Section 603 of FLPMA authorizes BLM to manage lands so as to not impair their wilderness character. *Tri-County Cattleman’s Association Idaho Cattlemen’s Association*, 60 IBLA 305, 314 (1981). There is no other statutory authority for BLM to study and manage public lands as if they were wilderness. Public lands are to be managed so as to not unduly and unnecessarily degrade the resources. (43 U.S.C. §1732(b) [nondegradation standard], except for WSAs which are managed so as to not impair the wilderness character.) *Id.* at 1782(c).

The Interior Secretary's authority to identify public lands as wilderness study areas under Section 603 has expired. *State of Utah v. Babbitt*, 137 F.3d 1193, 1206, n.17 (10th Cir. 1998) (Secretary Babbitt wrote "I also agree with you that FLPMA's section 603 no longer provides authority to inventory BLM land in Utah for wilderness values."). BLM has attempted to claim discretion to manage lands to preserve their wilderness character but the planning rules do not so provide. The rules were revised to remove wilderness study from the general planning process and have never been amended to make wilderness study part of the land use planning process [By comparison, the Forest Service revised its planning rules to integrate wilderness study and recommendations into each plan revision. 36 C.F.R. §219.27].

Section 202 of FLPMA provides for the development and revision of land use plans. 43 U.S.C. §1712. Land use planning must have coordination with state and local governments, public involvement and be consistent with FLPMA. 43 U.S.C. §1712(a). The criteria for developing and revising land use plans, includes (1) using and observing the principles of multiple use and sustained yield set forth in FLPMA and other applicable laws, 43 U.S.C. §1712(c)(1); (2) interdisciplinary approach, §1712(c)(2); (3) priority to designate ACECs, §1712(c)(3); and (4) "to the extent consistent with the laws governing the administration of the public lands, coordinate the land use inventory, planning, and management activities of or for such lands with the land use planning and management programs of other Federal departments and agencies and of the States and local governments within which the lands are located;" §1712(c)(9). FLPMA further states: "Land use plans of the Secretary under this section shall be consistent with State and local plans to the maximum extent he finds consistent with Federal law and the purposes of this Act." *Id.*

Nothing in Section 202, which governs land use planning, authorizes wilderness study or wilderness-type management. The history of the planning rules shows that the word "wilderness" was deleted from the draft of the planning rules on purpose. When BLM wrote the rules governing land use plans, it originally defined a resource management plan as including "the initial determination of whether a wilderness study area shall be recommended to the President for recommendation to the Congress as suitable or unsuitable as an addition to the National Wilderness Preservation System." 43 Fed. Reg. 58764, 58768-69 (1978) draft 43 C.F.R. §1601.0-5(p)(2). The definition of a resource management plan was later revised to delete reference to wilderness study area recommendations. 44 Fed. Reg. 46386 (1979). Thus, BLM has no regulations in the land use planning chapter authorizing establishment of wilderness type areas or authorizing nonimpairment management for such lands other than designated WSAs designation pursuant to Section 603, which expired.

BLM adopted the Wild Lands Policy through three Manuals, based on its claimed discretion in FLPMA, Sections 201, 202 and 302 of FLPMA. Those provisions do not support BLM's claimed authority to designate Wild Lands or LWCs or to manage them as if they were designated WSAs for nonimpairment of the wilderness character. IM 2011-154 was adopted without proper comment procedures and without coordination with local governments. Under Section 202(a), BLM has no choice but to coordinate with local governments and to resolve conflicts in land use plans. 43 U.S.C. §1712(a). So far BLM has failed to do so on this very important issue. No Wyoming local government within the affected area supports proposed or identified LWCs. Several of

the applicable local government plans oppose new wilderness character areas. BLM has clearly violated Section 202 by not coordinating both its inventory and LWC determination with the local governments.

The OS/TS PDEIS also fails to identify which, if any, inventory it has used to identify the LWCs. For example, in the Rock Springs Field Office, BLM has maps of the alleged LWCs which were identified without any coordination with local governments. The single map in the OS/TS PDEIS fails to identify these areas or to disclose the factual basis for the LWC classification. OS/TS PDEIS Figure 2.3.3-3. Thus, it is impossible to divine their location or the resource values that prompted the classification being used in the OS/TS PDEIS. If CLG had access to this information it could provide site specific documentation of the errors in the premise that these are LWCs.

These lands are not “wilderness” as that term is used in the Wilderness Act. These areas are heavily roaded and include the Wyoming Checkerboard where Anadarko owns the alternating sections. There are powerlines, rights-of-way for pipelines, wind farms as well as coal mining and oil and gas development.

It appears that the OS/TS PDEIS adopts this unofficial and inaccurate information and excluded significantly high potential public lands from oil shale leasing. CLG requested the information regarding these inventories in November and never received it. CLG assumes that for Utah the OS/TS PDEIS uses the Utah HR 1925 lands without regard to the RMP decisions that evaluated those lands in 2008.

Figure 2.3.3-3 depicts the Wyoming LWCs without providing any other information or even labels. Chapter 6 of the OS/TS PDEIS lists the areas and acreage without providing maps or a description. The OS/TS PDEIS uses a limited and incorrect definition of wilderness. Footnote to Table 6.2.3 states: “The key characteristics of wilderness that may be considered in land use planning include an area’s appearance of naturalness and the existence of outstanding opportunities for solitude or primitive and unconfined types of recreation.” This statement is materially incorrect, because the definition of wilderness requires that an area be roadless and that it be greater than 5,000 acres. 16 U.S.C. §1131(a). The OS/TS PDEIS conveniently drops the first two criteria.

Table 6.1.1-2 purports to list LWCs in Wyoming, when that classification has never been adopted or even made public. The Adobe Town WSA consists of 85,710 acres. None of the listed areas correspond to WSAs designated in 1980. Since there is no information provided, CLG members cannot provide meaningful comments. #6)>

5. <([#7 [1.5] [9.8] OS/TS PDEIS FAILS TO CONFORM TO NEPA RULES A. PURPOSE AND NEED

“Agency action should be overturned only when the agency has ‘relied on factors which Congress has not intended it to consider, entirely failed to consider an important aspect of the problem, offered an explanation for its decision that runs counter to the evidence before the agency, or is so implausible that it could not be ascribed to a difference in view or the product of agency expertise.’” *Motor Vehicle Mfrs. Ass’n v. State Farm Mutual Auto. Ins. Co.*, 463 U.S. 29, 43 (1983). The OS/TS PDEIS meets the definition of arbitrary and capricious as the explanation for the land use allocations do not have sufficient explanation or documentation to support them, and the explanation for revision runs counter to the facts.

i. Real Purpose and Need Unaddressed

The Notice of Intent and the statement of Purpose and Need in the PDEIS omit the real basis for the new programmatic EIS. BLM settled two lawsuits, which challenged both the 2008 PFEIS Record of Decision *Colorado Environmental Coalition (CEC) v. Salazar*, No. 09-0085; and the regulations promulgated to implement an oil shale and tar sands leasing program, *Colorado Environmental Coalition (CEC) v. Salazar*, 09-0091. The conduct of the two cases and, particularly, the CEC's failure to prosecute the cases strongly suggests that this was a friendly litigation with an equally friendly settlement [It is ironic that the environmental plaintiffs excoriated BLM for settling the Utah wilderness inventory case with the State of Utah and yet clearly filed these two cases for the purpose of securing sweetheart terms to eviscerate the oil shale and tar sands programs].

Plaintiffs filed the two cases in February of 2009, but the government sought numerous extensions of time to answer and settled the case shortly before the administrative records were to be filed before the court.

BLM's reconsideration of the 2008 OS/TS ROD is based entirely on the terms of the settlement in which BLM committed to this revision. *CEC v. Salazar*, #63 ¶1 ("No later than 120 days after this Settlement Agreement becomes effective, Defendants will publish a notice of intent ("NOI") to consider amending each of the land use planning decisions made by the 2008 OSTs ROD.") BLM also committed to consider excluding from oil shale and tar sands development all "lands with wilderness character" a term that did not exist until December 23, 2010. BLM also agreed to exclude existing and proposed ACECs and the Adobe Town rare and uncommon area. The state law designation of a rare and uncommon area only prohibits noncoal surface mining but allows coal mining under certain conditions, as well as oil and gas development. EQC Rules Ch. VII. It cannot apply to public land. *Calif. Coastal Commn. v. Granite Rock Co.*, 480 U.S. 572 (1987) (holding state's coastal zone management could not regulate mining on federal land).

In the rulemaking case, BLM committed to amending the oil shale and tar sands leasing rules within 15 months. BLM has made no move to initiate the changes. The settlement terms mandate the content of the final rules to a degree that violates public policy and the law, because BLM agrees in advance to what the final rules will provide. BLM also agreed to deny applications to convert RD&D leases to commercial leases based on environmental and resource considerations, to reject plans of development and to limit commercial leases to RD&D lessee after expressions of interest and detailed stipulations. *CEC v. Salazar*, No. 09-0091, Doc. No. 80-1 ¶¶1-6. The settlement predetermines the outcome of the rulemaking such that BLM has relinquished its authority and discretion.

The 2008 regulations remain in effect but cannot be implemented under the terms of the settlement, which prohibit oil shale leasing. By accepting the plaintiffs' demands for content, BLM has failed to comply with the 2005 EP Act, Section 369 to develop a commercial oil shale and tar sands leasing program.

As is clear in the OS/TS PDEIS, BLM also committed to a predetermined outcome in the programmatic EIS to reduce the potential for oil shale and tar sands development by removing 75% of the land base and limiting the remnants of the program to research and development, rather than the commercial scale mandated by federal law. The fast pace of the drafting of the OS/TS PDEIS and the fact that entire chapters are largely the

same as the 2008 PFEIS. BLM is doing a rush job to issue a final decision without regard to the facts or competing legal obligations and constraints.

ii. Purpose and Need for Revision Unsupported in OS/TS PDEIS

The Notice of Intent to revise the 2008 Oil Shale and Tar Sands FEIS stated: “The BLM has decided to take a fresh look at the land use plan allocation decisions made in the 2008 ROD associated with the Programmatic EIS, in order to consider which lands should be open to future leasing of oil shale and tar sands resources.” 76 Fed. Reg. 21003 (2012). The Notice of Intent went on to state that:

As there are no economically viable ways yet known to extract and process oil shale for commercial purposes, and Utah tar sands deposits are not at present a proven commercially-viable energy source, the BLM, through its planning process, intends to take a hard look at whether it is appropriate for approximately 2,000,000 acres to remain available for potential development of oil shale, and approximately 431,224 acres of public land to remain available for potential development of tar sands.

Id.

The OS/TS PDEIS expresses the purpose and need as necessary to determine which lands should be removed from the classification of available for leasing. “The purpose and need for this proposed planning action is to reassess the appropriate mix of allowable uses with respect to oil shale and tar sands leasing and potential development. Specifically, the BLM will consider amending the applicable Resource Management Plans (RMPs) to specify whether any areas in Colorado, Utah, and Wyoming currently open for application for future leasing and development of oil shale or tar sands should not be available for such application for leasing and development.”

PDEIS 1-4. #7])>

<([#8 [9.2.2] The criteria to exclude high potential oil shale and tar sands lands from leasing suffers

several flaws. First, OS/TS PDEIS does not and indeed cannot explain how it conforms to Section 369, since BLM previously concluded that similar alternative would not conform. 2008 Record of Decision PFEIS (2008 ROD) at 22 (“Much of the most geologically prospective acreage would be excluded under Alternative C; in particular areas which are in close proximity to three of the six RD&D leases would be excluded. In addition, this unreasonably fragments the area that would be available for application, resulting in parcels that are unlikely to be explored, leased, or developed.”) #8])>

<([#64 [9.2.1] Second, Congress has prohibited BLM from spending federal funds to classify and manage lands

as LWCs as directed in S.O. 3310. Alternatives 2-4 propose exclusions based on LWCs, thus implementing the S.O. 3310 in defiance of the ban on spending federal funds to do so [BLM’s actions violate the Anti-Deficiency Act, 31 U.S.C. §1341 and the involved officials could face adverse employment actions, *Id.* at §1350, and criminal penalties, §1349].

#64])> <([#65 [9] [3.1.5] Third, all of the alternatives exclude from oil shale leasing the Adobe Town Rare & Uncommon Area, which is a state law classification that allows leasing but prohibits mining. The rare and uncommon designation cannot apply to public land, because the 1872 mining laws, as amended, preempt state law. *Calif. Coastal Commn. v. Granite Rock Co.*, 480 U.S. 572 (1987) (holding state’s coastal zone management

could not regulate mining on federal land).

The Coalition has previously explained that the larger Adobe Town area is not supported by Sweetwater County and impairs private land uses. Fourth, the OS/TS PDEIS provides no information about these areas, although many of the ACECs are merely proposed. Hence, there is no ‘fresh look’ nor does the OS/TS PDEIS disclose the new information upon which BLM is relying to support the actions proposed in the OS/TS PDEIS. The OS/TS PDEIS does not provide any information that would support the status of these areas or their exclusion. The apparent rush to complete the OS/TS PDEIS resulted in omission of the description of areas to be excluded, and this failure to describe or analyze the areas prevents the public and coordinating entities from meaningful public comment. #651)>

<([#9 [1.5] [2] **b. Detailed Analysis of Alternatives**

The OS/TS PDEIS identifies the Preferred Alternative as 2(b).

The BLM has selected Alternative 2(b) as the Preferred Alternative. The Preferred Alternative would make approximately 461,965 acres available for future consideration for commercial oil shale leasing and 91,045 acres available for application for commercial tar sands leasing, but only for research, development, and demonstration (RD&D) leases. The BLM would issue a commercial lease only when a lessee satisfies the conditions of its RD&D lease and the regulations at 43 CFR Subpart 3926 for conversion to a commercial lease. The preference right acreage, if any, which would be included in the converted lease, would be specified in the RD&D lease.

OS/TS PDEIS at i.

The OS/TS PDEIS, however, does not contain any specific analysis of the expanded RD&D program that is being proposed in lieu of the commercial leasing program. The OS/TS PDEIS attempts to compensate for this defect by stating:

The environmental impacts of Alternative 2(b) would be analytically indistinguishable from those of Alternative 2(a). Only the method of obtaining a lease would be different. Accordingly, the analysis in this PEIS of Alternative 2 applies fully and equally to both alternatives. To the extent there may be differences in environmental consequences between Alternative 2(a) and 2(b), these would be related to the timing of the commencement of impacts, as well as, possibly, length of disturbance.

However, these issues are best addressed in the lease and/or project-specific analysis.

OS/TS PDEIS at ES-7, 2-35. The OS/TS PDEIS states that this alternative was not developed until quite late in the process.

As the Draft PEIS was being developed, the idea for this alternative emerged. It is presented here in brief. This alternative is not noted elsewhere in the document but will be developed further in preparation of the Final PEIS. Analytically, this subalternative is indistinguishable from Alternative 2(a) in terms of environmental consequences. Therefore further environmental analysis in preparation of the Final PEIS is not anticipated, although more detailed explanation may be provided, particularly in response to comments received.

OS/TS PDEIS at 2-35.

The OS/TS PDEIS statement that Alternative 2(b) environmental impacts are basically the same as Alternative 2(a) is untrue. Alternative 2(b) changes the timing of oil shale leasing to slow it down and this change in timing significantly changes the nature of the impacts on water, surface disturbance. NEPA requires agencies to consider direct, indirect, and cumulative effects in the context of geography and timing. 40 C.F.R. §1508.25. The preferred alternative delays in issuing RD&D leases and not issuing commercial leases will change the scope and impact and must be separately analyzed. The very limited information about Alternative 2(b) and the omitted discussion of the imminent rule changes do not provide the public with sufficient information to determine whether, in fact, it is virtually identical to Alternative 2(a). If Alternative 2(b) is essentially the same, then BLM should and could have changed Alternative 2(a). BLM has already committed to rule changes in the CEC settlement agreement. The OS/TS PDEIS omits all discussion, even though the rulemaking is a connected action that falls within the scope of this EIS and failure to discuss the connected actions violates NEPA. 40 C.F.R. §§1501.7; 1508.25. For instance, the OS/TS PDEIS claims Alternative 2(b) will change the lease terms but provides no information on what those changes will be, other than it will only authorize RD&D leases. *Id.* at ES-7, 2-35.

NEPA requires that each alternative be analyzed in detail. 40 C.F.R. §1502.14(b) (substantial treatment must be devoted “to each alternative considered in detail including the proposed action so that reviewers may evaluate their comparative merits.”). The discussion of alternatives in the EIS must be sufficient to permit a reasoned choice among the options.” *State of Wyoming v. USDA*, 661 F.3d 1209, 1243 (10th Cir. 2011) (quoting *AWARE v. Colo. Dep’t of Transp.*, 153 F.3d 1122, 1130 (10th Cir. 1998)). BLM’s failure to explain the preferred alternative or its impacts on the respective states and communities, requires that BLM withdraw the draft and revise or issue a supplement to explain the preferred alternative. 40 C.F.R. 1502.9 (“If a draft statement is so inadequate as to preclude meaningful analysis, the agency shall prepare and circulate a revised draft of the appropriate portion.”)

Alternative 2(b) does not conform to Section 369 because it continues the RD&D program instead of providing for a commercial leasing program. While an agency can consider an alternative that requires additional authority, it must disclose this fact. *Forty Questions on CEQ NEPA Regulations*, 46 Fed. Reg. 18026 (1981) as amended 51 Fed. Reg. 15618 (1986), Answer to Question 2(b). The OS/TS PDEIS does not propose an amendment to the 2005 EP Act to modify the mandate.

#9])> c. <([#10 [1.5] [6.5] Omission of Significant New Information

The Purpose and Need for the OS/TS PDEIS is justified as a “fresh look” at oil shale and tar sands development. 76 Fed. Reg. 21003 (2011). The OS/TS PDEIS is not in fact a “fresh look,” it is merely a retread of an alternative previously rejected by BLM on the grounds that it would not conform to Section 369 of the 2005 EPA. [2008 ROD at 22]. The purposeful omission of new information is significant and violates NEPA. Since the 2008 ROD was signed, several companies have been developing oil shale pursuant to the RD&D leases. The OS/TS PDEIS omits these results and progress reports. Similarly advances in technologies and actual experience with these technologies has been omitted. Instead, the OS/TS PDEIS repeats throughout the conclusion that oil shale and tar sands are not commercially viable and also repeats old data regarding the

amount of water, power and surface disturbance.

The OS/TS PDEIS excludes new information regarding oil shale and tar sands technology and makes very limited the use of the 2010 and 2011 USGS assessments of potential. OS/TS PDEIS 2-77. Chapter 3 and App. A are very similar, if not identical, to the 2008 FEIS and notably do not discuss oil shale extraction technology used by Red Leaf or Enefit.

The OS/TS PDEIS purports to include new information regarding sage grouse, LWCs and ACECs but the information is vague and incomplete as to preclude any kind of meaningful analysis. The OS/TS PDEIS lacks a discussion disclosing the resource values of these areas, the basis for the respective classification, or the other current land uses. The OS/TS PDEIS does not discuss the Wyoming sage grouse strategy or how BLM adopted the state strategy as an interim protection.

Many of these areas have oil and gas leases and even production, which would contradict the description as LWCs. In Wyoming, the OS/TS PDEIS omits that these areas are also located in the Wyoming Checkerboard where the private land is owned by Anadarko, a gas development company. The OS/TS PDEIS concludes that private land is inconsistent with development when the private lands in Wyoming have been developed for decades and generally in conjunction with public lands.

While BLM could theoretically decide not to issue individual leases, it does not have the discretion to simply discard new and relevant information. This information is environmentally significant since it shows retort methods using modest amounts of water and causing significantly less surface disturbance than assumed in 2008. NEPA requires BLM to consider significant new information and this omission results in a significant bias of the OS/TS PDEIS against additional oil shale and tar sands development notwithstanding the congressional mandate to proceed with this program. Similarly, the OS/TS PDEIS omits the statutorily required assessment of oil shale and tar sands potential. 42 U.S.C. §15927(m). The USGS Assessment reports completed in 2010 and 2011 identified additional land as having high potential but the OS/TS PDEIS did not use this report in its identification of potential lands. Instead, the OS/TS PDEIS simply modified the areas identified in 2008 and made them 75% smaller.

The omission of new information is further documented in the fact that many of the chapters, especially Chapter 3 and the Appendices, are largely unchanged from the 2008 PFEIS. This only shows that BLM limited its update the OS/TS PDEIS to the alleged LWCs and other special designations as a basis to marginalize a congressionally mandated program.

#10]> d. <([#11 [6.3.5] [6.3.2] OS/TS PDEIS Dismissal of Technology Fails to Acknowledge Significant Scientific Controversies

At a minimum, BLM must acknowledge that there is a scientific controversy regarding its key assumptions of environmental impact and support its position. 40 C.F.R.

§1508.127(b)(4); *Middle Rio Grand Conservation Dist. v. Norton*, 294 F.3d 1220, 1229 (10th Cir. 2002) (setting aside critical habitat designation EIS on the basis that “[t]he wide disparity in the estimates of water required for the designation, and the associated loss of farmland acreage, indicate that a substantial dispute exists as to the effect of the designation.”). Like the above decision, there is a wide disparity in estimates of water, surface area and electrical power assumed to be necessary for oil shale development. BLM, like the USFWS, must address the disparities, especially since the newer data

reflect new information.

The OS/TS PDEIS repeats the refrain that oil shale development will require more than 1 barrel of water for each barrel of oil. OS/TS PDEIS 4-3, 4-9, 4-11, 4-33, 4-47, 4-48, 5-32, 5-35, A-85. As described by Red Leaf and Enefit, two companies operating in Colorado and Utah under RD&D leases, new technology does not rely on large amounts of water in the retort process. The R&D program was intended to provide BLM with this type of information, yet it is excluded from the OS/TS PDEIS. By using outdated or erroneous assumptions, the OS/TS PDEIS exaggerates the water and power needs as well as the surface disturbance.

The same defects apply to the OS/TS PDEIS assumptions about the size of the surface disturbance and the amount of electrical power needed. OS/TS PDEIS at A-46, A-62, A-80, A-84, A-85. In part, these errors arise because the BLM never updated Chapter 3 or the Appendices. These same assumptions are carried through to Chapters 2 and 4-6, thus tainting the entire analysis with erroneous assumptions.

The above assumptions are relevant to the OS/TS PDEIS conclusion that oil shale and tar sands have not been shown to be commercially viable. OS/TS PDEIS at 2-57, 2-76, 3-238. This very curious statement cannot be reconciled with the fact that the province of Alberta has been producing oil from tar sands for more than 20 years and even transports tar sands oil to Utah for refining. Similarly, Enefit has been producing oil from oil shale for more than 30 years. The OS/TS PDEIS does not provide any definition of commercial viability but proven business operations should suffice and it is inexplicable that the OS/TS PDEIS repeats a conclusion that is contradicted by incontrovertible facts. The issue of commercial viability is also the basis for Alternative 2b, which would actually limit oil shale development to another RD&D program, without authorizing commercial leases. The preferred alternative rests on the highly disputed premise that oil shale is not commercially viable. NEPA requires that BLM disclose and discuss scientific controversies. The OS/TS PDEIS does not.

#11)> 6. <([#12 [3.10.3] ONE-SIDED ECONOMIC AND SOCIAL ANALYSIS

The OS/TS PDEIS assumes that oil shale and tar sands development will lead to a boom and bust economic cycle. OS/TS PDEIS 2-36, 3-242. Based on that premise, the OS/TS PDEIS describes Alternative 1 as harmful and Alternatives 2-4, which feature little to no development, as beneficial. OS/TS PDEIS at ES-9, Table 2.3.2-2, Table 2.4.2-2, Table 2.6-1.

The OS/TS PDEIS omits the fact that the lands classified as high potential are in the regions where there is already a viable energy economy. For example, in southwestern Wyoming, there are several major gas fields producing conventional and coalgas, including Pinedale Anticline, Jonah, Moxa Arch, Continental Divide and Hiawatha. There are numerous other plays for oil and natural gas as well. Coal mining plays important role in Sweetwater and Lincoln Counties, with trona also in Sweetwater and Uinta Counties. Construction of wind farms and related transmission lines continues at a rapid pace as well. Thus, oil shale will add to the economy but is unlikely to be significant enough to create an economic boom.

The OS/TS PDEIS fails to consider the cumulative impacts and connected actions in this discussion of the economic and social impacts. It is true that the current energy development has generated housing shortages and pressure on existing roads. But Wyoming has one of the lowest unemployment records in the country and has

weathered the severe recession, and in reality a national depression, far better than other states such as California, Oregon and Washington.

Taking the OS/TS PDEIS discussion to its logical conclusion, one would conclude that it is BLM's view that it is better for the residents of rural counties and communities to remain poor and isolated. OS/TS PDEIS at ES-9, Table 2.3.2-2, Table 2.4.2-2, Table 2.6-1. It is correct that the upsurge in energy development has changed western Wyoming communities. There is more traffic, more demand for housing and other services. There has also been more opportunity for jobs and to lease or sell private land related to energy projects, with the injection of cash into the economy. Certainly, the State of Wyoming and the trust beneficiaries, the University and Wyoming Game & Fish Department, have also seen significant increases in revenues, which allowed Wyoming to avoid the job losses, bank failures and bankruptcies that haunt many other states and large cities.

The oil shale program would add to the existing energy industry but would be a relatively small portion. Wyoming is already the second largest recipient of federal royalty revenues and revenues from oil shale would not significantly change that. It would, however, represent continued diversification in energy development. #12)>

7. CONCLUSIONS AND RECOMMENDATIONS

The OS/TS PDEIS suffers from a number of fatal flaws.

. <(#13 [9.2.2] Any alternative needs to conform to Section 369 of the 2005 EPA, retain the land allocations adopted in 2008 to avoid discontinuous development, and ensure that a commercial leasing program is feasible;

#13)> . <(#14 [9.2.1] Implementation of LWC management in Alternatives 2, 3 and 4 violate the

congressional limitation on the expenditure of funds to implement S.O. 3310 and exceed BLM's authority;

#14)> . <(#15 [9.5] All of the alternatives except Alternative 1 violate FLPMA land use planning

processes and rules by superseding the ongoing plan revision for the Rock Springs area;

#15)> . <(#16 [1.5] OS/TS PDEIS violates NEPA

. by failing to support the purpose and need in the PDEIS;

. by failing to fully analyze the preferred alternative so that the public can meaningfully comment;

. omitting significant new information regarding oil shale and tar sands potential and technological advances;

. failing to fully disclose the basis for excluding land areas from oil shale and tar sands development, when such areas were proposed by special interest groups without providing maps, facts, or rationale to support the adoption of these proposals;

. failing to address the scientific controversies regarding the environmental impacts and resource needs for oil shale and tar sands development.

#16)> The Coalition members appreciate the opportunity to comment on this draft, but believe that unless BLM issues a new draft or a substantive supplement, the OS/TS PDEIS cannot survive judicial scrutiny.

ADDITIONAL COMMENTS BY COALITION OF LOCAL GOVERNMENTS1
OSTS November Comments Resubmitted May 4, 2012 Additional Discussion

<([#17 [13] Chapter 1

p. 1-1

Change:

“designate” to “classify”

Additional Discussion:

43 U.S.C. §1712 uses the term classify, not designate. #17]>

<([#18 [9] p. 1-1

Add to first paragraph:

“For the public lands to be closed to future oil shale and tar sands leasing, DOI will prepare a withdrawal in accordance with FLPMA...”

Additional Discussion:

In the event the Secretary adopts the preferred alternative, FLPMA requires that the Secretary issue a formal withdrawal. 43 U.S.C. §§1702(j); 1714(c). The Secretary must also report this closure of a major multiple use to the congressional committees have jurisdiction over public lands. Id. at §1712(e). #18]>

<([#19 [10.7] p. 1-4

Add:

“Utah counties currently use tar sands deposits to pave the local roads...”

Additional Discussion:

OS/TS PDEIS repeatedly states that tar sands are not commercially feasible to develop. A paving company in Uintah County has been using tar sands for several decades as paving material. #19]>

<([#20 [9.1] 1.1 Purpose and Need

Add

“Development of oil shale and tar sands would produce oil. In addition, tar sands provide paving material for local roads without additional processing.”

Additional Discussion:

The 2005 EP Act requires that BLM develop a program to use oil shale and tar sands to produce oil. Since this is the law, it should be part of the purpose and need. #20]>

<([#21 [13] 1.1.1

Add: “The BLM RMPs are currently being revised in Wyoming...”

Additional Discussion:

The Notice of Intent to revise the Green River RMP was published Feb. 1, 2011, 76 Fed. Reg. 5607. #21]>

<([#22 [6.1.1] 1.2 OS/TS PDEIS 1-10.

Change:

“25 gal of shale per ton of rock (gal/ton) or more and are 25 feet thick...”

to

“15 gal of shale per ton of rock (gal/ton) or more and are 15 feet thick”

Additional Discussion:

The distinction puts Colorado and Utah at a disadvantage. CLG recognizes this was a decision made in the 2008 PFEIS but it still appears to be arbitrary. #22]>

<([#23 [9.5] 1.2 OS/TS PDEIS 1-11, lines 26-27

Delete:

“As discussed in Chapter 2, additional areas are closed and will not be available for the future opportunity to lease for oil shale and tar sands on the basis of local planning decisions.”

Additional Discussion:

The closures based on the criteria used in the OS/TS PDEIS are inconsistent with local land use plans and are not supported by the record or the facts. As CLG informed BLM as part of its cooperating agency comments, Sweetwater County resolution on Adobe Town only supports special management within the wilderness study area (WSA) boundaries. The Wyoming Rare and Uncommon Area designation only limits mining, not oil and gas leasing. Thus, it should not be the basis to close this area to oil shale development. #23]>

<([#24 [9.5] 1.4.3 OS/TS PDEIS 1-17 Comment:

“If the lack of information is due to the proprietary nature of the data or BLM’s delay in approving operation of RD&D Leases, then the PEIS should disclose it.” It is not credible that BLM has not received any information, given the number of presentations being made by the lessees. #24]>

<([#37 [8] 2.2.3 Management of BLM-Administered Lands OS/TS PDEIS 2-9, line 39

Add: FLPMA also directs BLM to give priority to principal or major multiples uses, which include mineral development, livestock grazing, fish and wildlife, rights-of-way, and recreation. 43 U.S.C. §1702(m).

Additional Discussion:

The principal multiple uses established in FLPMA differentiate public land management from that of the Forest Service which uses a similar but different definition of multiple use. Omission of the emphasis on public land uses rather than resource preservation suggests that the preferred alternative falls short of this directive as well.

#37])>

<(**#38** [9.2.1] 2.2.3 Management of BLM-Administered Lands OS/TS PDEIS 2-10 “FLPMA directs the BLM to give priority to the designation of ACECs. Designated ACECs include public lands where special management attention and direction are needed to protect and prevent irreparable damage to important historic, cultural, and scenic values, fish, or wildlife resources or other natural systems or processes.”

To:

“FLPMA directs the BLM to give priority to the designation of ACECs in the land use planning process. The respective RMPs within the project area designated ACECs that BLM determined merited special management to protect and prevent irreparable damage to important...”

Additional Discussion:

ACEC designation is specifically limited to resources that are in fact threatened and to those resources determined to be nationally or regionally significant.

This is an important limitation in light of proposed ACECs that the OS/TS PDEIS appears to have incorporated. In the case of the Rock Springs Field Office, the determination of significance is still pending and would not apply to resources that are otherwise ubiquitous. **#38])>**

<(**#39** [3.1.7] 2.2.3 Management of BLM-Administered Lands

Page 2-10 line 35 Add: Any area meeting the definition of having wilderness character must first be determined to be roadless and second must be greater than 5000 acres.

Additional Discussion:

OS/TS PDEIS omits the two initial screens for wilderness character: lack of roads and size.

#39])>

<([#40 [9.2.1] Revise: 2-12 lines 8-9

Interior Secretary does not have independent authority to designate rivers under the Wild & Scenic Rivers Act. #40])>

<([#41 [3.9.1] 2.2.3 Management of BLM-Administered Lands OS/TS PDEIS 2-12 NHST paragraph

Add: “The prospective oil shale resources in Wyoming intersect with several NHSTA segments, including the Oregon and Mormon Pioneer trails and California and Pony Express trails.” #41])>

<([#42 [8.3] 2.2.3 Management of BLM-Administered Lands OS/TS PDEIS 2-12-13

Change:

“A significant portion of the public lands within the most geologically prospective oil shale area is undergoing development of its oil and gas resources. Conflicts in development among resources (e.g., oil shale or tar sands and oil and gas) may occur.”

to

“A significant portion of the public lands within the most geologically prospective oil shale area is undergoing development of its oil and gas resources, as well as coal and coal and gas. Conflicts in development among resources (e.g., oil shale or tar sands and oil and gas and wind farms and related transmission lines) may occur.”

Additional Discussion:

Sweetwater County has both coal mining and coal gas development. Also wind farm development and related transmission lines are also being developed.

Comment: “PEIS still needs to identify potential conflicts. Otherwise PEIS is all about wilderness or ESA and ignores grazing, ROW, wind farms and other land uses.” #42])>

Page 6 of 14 COALITION OF LOCAL GOVERNMENTS COMMENTS ON OS/TS PDEIS
ADDITIONAL COMMENTS BY COALITION OF LOCAL GOVERNMENTS
OSTS November Comments Resubmitted May 4, 2012 Additional Discussion

<([#43 [9.2.3] 2.2.3 Management of BLM-Administered Lands OS/TS PDEIS 2-13

Last paragraph re: Energy Policy Act of 2005

Delete: “Land exchanges, however, are not completed on an acre-for-acre basis, but instead are completed on an equal-value basis. One of the more challenging aspects of the land exchange process is developing an exchange proposal where the appraised values of the federal and nonfederal lands are equal. Given the complexities of achieving equal-value land exchanges, especially recognizing the difficulty in valuing a commodity like oil shale or tar sands, a viable exchange proposal may be difficult to achieve. The initial basis for considering land exchange opportunities lies within existing land use plans.”

and

“on a case-by-case basis when the results will consolidate ownership and improve management of natural resources.”

Add: “exchange is for fair market value and is in the public interest.”

Additional Discussion:

Land exchanges are governed by principles of fair market value and public interest. OS/TS PDEIS purports to add other criteria that might be a factor in determining public interest but are not the only factor. #43)>

<([#44 [6.1.1] 2.3 Oil Shale

Comment: “PEIS should use same standard for each state. This criteria puts Utah and Colorado at a disadvantage by excluding additional potential land that is included for Wyoming.”

Additional Discussion:

CLG realizes that BLM made the same determination in 2008 but still believes it should be corrected. #44)>

<([#45 [6.3.5] 2.3.1 Potential Commercial Oil Shale Development Technologies OS/TS PDEIS 2-15

“Jordan and Estonia both have extensive oil shale developments.” #45)>

Page 7 of 14 COALITION OF LOCAL GOVERNMENTS COMMENTS ON OS/TS PDEIS

<([#46 [6.3.5] 2.3.1 Potential Commercial Oil Shale Development Technologies OS/TS PDEIS 2-16

Change: “Because commercial oil shale development technologies are still largely in an R&D phase, many details regarding the specific technologies that may be used in the future to produce oil from oil shale are unknown. In the absence of reasonably complete information about the technologies that may be deployed, a number of assumptions have been made. These assumptions are discussed in Section 4.1.”

To:

“Because commercial oil shale development technologies are still largely in an R&D phase, many details regarding the specific technologies that may be used in the future to produce oil from oil shale have not been deployed in the United States although they have been used extensively overseas. The PEIS makes a number of assumptions which are discussed in Section 4.1.”

Additional Discussion:

The OS/TS PDEIS limits evaluation of commercial viability to published date, thereby excluding the recent information. Commercial viability is traditionally determined by whether a

company will invest its money in the technology and there is ample evidence of that. #46)>

<([#47 [9.3] 2.3.1 Potential Commercial Oil Shale Development Technologies OS/TS PDEIS 2-20, lines 3238

Delete:

“If and when the BLM receives applications to lease oil shale as well as the additional information to make such a decision, the BLM will conduct additional NEPA and other required analyses, including consideration of direct, indirect, and cumulative effects, reasonable alternatives, and possible mitigation measures appropriate to the anticipated development. On the basis of that NEPA analysis to be conducted at the lease stage, the BLM will consider further amendment of one or more plans, if necessary, including, but not limited to, the establishment of general lease stipulations and BMPs.”

Comment:

“BLM has sufficient information from the RMPs to identify general conditions of development and likely lease stipulations. Otherwise the PEIS fails to perform an important function.” #47)>

OSTS November Comments Resubmitted May 4, 2012 Additional Discussion

<([#58 [9.5] 2.3.3.3 Alternative 4, Oil Shale Moderate Development (2008 OSTS PEIS ROD Minus Adobe Town and ACECs) (Alternative 4a), with RD&D First Requirement (4b)

Change:

“Under Alternative, lands that would be available for future consideration for leasing would include those BLM-administered lands within the most geologically prospective oil shale areas, including split estate lands where the federal government owns the mineral rights. ~~The whole of Adobe Town in Wyoming WSAs and ACECs which prohibit leasing would be excluded, as would all ACECs, as described above.~~ Lands available for application for leasing under Alternative 4 are shown in Figures 2.3.3-9, 2.3.3-10, and 2.3.3-11.”

Additional Discussion:

Wilderness protection does not belong in this alternative. It directly conflicts with public land use plans for CLG members, including but not limited to Lincoln County, Sweetwater County, and Sweetwater Conservation District. #58]>

<([#59 [2.4] 2.3.3.3 Alternative 4, Oil Shale Moderate Development (2008 OSTS PEIS ROD Minus Adobe Town and ACECs) (Alternative 4a), with RD&D First Requirement (4b)

“Similarly, with respect to the management of sage-grouse habitat, under Alternative 4, 20 lands would be managed as in Alternative 1.” CLG prefers this Alternative to Alternatives 2 and 3. Assuming BLM does not select Alternative 1 or the recommended Wyoming exception, then this would be better. It shows appropriate deference to a state strategy that is the product of a long process.

#59]>

Page 12 of 14 COALITION OF LOCAL GOVERNMENTS COMMENTS ON OS/TS PDEIS
ADDITIONAL COMMENTS BY COALITION OF LOCAL GOVERNMENTS1
OSTS November Comments Resubmitted May 4, 2012 Additional Discussion

<([#60 [9.2.4] 2.3.3.3 Alternative 4, Oil Shale Moderate Development (2008 OSTS PEIS ROD

Minus Adobe Town and ACECs) (Alternative 4a), with RD&D First Requirement (4b)

Changes:

~~“Depending on what the applicable RMP provides with respect to LWC and core and priority sage-grouse habitat, it may be necessary to initiate a plan amendment at the leasing and/or development stage to make allocation decisions on an individual RMP basis regarding management of these lands with respect to oil shale and tar sands resources. The reason for qualifying the amount of acreage available for lease under this alternative is that while areas of core and priority sage-grouse and areas of LWC are left open for potential future leasing and development of oil shale and tar sands resources, the likelihood of all this acreage as being available for further oil shale and tar sands resources leasing and development is low. National and state-specific guidance related to sage-grouse management and protection of core and priority habitat may limit the lands available for leasing will likely result in substantially less acreage being available, as will field office management decisions related to the protection of LWC. It is difficult to establish disturbance amounts at the programmatic level, before more is known regarding the specifics of leasehold location and technology to be used.” #60]>~~

<([#61 [2.5] 2.5.1 Alternatives That Use the New USGS In-Place Oil Assessment Maps as the Basis for 16 the Planning Area To Be Analyzed

“Several comments were received during the public scoping process that suggested that 19 the BLM should develop an alternative that examines the oil shale resource in the area defined 20 by the recent USGS assessment of in-place oil in oil shales of the Green River Formation in the 21 Piceance and Uinta Basins of western Colorado and eastern Utah (USGS 2010a,b; 2011).”

Additional Discussion:

PEIS should document conclusion that additional areas are not commercial now. Pinedale Anticline and Jonah were originally dismissed as lacking commercial potential. #61]>

Page 13 of 14 COALITION OF LOCAL GOVERNMENTS COMMENTS ON OS/TS PDEIS
ADDITIONAL COMMENTS BY COALITION OF LOCAL GOVERNMENTS 1
OSTS November Comments Resubmitted May 4, 2012 Additional Discussion

<([#62 [2.5] 1. The Coalition of Local Governments (CLG) provided comments on Chapters 1 and 2 prior to its publication. Notably BLM accepted very few of the comments and CLG reiterates these comments.

2.5.4 Alternatives That Prohibit Leasing in Specific Areas 1

Add:

A number of scoping comments requested that the BLM develop alternatives prohibiting commercial leasing in specific areas, including all NPS units, the GSENM, existing WSAs, and wilderness-quality lands in Utah. Since the scoping meetings were conducted, the BLM has determined that the scope of this PEIS will be limited to BLM-administered lands only and will not evaluate commercial leasing on USFS- and NPS-administered lands nor will it revise the land use

decisions made in the RMPs. #62])>

<([#63 [2.4] 2.5.9 Opening of All Lands with Wilderness Characteristics to Oil Shale and Tar Sands Leasing

RE: Comments on Draft Bureau of Land Management (BLM) Oil Shale & Tar Sands PEIS

Dear Secretary Salazar, Director Abbey, et al:

<([#1 [9.8] On its face the BLM's 2012 Oil Shale and Tar Sands Draft Programmatic Environmental Impact

Statement, BLM Project #W0-300-1310-PP-OSIR for Lands Administered by the BLM in Colorado, Utah and Wyoming (Hereafter 2012 OSTIS DPEIS) is nothing more than part of a negotiated settlement from a friendly lawsuit brought by an environmental coalition.' During this process, which began early 2011, it has been unfortunate that Uintah County must continue to educate the federal government on the realities of oil shale and oil sands development. The Administration's death grip on old stereotypes related to oil shale and oil sands development does not make them true.

On May 5, 2011, Uintah County sent a letter to the Bureau of Land Management respectfully requesting the BLM to cease and desist further activity on the Programmatic EIS for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the BLM. See attached letter. Apparently, the BLM has decided to ignore the cordial request from a cooperating entity. In addition to this request, Uintah County along with many of its neighboring counties has requested an extension to the comment period. This request was denied on May 3, 2012. Thus, Uintah County is left with no other alternative but to build and preserve the record and wait for the inevitable to be decided.²

So here we go again.

¹ In a letter, stamped May 3, 2012, Director Robert Abbey denied a request to extend the comment period by Representative Jason Chaffetz, citing the Settlement Agreement as prohibitive in the agreed timeline. However, Uintah County understands that these new draft regulations are expected to be provided to the State of Utah within the next 10-15 days. Extending the comment period for a few weeks after publication would not disrupt the BLM's sacred timeline. Director Abbey may not want to connect this PEIS to the new draft regulations, but they are in fact just two sides of the same coin. What good does it do to talk about the size and location of a water pipe if the reservoir is drained? Director Abbey also pointed to the 90 day review period as providing sufficient time to review and comment. However, just three months ago the BLM granted requests for additional time to provide comments related to the sage-grouse EIS for an additional 45 days.

² Why "inevitable"? In an email, attached to these comments, Sherri Thompson, Project Manager for this PEIS, stated: "As there are no economically viable ways yet known to extract and process oil shale for commercial

purposes, and tar sands is not at present a proven commercially-viable energy source, the BLM, through its planning process, is taking a hard look at whether it is appropriate for approximately 2,000,000 acres to remain available for potential development of oil shale, and approximately 431,000 acres of public land to remain available for potential development of tar sands. This new planning initiative will provide the BLM an opportunity to consider the 2008 allocation decisions in light of the still nascent character of the technology necessary to economically develop oil shale resources, as well as certain information not available in 2008.” Sadly, the outcome of this PEIS process was predetermined. #1)>

<([#2 [9.2.2] 2005 Energy Policy Act Mandate (or Oil Shale and Tar Sands Program Section 369 of the Energy Policy Act, adopted on August 8, 2005, declared it to be the United States’ policy that “oil shale, tar sands, and other unconventional fuels are strategically important domestic resources that should be developed to reduce the growing dependence of the United States on politically and economically unstable sources of foreign oil imports.” 42 U.S.C. §15927(b)(1). This policy statement is an unambiguous mandate from Congress. Further, Congress also directed that it be United States’ policy that commercial development of oil shale “be conducted in an environmentally sound manner, using practices that minimize impacts.” 42 U.S.C. §15927(b)(2). Apparently Congressional Policy is not even a blip on the BLM’s screen for the the Draft OSTs PEIS states on page 1-13, lines 39-45: “Issues determined to fall outside the scope of the PEIS because they were not pertinent to the purpose and need for the proposed land use planning decision as described in the NO! included issues relating to ... foreign oil as a national security issue.” Section 369 further required that the Interior Secretary promptly follow the completion of the programmatic EIS with regulations establishing an oil shale leasing program. See 42 U.S.C. §15927(d)(2). The BLM simply must not be concerned with Congressional mandates for the Preferred Alternative simply emasculates the program by cutting off the most geologically prospective public lands that are otherwise suitable and available for mineral leasing.³

³ The USGS has estimated the total in-place oil shale resources to be: Eocene Green River Formation to be 1.44 trillion barrels; Piceance Basin of Colorado to be 1.52 trillion barrels; and the Uinta Basin to be 1.32 trillion barrels. #2)>

<([#3 [9.2.1] [3.1.3] Wilderness Characteristics

Our May 5, 2011 letter stated:

“According to the preliminary purpose and need statement in the notice of intent, the Programmatic EIS will analyze removing from oil shale and tar sands leasing ‘All areas that the BLM has identified or may identify as a result of inventories conducted during this planning process, as lands containing wilderness characteristics[.]’ Further, the notice of intent states:

Lands that the BLM identifies as having wilderness characteristics will be considered

during this planning initiative, as described above, and consistent with Secretarial Order No. 3310, dated Dec. 22, 2010, and BLM Manuals 6301 and 6302. Future leasing of lands determined by the BLM to have wilderness characteristics, if compatible with the allocation decisions stemming from this initiative, will subsequently be assessed in accordance with BLM Manual 6303, as appropriate (i.e. where the BLM has not determined, consistent with BLM Manual 6302, whether the lands with wilderness characteristics at issue should be receive a wild lands designation, BLM Manual 6303 will apply).’

This language documents the BLM’s intent to implement, administer and/or enforce Secretarial Order 3310 and one or more of the BLM guidance manuals promulgated under Order 3310. However, any attempt by the BLM [to do so] is a patent violation of Section 1769 of the April 21, 2011 Congressional Continuing Resolution to Fund Fiscal Year 2011 through September 30, 2011.”

Utah County followed up with a comment letter, dated November 14, 2011 (attached hereto and incorporated by reference). BLM knows it was all too happy to resolve a friendly-lawsuit and take the opportunity, under the guise of complying with a settlement agreement, to ram through the Administration’s environmental agenda. The facts are all too obvious.

From our November 14, 2011 letter:

“While Interior Secretary Salazar issued S.O. 3310 on December 23, 2010, Congress prohibited the expenditure of any federal funds for FY 2011 as of April 7, 2011. BLM Director’s admission in a congressional hearing that the Federal Land Policy and Management Act (FLPMA) did not authorize the designation of Wild Lands or “lands with wilderness character” no doubt persuaded many members of Congress to halt this ill-conceived program.”

In summary, in late 2010, Secretary Salazar initiated this portion of the Administration’s environmental agenda. Then the opportunity came, shortly thereafter, to finalize a complex and nuanced Settlement Agreement, and a Joint Motion to Administratively Close the Case, with a coalition of environmental groups. This facade of a legal action gave the administration the cover it needed to pursue its wilderness characteristics policy. This chain of events screams of collusion!

Finally as it pertains to lands with wilderness characteristics, BLM lacks authority to manage lands as if they were wilderness unless such lands were designated as wilderness study areas (WSAs) within the 15-year review and study period, 43 U.S.C. §1782, or such lands have been designated by Congress. While BLM can inventory any resource on public lands and this may include wilderness character, it cannot use the inventory to change management. To the extent that any of the proposed Alternatives propose to manage the lands deemed having wilderness character, closing them to oil shale and tar sands development is clearly in violation of the Congressional prohibition. #3]>

<([#4 [9.8] Cooperators Unanimous Opposition

Utah County greatly appreciates the support from its neighboring counties in providing a strong unified opposition to the reckless course the BLM is pursuing.

On April 9, 2012, the Utah County Board of County Commissioners passed Resolution #04-09-2012, A Resolution Opposing the BLM’s 2012 Oil Shale and Tar Sands Draft Programmatic Environmental Impact Statement, BLM Project #W0-300-1310-PP-OSffi... (Hereafter 2012 OSTS DPEIS) for Lands Administered by the BLM in Colorado, Utah and Wyoming. This

Resolution outlines direct and pointed comments relating to the 2012 OSTs DPEIS and are attached hereto and incorporated by reference. We have also included copies of resolutions passed by fellow cooperators voicing similar objections to the 2012 OSTs DPEIS. #4])>

<([#5 [9.5] Local Plan

In very recognizable fashion FLPMA created a system of public land management honoring the American philosophy of “laboratories of democracy.” In 1932, U.S. Supreme Court Justice Louis Brandeis stated “It is one of the happy incidents of the federal system that a single courageous State may, if its citizens choose, serve as a laboratory; and try novel social and economic experiments without risk to the rest of the country.” *New State Ice Co. v. Liebmann*, 285 U.S. 262 (1932) (dissenting opinion). Uintah County, a political subdivision of the State of Utah, is exercising its duty under our system of Federalism to try sound novel approaches to manage public lands within its boundaries. Again, it is incumbent on federal agencies to the maximum extent possible be consistent with State and local plans (including the State of Utah and Uintah County). Anything short of this constitutes a violation of federal law and is subject to judicial review.

Uintah County has adopted into its general plan, in conjunction with the State of Utah, the Uintah Basin Energy Zone and a Plan for Managing and Developing Oil Shale and Oil Sands Resources within the Borders of Uintah County. A copy of said general plan provisions and relevant Utah Code sections are attached hereto and incorporated by reference. The BLM must be consistent with our local plan to the maximum extent possible. #5])>

<([#6 [9.8] General Objection To DPEIS

In addition to the comments above and those provided in the attached table, Uintah County provides a general objection to the 2012 OSTs DPEIS. As clearly stated in the attached Resolution, Uintah County has shown that this process is unsupportable, arbitrary and a blatant show of conformity to a friendly-lawsuit settlement agreement, which falls out of the public process mandated by Congress. Should BLM continue to go forward with the 2012 OSTs DPEIS regardless of the grievances outlined in the attached Resolution, the only legally viable alternative would be for the BLM to adopt the No-Action Alternative. #6])>

<([#7 [9.8] Comment Form

Uintah County, Utah, a cooperating agency in this environmental review process, has summarized other more specific comments in the attached comment form. These comments are provided in this format to help the reader follow our comments related to this voluminous document. Said comments are provided to log more specific concerns but should not be construed as limiting the impact or legal effect of Uintah County’s general objection to the entirety of this process.⁴ Uintah County reserves the right, under this general objection, to legally challenge the entire 2012 OSTs DPEIS as soon as BLM completes its charade and reaches its apparent inevitable conclusion.

⁴ Uintah County chooses to exercise restraint by not just logging a general comment borrowed from General

Anthony Clement McAuliffe: “Nuts!” #7])>

<([#8 [1.3] Section 4(C)(1) of the MOU Between the Department of the Interior, Bureau of Land

Management and Uintah County, Utah As a Cooperating Agency (hereinafter “MOU”) states: “The Parties agree to participate in this planning process in good faith and make all reasonable efforts to resolve disagreements.” So far Uintah County has been flat out ignored in this process. In addition, Section 5(E) of the MOU states: “Where the BLM and one or more Cooperators disagree on substantive elements of the RMP/EIS (such as designation of the Alternatives to be analyzed or analysis of effects), and these disagreements cannot be resolved, the BLM will include a summary of the Cooperator’s views in the Draft RMPNDraft PEIS and the Proposed RMPA/Final PEIS. The BLM will also describe substantial inconsistencies between its proposed action(s) and the objectives of state, local, or tribal land use plans and policies.” BLM has failed to conform to its own simple obligations with its MOU. #8J)>

If you have any questions regarding our comments, please contact Jonathan Stearmer, jonathan@uintahcountyattorney.org by email or at 435-781-5432.

United States Department of the Interior

BUREAU OF LAND MANAGEMENT

Washington, D.C. 20240

The Honorable Jason Chaffetz

House of Representatives

Washington, DC 20515

Dear Representative Chaffetz:

<http://www.blm.gov>

MAY 3 2012

Thank you for your April 18, 2012, letter requesting an extension of the timeframe to submit comments on the Draft Oil Shale and Tar Sands Programmatic Environmental Impact Statement (PEIS). Comments are currently due May 4, 2012. Your request is to extend the comment period for a minimum of 60 days.

Regrettably, the Bureau of Land Management (BLM) is unable to grant your request for an extension. On January 16, 2009, a lawsuit was filed by several organizations challenging the 2008 PEIS Record of Decision (ROD). This suit was settled, and as a condition of that settlement, the BLM has agreed to engage in a new planning initiative that takes a fresh look at the allocation decisions made in the 2008 ROD. Under the February 2011 settlement agreement filed with the District Court in Colorado, the BLM agreed to use its best efforts to complete its decision-making and approve a ROD for this new planning process by December 31, 2012.

The BLM anticipates issuing amendments to the existing oil shale regulations by May 15, 2012.

The changes in the regulations will not have an impact on the allocation decisions made in the PEIS. The regulations will guide approval of and apply to leasing and development operations once a decision has been made to move forward with a commercial oil shale project. The PEIS reassesses the appropriate mix of allowable uses with respect to opening lands for future oil shale and tar sands leasing and potential development.

Our goal is to achieve the terms of the agreement with maximum public participation. We are working diligently to comply with the settlement agreement while providing many opportunities for public participation. In March 2012, the BLM held four open houses in several cities in Colorado, Utah, and Wyoming to encourage public participation in the review process. Furthermore, the public is provided 90 days to review and comment on the Draft PEIS, as required by the BLM land use planning regulations (43 CFR 1610.2(e)). We believe this provides the public with sufficient opportunity to review and provide substantive comments on the draft document.

As this document supports only decision-making regarding land use allocation and not lease issuance or approval of development activities, there will be further opportunity to participate in future NEPA processes relating to potential oil shale development in Colorado, Utah, and Wyoming. I appreciate your interest in this important matter.

Sincerely,

be: LLM:W0620:LS:401

LLM:W0320

RE: Request for Extension to Comment Period on Draft BLM Oil Shale & Tar Sands PEIS

Sent via First Class Mail and email: Secretary Ken Salazar exsect{il.ios.doi.uov;

Robert Abbey Dirccctonmblm.gov

Dear Secretary Salazar, Director Abbey, et all:

<([#9 [1.1.1] On April 9, 2012, Uintah County, Utah passed a resolution opposing the BLM's 2012 Oil Shale

and Tar Sands Draft Programmatic Environmental Impact Statement (attached hereto with other resolutions from counties in the Tri-State area). As a cooperating agency in this environmental review we respectfully request an extension to the comment period. currently set to expire May 4, 2012. It is our understanding that this request for an extension has also been made, by resolution, by eight other counties, also acting under their cooperator status. Three distinct justifications necessitate this extension.

First, under the friendly~lawsuit settlement agreement the BLM agreed to develop new oil shale regulations. We understand the draft regulations are due to be published on or around May 15, 2012. As a cooperator it is impossible for us to make clear concise comments on the PDEIS until we have the opportunity to understand at least in some detail the scope of these new regulations. Indeed, cooperators run a substantial risk in proffering inconsistent and confusing responses to the DPEIS and any draft regulations; thus, undermining the integrity ofNEPA process. Consequently an extension should be granted to at least 30 days after publication of this new oil shale regulation.

Second, the sheer volume of the DPEIS necessitates a time consuming review. As a cooperator, Uintah County requests additional time to vet and analyze the DPEIS. This need becomes even more prominent based on the anticipation of new draft regulations pending publication, for it is extremely difficult to adequately comment on a four volume DPEIS if we do not have all relevant information.

Third, as detailed in the attached Resolution, Uintah County has raised numerous legal challenges to the very process of the BLM taking a "fresh look" at lands available for oil shale and oil sands. Granting an extension will allow the BLM to thoughtfully consider the consequences of continuing down this tenuous political road and give time for the BLM to make the correct decision to cease and desist all actions related to the DPEIS.

We look forward to seeing the requested extension granted. #9])> If you have any questions regarding

our comments, please contact Jonathan Stearmer, jonathan/iflllimahcountvatorne\|.om by email or at 435-781-5432.

2012 011 Shale/Tar Sands PEIS Draft Review

OSTS_Chapter_1 [1].docx

The BLM is in the process of taking a fresh look at the decisions made in the 2008 Oil Shale and Tar Sands Programmatic

Environmental Impact Statement (OSTS PEIS). As background, the Notice of Intent (NOI) to Prepare a

Programmatic Environmental Impact Statement (PEIS) and Possible Land Use Plan Amendments for Allocation

of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado,

Utah, and Wyoming was published on April 4, 2011. As there are no economically viable ways yet known to

extract and process oil shale for commercial purposes, and tar sands is not at present a proven commercially viable

energy source, the BLM, through its planning process, is taking a hard look at whether it is appropriate

for approximately 2,000,000 acres to remain available for potential development of oil shale, and approximately

431,000 acres of public land to remain available for potential development of tar sands. This new planning

initiative will provide the BLM an opportunity to consider the 2008 allocation decisions in light of the still

nascent character of the technology necessary to economically develop oil shale resources, as well as certain

information not available in 2008. In 2009, a consortium of plaintiffs filed two lawsuits in the federal District

of Colorado, each now captioned CEC v. Salazar, against the BLM and the Department of Interior. The second

suit challenged the BLM's 2008 resource management plan amendments and record of decision (ROD) for Oil

Shale and Tar Sands Resources. This suit was settled. Under the settlement agreement filed with the District

Court in Colorado, the BLM agreed to use best efforts to complete its decision-making, and approve a Record of Decision for this new planning process by December 31, 2012. As such, we are working with some extremely tight timeframes. The internal Draft of the 2012 OSTIS PEIS will be available on October 17th for a three week review period, ending November 4, 2011. Argonne National Laboratory, the contractor for this PEIS, will provide the document to a Sharepoint site, where it can be downloaded. I am giving your names, phone numbers and email addresses to Argonne National Laboratory today so that you can access the file transfer site. This will take a day or two, so in the meantime, I have attached Chapter 1 to this email in case anyone has time to get started today. Chapters 1-5 will be available Monday morning, October 17th. Chapter 6 will be available on Friday, October 21st. Comments should be made using Track Changes. Staff can send comments directly to Kurt Picel, the Argonne National Laboratory Project Manager at atkpichel@anl.gov. I know you and your staffs' are very busy with other work. We appreciate your help and involvement in this process. If you have any questions regarding the review, please contact Sherri Thompson, Project Manager, at 303.239.3758. Thank-you!

Subject:

Dear Sir or Madame:

Request to Cease and Desist Further Activity on Programmatic EIS for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the BLM in Colorado, Utah and Wyoming, W0-300-131 0-PP-OSHL
On April 14, 2011, the BLM caused to be published in the Federal Register, Volume 76, No 72 Thursday, April 14, 2011, pages 21003-21005, a notice of intent to prepare the abovereferenced

Programmatic EIS. According to the notice of intent, the BLM “intends to take a hard look at whether it is appropriate for approximately 2,000,000 acres [approved in prior BLM RMPs for oil shale leasing and development] to remain available for potential development of oil shale, and approximately 431,224 acres of public land [approved in prior BLM RMPs for tar sands leasing and development] to remain available for potential development of tar sands.” Id, at page 21003. The Programmatic EIS will consider amending several RMPs accordingly, including the Vernal, Price, Richfield and Monticello RMPs in Utah. Id
According to the preliminary purpose and need statement in the notice of intent, the Programmatic EIS will analyze removing from oil shale and tar sands leasing “All areas that the BLM has identified or may identify as a result of inventories conducted during this planning process, as lands containing wilderness characteristics[.]” Id, at page 21004. Further, the notice of intent states:

Id

Lands that the BLM identifies as having wilderness characteristics will be considered during this planning initiative, as described above, and consistent with Secretarial Order No. 3310, dated Dec. 22, 2010, and BLM Manuals 6301 and 6302. Future leasing of lands determined by the BLM to have wilderness characteristics, if compatible with the allocation decisions stemming from this initiative, will subsequently be assessed in accordance with BLM Manual 6303, as appropriate (i.e., where the BLM has not determined, consistent with BLM Manual 6302, whether the lands with wilderness characteristics at issue should be receive a wild lands designation, BLM Manual 6303 will apply).

This language documents the BLM’s intent to implement, administer and/or enforce Secretarial Order 3310 and one or more of the BLM guidance manuals promulgated under Order

3310. However, any attempt by the BLM to implement, administer and/or enforce Secretarial Order 3310, including any effort by the BLM to proceed further on the above-referenced Programmatic EIS, is a patent violation of Section 1769 of the April 21, 2011 Congressional Continuing Resolution to Fund Fiscal Year 2011 through September 30, 2011, which states: For the fiscal year ending September 30, 2011, none of the funds made available by this division or any other Act may be used to implement, administer, or enforce Secretarial Order No. 3310 issued by the Secretary of the Interior on December 22, 2010.

The BLM should immediately cease and desist all activities related to the abovereferenced Programmatic EIS and immediately publish a revised notice in the Federal Register signifying its cessation of all work on the Programmatic EIS in compliance with the abovequoted provision in the 2011 CR. Otherwise, the BLM would be in contempt of Congress. We are prepared to seek a court order to this effect if necessary.

Please advise what course of action you will take as soon as possible. Thank you.

Re: Uintah County, Utah's Comments on 2011 the Preferred Alternative of the Draft Oil Shale and Tar Sands Programmatic Environmental Impact Statement (PEIS)

To Whom It May Concern:

Uintah County writes to reiterate its view that Alternative 1, the no-action alternative of the above-referenced PEIS, should be chosen by the BLM as the preferred alternative for this PEIS. The primary reasons making Alternative 1, the no-action alternative, the preferred alternative herein, were already explained at pages 6-8 of Uintah County's November 7, 2011 written comments submitted in this matter. Uintah County incorporates herein by this reference, pages

6-8 of its November 7, 2011 written comments, as primary reasons why the no-action alternative should become the preferred alternative herein.

Additional reasons for making the no-action alternative the preferred alternative are as follows: Alternative 1, the no-action alternative, clearly conforms to the mandate by Congress in the 2005 Energy Policy Act, (2) conforms to the authority that the Bureau of Land Management (BLM) can exercise, (3) also is consistent with the local government plans, programs, and policies; (4) Choosing an alternative that cuts back on domestic energy production capability is ill advised given the dire condition of the world's present energy-related politics.

Sherri Thompson

November 14, 2011

Page 2

1. 2005 Energy Policy Act Mandate for Oil Shale and Tar Sands Program

Section 369 of the Energy Policy Act, adopted on August 8, 2005, declared it to be the United States' policy that "oil shale, tar sands, and other unconventional fuels are strategically important domestic resources that should be developed to reduce the growing dependence of the United States on politically and economically unstable sources of foreign oil imports." 42 U.S.C. § 15927(b)(1). Congress also directed that it be United States policy that commercial development of oil shale "be conducted in an environmentally sound manner, using practices that minimize impacts." 42 U.S.C. § 15927(b)(2).

Section 369 further required that the Interior Secretary promptly follow the completion of the programmatic EIS with regulations establishing an oil shale leasing program. See 42 U.S.C. § 15927(d)(2) ("Not later than 6 months after the completion of the [PEIS] under this subsection, the Secretary [of the Interior] shall publish a final regulation establishing such [commercial oil shale and tar sands leasing] program."). The Interior Department did not issue final rules until November 2008. Thus, any programmatic EIS must commit to a robust program. Alternatives 2 and 3 do not conform to the Energy Policy Act direction which still limits BLM's discretion to simply emasculate the program by eliminating public lands that are otherwise suitable and available for mineral leasing.

2. Lands With Wilderness Character

On February 15, 2011, BLM settled a challenge of the adequacy of the Final PEIS with a coalition of environmental groups. BLM agreed to revise the oil shale and tar sands regulations and to revise the EIS to consider an alternative that would exclude all lands with wilderness character from future oil shale and tar sands leasing. *CEC v. Salazar*, Civ. Nos. 09-85; 09-90. Uintah County, in its November 8, 2011 written comment and elsewhere, has provided BLM with detailed comments regarding its lack of authority to manage lands as if they were wilderness unless such lands were designated as wilderness study areas (WSAs) within the 15-year review and study period, 43 U.S.C. § 1782, or such lands have been designated by Congress.

While Interior Secretary Salazar issued S.O. 3310 on December 23, 2010, Congress prohibited the expenditure of any federal funds for FY 2011 as of April 7, 2011. BLM Director's admission in a congressional hearing that the Federal Land Policy and Management Act (FLPMA) did not authorize the designation of Wild Lands or "lands with wilderness character" no doubt persuaded many members of Congress to halt this ill-conceived program.

While an agency can consider an alternative for which it needs statutory authority, it must disclose this salient fact. The Alternative 2 of the 2011 PEIS fails to disclose or discuss the need

for additional legal authority. Moreover, while BLM can inventory any resource on public lands and this would consider wilderness character, it cannot use the inventory to change management.

Sherri Thompson

November 14, 2011

Page 3

43 U.S.C. §1711(a). To the extent that Alternatives 2, 3 and 4 propose to manage the lands with wilderness character to close them to oil shale and tar sands, BLM is clearly in violation of that prohibition.

It appears that the BLM has inventoried “lands with wilderness character” in three states in preparation of the PEIS yet it did so without consideration of the above and with no analysis or disclosure of the need or impacts of such designations. In the Vernal Field Office Resource Management Plan, lands with WC were analyzed in detail and those that were determined to possess WC were designated as such in the RMP. The attempt to make additional WC lands designations is simply another attempt to circumvent the resource planning process, plan decisions, analysis, disclosure and public participation.

3. Only Alternative 1, the No Action Alternative Is Consistent With State and Local Government Plans and Policies

FLPMA requires that any BLM land use plan to conform to state and local government plans to the extent it is consistent with federal law. 43 U.S.C. §1712(c)(9) (“Land use plans of the Secretary under this section shall be consistent with State and local plans to the maximum extent he finds consistent with Federal law and the purposes of this Act.”). Alternatives 2, 3 and 4 all fail to meet this standard and thus only Alternative 1 conforms to the consistency mandate.

4. Any Alternative Which Cuts Back on Domestic Energy Production Capability Is Ill Advised Given the Current International Energy Related Political Climate.

The Interior Department’s current policies to delay or shut down energy development is incomprehensible when viewed in the context of current world events as well as the economic recession that has gripped the country for more than four years. The Department’s continued efforts to stymie domestic energy production threaten national security in a profound way. Oil and gas imports from the Middle East continue to be vulnerable due to increased Islamic militancy in even countries that were previously considered allies. The changes in government and leadership leave the U.S. relationship with countries like Egypt, Libya, and Yemen fragile. The oil fields in Mexico are declining and Venezuela production was nationalized by its charismatic but erratic president, who is not a U.S. ally. The Interior Department’s continued efforts to limit domestic energy production cannot be justified in this context.

Chapters 3-6

Uintah County chooses not to provide additional comments on Chapters 3-6 of the PEIS. For the reasons stated in its November 7, 2011 written comments, Uintah County views this entire 2011 PEIS effort as an illegal attempt at an end run around the Congressional Moratorium against the Order 3310 Wildlands Policy and all that resembles it. This PEIS effort is plainly an effort to push the Order 3310 Wildlands Agenda. For these reasons, Uintah County will not grace or

Sherri Thompson

November 14, 2011

Page 4

dignify this illegal 2011 PEIS effort with additional comments on Chapters 3-6 at this time.

The County reserves the right to comment in detail on the public draft with full expectation that our comments will be fully considered at that time. We have downloaded three different

versions of the draft and did not have adequate time to do a comprehensive review. A determination was made that it was more cost effective to wait for the final draft when we should have a more reviewer friendly text and adequate time to conduct a more comprehensive review. This in no way affects our selection of the preferred alternative, which is supported by our comments here.

Sincerely,

UINTAH COUNTY COMMISSION

Darlene R. Bums, Chair

Michael J. Me

UINTAH COUNTY COMMISSION

RESOLUTION NO. #04-09-2012

A RESOLUTION OPPOSING THE BLM'S 2012 OIL SHALE AND TAR SANDS DRAFT PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT, BLM PROJECT #W0-300-1310-PP-OSHL (HEREAFTER 2012 OSTs DPEIS) FOR LANDS ADMINISTERED BY THE BLM IN COLORADO, UTAH AND WYOMING

This Resolution is adopted in open meeting after due opportunity for public comment, by the Board of Commissioners of Uintah County, in order to redress the many violations of law, regulation, and policy by the BLM with respect to the BLM's 2012 OSTs DPEIS.

BACKGROUND

As background to this Resolution, Uintah County recites the following grievances:

WHEREAS, On April 14, 2011, the BLM caused to be published in the Federal Register, Volume 76, No 72/Thursday, April 14, 2011, pages 21003-21005, a notice of intent to prepare the 2012 OSTs DPEIS; and

<([#10 [9.2.1] [3.1.3] WHEREAS, the preliminary purpose and need statement in the notice of intent, states the PEIS

will analyze removing from oil shale and tar sands leasing "All areas that the BLM has identified or may identify as a result of inventories conducted during this planning process, as lands containing wilderness characteristics[.]" Id., at page 21004; and

WHEREAS, the notice of intent further states at page 21004:

Lands that the BLM identifies as having wilderness characteristics will be considered during this planning initiative, as described above, and consistent with Secretarial Order No. 3310, dated Dec. 22, 2010, and BLM Manuals 6301 and 6302. Future leasing of lands determined by the BLM to have wilderness characteristics, if compatible with the allocation decisions stemming from this initiative, will subsequently be assessed in accordance with BLM Manual 6303, as appropriate (i.e., where the BLM has not determined, consistent with BLM Manual 6302, whether the lands with wilderness characteristics at issue should be receive a wild lands designation, BLM Manual 6303 will apply); and

WHEREAS, the Purpose and Need portion of the 2012 OSTs DPEIS states at page 1-5, lines 14-18:

"In addition, the BLM has recently completed updating its inventory of lands having wilderness characteristics (LWC) in each of the three states for the planning area, and the status of several areas originally proposed to be Areas of Critical Environmental Concern (ACECs) in Utah has changed since the preparation of the 2008 OSTs PEIS."

WHEREAS, this language documents the BLM's intent to implement, administer and/or enforce Secretarial Order 3310 and one or more of the BLM guidance manuals promulgated under

Order

3310;and

WHEREAS, any attempt by the BLM to implement, administer and/or enforce Secretarial Order 3310, including any effort by the BLM to proceed further on the 2012 OSTs DPEIS, violates the spending moratorium of Section 17 69 of the April 21, 2011 Congressional Continuing Resolution to Fund Fiscal Year 2011 through September 30, 2011, which states:

For the fiscal year ending September 30, 2011, none of the funds made available by this division or any other Act may be used to implement, administer, or enforce Secretarial Order No. 3310 issued by the Secretary of the Interior on December 22, 2010; and

WHEREAS, this spending moratorium has been carried forward in all subsequent Congressional spending resolutions up to and including the current spending resolution; and

WHEREAS, the 2012 OSTs DPEIS, is an admitted attempt by the BLM to implement, administer and/or enforce Secretarial Order 3310 and its policies and objectives, all in violation of the Spending Moratorium of the 2011 Continuing Resolution; and **#10)**>

<([#11 [9.8] WHEREAS, the 2008 Oil Shale and Tar Sands Programmatic EIS (2008 OSTs PEIS) was

required under Section 369 (d) (1) of the Energy Policy Act of 2005 and was prepared in cooperation with 14 federal, state, and local governmental organizations; and

WHEREAS, the 2008 OSTs PEIS was 3 years in the making, and it honored the input of a task force of Governors and other stakeholders as per requirement of the 2005 Energy Policy Act;

WHEREAS, the Record of Decision (ROD) for the 2008 OSTs PEIS amended 10 land use plans in Colorado, Utah, and Wyoming to make approximately 2 million acres of public lands available for potential leasing and development of oil shale and approximately 430,000 acres available for tar sands leasing. Together with the regulations published in 2006 and 2008 for oil shale and tar sands resources, the 2008 OSTs PEIS and subsequent land use amendments constituted a reasonable and rational establishment of an oil shale and tar sands program as mandated in the Energy Policy Act of 2005; and

#11)> **<([#12** [6.1.2] WHEREAS, the oil shale and tar sands program to which the 2008 OSTs PEIS and related

regulations gave birth, was a reasonable response to the fact that oil shale and tar sands resources in the Green River Formation located in northeastern Utah, northwestern Colorado and southwestern Wyoming may reach 9 trillion barrels of oil; and

WHEREAS, the U.S. Geological Survey Oil Shale Assessment Team reports the estimated total in-place oil shale resource for the Uinta Basin of Utah to be 1.32 trillion barrels; and

#12)> **<([#13** [9.8] WHEREAS, the preferred alternative in the 2012 OSTs DPEIS drastically shrinks, diminishes

and in many areas outright reverses virtually all of the lands made available for Oil Shale and Tar Sands development in 2008, and does so using the same data and science; and

#13)> **<([#14** [2.2] WHEREAS, the 2012 OSTs DPEIS fails to analyze alternative 2b, and the BLM admits as

much on pages 2-35 of the 2012 OSTs DPEIS; and

#14)> **<([#15** [9.2.2] WHEREAS, such a drastic reversal in lands available for Oil Shale and Tar Sands development

between the 2008 PEIS and the 2012 preferred alternative, violates regulatory Task Force requirements of certainty for industry and investors; and

WHEREAS, such a drastic reversal of lands available for Oil Shale and Tar Sands development

in 2008, constitutes a de facto, piece-meal revision of previous BLM Resource Management Plan, in violation of the Section 202 Planning Process under FLPMA;

WHEREAS, the preferred alternative in the 2012 OSTs DPEIS entirely ignores the input of the task force, the cooperating agencies, and the other stakeholders which the 2005 Energy Policy Act directed the BLM to honor and follow; and moreover the 2012 OSTs DPEIS may well violate various memoranda of understanding (MOUs) with counties, cities and local government coalitions which require the BLM to (1) publish the written input of cooperators who have unresolved disagreements over the substantive elements of the 2012 OSTs DPEIS, and (2) describe the objectives of the cooperators' land use plans and policies; and

WHEREAS, the 2012 OSTs DPEIS restricts the acreage allotted in the 2008 PWID for research and development leasing;

WHEREAS, the 2012 OSTs DPEIS threatens to arbitrarily undermine the process and the work utilized in creation of the 2008 OSTs PEIS, and essentially dismantle a reasonable and rational oil shale and tar sands program in violation of Section 369 of the 2005 Energy Policy Act; and **#15])>**

<([#16 [1.5] WHEREAS, the 2012 OSTs DPEIS is the creature of a friendly lawsuit settlement agreement

between the BLM and ideological opponents to oil shale development, and is therefore entirely pre-determined and pre-decisional in violation of NEPA, with no apparent rationale for revising the acreages approved in 2008; and **#16])>**

<([#17 [2.2] WHEREAS, the BLM has settled on a preferred alternative in the 2012 OSTs DPEIS

admittedly without having first analyzed its impacts; BLM should be required to withdraw the preferred status of the alternative until it has performed this analysis; and

WHEREAS, the acreage approved for Oil Shale and Tar Sands development in the 2012 OSTs DPEIS preferred alternative bears no rational relationship to the stated purpose and need;

#17])> <([#18 [1.5] WHEREAS, the Department of Energy has basically abdicated the responsibility Congress

placed upon it to defend and uphold a viable oil shale energy program in America, leaving it instead to the BLM encumbered by a host of anti-oil shale pre-wilderness groups steering BLM's every move; **#18])>**

<([#19 [9.5] WHEREAS, the alternative adopted in the ROD of the 2008 OSTs PEIS is now the No Action

Alternative of the 2012 OSTs DPEIS; and

WHEREAS, the 2008 OSTs PEIS chosen alternative is consistent with the multiple use, sustained yield mandate of the Federal Land Policy and Management Act (FLPMA); and

WHEREAS, the 2008 OSTs PEIS chosen alternative is consistent with county general plans and policies which call for responsible development of available energy resources, but in stark contrast the 2012 OSTs DPEIS is plainly inconsistent with State and Local plans and policies, including the Uintah Basin Energy Zone legislation passed in the 2012 Utah Legislature (Senate Bill 83- SEE UTAH CODE 631-8-102 & 105.5) and passed by the Uintah County Commission (amendment 8.16 of the Uintah County General Plan), and should the BLM continue with the 2012 OSTs DPEIS it will need to adequately explain why consistency is not achievable; and

WHEREAS, Uintah County has adopted the following into its general plan:

“Further, additional lands in Uintah County should also be approved for full oil shale and/or oil sands leasing and development if they either have a minimum resource

thickness of 15 feet, or are estimated to produce a minimum yield of 15/ gal of oil per ton of ore. Lands with these minimum resource thicknesses and gallonage yield estimates were approved for oil shale and/or oil sands development in Wyoming within the Green River Formation. Similarly situated resources should be subjected to the same approval process.”

Should the BLM continue with the 2012 OSTs DPEIS it will need to be to the maximum extent possible consistent with this general plan or adequately explain why consistency is not achievable; and #19)>

<([#20 [6.3.4] WHEREAS, even prior to 2008, the development and production of oil from oil shale has been

proven beyond a doubt to be technologically and economically feasible; and #20)>

<([#47 [6.3.2.1] WHEREAS, even prior to 2008, this same technology to extract oil from the oil shale rock is not

only economically feasible, but it requires little to no consumption of water, contrary to the myths which falsely claim that oil shale extraction requires large consumption of water resources; and #47)>

<([#21 [6.2.2] WHEREAS, the energy captured in the extract of oil from shale (natural gas capture, etc.,) more

than makes up for energy consumed in that extraction process, thus dispelling the myth that the oil shale extraction process consumes more energy than it produces; #21)>

<([#22 [3.10.3] WHEREAS, the rising price of gasoline, coupled with ever increasing loss of good paying jobs

due to the Administration’s policies against energy development on western public lands, result in increasing hardships for families and the local economy, to the point where some fear the window of opportunity is about to close for a civil, lawful and orderly response as citizens feel more and more pressured and desperate financially; and

#22)> <([#23 [6.3.3.1] WHEREAS, the 2012 OSTs DPEIS improperly limits technology testing to strictly in situ

efforts and does not allow for development of other technologies; and

#23)> <([#24 [1.1.1] WHEREAS, the BLM has left insufficient time for the public and cooperators to meaningfully

comment on the public 2012 OSTs DPEIS by the present comment deadline of May 4, 2012, because a highly relevant commercial oil shale BLM regulation is not due to be published until May 15, 2012 and the public should have the right to view that regulation first and then submit comments on the 2012 OSTs DPEIS in light of the regulation; and

#24)> <([#25 [2.1.1] WHEREAS, the same problems with lack of consistency with local plans and policies and

failure to honor the input of cooperators and all stakeholders, also besets many public lands EIS projects, in addition to the 2012 OSTs DPEIS. The cooperators from Utah and Wyoming have already unanimously requested for the No-Action alternative in the 2012 OSTs DPEIS become the preferred alternative. #25)>

RESOLUTION

NOW THEREFORE, BE IT RESOLVED BY UTAH COUNTY, STATE OF UTAH AS FOLLOWS:

<([#26 [9.2.1] I. Uintah County declares the BLM’s continuing to administer and carry out the 2012

OSTS DPEIS, and updating any inventory of lands having wilderness characteristics, to be an open contempt and flaunting of the Congressional Spending Moratorium first imposed in the 2011 Continuing Resolution and carried forward in all subsequent Congressional spending resolutions up to and including the present;

2. Uintah County calls upon the BLM to cease all further activities with respect to administering and carrying out the 2012 OSTs DPEIS, because doing so constitutes an open contempt and violation of the Congressional Spending Moratorium against implementing, administering and/or enforcing Secretarial Order 3310, which Spending Moratorium was first imposed in the 2011 Continuing Resolution and carried forward in all subsequent Congressional spending resolutions up to and including the present;

3. Uintah County calls upon the BLM to immediately cease and desist all activities related to the 2012 OSTs DPEIS and immediately publish a revised notice in the Federal Register signifying its cessation of all work on the Programmatic EIS in obedience to the above-quoted Spending Moratorium. Otherwise, the BLM would be in contempt of Congress;

~~#26)~~ ~~<([#27 [2.1.1]~~ 4. Should BLM continue to go forward with the 2012 OSTs DPEIS regardless of these

grievances, the only legally, viable alternative would be if the BLM adopted the NO-Action Alternative, which is identical to the Alternative chosen in the ROD of the 2008 OSTs PEIS ;

~~#27)~~ ~~<([#28 [9.5]~~ 5. Should BLM decide to flagrantly defy Congress and proceed with the 2012 OSTs

DPEIS, it is still obligated under FLPMA to be consistent with State and Local plans to the maximum extent possible;

~~#28)~~ ~~<([#29 [9.1]~~ 6. The BLM must cease and desist all activities related to the 2012 OSTs DPEIS because

even within its own document the Purpose and Need is unsupportable, arbitrary and a blatant show of conformity to a friendly-lawsuit settlement agreement, which falls out of the public process followed in developing the 2008 OSTs PEIS, and the 2012 OSTs DPEIS omits full and proper analysis of economically viable and technologically advanced extraction methods;

~~#29)~~ ~~<([#30 [1.1.1]~~ 7. Should BLM decide to ignore all of the above and proceed, the BLM should extend the

May 4, 2012 deadline for public comment on the 2012 OSTs DPEIS at least 30 days after publication of the expected oil shale regulation due to be published on or around May 15, 2012.

~~#30)~~

~~<([#31 [1.3]~~ 8. The BLM should honor the input of cooperators, particularly if they are local governments, as required by Section 202(c)(9) of FLPMA and the relevant terms of the ELMCooperator

MOUs, in all matters, not just with respect to the 2012 OSTs DPEIS.

~~#31)~~ APPROVED AND ADOPTED by a duly constituted quorum of the Board of County Commissioners of Uintah County Commissioners of Uintah County this 9111 day of April, 2012.

BOARD OF COUNTY COMMISSIONERS

UINTAH COUNTY, UTAH

ATTEST:

Michael W. Wilkins, Clerk/Auditor

8.16 Uintah County hereby creates an Energy Zone with the county for the purpose of

maximizing efficient and responsible development of energy and mineral resources. The land area and boundaries of the Uintah County Energy Zone are described as follows:

Township 28 Range 18E, Township 28 Range 19E, Township 28 Range 20E, Township 28 Range 21E, Township 28 Range 22E, Township 28 Range 23E, Township 28 Range 24E, Township 2N Range 1 W, Township 2N Range 1E, Township 2N Range 2E, Township 38 Range 18E, Township 38 Range 19E, Township 38 Range 20E, Township 38 Range 21E, Township 38 Range 22E, Township 38 Range 23E, Township 38 Range 24E, Township 48 Range 19E, Township 48 Range 20E, Township 48 Range 21E, Township 48 Range 22E, Township 48 Range 23E, Township 48 Range 24E, Township 48 Range 25E, Township 58 Range 19E, Township 58 Range 20E, Township 58 Range 21E, Township 58 Range 22E, Township 58 Range 23E, Township 58 Range 24E, Township 58 Range 25E, Township 68 Range 19E, Township 68 Range 20E, Township 68 Range 21E, Township 68 Range 22E, Township 68 Range 23E, Township 68 Range 24E, Township 68 Range 25E, Township 78 Range 19E, Township 78 Range 20E, Township 78 Range 21E, Township 78 Range 22E, Township 78 Range 23E, Township 78 Range 24E, Township 78 Range 25E, Township 88 Range 17E, Township 88 Range 18E, Township 88 Range 19E, Township 88 Range 20E, Township 88 Range 21E, Township 88 Range 22E, Township 88 Range 23E, Township 88 Range 24E, Township 88 Range 25E, Township 98 Range 17E, Township 98 Range 18E, Township 98 Range 19E, Township 98 Range 20E, Township 98 Range 21E, Township 98 Range 22E, Township 98 Range 23E, Township 98 Range 24E, Township 98 Range 25E, Township 10S Range 17E, Township 10S Range 18E, Township 10S Range 19E, Township 10S Range 20E, Township 10S Range 21E, Township 10S Range 22E, Township 10S Range 23E, Township 10S Range 24E, Township 10S Range 25E, Township 11S Range 17E, Township 11S Range 18E, Township 11S Range 19E, Township 11S Range 20E, Township 11S Range 21E, Township 11S Range 22E, Township 11S Range 23E, Township 11S Range 24E, Township 11S Range 25E, Township 12S Range 20E, Township 12S Range 21E, Township 12S Range 22E, Township 12S Range 23E, Township 12S Range 24E, Township 12S Range 25E, Township 13S Range 20E, Township 13S Range 21E, Township 13S Range 22E, Township 13S Range 23E, Township 13S Range 24E, Township 13S Range 25E, Township 13S Range 26 E, Township 14S Range 21E, Township 14S Range 22E, Township 14S Range 23E, Township 14S Range 24E, Township 14S Range 25E, and Township 14S Range 26 E.

These lands contain abundant, world-class deposits of energy and mineral resources, including oil, natural gas, oil shale, oil sands, gilsonite, coal, phosphate, gold, uranium, and copper, as well as areas with high wind and solar energy potential; and the highest management priority for all lands within the Uintah Basin Energy Zone is responsible management and development of existing energy and mineral resources in order to provide long-term domestic energy and supplies for Utah and the United States of America.

8.17 Uintah County's Plan for Managing and Developing Oil Shale and Oil Sands Resources within the Borders of Uintah County:

1. Representatives from Uintah County have observed economically viable technologies for extracting and processing oil shale and oil sands and know that they exist and are applied every day. Similar applicable technologies should immediately be applied today to oil shale and oil sands resources within Uintah County.
2. All lands approved for oil shale and oil sands leasing and development in the 2008 BLM Oil Shale and Tar Sands Programmatic Environmental Impact Statement (2008 OSTs PEIS) should be fully leased and developed for those resources.
3. Further, additional lands in Uintah County should also be approved for full oil shale and/or oil sands leasing and development if they either have a minimum resource thickness of 15 feet, or are estimated to produce a minimum yield of 15/gal of oil per ton of ore. Lands with these minimum resource thicknesses and gallonage yield estimates were approved for oil shale and/or oil sands development in Wyoming within the Green River Formation. Similarly situated resources should be subjected to the same approval process
4. Uintah County requires all applicable Federal agencies to fully comply with The Federal Land Policy and Management Act of 1976, as amended (hereinafter "FLPMA"), by being consistent with State and local plans to the maximum extent possible in managing public lands within Uintah County. Uintah County is committed to insure management of public lands is subject to consistent objective policy and not the political vagaries of the day.¹ Sound 1 Secretarial Order 3310, dated Dec. 22, 2010 and the 2011 Oil Shale and Tar Sands Programmatic Environmental Impact Statement are perfect examples of an attempted end-run by the Executive around Legislative mandates and a new administration's attempt to undue years of objective sound policy making to satisfy campaign promises. However, any attempt by the BLM to implement, administer and/or enforce Secretarial Order 3310, including any effort by the BLM to proceed further on the 2011 OSTs PEIS, is a patent violation of the funding moratorium against such activities, as found in Section 1769 of the April 2, 2011 Congressional Resolution to Fund Fiscal year 2011 through September 30, 2011, and subsequent Congressional funding measures which perpetuate this moratorium, which states: For the fiscal year ending September 30, 2011 [and subsequent fiscal years as applicable], none of the funds made available by this division or any other Act may be used to implement, administer, or enforce Secretarial Order 3310 issued by the Secretary of the Interior on December 22, 2010. The BLM should immediately cease and desist all activities related to the 2011 OSTs PEIS and immediately publish a revised notice in the Federal Register signifying its cessation of all work on the Programmatic EIS or it will continue to be in contempt of Congress.

consistent management will increase the energy independence of the United States of America and provide local economic stability. Any attempts by a federal agency to not adhere to the plain language of FLPMA requiring consistency with State and local plans will be challenged and if necessary legal action will ensue.

In very recognizable fashion FLPMA created a system of public land management honoring the American philosophy of "laboratories of democracy." In 1932, U.S. Supreme Court Justice Louis Brandeis stated "It is one of the happy incidents of the federal system that a single courageous State may, if its citizens choose, serve as a laboratory; and try novel social and economic experiments without risk to the rest of the country." *New State Ice Co. v. Liebmann*, 285 U.S. 262 (1932) (dissenting opinion). Uintah County, a political subdivision of the State of Utah, is exercising its duty under our system of Federalism to try sound novel approaches to manage public lands within its boundaries. Again, it is incumbent on federal agencies to the maximum extent possible be consistent with this plan. Anything short of this constitutes a violation of federal law and is subject to judicial review.

5. Consistent with this Chapter, Uintah County will utilize best available technology to develop a map showing all lands that should be leased and fully developed for oil shale and oil sands in Uintah County. This map will supersede the current State of Utah map showing lands estimated to produce a minimum yield of 25/gal of oil per ton of ore and a copy thereof shall be available for public inspection in the office of the Uintah County Commission. Enrolled Copy S.B. 83

1 UINTAH BASIN ENERGY ZONES

2 2012 GENERAL SESSION

3 STATE OF UTAH

4 Chief Sponsor: Kevin T. Van Tassell

5 House Sponsor: John G. Mathis

6

7 LONG TITLE

8 General Description:

9 This bill modifies Title 63J, Chapter 8, State of Utah Resource Management Plan for
10 Federal Lands, by creating the Uintah Basin Energy Zone.

11 Highlighted Provisions:

12 This bill:

13 < defines the term "Uintah Basin Energy Zone";

14 < creates the Uintah Basin Energy Zone;

15 < adopts an energy exploration, access, and development policy for the Uintah Basin
16 Energy Zone, including:

17 C promoting full, responsible development of energy and mineral resources within
18 the Uintah Basin Energy Zone; and

19 C achieving and maintaining sustainable levels of energy, hard rock, and natural
20 resources in the Uintah Basin Energy Zone;

21 < promotes local, state, and federal collaboration to develop energy and mineral

22 resources in the Uintah Basin Energy Zone; and

23 < makes technical changes.

24 Money Appropriated in this Bill:

25 None

26 Other Special Clauses:

34 63J-8-105.5, Utah Code Annotated 1953

35

36 Be it enacted by the Legislature of the state of Utah:

37 Section 1. Section 63J-4-401 is amended to read:

38 63J-4-401. Planning duties of the planning coordinator and office.

39 (1) The state planning coordinator shall:

40 (a) act as the governor's adviser on state, regional, metropolitan, and local
41 governmental planning matters relating to public improvements and land use;

42 (b) counsel with the authorized representatives of the Department of Transportation,
43 the State Building Board, the Department of Health, the Department of Workforce Services,
44 the Labor Commission, the Department of Natural Resources, the School and Institutional
45 Trust Lands Administration, and other proper persons concerning all state planning matters;

46 (c) when designated to do so by the governor, receive funds made available to Utah by
47 the federal government;

48 (d) receive and review plans of the various state agencies and political subdivisions
49 relating to public improvements and programs;

50 (e) when conflicts occur between the plans and proposals of state agencies, prepare
51 specific recommendations for the resolution of the conflicts and submit the recommendations
52 to the governor for a decision resolving the conflict;

53 (f) when conflicts occur between the plans and proposals of a state agency and a
54 political subdivision or between two or more political subdivisions, advise these entities of
the

55 conflict and make specific recommendations for the resolution of the conflict;

56 (g) act as the governor's planning agent in planning public improvements and land use
57 and, in this capacity, undertake special studies and investigations;

Enrolled Copy S.B. 83

- 3 -

58 (h) provide information and cooperate with the Legislature or any of its committees in
59 conducting planning studies;

60 (i) cooperate and exchange information with federal agencies and local, metropolitan,
61 or regional agencies as necessary to assist with federal, state, regional, metropolitan, and local
62 programs;

63 (j) make recommendations to the governor that the planning coordinator considers

64 advisable for the proper development and coordination of plans for state government and
65 political subdivisions; and

66 (k) oversee and supervise the activities and duties of the public lands policy
67 coordinator.

68 (2) The state planning coordinator may:

69 (a) perform regional and state planning and assist state government planning agencies
70 in performing state planning;

71 (b) provide planning assistance to Indian tribes regarding planning for Indian
72 reservations; and

73 (c) assist city, county, metropolitan, and regional planning agencies in performing
74 local, metropolitan, and regional planning, provided that the state planning coordinator and
the

75 state planning coordinator's agents and designees recognize and promote the plans, policies,
76 programs, processes, and desired outcomes of each planning agency whenever possible.

77 (3) When preparing or assisting in the preparation of plans, policies, programs, or
78 processes related to the management or use of federal lands or natural resources on federal
79 lands in Utah, the state planning coordinator shall:

80 (a) incorporate the plans, policies, programs, processes, and desired outcomes of the
81 counties where the federal lands or natural resources are located, to the maximum extent
82 consistent with state and federal law, provided that this requirement shall not be interpreted to
83 infringe upon the authority of the governor;

84 (b) identify inconsistencies or conflicts between the plans, policies, programs,
85 processes, and desired outcomes prepared under Subsection (3)(a) and the plans, programs,
S.B. 83 Enrolled Copy

- 4 -

86 processes, and desired outcomes of local government as early in the preparation process as
87 possible, and seek resolution of the inconsistencies through meetings or other conflict
88 resolution mechanisms involving the necessary and immediate parties to the inconsistency or
89 conflict;

90 (c) present to the governor the nature and scope of any inconsistency or other conflict
91 that is not resolved under the procedures in Subsection (3)(b) for the governor's decision
about

92 the position of the state concerning the inconsistency or conflict;

93 (d) develop, research, and use factual information, legal analysis, and statements of
94 desired future condition for the state, or subregion of the state, as necessary to support the
95 plans, policies, programs, processes, and desired outcomes of the state and the counties where
96 the federal lands or natural resources are located;

97 (e) establish and coordinate agreements between the state and federal land management
98 agencies, federal natural resource management agencies, and federal natural resource
99 regulatory agencies to facilitate state and local participation in the development, revision, and
100 implementation of land use plans, guidelines, regulations, other instructional memoranda, or
101 similar documents proposed or promulgated for lands and natural resources administered by
102 federal agencies; and

103 (f) work in conjunction with political subdivisions to establish agreements with federal
104 land management agencies, federal natural resource management agencies, and federal
natural

105 resource regulatory agencies to provide a process for state and local participation in the
106 preparation of, or coordinated state and local response to, environmental impact analysis
107 documents and similar documents prepared pursuant to law by state or federal agencies.
108 (4) The state planning coordinator shall comply with the requirements of Subsection
109 63C-4-102(8) before submitting any comments on a draft environmental impact statement or
110 on an environmental assessment for a proposed land management plan, if the governor
would
111 be subject to Subsection 63C-4-102(8) if the governor were submitting the material.
112 (5) The state planning coordinator shall cooperate with and work in conjunction with
113 appropriate state agencies and political subdivisions to develop policies, plans, programs,
Enrolled Copy S.B. 83

- 5 -

114 processes, and desired outcomes authorized by this section by coordinating the development
of

115 positions:

116 (a) through the Resource Development Coordinating Committee;

117 (b) in conjunction with local government officials concerning general local government
118 plans;

119 (c) by soliciting public comment through the Resource Development Coordinating
120 Committee; and

121 (d) by working with the Public Lands Policy Coordinating Office.

122 (6) The state planning coordinator shall recognize and promote the following principles
123 when preparing any policies, plans, programs, processes, or desired outcomes relating to
124 federal lands and natural resources on federal lands pursuant to this section:

125 (a) (i) the citizens of the state are best served by applying multiple-use and
126 sustained-yield principles in public land use planning and management; and

127 (ii) multiple-use and sustained-yield management means that federal agencies should
128 develop and implement management plans and make other resource-use decisions that:

129 (A) achieve and maintain in perpetuity a high-level annual or regular periodic output of
130 mineral and various renewable resources from public lands;

131 (B) support valid existing transportation, mineral, and grazing privileges at the highest
132 reasonably sustainable levels;

133 (C) support the specific plans, programs, processes, and policies of state agencies and
134 local governments;

135 (D) are designed to produce and provide the desired vegetation for the watersheds,
136 timber, food, fiber, livestock forage, and wildlife forage, and minerals that are necessary to

137 meet present needs and future economic growth and community expansion without
permanent

138 impairment of the productivity of the land;

139 (E) meet the recreational needs and the personal and business-related transportation
140 needs of the citizens of the state by providing access throughout the state;

141 (F) meet the recreational needs of the citizens of the state;

S.B. 83 Enrolled Copy

- 6 -

142 (G) meet the needs of wildlife;

143 (H) provide for the preservation of cultural resources, both historical and

144 archaeological;
145 (I) meet the needs of economic development;
146 (J) meet the needs of community development; and
147 (K) provide for the protection of water rights;
148 (b) managing public lands for “wilderness characteristics” circumvents the statutory
149 wilderness process and is inconsistent with the multiple-use and sustained-yield
management
150 standard that applies to all Bureau of Land Management and U.S. Forest Service lands that
are
151 not wilderness areas or wilderness study areas;
152 (c) all waters of the state are:
153 (i) owned exclusively by the state in trust for its citizens;
154 (ii) are subject to appropriation for beneficial use; and
155 (iii) are essential to the future prosperity of the state and the quality of life within the
156 state;
157 (d) the state has the right to develop and use its entitlement to interstate rivers;
158 (e) all water rights desired by the federal government must be obtained through the
159 state water appropriation system;
160 (f) land management and resource-use decisions which affect federal lands should give
161 priority to and support the purposes of the compact between the state and the United States
162 related to school and institutional trust lands;
163 (g) development of the solid, fluid, and gaseous mineral resources of the state is an
164 important part of the economy of the state, and of local regions within the state;
165 (h) the state should foster and support industries that take advantage of the state’s
166 outstanding opportunities for outdoor recreation;
167 (i) wildlife constitutes an important resource and provides recreational and economic
168 opportunities for the state’s citizens;
169 (j) proper stewardship of the land and natural resources is necessary to ensure the
Enrolled Copy S.B. 83

- 7 -

170 health of the watersheds, timber, forage, and wildlife resources to provide for a continuous
171 supply of resources for the people of the state and the people of the local communities who
172 depend on these resources for a sustainable economy;
173 (k) forests, rangelands, timber, and other vegetative resources:
174 (i) provide forage for livestock;
175 (ii) provide forage and habitat for wildlife;
176 (iii) provide resources for the state’s timber and logging industries;
177 (iv) contribute to the state’s economic stability and growth; and
178 (v) are important for a wide variety of recreational pursuits;
179 (l) management programs and initiatives that improve watersheds, forests, and increase
180 forage for the mutual benefit of wildlife species and livestock, logging, and other
agricultural
181 industries by utilizing proven techniques and tools are vital to the state’s economy and the
182 quality of life in Utah; and
183 (m) (i) land management plans, programs, and initiatives should provide that the
184 amount of domestic livestock forage, expressed in animal unit months, for permitted, active

185 use as well as the wildlife forage included in that amount, be no less than the maximum
186 number of animal unit months sustainable by range conditions in grazing allotments and
187 districts, based on an on-the-ground and scientific analysis;

188 (ii) the state opposes the relinquishment or retirement of grazing animal unit months in
189 favor of conservation, wildlife, and other uses;

190 (iii) (A) the state favors the best management practices that are jointly sponsored by
191 cattlemen's, sportsmen's, and wildlife management groups such as chaining, logging,
seeding,
192 burning, and other direct soil and vegetation prescriptions that are demonstrated to restore
193 forest and rangeland health, increase forage, and improve watersheds in grazing districts and
194 allotments for the mutual benefit of domestic livestock and wildlife;

195 (B) when practices described in Subsection (6)(m)(iii)(A) increase a grazing
196 allotment's forage beyond the total permitted forage use that was allocated to that allotment
in
197 the last federal land use plan or allotment management plan still in existence as of January 1,
S.B. 83 Enrolled Copy

- 8 -

198 2005, a reasonable and fair portion of the increase in forage beyond the previously allocated
199 total permitted use should be allocated to wildlife as recommended by a joint, evenly
balanced
200 committee of livestock and wildlife representatives that is appointed and constituted by the
201 governor for that purpose;

202 (C) the state favors quickly and effectively adjusting wildlife population goals and
203 population census numbers in response to variations in the amount of available forage
caused
204 by drought or other climatic adjustments, and state agencies responsible for managing
wildlife
205 population goals and population census numbers will give due regard to both the needs of
the
206 livestock industry and the need to prevent the decline of species to a point where listing
under
207 the terms of the Endangered Species Act when making such adjustments;

208 (iv) the state opposes the transfer of grazing animal unit months to wildlife for
209 supposed reasons of rangeland health;

210 (v) reductions in domestic livestock animal unit months must be temporary and
211 scientifically based upon rangeland conditions;

212 (vi) policies, plans, programs, initiatives, resource management plans, and forest plans
213 may not allow the placement of grazing animal unit months in a suspended use category
unless
214 there is a rational and scientific determination that the condition of the rangeland allotment
or
215 district in question will not sustain the animal unit months sought to be placed in suspended
216 use;

217 (vii) any grazing animal unit months that are placed in a suspended use category should
218 be returned to active use when range conditions improve;

219 (viii) policies, plans, programs, and initiatives related to vegetation management

220 should recognize and uphold the preference for domestic grazing over alternate forage uses in

221 established grazing districts while upholding management practices that optimize and expand

222 forage for grazing and wildlife in conjunction with state wildlife management plans and 223 programs in order to provide maximum available forage for all uses; and

224 (ix) in established grazing districts, animal unit months that have been reduced due to 225 rangeland health concerns should be restored to livestock when rangeland conditions improve,

Enrolled Copy S.B. 83

- 9 -

226 and should not be converted to wildlife use.

227 (7) The state planning coordinator shall recognize and promote the following findings

228 in the preparation of any policies, plans, programs, processes, or desired outcomes relating to

229 federal lands and natural resources on federal lands under this section:

230 (a) as a coholder of R.S. 2477 rights-of-way with the counties, the state supports its 231 recognition by the federal government and the public use of R.S. 2477 rights-of-way and urges

232 the federal government to fully recognize the rights-of-way and their use by the public as 233 expeditiously as possible;

234 (b) it is the policy of the state to use reasonable administrative and legal measures to 235 protect and preserve valid existing rights-of-way granted by Congress under R.S. 2477, and to

236 support and work in conjunction with counties to redress cases where R.S. 2477 rights-of-way

237 are not recognized or are impaired; and

238 (c) transportation and access routes to and across federal lands, including all 239 rights-of-way vested under R.S. 2477, are vital to the state's economy and to the quality of life

240 in the state, and must provide, at a minimum, a network of roads throughout the resource 241 planning area that provides for:

242 (i) movement of people, goods, and services across public lands;

243 (ii) reasonable access to a broad range of resources and opportunities throughout the 244 resource planning area, including:

245 (A) livestock operations and improvements;

246 (B) solid, fluid, and gaseous mineral operations;

247 (C) recreational opportunities and operations, including motorized and nonmotorized 248 recreation;

249 (D) search and rescue needs;

250 (E) public safety needs; and

251 (F) access for transportation of wood products to market;

252 (iii) access to federal lands for people with disabilities and the elderly; and

253 (iv) access to state lands and school and institutional trust lands to accomplish the

S.B. 83 Enrolled Copy

- 10 -

254 purposes of those lands.

255 (8) The state planning coordinator shall recognize and promote the following findings
256 in the preparation of any plans, policies, programs, processes, or desired outcomes relating
257 to

257 federal lands and natural resources on federal lands pursuant to this section:

258 (a) the state's support for the addition of a river segment to the National Wild and
259 Scenic Rivers System, 16 U.S.C. Sec. 1271 et seq., will be withheld until:

260 (i) it is clearly demonstrated that water is present and flowing at all times;

261 (ii) it is clearly demonstrated that the required water-related value is considered
262 outstandingly remarkable within a region of comparison consisting of one of the three
263 physiographic provinces in the state, and that the rationale and justification for the
264 conclusions

264 are disclosed;

265 (iii) it is clearly demonstrated that the inclusion of each river segment is consistent
266 with the plans and policies of the state and the county or counties where the river segment is
267 located as those plans and policies are developed according to Subsection (3);

268 (iv) the effects of the addition upon the local and state economies, agricultural and
269 industrial operations and interests, outdoor recreation, water rights, water quality, water
270 resource planning, and access to and across river corridors in both upstream and downstream
271 directions from the proposed river segment have been evaluated in detail by the relevant
272 federal

272 agency;

273 (v) it is clearly demonstrated that the provisions and terms of the process for review of
274 potential additions have been applied in a consistent manner by all federal agencies;

275 (vi) the rationale and justification for the proposed addition, including a comparison
276 with protections offered by other management tools, is clearly analyzed within the multiple-
277 use

277 mandate, and the results disclosed;

278 (vii) it is clearly demonstrated that the federal agency with management authority over
279 the river segment, and which is proposing the segment for inclusion in the National Wild
280 and

280 Scenic River System will not use the actual or proposed designation as a basis to impose
281 management standards outside of the federal land management plan;

Enrolled Copy S.B. 83

- 11 -

282 (viii) it is clearly demonstrated that the terms and conditions of the federal land and
283 resource management plan containing a recommendation for inclusion in the National Wild
284 and Scenic River System:

285 (A) evaluates all eligible river segments in the resource planning area completely and
286 fully for suitability for inclusion in the National Wild and Scenic River System;

287 (B) does not suspend or terminate any studies for inclusion in the National Wild and
288 Scenic River System at the eligibility phase;

289 (C) fully disclaims any interest in water rights for the recommended segment as a result
290 of the adoption of the plan; and

291 (D) fully disclaims the use of the recommendation for inclusion in the National Wild
292 and Scenic River System as a reason or rationale for an evaluation of impacts by proposals

for

293 projects upstream, downstream, or within the recommended segment;
294 (ix) it is clearly demonstrated that the agency with management authority over the river
295 segment commits not to use an actual or proposed designation as a basis to impose Visual
296 Resource Management Class I or II management prescriptions that do not comply with the
297 provisions of Subsection (8)(t); and
298 (x) it is clearly demonstrated that including the river segment and the terms and
299 conditions for managing the river segment as part of the National Wild and Scenic River
300 System will not prevent, reduce, impair, or otherwise interfere with:
301 (A) the state and its citizens' enjoyment of complete and exclusive water rights in and
302 to the rivers of the state as determined by the laws of the state; or
303 (B) local, state, regional, or interstate water compacts to which the state or any county
304 is a party;
305 (b) the conclusions of all studies related to potential additions to the National Wild and
306 Scenic River System, 16 U.S.C. Sec. 1271 et seq., are submitted to the state for review and
307 action by the Legislature and governor, and the results, in support of or in opposition to, are
308 included in any planning documents or other proposals for addition and are forwarded to the
309 United States Congress;

S.B. 83 Enrolled Copy

- 12 -

310 (c) the state's support for designation of an Area of Critical Environmental Concern
311 (ACEC), as defined in 43 U.S.C. Sec. 1702, within federal land management plans will be
312 withheld until:
313 (i) it is clearly demonstrated that the proposed area satisfies all the definitional
314 requirements of the Federal Land Policy and Management Act of 1976, 43 U.S.C. Sec.
315 1702(a);
316 (ii) it is clearly demonstrated that the area proposed for designation as an ACEC is
317 limited in geographic size and that the proposed management prescriptions are limited in
318 scope
319 to the minimum necessary to specifically protect and prevent irreparable damage to the
320 relevant
321 and important values identified, or limited in geographic size and management prescriptions
322 to
323 the minimum required to specifically protect human life or safety from natural hazards;
324 (iii) it is clearly demonstrated that the proposed area is limited only to areas that are
325 already developed or used or to areas where no development is required;
326 (iv) it is clearly demonstrated that the proposed area contains relevant and important
327 historic, cultural or scenic values, fish or wildlife resources, or natural processes which are
328 unique or substantially significant on a regional basis, or contain natural hazards which
329 significantly threaten human life or safety;
330 (v) the federal agency has analyzed regional values, resources, processes, or hazards for
331 irreparable damage and its potential causes resulting from potential actions which are
332 consistent with the multiple-use, sustained-yield principles, and the analysis describes the
333 rationale for any special management attention required to protect, or prevent irreparable
334 damage to the values, resources, processes, or hazards;
335 (vi) it is clearly demonstrated that the proposed designation is consistent with the plans

333 and policies of the state and of the county where the proposed designation is located as those
334 plans and policies are developed according to Subsection (3);

335 (vii) it is clearly demonstrated that the proposed ACEC designation will not be applied
336 redundantly over existing protections provided by other state and federal laws for federal
lands

337 or resources on federal lands, and that the federal statutory requirement for special
management

Enrolled Copy S.B. 83

- 13 -

338 attention for a proposed ACEC will discuss and justify any management requirements
needed

339 in addition to those specified by the other state and federal laws;

340 (viii) the difference between special management attention required for an ACEC and
341 normal multiple-use management has been identified and justified, and that any
determination

342 of irreparable damage has been analyzed and justified for short and long-term horizons;

343 (ix) it is clearly demonstrated that the proposed designation:

344 (A) is not a substitute for a wilderness suitability recommendation;

345 (B) is not a substitute for managing areas inventoried for wilderness characteristics

346 after 1993 under the BLM interim management plan for valid wilderness study areas; and

347 (C) it is not an excuse or justification to apply de facto wilderness management

348 standards; and

349 (x) the conclusions of all studies are submitted to the state, as a cooperating agency, for
350 review, and the results, in support of or in opposition to, are included in all planning
351 documents;

352 (d) sufficient federal lands are made available for government-to-government

353 exchanges of school and institutional trust lands and federal lands without regard for a

354 resource-to-resource correspondence between the surface or mineral characteristics of the
355 offered trust lands and the offered federal lands;

356 (e) federal agencies should support government-to-government exchanges of land with

357 the state based on a fair process of valuation which meets the fiduciary obligations of both
the

358 state and federal governments toward trust lands management, and which assures that
revenue

359 authorized by federal statute to the state from mineral or timber production, present or
future, is

360 not diminished in any manner during valuation, negotiation, or implementation processes;

361 (f) agricultural and grazing lands should continue to produce the food and fiber needed

362 by the citizens of the state and the nation, and the rural character and open landscape of rural
363 Utah should be preserved through a healthy and active agricultural and grazing industry,

364 consistent with private property rights and state fiduciary duties;

365 (g) the resources of the forests and rangelands of the state should be integrated as part

S.B. 83 Enrolled Copy

- 14 -

366 of viable, robust, and sustainable state and local economies, and available forage should be
367 evaluated for the full complement of herbivores the rangelands can support in a sustainable

368 manner, and forests should contain a diversity of timber species, and disease or insect
369 infestations in forests should be controlled using logging or other best management
practices;
370 (h) the state opposes any additional evaluation of national forest service lands as
371 “roadless” or “unroaded” beyond the forest service’s second roadless area review evaluation
and
372 opposes efforts by agencies to specially manage those areas in a way that:
373 (i) closes or declassifies existing roads unless multiple side by side roads exist running
374 to the same destination and state and local governments consent to close or declassify the
extra
375 roads;
376 (ii) permanently bars travel on existing roads;
377 (iii) excludes or diminishes traditional multiple-use activities, including grazing and
378 proper forest harvesting;
379 (iv) interferes with the enjoyment and use of valid, existing rights, including water
380 rights, local transportation plan rights, R.S. 2477 rights, grazing allotment rights, and
mineral
381 leasing rights; or
382 (v) prohibits development of additional roads reasonably necessary to pursue
383 traditional multiple-use activities;
384 (i) the state’s support for any forest plan revision or amendment will be withheld until
385 the appropriate plan revision or plan amendment clearly demonstrates that:
386 (i) established roads are not referred to as unclassified roads or a similar classification;
387 (ii) lands in the vicinity of established roads are managed under the multiple-use,
388 sustained-yield management standard; and
389 (iii) no roadless or unroaded evaluations or inventories are recognized or upheld
390 beyond those that were recognized or upheld in the forest service’s second roadless area
review
391 evaluation;
392 (j) the state’s support for any recommendations made under the statutory requirement to
393 examine the wilderness option during the revision of land and resource management plans
by

Enrolled Copy S.B. 83

- 15 -

394 the U.S. Forest Service will be withheld until it is clearly demonstrated that:
395 (i) the duly adopted transportation plans of the state and county or counties within the
396 planning area are fully and completely incorporated into the baseline inventory of
information
397 from which plan provisions are derived;
398 (ii) valid state or local roads and rights-of-way are recognized and not impaired in any
399 way by the recommendations;
400 (iii) the development of mineral resources by underground mining is not affected by
401 the recommendations;
402 (iv) the need for additional administrative or public roads necessary for the full use of
403 the various multiple-uses, including recreation, mineral exploration and development, forest
404 health activities, and grazing operations is not unduly affected by the recommendations;

405 (v) analysis and full disclosure is made concerning the balance of multiple-use
406 management in the proposed areas, and that the analysis compares the full benefit of
407 multiple-use management to the recreational, forest health, and economic needs of the state
and

408 the counties to the benefits of the requirements of wilderness management; and
409 (vi) the conclusions of all studies related to the requirement to examine the wilderness
410 option are submitted to the state for review and action by the Legislature and governor, and
the

411 results, in support of or in opposition to, are included in any planning documents or other
412 proposals that are forwarded to the United States Congress;

413 (k) the invasion of noxious weeds and undesirable invasive plant species into the state
414 should be reversed, their presence eliminated, and their return prevented;

415 (l) management and resource-use decisions by federal land management and regulatory
416 agencies concerning the vegetative resources within the state should reflect serious
417 consideration of the proper optimization of the yield of water within the watersheds of the
418 state;

419 (m) (i) it is the policy of the state that:

420 (A) mineral and energy production and environmental protection are not mutually
421 exclusive;

S.B. 83 Enrolled Copy

- 16 -

422 (B) it is technically feasible to permit appropriate access to mineral and energy
423 resources while preserving nonmineral and nonenergy resources;

424 (C) resource management planning should seriously consider all available mineral and
425 energy resources;

426 (D) the development of the solid, fluid, and gaseous mineral resources of the state and
427 the renewable resources of the state should be encouraged;

428 (E) the waste of fluid and gaseous minerals within developed areas should be
429 prohibited; and

430 (F) requirements to mitigate or reclaim mineral development projects should be based
431 on credible evidence of significant impacts to natural or cultural resources;

432 (ii) the state's support for mineral development provisions within federal land
433 management plans will be withheld until the appropriate land management plan
environmental

434 impact statement clearly demonstrates:

435 (A) that the authorized planning agency has:

436 (I) considered and evaluated the mineral and energy potential in all areas of the
437 planning area as if the areas were open to mineral development under standard lease
438 agreements; and

439 (II) evaluated any management plan prescription for its impact on the area's baseline
440 mineral and energy potential;

441 (B) that the development provisions do not unduly restrict access to public lands for
442 energy exploration and development;

443 (C) that the authorized planning agency has supported any closure of additional areas
444 to mineral leasing and development or any increase of acres subject to no surface occupancy
445 restrictions by adhering to:

446 (I) the relevant provisions of the Federal Land Policy and Management Act of 1976, 43
447 U.S.C. Sec. 1701 et seq.;

448 (II) other controlling mineral development laws; and

449 (III) the controlling withdrawal and reporting procedures set forth in the Federal Land
Enrolled Copy S.B. 83

- 17 -

450 Policy and Management Act of 1976, 43 U.S.C. Sec. 1701 et seq.;

451 (D) that the authorized planning agency evaluated whether to repeal any moratorium
452 that may exist on the issuance of additional mining patents and oil and gas leases;

453 (E) that the authorized planning agency analyzed all proposed mineral lease

454 stipulations and considered adopting the least restrictive necessary to protect against damage
to

455 other significant resource values;

456 (F) that the authorized planning agency evaluated mineral lease restrictions to

457 determine whether to waive, modify, or make exceptions to the restrictions on the basis that
458 they are no longer necessary or effective;

459 (G) that the authorized federal agency analyzed all areas proposed for no surface

460 occupancy restrictions, and that the analysis evaluated:

461 (I) whether directional drilling is economically feasible and ecologically necessary for
462 each proposed no surface occupancy area;

463 (II) whether the directional drilling feasibility analysis, or analysis of other

464 management prescriptions, demonstrates that the proposed no surface occupancy
prescription,

465 in effect, sterilizes the mineral and energy resources beneath the area; and

466 (III) whether, if the minerals are effectively sterilized, the area must be reported as

467 withdrawn under the provisions of the Federal Land Policy and Management Act; and

468 (H) that the authorized planning agency has evaluated all directional drilling

469 requirements in no surface occupancy areas to determine whether directional drilling is
feasible

470 from an economic, ecological, and engineering standpoint;

471 (n) motorized, human, and animal-powered outdoor recreation should be integrated

472 into a fair and balanced allocation of resources within the historical and cultural framework
of

473 multiple-uses in rural Utah, and outdoor recreation should be supported as part of a balanced

474 plan of state and local economic support and growth;

475 (o) off-highway vehicles should be used responsibly, the management of off-highway

476 vehicles should be uniform across all jurisdictions, and laws related to the use of off-
highway

477 vehicles should be uniformly applied across all jurisdictions;

S.B. 83 Enrolled Copy

- 18 -

478 (p) (i) rights-of-way granted and vested under the provisions of R.S. 2477 should be
479 preserved and acknowledged;

480 (ii) land use management plans, programs, and initiatives should be consistent with

481 both state and county transportation plans developed according to Subsection (3) in order to

482 provide a network of roads throughout the planning area that provides for:

483 (A) movement of people, goods, and services across public lands;
484 (B) reasonable access to a broad range of resources and opportunities throughout the
485 planning area, including access to livestock, water, and minerals;
486 (C) economic and business needs;
487 (D) public safety;
488 (E) search and rescue;
489 (F) access for people with disabilities and the elderly;
490 (G) access to state lands; and
491 (H) recreational opportunities;
492 (q) transportation and access provisions for all other existing routes, roads, and trails
493 across federal, state, and school trust lands within the state should be determined and
494 identified, and agreements should be executed and implemented, as necessary to fully
authorize
495 and determine responsibility for maintenance of all routes, roads, and trails;
496 (r) the reasonable development of new routes and trails for motorized, human, and
497 animal-powered recreation should be implemented;
498 (s) (i) forests, rangelands, and watersheds, in a healthy condition, are necessary and
499 beneficial for wildlife, livestock grazing, and other multiple-uses;
500 (ii) management programs and initiatives that are implemented to increase forage for
501 the mutual benefit of the agricultural industry, livestock operations, and wildlife species
should
502 utilize all proven techniques and tools;
503 (iii) the continued viability of livestock operations and the livestock industry should be
504 supported on the federal lands within the state by management of the lands and forage
505 resources, by the proper optimization of animal unit months for livestock, in accordance
with

Enrolled Copy S.B. 83

- 19 -

506 the multiple-use provisions of the Federal Land Policy and Management Act of 1976, 43
507 U.S.C. 1701 et seq., the provisions of the Taylor Grazing Act of 1934, 43 U.S.C. 315 et seq.,
508 and the provisions of the Public Rangelands Improvement Act of 1978, 43 U.S.C. 1901 et
seq.;

509 (iv) provisions for predator control initiatives or programs under the direction of state
510 and local authorities should be implemented; and
511 (v) resource-use and management decisions by federal land management and
512 regulatory agencies should support state-sponsored initiatives or programs designed to
stabilize
513 wildlife populations that may be experiencing a scientifically demonstrated decline in those
514 populations; and
515 (t) management and resource use decisions by federal land management and regulatory
516 agencies concerning the scenic resources of the state must balance the protection of scenery
517 with the full management requirements of the other authorized uses of the land under
518 multiple-use management, and should carefully consider using Visual Resource
Management
519 Class I protection only for areas of inventoried Class A scenery or equivalent.
520 (9) Notwithstanding any provision of Section 63J-8-105.5, the state is committed to

521 establishing and administering an effective statewide conservation strategy for greater sage
522 grouse.

523 [(9)] (10) Nothing contained in this section may be construed to restrict or supersede
524 the planning powers conferred upon state departments, agencies, instrumentalities, or
525 advisory

525 councils of the state or the planning powers conferred upon political subdivisions by any
526 other

526 existing law.

527 [(10)] (11) Nothing in this section may be construed to affect any lands withdrawn
528 from the public domain for military purposes, which are administered by the United States
529 Army, Air Force, or Navy.

530 Section 2. Section 63J-8-102 is amended to read:

531 63J-8-102. Definitions.

532 As used in this chapter:

533 (1) "ACEC" means an area of critical environmental concern.

S.B. 83 Enrolled Copy

- 20 -

534 (2) "AUM" means animal unit months, a unit of grazing forage.

535 (3) "BLM" means the United States Bureau of Land Management.

536 (4) "FLPMA" means the Federal Land Policy Management Act of 1976, 43 U.S.C. Sec.
537 1701 et seq.

538 (5) "Forest service" means the United States Forest Service within the United States
539 Department of Agriculture.

540 (6) "Multiple use" means proper stewardship of the subject lands pursuant to Section
541 1031(C) of FLPMA, 43 U.S.C. Sec. 170(C).

542 (7) "OHV" means off-highway vehicle as defined in Section 41-22-2.

543 (8) "Settlement Agreement" means the written agreement between the state and the
544 Department of the Interior in 2003 (revised in 2005) that resolved the case of State of Utah
v.

545 Gale Norton, Secretary of Interior (United States District Court, D. Utah, Case No.
546 2:96cv0870).

547 (9) "SITLA" means the School and Institutional Trust Lands Administration as created
548 in Section 53C-1-201.

549 (10) (a) "Subject lands" means the following non-WSA BLM lands:

550 (i) in Beaver County:

551 (A) Mountain Home Range South, Jackson Wash, The Toad, North Wah Wah
552 Mountains, Central Wah Wah Mountains, and San Francisco Mountains according to the
553 region map entitled "Great Basin Central" linked in the webpage entitled "Citizen's Proposal
554 for Wilderness in Utah" at <http://www.protectwildutah.org/proposal/index.html> as the
webpage

555 existed on February 17, 2011; and

556 (B) White Rock Range, South Wah Wah Mountains, and Granite Peak according to the
557 region map entitled "Great Basin South" linked in the webpage entitled "Citizen's Proposal
for

558 Wilderness in Utah" at <http://www.protectwildutah.org/proposal/index.html> as the webpage
559 existed on February 17, 2011;

560 (ii) in Box Elder County: Little Goose Creek, Grouse Creek Mountains North, Grouse
561 Creek Mountains South, Bald Eagle Mountain, Central Pilot Range, Pilot Peak, Crater Island
Enrolled Copy S.B. 83

- 21 -

562 West, Crater Island East, Newfoundland Mountains, and Grassy Mountains North according
to

563 the region map entitled "Great Basin North" linked in the webpage entitled "Citizen's
Proposal

564 for Wilderness in Utah" at <http://www.protectwildutah.org/proposal/index.html> as the
webpage

565 existed on February 17, 2011;

566 (iii) in Carbon County: Desbrough Canyon and Turtle Canyon according to the region
567 map entitled "Book Cliffs" linked in the webpage entitled "Citizen's Proposal for
Wilderness in

568 Utah" at <http://www.protectwildutah.org/proposal/index.html> as the webpage existed on
569 February 17, 2011;

570 (iv) in Daggett County: Goslin Mountain, Home Mountain, Red Creek Badlands,
571 O-wi-yu-kuts, Lower Flaming Gorge, Crouse Canyon, and Diamond Breaks according to the
572 region map entitled "Dinosaur" linked in the webpage entitled "Citizen's Proposal for
573 Wilderness in Utah" at <http://www.protectwildutah.org/proposal/index.html> as the webpage
574 existed on February 17, 2011;

575 (v) in Duchesne County: Desbrough Canyon according to the region map entitled
576 "Book Cliffs" linked in the webpage entitled "Citizen's Proposal for Wilderness in Utah" at
577 <http://www.protectwildutah.org/proposal/index.html> as the webpage existed on February 17,
578 2011;

579 (vi) in Emery County:

580 (A) San Rafael River and Sweetwater Reef, according to the region map entitled
581 "Canyonlands Basin" linked in the webpage entitled "Citizen's Proposal for Wilderness in
582 Utah" at <http://www.protectwildutah.org/proposal/index.html> as the webpage existed on
583 February 17, 2011;

584 (B) Flat Tops according to the region map entitled "Glen Canyon," which is available
585 by clicking the link entitled "Dirty Devil" at the webpage entitled "Citizen's Proposal for
586 Wilderness in Utah" at <http://www.protectwildutah.org/proposal/index.html> as the webpage
587 existed on February 17, 2011; and

588 (C) Price River, Lost Spring Wash, Eagle Canyon, Upper Muddy Creek, Molen Reef,
589 Rock Canyon, Mussentuchit Badland, and Muddy Creek, according to the region map
entitled

740 (C) Fremont Gorge, Pleasant Creek Bench, Notom Bench, Mount Ellen, and Bull
741 Mountain, according to the region map entitled “Henry Mountains” linked at the webpage
742 entitled “Citizen’s Proposal for Wilderness in Utah” at
743 <http://www.protectwildutah.org/proposal/index.html> as the webpage existed on February 17,
744 2011; and
745 (D) Capital Reef Adjacents, Muddy Creek, Wild Horse Mesa, North Blue Flats, Red
746 Desert, and Factory Butte, according to the region map entitled “San Rafael Swell” linked at
747 the webpage entitled “Citizen’s Proposal for Wilderness in Utah” at
748 <http://www.protectwildutah.org/proposal/index.html> as the webpage existed on February 17,
749 2011.
750 (b) “Subject lands” also includes all BLM and Forest Service lands in the state that are

744 not Wilderness Area or Wilderness Study Areas;

745 (c) "Subject lands" does not include the following lands that are the subject of
746 consideration for a possible federal lands bill and should be managed according to the 2008
747 Price BLM Field Office Resource Management Plan until a federal lands bill provides
748 otherwise:

749 (i) Turtle Canyon and Desolation Canyon according to the region map entitled "Book
750 Cliffs" linked in the webpage entitled "Citizen's Proposal for Wilderness in Utah" at
751 <http://protectwildutah.org/proposal/index.html> as the webpage existed on February 17, 2011;

752 (ii) Labyrinth Canyon, Duma Point, and Horseshoe Point, according to the region map
753 entitled "Canyonlands Basin" linked in the webpage entitled "Citizen's Proposal for
Wilderness

754 in Utah" at <http://protectwildutah.org/proposal/index.html> as the webpage existed on
February

755 17, 2011; and

756 (iii) Devil's Canyon, Sid's Mountain, Mexican Mountain, San Rafael Reef, Hondu
757 Country, Cedar Mountain, and Wild Horse, according to the region map entitled "San Rafael

816 [(11)] (12) "Wilderness area" means those BLM and Forest Service lands added to the
817 National Wilderness Preservation System by an act of Congress.

818 [(12)] (13) "WSA" and "Wilderness Study Area" mean the BLM lands in Utah that
819 were identified as having the necessary wilderness character and were classified as
wilderness

820 study areas during the BLM wilderness review conducted between 1976 and 1993 by
authority

821 of Section 603 of FLPMA and labeled as Wilderness Study Areas within the final report of
the

822 President of the United States to the United States Congress in 1993.

823 Section 3. Section 63J-8-105 is amended to read:

824 63J-8-105. Maps available for public review.

825 A printed copy of the maps referenced in [Subsection] Subsections 63J-8-102(10) and
826 (11) shall be available for inspection by the public at the offices of the Utah Association of
827 Counties.

828 Section 4. Section 63J-8-105.5 is enacted to read:

829 63J-8-105.5. Uintah Basin Energy Zone established -- Findings -- Management
830 and land use priorities.

831 (1) There is established the Uintah Basin Energy Zone in Daggett, Uintah, and
832 Duchesne Counties for the purpose of maximizing efficient and responsible development of
833 energy and mineral resources.

834 (2) The land area and boundaries of the Uintah Basin Energy Zone are described in
835 Subsection 63J-8-102(11) and illustrated on the map described in Section 63J-8-105.

836 (3) The state finds that:

837 (a) the lands comprising the Uintah Basin Energy Zone contain abundant, world-class
838 deposits of energy and mineral resources, including oil, natural gas, oil shale, oil sands,
839 gilsonite, coal, phosphate, gold, uranium, and copper, as well as areas with high wind and
solar

840 energy potential; and

841 (b) the highest management priority for all lands within the Uintah Basin Energy Zone

Enrolled Copy S.B. 83

- 31 -

842 is responsible management and development of existing energy and mineral resources in
order

843 to provide long-term domestic energy and supplies for Utah and the United States.

844 (4) The state supports:

845 (a) efficient and responsible full development of all existing energy and mineral
846 resources located within the Uintah Basin Energy Zone, including oil, oil shale, natural gas,
oil

847 sands, gilsonite, phosphate, gold, uranium, copper, solar, and wind resources; and

848 (b) a cooperative management approach among federal agencies, state, and local
849 governments to achieve broadly supported management plans for the full development of all

850 energy and mineral resources within the Uintah Basin Energy Zone.

851 (5) The state calls upon the federal agencies who administer lands within the Uintah
852 Basin Energy Zone to:

853 (a) fully cooperate and coordinate with the state and with Daggett, Uintah, and
854 Duchesne Counties to develop, amend, and implement land and resource management plans
855 and to implement management decisions that are consistent with the purposes, goals, and
856 policies described in this section to the maximum extent allowed under federal law;

857 (b) expedite the processing, granting, and streamlining of mineral and energy leases
858 and applications to drill, extract, and otherwise develop all existing energy and mineral
859 resources located within the Uintah Basin Energy Zone, including oil, natural gas, oil shale,
oil

860 sands, gilsonite, phosphate, gold, uranium, copper, solar, and wind resources;

861 (c) allow continued maintenance and increased development of roads, power lines,
862 pipeline infrastructure, and other utilities necessary to achieve the goals, purposes, and
policies

863 described in this section;

864 (d) refrain from any planning decisions and management actions that will undermine,
865 restrict, or diminish the goals, purposes, and policies for the Uintah Basin Energy Zone as
866 stated in this section; and

867 (e) refrain from implementing a policy that is contrary to the goals and purposes
868 described within this section.

869 (6) The state calls upon Congress to establish an intergovernmental standing

S.B. 83 Enrolled Copy

- 32 -

870 commission among federal, state, and local governments to guide and control planning
871 decisions and management actions in the Uintah Basin Energy Zone in order to achieve and
872 maintain the goals, purposes, and policies described in this section.

873 (7) Notwithstanding the provisions of this section, the state's grazing and livestock
874 policies and plans on land within the Uintah Basin Energy Zone shall continue to be
governed

875 by Sections 63J-4-401 and 63J-8-104.

876 Section 5. Effective date.

877 If approved by two-thirds of all the members elected to each house, this bill takes effect
878 upon approval by the governor, or the day following the constitutional time limit of Utah
879 Constitution Article VII, Section 8, without the governor's signature, or in the case of a veto,
880 the date of veto override

<([#32 [9.1] Page: ES-1 (p. 39) Line 34 Commenter: Jon Stearmer, Uintah County
 Comment: The purpose is dear- friendly lawsuit settlement agreement
 with an environmental coalition. A need has not been shown
 as no new information is being analyzed. A careful analysis
 of the previous PEIS and this current draft shows very little
 change. The Preferred Alternative has little to no analysis at
 all. #32])>

<([#33 [6.3.5] Page: ES-5 (p. 43) Line 15 Commenter: Jon Stearmer, Uintah County
 Comment: This is not an experimental stage. It is beyond dispute that
 numerous companies have profitably extracted oil from shale
 for many years. #33])>

<([#34 [2.5] Page: ES-5 (p. 43) Line 28 Commenter: Jon Stearmer, Uintah County
 Comment: If this is indeed a “fresh look”, as stated in the purpose and
 need, then the “fresh look” needs to consider an alternative
 providing more liberal acreage allocation. By designating the
 publicly vetted 2008 RMP as a ceiling the results of this PEIS
 are unjustifiably skewed.

#34])>

<([#35 [2.1] Page: ES-5 (p. 43) Line 33 Commenter: Jon Stearmer, Uintah County
 Comment: This is the only viable alternative based on comments in
 Uintah County’s Resolution, attached hereto and
 incorporated by reference. All neighboring counties in Utah,
 Colorado and Wyoming have voiced these comments. To
 the extent Uintah County could gather copies of their passed
 resolutions they are attached hereto and incorporated by
 reference.

#35])>

<([#36 [2.2] Page: ES-6 (p.44) Line 16 Commenter: Jon Stearmer, Uintah County
 Comment: The use of the word “may” is synonymous with speculation
 and conjectures. No new scientific analysis is provided and
 this merely a statement filled with political sway. #36])>

Draft Programmatic Environmental Impact Statement and Possible Land Use Plan Amendments

May 4 2012 ‘

<([#37 [3.1.7] Page: 1-2 (p.50) Line: Second Paragraph Commenter: Jon Stearmer, Uintah
 County

Comment: This PEIS was not the first step in which lands within Uintah
 County were to be allocated as open or closed to oil shale/oil
 sands development. This process was completed after
 multiple years of analysis culminating in the 2008 RMP. This
 PEIS is merely a charade of a public process to conform with
 a settlement agreement.

#37])>

<([#38 [9.1] Page: 1-4 (p.52) Line 9 Commenter: Jon Stearmer, Uintah County Comment: Politically motivated through a friendly lawsuit settlement. #38])>

<([#39 [2.5] Page: 1-4 (p.52) Line: 2 Commenter: Jon Stearmer, Uintah County Comment: An alternative should be considered providing more available land. #39])>

<([#40 [9.8] Page: 1-5 (p. 53) Line 18 Commenter: Jon Stearmer, Uintah County Comment: All reasons should be given so the public can weigh the strength of the decision to take a “hard look.” A hollow statement saying there are other reasons does not allow cooperators and the public to carefully analyze the motivation and the science behind this PEIS.

#40])>

<([#41 [6.3.5] Page: 1-6 (p.54) Line 18 Commenter: Jon Stearmer, Uintah County Comment: Experimental state is a political statement. Estonia has been economically utilizing this resource for almost 100 years. Brazilian Petrobras has proven their shale oil technology since 1981. #41])>

<([#42 [6.1.1] Page: 1-10 (p. 58) Line 12 Commenter: Jon Stearmer, Uintah County Comment: The same thickness and gallonage should be used throughout the Green River Formation. Uintah County has, through its General Plan, adopted the same criteria as Wyoming. The BLM must be consistent to the maximum extent possible with Uintah County’s Oil Shale Plan, attached hereto an incorporated by reference.

#42])>

<([#43 [9.1] Page: 1-13 (p. 61) Line 39 Commenter: Jon Stearmer, Uintah County Comment: Most of these comments are not outside of the scope for the stated purpose and need. All factors must be weighed, including by not limited to the full cost of outsourcing our energy production to other countries. This merely allows the Administration to thump its chest concerning its “green .. environmental policies. #43])>

<([#44 [6] Page: 1-14 (p. 62) Line 24 Commenter: Jon Stearmer, Uintah County Comment: And this is supported by what data? Refer back to comment on Enefit and Petrobras. #44])>

<([#45 [1.3] Page: 1-15 (p.63) Line 41 Commenter: Jon Stearmer, Uintah County Comment: These roles have not been followed based on comment made in Uintah County’s comment letter. BLM has failed to comply with its own cooperator MOU.

#45])>

<([#46 [9.5] Page: 1-21 Line 39 (p. 69) Commenter: Jon Stearmer, Uintah County Comment: It is not “where possible”, but to the .. maximum extent” consistent with federal law and the purposes of FLPMA. BLM has been provided with a copy of Uintah County’s Energy

Zone and Oil Shale plans. BLM must be consistent with said plans to the maximum extent possible. #46]>

<([#1 [12] The development of Oil Shale and Tar Sands is no appropriate for this state or the current world situation. Utah is know for beautiful landscapes. I've been to the Desolation Canyon Put-in and am disappointed by the miles spotted development already being done. Furthermore, Oil Shale and Tar Sands are not effective means of energy. For these we sacrifice large amounts of water for little gain. While 75% of Earth is covered with water only the smallest fraction is fresh water, which will be being used for this development. Please say no to oil shale and tars sands. #1])> Thank you

Submission Text

Dear Sir or Madam:

Vermillion Ranch Limited Partnership (VRLP or Vermillion) submits its comments on the Oil Shale and Tar Sands Programmatic Draft Environmental Impact Statement (OS/TS PDEIS). Vermillion is a family-owned ranching partnership that operates in the three corners area of Wyoming, Utah and Colorado. Vermillion participated in the Vernal Resource Management Plan (RMP) as well as the Little Snake River RMP process and has been an active proponent of multiple use on federal land.

<([#1 [2.1.1] I. LOCAL GOVERNMENT ALTERNATIVE

The OS/TS PDEIS seeks comments on expanded oil shale leasing program in Utah and Wyoming. Vermillion supports either Alternative 1 (no action) or the adoption of an alternative that retains the land use allocations made in Alternative 1 with sufficient flexibility to allow commercial leasing where determined to be feasible.

Vermillion objects to the effort to revise these land use plans through the back door without the data or information that was used or is being used to write the land use plans. This is especially confusing for the public lands in the Rock Springs Field Office. Selection of Alternative 1 for Utah and Wyoming would avoid this conflict and the insufficient data found in the OS/TS PDEIS.

Vermillion actively participated in the Vernal RMP adopted in 2008 and the Little Snake River RMP adopted in 2009. Those decisions affect much, if not most, of the high potential oil shale and tar sands in Utah, and oil shale in Colorado. #1)> <([#2 [3.1.3]

Vermillion objects

strongly to the exclusion of all alleged lands with wilderness character (LWCs). BLM carefully analyzed the citizen proposed wilderness areas in the Vernal and LSR planning process. Using the OS/TS PDEIS to eviscerate those decisions betrays the public who participated. Second-guessing those decisions without fully airing the basis for such changes is not consistent with the planning procedures. #2)>

<([#3 [8.2] In addition, implementation of the LWC classification will greatly impair other multiple

uses, including livestock grazing which depends on access to the allotments, often along public, but unimproved, roads. It will interfere with future and existing range projects to develop water, build fences and otherwise change the landscape to improve it for livestock and wildlife because a more restrictive visual resource management is applied.

#3)> <([#4 [9.5] Much of the affected land in Wyoming is located within the boundaries of the Rock

Springs Field Office which is currently revising its RMP. As currently postured, the OS/TS PDEIS will conflict with many pending RMP decisions, such as alleged LWCs, Areas of Critical Environmental Concern (ACECs) and other special designations. It would make more sense to allow the Rock Springs office to handle these issues as an integral part of the ongoing plan revision process.

#4) <(**#5** [3.1.7] Vermillion notes that the map in Chapter 2 identifies Adobe Town as a LWC.

This area,

excluding the WSA of about 82,000 acres, does not meet the definition of wilderness. It is roaded and is the site of many development activities including oil and gas development, rights-of-way for wind energy and pipelines and water reservoirs. As shown on the map, it appears that Adobe Town LWC also exceeds the area classified by Wyoming Commission on Environmental Quality as rare and uncommon. Figure 2.3.3-3 (showing LWC going to Colorado-Wyoming border).

#5) <(**#6** [9.2.4] The rest of the high potential area in Wyoming is covered by the Kemmerer RMP which

was final in 2008. The OS/TS PDEIS does not provide any basis to revise the RMP decisions as they apply to oil shale development. The Kemmerer RMP adopted the Wyoming sage grouse strategy to protect core area habitat. The OS/TS PDEIS does not identify any deficiencies in the Wyoming sage grouse strategy that would support a change in position from the 2008 PFEIS.

#6) <(**#7** [9.7] Under the 2008 rules, 43 C.F.R. Parts 3900, 3920, 3930, Research Demonstration and

Development (RD&D) leases were issued before commercial lease rules were adopted. 43 U.S.C. §15927(e). The OS/TS PDEIS would expand RD&D without any commercial leasing.

#7) <(**#8** [2.1] The BLM signed a settlement agreement proposes amendments to the Oil Shale Final

Rule. The proposed amendments require BLM to expressly state that it has discretion to deny an application converting an RD&D lease to a commercial lease based on environmental and other resource considerations and that BLM has discretion to reject an oil shale commercial lessee's proposed plan of development based on environmental or other resource considerations. This would add additional requirements under 43 C.F.R. §3926.10.

The proposed amendments require BLM to only consider issuing a commercial oil shale lease upon application for a conversion from an RD&D lease to a commercial lease, or after BLM issues a call for expression of leasing interest. The proposed amendments also require BLM to not issue any commercial lease unless it is shown that operations can be done without unacceptable environmental risk. Finally, the proposed amendments require plans of development for oil shale commercial leases to include watershed and groundwater protection plans, and environmental protection and mitigation plans, including defined standards for each of these requirements. BLM acknowledged that approval of any conversion to a commercial lease must be preceded by a NEPA analysis.

These changes, when coupled with the discontinuous parcels made available for RD&D leasing in the OS/TS PDEIS alternatives, other than Alternative 1, will not provide the necessary assurance to industry that it will realize a return on investment. Any land

configuration needs to be sufficiently contiguous that a company can recover the multimillion dollar investment that even an RD&D project requires. Alternatives 2 - 4 do not achieve that objective. #8]>

<([#9 [9.2.2] II. OS/TS PDEIS DOES NOT CONFORM TO SECTION 369 OF THE 2005 ENERGY POLICY

ACT

In 2005, Congress directed BLM to establish a commercial program for development of oil shale and tar sands. Section 369 of the Energy Policy Act (2005 EP Act) adopted on August 8, 2005 relates to “Oil Shale, Tar Sands, and Other Strategic Unconventional Fuels.” 42 U.S.C. §15927. That title declared it to be the United States’ policy that “oil shale, tar sands, and other unconventional fuels are strategically important domestic resources that should be developed to reduce the growing dependence of the United States on politically and economically unstable sources of foreign oil imports.” 42 U.S.C. § 15927(b)(1). Congress also directed that it be United States policy that commercial development of oil shale “be conducted in an environmentally sound manner, using practices that minimize impacts.” 42 U.S.C. §15927(b)(2).

The 2005 EP Act required that the Interior Secretary promptly follow the completion of the programmatic EIS with regulations establishing a commercial oil shale and tar sands leasing program. 42 U.S.C. §15927(d)(2) (“Not later than 6 months after the completion of the [PEIS] under this subsection, the Secretary [of the Interior] shall publish a final regulation establishing such [commercial oil shale and tar sands leasing] program.”).

Section 369 directs the Department of the Interior (DOI) to issue commercial oil shale leases 180 days after the final rules are promulgated. *Id.* Lease sales are to include consultation with states, local governments, tribal governments and others to determine the level of interest. *Id.* DOI promulgated the final rules in November 2008. 73 Fed. Reg. 69414 (2008). Rather than follow the law, DOI suspended all oil shale leasing in 2009 and has ignored its Task Force reporting obligations. 42 U.S.C. §15927(h).

While DOI is required to file reports with Congress each year, none has been prepared since 2008. <http://www.unconventionalfuels.org/publications.html>. The only reports now prepared are on “Secure Fuels.”

The extent of Congress’ commitment to unconventional fuels including oil shale and tar sands is also found in the establishment of a Task Force. 42 U.S.C. §15927(h).

Department of Energy is to create commercial strategic fuel development program and to coordinate with state and local governments. DOI was to prepare a new assessment of priority areas in the Green River Region, which includes Wyoming, Utah and Colorado. *Id.* at §15927(m)(B). The heavy oil assessment was also to be updated. *Id.* §15927(p).

BLM proceeded to implement the direction by preparing a programmatic EIS that addressed the environmental impacts of oil shale and tar sands development and identified the public lands with the best potential. Based on the two considerations, BLM identified about two million acres of public land in Wyoming, Utah, and Colorado as suitable and available for oil shale and tar sands development. ROD, 2008 OS/TS PFEIS at 1-4. BLM also promulgated rules to implement the commercial leasing program. 43 C.F.R. Parts 3900, 3920, 3930, 3936.

The OS/TS PDEIS is intended to analyze the impacts of a commercial leasing program,

not the RD&D program authorized in subsection (c). 42 U.S.C. §15927(c). The 2008 PFEIS accomplished this mandate but the OS/TS PDEIS does not. Instead its identification of land omits high potential land and limits development to small and scattered areas that it makes a commercial program less feasible and is calculated to discourage commercial development. The OS/TS PDEIS admits this when it claims the changes are needed to conduct additional research. OS/TS PDEIS at 1-5. The law authorized RD&D separately and did not give the Secretary the discretion to substitute a commercial leasing program with an extended RD&D program that limits such research and development to small and discontinuous tracts of land. Based on the terms of the settlement with CEC, RD&D leases would not have an assurance of conversion to a commercial lease. These and other conditions make development so uncertain that it cannot be described as a commercial program.

#9] > <([#10 [3.1.3] [9.5] III. OS/TS PDEIS FAILS TO CONFORM TO RMP PROCEDURES

A. OS/TS PDEIS Supersedes RMP Decisions Without Adequate

Rationale

The preferred alternative excludes more than 75% of the lands previously determined to be available for oil shale or tar sands leasing. This occurs even though most of the same land area is still classified as suitable and available for oil and gas leasing.

The OS/TS PDEIS purports to override the local land use planning process by designating LWCs and implementation of wilderness management, ACECs and other protective sites, including the ever-growing Adobe Town area. Programmatic decisions cannot override the RMP process and as such, BLM is running roughshod over the rules and procedures established for land use decisions by implementing the resource allocations well ahead of information and analysis.

The preferred alternative will remove from development lands alleged to have wilderness character, notwithstanding a congressional prohibition on changing management to protect these lands. [Continuing Appropriations Act 2011, Pub. L. 112-10 (2011CR); Continuing Appropriations Act 2012, Pub. L. 112-36 (112th Congress) H.R. 2608, 10/05/11] The OS/TS PDEIS also proposes to exclude ACECs and other areas nominated by special interest groups, including groups that sued BLM in 2009, from oil shale or tar sands leasing. In many cases, the preferred alternative vetoes recent land use planning decisions, such as those for the Kemmerer RMP. In the case of the Rock Springs RMP, the OS/TS PDEIS will essentially make decisions that bind the plan revision process, without the requisite analysis or data.

The Utah public lands excluded were carefully reviewed in a separate alternative for the Vernal RMP. Virtually all of these areas have public roads and many, such as the parcels around the Dinosaur National Monument, do not meet the 5,000 acre minimum requirement in order to be considered for wilderness designation. Vermillion livestock graze in this region and Vermillion relies on motorized access to manage its livestock and to maintain range improvements. A LWC classification will materially impair operations.

The Rock Springs Field Office initiated its plan revision in Spring of 2011. Much of the Wyoming high potential area is located in the Rock Springs Field Office but the OS/TS PDEIS appears to use proposed LWCs and ACECs that have not yet been fully addressed within the cooperating agency process, let alone a DEIS. This dilemma illustrates the flaws in BLM's efforts to impose top down decisions on LWCs and

ACECs as well as the Adobe Town area, when those issues are still being addressed among the cooperating agencies. If BLM proceeds on this time table, it will eviscerate the land use planning process. This situation also suggests that BLM has chosen to proceed without regard to its obligation to coordinate with local governments. For instance, Sweetwater County went on record a year ago as only supporting special management for the Adobe Town area within its wilderness study boundaries. The DEIS would adopt protection for a much larger area.

Vermillion has no independent knowledge of proposed ACECs or LWCs. Due to the lack of disclosure and discussion in the OS/TS PDEIS, Vermillion cannot comment meaningfully.

#10)> <(**#11** [9.2.4] B. Sage Grouse Management

The State of Wyoming has been aggressively developing a sage grouse strategy for management since 2004. By 2008, the sage grouse core areas had been defined and management guidelines developed. Wyoming Gov. E.O. 2008-2, 2010-4; 2011-5. Wyoming BLM largely adopted or followed these guidelines in the RMP revisions for the Kemmerer, Pinedale and Rawlins Field Office. Thus, the candidate status of the sage grouse is not a basis to remove these lands from oil shale and tar sands development given the management restrictions already in place.

Wyoming BLM initiated a statewide RMP amendment for the sage grouse to address the 2008 executive order in fall of 2009. [BLM IM 2010-012 Sage Grouse Habitat Management, December 29, 2009; IM 2010-013 Oil and Gas Leasing Screen for Greater Sage Grouse, December 29, 2009]

#11)> <(**#12** [9.2.1] [3.1.3] IV. IMPLEMENTATION OF LWC CLASSIFICATIONS IN RMPS IS UNLAWFUL

A significant percent of the excluded acreage in the OS/TS PDEIS is justified on the basis that the LWCs must be protected. OS/TS PDEIS at 1-5, 2-12, 2-21, 2-52.

A. OS/TS PDEIS violates Congressional Funding Freeze on LWC Identification and Management

On December 22, 2010, Secretary Salazar announced a new initiative to identify and manage public lands with wilderness character. Secretarial Order No. 3310 Protecting Wilderness Characteristics on Lands Managed by the Bureau of Land Management (Dec. 22, 2010). (The Wild Lands Policy and IM 2011-154 contradict the commitments made to the State of Utah, the U.S. Congress and the public when the Secretary stated that he would honor the Settlement Agreement between Utah and DOI (Answering Yes to the question from Senator Bennett “Do you agree that currently the Department has no authority to establish new WSAs (Post-603 WSAs) under any provision of law, such as the Wilderness Act of [sic] Section 202 of FLPMA?”) The Secretary also stated BLM had no authority to impose nonimpairment management on non-WSA lands.)

This action was followed with the adoption of manuals to guide BLM employees in the implementation of the extra-wilderness designation process. The resulting controversy, not to mention Director Abbey’s admission that no specific section of Federal Land Policy Management Act (FLPMA) authorized the identification of lands with wilderness character outside of Section 603, led Congress to defund the entire initiative. [Continuing Appropriations Act 2011, Pub. L. 112- 10 (2011CR); Continuing Appropriations Act 2012, Pub. L. 112-36 (112th Congress) H.R. 2608, 10/05/11] BLM has long contended that a mere inventory of wilderness character falls within its

authority, citing 43 U.S.C. §1711(a). But FLPMA is equally clear that BLM cannot change land management based on an inventory unless and until the land use plan is amended. *Id.* The OS/TS PDEIS uses an undisclosed wilderness inventory and then proposes to change the management of these areas to protect the alleged wilderness character without disclosure of the basis of BLM's LWC determination. This is exactly what S.O. 3310 directed BLM to do. When Congress froze all funding for it, two months after the *Colorado Environmental Coalition v. Salazar* (09-0085, 09-0091) settlement, BLM's hands were tied. The apparent decision to proceed regardless of the funding freeze is in contempt of Congress and unlawful, 31 U.S.C. §1341. (The Antideficiency Act provides that "an officer or employee of the U.S.

Government may not make or authorize an expenditure or obligation exceeding an amount available in an appropriation or fund for the expenditure or obligation; involve the government in a contract or obligation for the payment of money before an appropriation is made unless authorized by law . . ." 31 U.S.C. §1341. The act imposes criminal penalties for violation, *Id.* at §1350, and authorizes adverse personnel action for employees that violate the law. *Id.* at §1349.)

Calling these areas LWCs does not change the result. These areas are allegedly wilderness suitable and BLM proposes to manage them in the same manner as it would have had Congress not shut down all funding related to S.O. 3310. Changing the name from "Wildlands" to "LWCs" does not make the action any more lawful.

The OS/TS PDEIS contradicts Congress' clear direction that BLM cease and desist from implementing the provisions of S.O. 3310. That BLM put the implementing manuals in abeyance but issued Instruction Memorandum (IM) 2011-154 that implements the Order does not excuse BLM from complying with the defunding. IM 2011-154 suffers from procedural deficiencies as well. It was issued without coordinating with local governments, public comment or in accordance with rulemaking procedures. Thus, it independently violates Federal Land Policy and Management Act (FLPMA) mandate that its provisions be implemented through rulemaking, 43 U.S.C. §1740.

An instruction memorandum issued by BLM in order to evade the funding and implementation freeze on S.O. 3310 enjoys little or no presumption of legality. *United States v. Mead Corp.*, 533 U.S. 318 (2001) (holding that the court owes little deference to agency guidelines). By implementing the IM, BLM runs a serious risk that the OS/TS PDEIS will be set aside.

#12]> <([#13 [9.2.1] [3.1.3] B. NO LEGAL AUTHORITY TO IMPLEMENT SECRETARIAL ORDER 3310 OR SIMILAR DIRECTION

Unlike the definition of multiple use for National Forests, 16 U.S.C. §529, FLPMA does not include wilderness as one of the statutory multiple uses. 43 U.S.C. §1702(c).

Wilderness has its own definition, which is limited to Section 603. ("(i) The term 'wilderness' as used in section 1782 of this title shall have the same meaning as it does in section 1131(c) of Title 16." *Id.* §1702(i). The term 'wilderness' is found only in the definition section, 43 U.S.C. §1702(i) and the wilderness review provisions of Section 603, 43 U.S.C. §1782; 43 C.F.R. §1601.0-5(i). Section 603 is the only provision in federal law that authorizes the identification, study and recommendation of public lands for wilderness designation by Congress. Thus, BLM is not at liberty to add wilderness

to other provisions in FLPMA when Congress so clearly chose not to.

Only Section 603 of FLPMA authorizes BLM to manage lands so as to not impair their wilderness character. Tri-County Cattleman's Association Idaho Cattlemen's Association, 60 IBLA 305, 314 (1981). There is no other statutory authority for BLM to study and manage public lands as if they were wilderness. Public lands are to be managed so as to not unduly and unnecessarily degrade the resources. (43 U.S.C. §1732(b) [nondegradation standard], except for WSAs which are managed so as to not impair the wilderness character.) *Id.* at 1782(c).

The Interior Secretary's authority to identify public lands as wilderness study areas under Section 603 has expired. *State of Utah v. Babbitt*, 137 F.3d 1193, 1206, n.17 (10th Cir. 1998) (Secretary Babbitt wrote "I also agree with you that FLPMA's section 603 no longer provides authority to inventory BLM land in Utah for wilderness values."). BLM has attempted to claim discretion to manage lands to preserve their wilderness character but the planning rules do not so provide. The rules were revised to remove wilderness study from the general planning process and have never been amended to make wilderness study part of the land use planning process. (By comparison, the Forest Service revised its planning rules to integrate wilderness study and recommendations into each plan revision. 36 C.F.R. §219.27 (1982).)

Section 202 of FLPMA provides for the development and revision of land use plans. 43 U.S.C. §1712. Land use planning must have coordination with state and local governments, public involvement and be consistent with FLPMA. 43 U.S.C. §1712(a). The criteria for developing and revising land use plans, includes (1) using and observing the principles of multiple use and sustained yield set forth in FLPMA and other applicable laws, 43 U.S.C. §1712(c)(1); (2) interdisciplinary approach, §1712(c)(2); (3) priority to designate ACECs, §1712(c)(3), and (4) "to the extent consistent with the laws governing the administration of the public lands, coordinate the land use inventory, planning, and management activities of or for such lands with the land use planning and management programs of other Federal departments and agencies and of the States and local governments within which the lands are located;" §1712(c)(9). FLPMA further states: "Land use plans of the Secretary under this section shall be consistent with State and local plans to the maximum extent he finds consistent with Federal law and the purposes of this Act." *Id.*

Nothing in Section 202, which governs land use planning, authorizes wilderness study or wilderness-type management. The history of the planning rules shows that the word "wilderness" was deleted from the draft of the planning rules on purpose. When BLM wrote the rules governing land use plans, it originally defined a resource management plan as including "the initial determination of whether a wilderness study area shall be recommended to the President for recommendation to the Congress as suitable or unsuitable as an addition to the National Wilderness Preservation System." 43 Fed. Reg. 58764, 58768-69 (1978) draft 43 C.F.R. §1601.0-5(p)(2). The definition of a resource management plan was later revised to delete reference to wilderness study area recommendations. 44 Fed. Reg. 46386 (1979). Thus, BLM has no regulations in the land use planning chapter authorizing establishment of wilderness type areas or authorizing nonimpairment management for such lands other than designated WSAs designation pursuant to Section 603, which expired.

BLM adopted the Wild Lands Policy through three Manuals, based on its claimed

discretion in FLPMA, Sections 201, 202 and 302 of FLPMA. Those provisions do not support BLM's claimed authority to designate Wild Lands or LWCs or to manage them as if they were designated WSAs for nonimpairment of the wilderness character.

IM 2011-154 was adopted without proper comment procedures and without coordination with local governments. Under Section 202(a), BLM has no choice but to coordinate with local governments and to resolve conflicts in land use plans. 43 U.S.C. §1712(a). So far BLM has failed to do so on this very important issue. No Wyoming local government within the affected area supports proposed or identified LWCs. Several of the applicable local government plans oppose new wilderness character areas. BLM has clearly violated Section 202 by not coordinating both its inventory and LWC determination with the local governments. **#13])>**

<([#14 [3.1.3] The OS/TS PDEIS also fails to identify which, if any, inventory it has used to identify the

LWCs. The OS/TS PDEIS fails to disclose these areas. The single map is not labeled so as to facilitate identification. Thus, it is impossible to divine the resource values that prompted the classification being used in the OS/TS PDEIS. If VRLP had access to this information it could provide site specific documentation of the errors in the premise that these are LWCs.

These lands are not "wilderness" as that term is used in the Wilderness Act. These areas are heavily roaded, and include the Wyoming Checkerboard where Anadarko owns the alternating sections. There are powerlines, rights-of-way for pipelines, wind farms as well as coal mining and oil and gas development.

VRLP assumes that for Utah the OS/TS PDEIS uses the Utah HR 1925 lands without regard to the Vernal RMP decisions that evaluated those lands in 2008.

Figures 2.3.3-2 and 2.3.3-3 depict LWCs but do not provide any additional information. Chapter 6 of the OS/TS PDEIS lists the areas and acreage without providing descriptions. It also omits the full definition of wilderness. The footnote to Table 6.2.3 states: "The key characteristics of wilderness that may be considered in land use planning include an area's appearance of naturalness and the existence of outstanding opportunities for solitude or primitive and unconfined types of recreation." This statement is materially incorrect, because the definition of wilderness requires that an area be roadless and that it be greater than 5,000 acres. 16 U.S.C. §1131(a). The OS/TS PDEIS conveniently drops the first two criteria.

Table 6.1.1-2 purports to list LWCs in Wyoming, when that classification has never been adopted or even made public. The Adobe Town WSA consists of 85,710 acres. None of the listed areas correspond to WSAs designated in 1980. Since there is no information provided, VRLP cannot provide meaningful comments. **#14])>**

<([#15 [9.1] V. OS/TS PDEIS FAILS TO CONFORM TO NEPA RULES

A. PURPOSE AND NEED

"Agency action should be overturned only when the agency has 'relied on factors which Congress has not intended it to consider, entirely failed to consider an important aspect of the problem, offered an explanation for its decision that runs counter to the evidence before the agency, or is so implausible that it could not be ascribed to a difference in view or the product of agency expertise.'" *Motor Vehicle Mfrs. Ass'n v. State Farm Mutual Auto. Ins. Co.*, 463 U.S. 29, 43 (1983). The OS/TS PDEIS meets the definition of arbitrary and capricious as the explanation for the land use allocations do not have

sufficient explanation and documentation to support them, and the explanation for revision runs counter to the facts.

1. Real Purpose and Need Unaddressed

The Notice of Intent and the statement of Purpose and Need in the PDEIS omit the real basis for the new programmatic EIS. BLM settled two lawsuits, which challenged both the 2008 PFEIS Record of Decision Colorado Environmental Coalition, (CEC) v. Salazar, No. 09-0085; and the regulations promulgated to implement an oil shale and tar sands leasing program, Colorado Environmental Coalition (CEC) v. Salazar, 09-0091. The conduct of the two cases and, particularly, the CEC's failure to prosecute the cases strongly suggests that this was a friendly litigation with an equally friendly settlement. Plaintiffs filed the two cases in February of 2009, but the government sought numerous extensions of time to answer and settled the case shortly before the administrative records were to be filed before the court.

BLM's reconsideration of the 2008 OS/TS ROD is based entirely on the terms of the settlement in which BLM committed to this revision. CEC v. Salazar, #63 ¶1 ("No later than 120 days after this Settlement Agreement becomes effective, Defendants will publish a notice of intent ("NOI") to consider amending each of the land use planning decisions made by the 2008 OSTs ROD.") BLM also committed to consider excluding from oil shale and tar sands development all "lands with wilderness character" a term that did not exist until December 23, 2010. BLM also agreed to exclude existing and proposed ACECs and the Adobe Town rare and uncommon area. The designation of rare and uncommon is pursuant to Wyoming law that only prohibits non-coal surface mining but allows coal and oil and gas development. Wyo. Stat. §35-11-112(a)(v). It cannot apply to public land.

In the rulemaking case, BLM committed to amending the oil shale and tar sands leasing rules within 15 months. BLM has made no move to initiate the rule changes. The settlement terms mandate the content of the final rules to a degree that violates public policy and the law, because BLM agrees in advance to what the final rules will provide. BLM also agreed to deny applications to convert RD&D leases to commercial leases based on environmental and resource considerations, to reject plans of development and to limit commercial leases to RD&D lessee after expressions of interest and detailed stipulations. CEC v. Salazar, No. 09-0091, Doc. No. 80-1 ¶¶1-6. The settlement predetermines the outcome of the rulemaking such that BLM has relinquished its authority and discretion.

The 2008 regulations remain in effect but cannot be implemented under the terms of the settlement, which prohibit oil shale leasing. By accepting the plaintiffs' demands for content, BLM has failed to comply with the 2005 EP Act, Section 369 to develop a commercial oil shale and tar sands leasing program.

As is clear in the OS/TS PDEIS, BLM also committed to a predetermined outcome in the programmatic EIS to reduce the potential for oil shale and tar sands development by removing 75% of the land base and limiting the remnants of the program to research and development, rather than the commercial scale mandated by federal law. The fast pace of the drafting of the OS/TS PDEIS and the fact that entire chapters are largely the same as in the 2008 PFEIS. BLM is doing a rush job to issue a final decision without regard to the facts or competing legal obligations and constraints.

2. Purpose and Need for Revision Unsupported in OS/TS PDEIS

The Notice of Intent to revise the 2008 Oil Shale and Tar Sands FEIS stated: “The BLM has decided to take a fresh look at the land use plan allocation decisions made in the 2008 ROD associated with the Programmatic EIS, in order to consider which lands should be open to future leasing of oil shale and tar sands resources.” 76 Fed. Reg. 21003 (2012). The Notice of Intent went on to state that:

As there are no economically viable ways yet known to extract and process oil shale for commercial purposes, and Utah tar sands deposits are not at present a proven commercially-viable energy source, the BLM, through its planning process, intends to take a hard look at whether it is appropriate for approximately 2,000,000 acres to remain available for potential development of oil shale, and approximately 431,224 acres of public land to remain available for potential development of tar sands.
Id.

The OS/TS PDEIS expresses the purpose and need as necessary to determine which lands should be removed from the classification of available for leasing. “The purpose and need for this proposed planning action is to reassess the appropriate mix of allowable uses with respect to oil shale and tar sands leasing and potential development. Specifically, the BLM will consider amending the applicable Resource Management Plans (RMPs) to specify whether any areas in Colorado, Utah, and Wyoming currently open for application for future leasing and development of oil shale or tar sands should not be available for such application for leasing and development.” PDEIS 1-4. #15)>

<(#16 [9.2.1] The criteria to exclude high potential oil shale and tar sands lands from leasing suffers

several flaws. First, OS/TS PDEIS does not and indeed cannot explain how it conforms to Section 369, since BLM previously concluded that similar alternative would not conform. 2008 Record of Decision PFEIS (2008 ROD) at 22 (“Much of the most geologically prospective acreage would be excluded under Alternative C; in particular areas which are in close proximity to three of the six RD&D leases would be excluded. In addition, this unreasonably fragments the area that would be available for application, resulting in parcels that are unlikely to be explored, leased, or developed.”) Second, Congress has prohibited BLM from spending federal funds to classify and manage lands as LWCs as directed in S.O. 3310. Alternatives 2-4 propose exclusions based on LWCs, thus implementing S.O. 3310 in defiance of the ban on spending federal funds to do so (31 U.S.C. §1341; §1350 (involved officials could face adverse employment actions) and, §1349 (criminal penalties)).

Third, all of the alternatives exclude from oil shale leasing the Adobe Town Rare & Uncommon Area, which is a state law classification that allows leasing but prohibits mining. The rare and uncommon designation cannot apply to public land, because the 1872 mining laws, as amended, preempt state law. *Calif. Coastal Commn. v. Granite Rock Co.*, 480 U.S. 572 (1987) (holding state’s coastal zone management could not regulate mining on federal land). Fourth, the OS/TS PDEIS provides no information about these areas. Hence, there is no ‘fresh look’ nor does the OS/TS PDEIS disclose the new information upon which BLM is relying to support the actions proposed in the OS/TS PDEIS. The apparent rush to complete the OS/TS PDEIS resulted in omission of the description of areas to be excluded, and this failure

to describe or analyze the areas prevents the public and coordinating entities from meaningful public comment.

#16])> <([#17 [2.2] [1.5] B. Detailed Analysis of Alternatives

The OS/TS PDEIS identifies the Preferred Alternative as 2(b).

The BLM has selected Alternative 2(b) as the Preferred Alternative. The Preferred Alternative would make approximately 461,965 acres available for future consideration for commercial oil shale leasing and 91,045 acres available for application for commercial tar sands leasing, but only for research, development, and demonstration (RD&D) leases. The BLM

would issue a commercial lease only when a lessee satisfies the conditions of its RD&D lease and the regulations at 43 CFR Subpart 3926 for conversion to a commercial lease. The preference right acreage, if any, which would be included in the converted lease, would be specified in the RD&D lease.

OS/TS PDEIS at i.

The OS/TS PDEIS, however, does not contain any specific analysis of the expanded RD&D program that is being proposed in lieu of the commercial leasing program. The OS/TS PDEIS attempts to compensate for this defect by stating:

The environmental impacts of Alternative 2(b) would be analytically indistinguishable from those of Alternative 2(a). Only the method of obtaining a lease would be different. Accordingly, the analysis in this PEIS of Alternative 2 applies fully and equally to both alternatives. To the extent there may be differences in environmental consequences between Alternative 2(a) and 2(b), these would be related to the timing of the commencement of impacts, as well as, possibly, length of disturbance. However, these issues are best addressed in the lease and/or project-specific analysis.

OS/TS PDEIS at ES-7, 2-35. The OS/TS PDEIS states that this alternative was not developed until quite late in the process.

As the Draft PEIS was being developed, the idea for this alternative emerged. It is presented here in brief. This alternative is not noted elsewhere in the document but will be developed further in preparation of the Final PEIS. Analytically, this subalternative is indistinguishable from Alternative 2(a) in terms of environmental consequences. Therefore further environmental analysis in preparation of the Final PEIS is not anticipated, although more detailed explanation may be provided, particularly in response to comments received.

OS/TS PDEIS at 2-35.

The OS/TS PDEIS statement that Alternative 2(b) environmental impacts are basically the same as Alternative 2(a) is untrue. Alternative 2(b) changes the timing of oil shale leasing to slow it down and this change in timing significantly changes the nature of the impacts on water and surface disturbance. NEPA requires agencies to consider direct, indirect, and cumulative effects in the context of geography and timing. 40 C.F.R. §1508.25. The preferred alternative delays in issuing RD&D leases and not issuing commercial leases will change the scope and impact and must be separately analyzed.

The scant information about Alternative 2(b) and omitted discussion of the regulatory changes do not provide the public with sufficient information to determine whether, in fact, it is virtually identical to Alternative 2(a). BLM has already committed to rule changes in the CEC settlement agreement. The OS/TS PDEIS omits all discussion, even though the rulemaking is a connected action that falls within the scope of this EIS and failure to discuss the connected actions violates NEPA.

If Alternative 2(b) is really identical, then BLM should and could have changed Alternative 2(a). For instance, the OS/TS PDEIS claims Alternative 2(b) will change the lease terms but provides no information on what those changes will be, other than it will only authorize RD&D leases. *Id.* at ES-7, 2-35.

NEPA requires that each alternative be analyzed in detail. 40 C.F.R. §1502.14(b) (substantial treatment must be devoted “to each alternative considered in detail including the proposed action so that reviewers may evaluate their comparative merits.”). The discussion of alternatives in the EIS must be sufficient to permit a reasoned choice among the options.” *State of Wyoming v. USDA*, 661 F.3d 1209, 1243 (10th Cir. 2011) (quoting *AWARE v. Colo. Dep’t of Transp.*, 153 F.3d 1122, 1130 (10th Cir. 1998)). BLM’s failure to explain the preferred alternative or its impacts on the respective states and communities requires that BLM withdraw the draft and revise or issue a supplement to explain the preferred alternative. 40 C.F.R. 1502.9 (“If a draft statement is so inadequate as to preclude meaningful analysis, the agency shall prepare and circulate a revised draft of the appropriate portion.”)

Alternative 2(b) does not conform to Section 369 because it continues the RD&D program instead of providing for a commercial leasing program. While an agency can consider an alternative that requires additional authority, it must disclose this fact. *Forty Questions on CEQ NEPA Regulations*, 46 Fed. Reg. 18026 (1981) as amended 51 Fed. Reg. 15618 (1986), Answer to Question 2(b). The OS/TS PDEIS does not propose an amendment to the 2005 EP Act to modify the mandate. **#17])>**

<([#18 [I.5] C. Omission of Significant New Information

The Purpose and Need for the OS/TS PDEIS is justified as a “fresh look” at oil shale and tar sands development. 76 Fed. Reg. 21003 (2011). The OS/TS PDEIS is not in fact a “fresh look,” it is merely a retread of an alternative previously rejected by BLM on the grounds that it would not conform to Section 369 of the 2005 EPA. [2008 ROD at 22].

The purposeful omission of new information is significant and violates NEPA. Since the 2008 ROD was signed, several companies have been developing oil shale pursuant to the RD&D leases. The OS/TS PDEIS omits these results and progress reports. Similarly advances in technologies and actual experience with these technologies has been omitted. Instead, the OS/TS PDEIS repeats the conclusion that oil shale and tar sands are not commercially viable and also repeats out-dated data regarding the amount of water, power and surface disturbance.

The OS/TS PDEIS excludes new information regarding oil shale and tar sands technology and makes very limited the use of the 2010 and 2011 USGS assessments of potential. OS/TS PDEIS 2-77. Chapter 3 and App. A are very similar, if not identical, to the 2008 FEIS and notably do not discuss oil shale extraction technology used by Red Leaf or Enefit.

The OS/TS PDEIS purports to include new information regarding sage grouse, LWCs

and ACECs but the information is vague and incomplete as to preclude any kind of meaningful analysis. The OS/TS PDEIS lacks a discussion of the basis for the respective classification, or the other current land uses. It also does not discuss the Wyoming sage grouse strategy or how BLM Wyoming has adopted restrictions to incorporate the strategy and core area protection. This may well be because many of these areas have oil and gas leases and even production, which would contradict the description as LWCs. In Wyoming, the OS/TS PDEIS omits the fact that these areas are also located in the Wyoming Checkerboard where the private land is owned by Anadarko, a gas development company. The OS/TS PDEIS concludes that private land is inconsistent with development when the private lands in Wyoming have been developed for decades and generally in conjunction with public lands.

While BLM could theoretically decide not to issue individual leases, it does not have the discretion to simply discard new and relevant information. This information is environmentally significant since it shows retort methods using modest amounts of water and causing significantly less surface disturbance than assumed in 2008. NEPA requires BLM to consider significant new information and this omission results in a significant bias of the OS/TS PDEIS against additional oil shale and tar sands development notwithstanding the congressional mandate to proceed with this program. Similarly, the OS/TS PDEIS omits the statutorily required assessment of oil shale and tar sands potential. 42 U.S.C. §15927(m). The USGS Assessment reports completed in 2010 and 2011 identified additional land as having high potential but the OS/TS PDEIS did not use this report in its identification of potential lands. Instead, the OS/TS PDEIS simply modified the areas identified in 2008 and made them 75% smaller. The omission of new information is further documented in the fact that many of the chapters, especially Chapter 3 and the Appendices, are largely unchanged from the 2008 PFEIS. This only shows that BLM updated the OS/TS PDEIS to tack on alleged LWCs and other special designations as a basis to marginalize a congressionally mandated program.

#18]> <(#19 [6.3.2] [6.5] D. OS/TS PDEIS Dismissal of Technology Fails to Acknowledge Significant Scientific Controversies

At a minimum, BLM must acknowledge that there is a scientific controversy regarding its key assumptions of environmental impact and support its position. 40 C.F.R. §1508.127(b)(4); *Middle Rio Grand Conservation Dist. v. Norton*, 294 F.3d 1220, 1229 (10th Cir. 2002) (setting aside critical habitat designation EIS on the basis that “[t]he wide disparity in the estimates of water required for the designation, and the associated loss of farmland acreage, indicate that a substantial dispute exists as to the effect of the designation.”). Like the above decision, there is a wide disparity in estimates of water, surface area and electrical power assumed to be necessary for oil shale development. BLM, like the USFWS, must address the disparities, especially since the newer data reflect new information.

The OS/TS PDEIS repeats the refrain that oil shale development will require more than 1 barrel of water for each barrel of oil. OS/TS PDEIS 4-3, 4-9, 4-11, 4-33, 4-47, 4-48, 5-32, 5-35, A-85; Appendix A. As described by Red Leaf and Enefit, two companies operating in Colorado and Utah under RD&D leases, new technology does not rely on large amounts of water in the retort process. The R&D program was intended to provide BLM with this type of information, yet it is excluded from the OS/TS PDEIS. By

using outdated or erroneous assumptions, the OS/TS PDEIS exaggerates the water and power needs as well as the surface disturbance.

The same defects apply to the OS/TS PDEIS assumptions about the size of the surface disturbance and the amount of electrical power needed. OS/TS PDEIS at A-46, A-62, A-80, A-84, A-85; App. A. In part, these errors arise because the BLM never updated Chapter 3 or the Appendices. These same assumptions are carried through to Chapters 2 and 4-6, thus tainting the entire analysis.

#19])> <([#20 [2.2] [6.3.5] The above assumptions are relevant to the OS/TS PDEIS conclusion that oil shale and

tar sands have not been shown to be commercially viable. OS/TS PDEIS at 2-57, 2-76, 3-238. This very curious statement cannot be reconciled with the fact that the province of Alberta has been producing oil from tar sands for more than 20 years and even transports tar sands oil to Utah for refining. Similarly, Enfit has been producing oil from oil shale for more than 30 years. The OS/TS PDEIS does not provide any definition of commercial viability but proven business operations should suffice and it is inexplicable that the OS/TS PDEIS repeats a conclusion that is contradicted by incontrovertible facts.

The issue of commercial viability is also the basis for Alternative 2b, which would actually limit oil shale development to another RD&D program, without authorizing commercial leases. The preferred alternative rests on the highly disputed premise that oil shale is not commercially viable. NEPA requires BLM to disclose and discuss the controversies and the OS/TS PDEIS does not. **#20])>**

<([#21 [3.10.3] VI. ONE-SIDED ECONOMIC AND SOCIAL ANALYSIS

The OS/TS PDEIS assumes that oil shale and tar sands development will lead to a boom and bust economic cycle. OS/TS PDEIS 2-36, 3-242. Based on that premise, the OS/TS PDEIS describes Alternative 1 as harmful and Alternatives 2-4, which feature little to no development, as beneficial. OS/TS PDEIS at ES-9, Table 2.3.2-2, Table 2.4.2-2, Table 2.6-1.

The OS/TS PDEIS discussion omits the fact that the lands classified as high potential are in regions where there is already a viable energy economy. For example, in southwestern Wyoming, there are several major gas fields producing conventional and coalgas, including Pinedale Anticline, Jonah, MoxaArch, Continental Divide and Hiawatha. There are numerous other plays for oil and natural gas as well. Coal mining plays important role in Sweetwater and Lincoln Counties, with trona also in Sweetwater and Uinta Counties. Construction of wind farms and related transmission lines continues at a rapid pace as well. Thus, oil shale will add to the economy but is unlikely to be significant enough to create an economic boom.

Uintah County produces about 50% of the oil and gas recovered in the State of Utah. Oil shale and tar sands development will diversify the energy economy but will not set off a boom.

The OS/TS PDEIS fails to consider the cumulative impacts and connected actions in this discussion of the economic and social impacts. It is true that the current energy development has generated housing shortages and pressure on existing roads, but Utah and Wyoming have some of the lowest unemployment records in the country and have weathered the severe recession, and in reality a national depression, far better than other states such as California, Oregon and Washington.

Taking the OS/TS PDEIS discussion to its logical conclusion, one would conclude that it is BLM's view that it is better for the residents of rural counties and communities to remain poor and isolated. OS/TS PDEIS at ES-9, Table 2.3.2-2, Table 2.4.2-2, Table 2.6-1. It is correct that the upsurge in energy development has changed western Wyoming and eastern Utah communities. There is more traffic, more demand for housing and other services. There has also been more opportunity for jobs, to lease or sell private land related to energy projects and the injection of cash into the economy. Certainly, the State of Wyoming and the trust beneficiaries, the University and Wyoming Game & Fish Department have also seen significant increases in revenues, which allowed Wyoming to avoid the job losses, bank failures and bankruptcies that haunt many other states and large cities.

The oil shale program would add to the existing energy industry but would be a relatively small portion. Wyoming is already the second largest recipient of federal royalty revenues and revenues from oil shale would not significantly change that. It would, however, represent continued diversification in energy development.

#21)> VII. CONCLUSIONS AND RECOMMENDATIONS

<([#22 [9.2.2] The OS/TS PDEIS suffers from a number of fatal flaws.

- All alternatives except Alternative 1 do not conform to Section 369 of the 2005 EPA; #22)>

<([#25 [9.2.1] - Implementation of LWC management in Alternatives 2, 3 and 4 violates the congressional limitation on the expenditure of funds to implement S.O. 3310 and exceed BLM's authority; #25)>

<([#23 [9.5] The OS/TS PDEIS suffers from a number of fatal flaws.

? All of the alternatives except Alternative 1 violate FLPMA land use planning processes and rules by superseding the existing RMPS and the ongoing plan revision for the Rock Springs area;

#23)> ? <([#24 [1.5] The OS/TS PDEIS suffers from a number of fatal flaws. OS/TS PDEIS violates NEPA;

? by failing to support the purpose and need in the PDEIS;

? by failing to fully analyze the preferred alternative so that the public can meaningfully comment;

? omitting significant new information regarding oil shale and tar sands potential and technological advances and omitting the rule changes that will significantly affect the timing of development;

? failing to fully disclose the basis for excluding land areas from oil shale and tar sands development, when such areas were proposed by special interest groups without providing maps, facts, or rationale to support the adoption of these proposals;

? failing to address the scientific controversies regarding the environmental impacts and resource needs for oil shale and tar sands development.

#24)> Vermillion appreciates the opportunity to comment on this draft, but urges withdrawal and supplementation of the PDEIS to address the identified omissions.

Submission Text

Dear Folks, A hardcopy of our comments has been provided by mail with attachments on an accompanying CD-ROM. We had one additional organization (Jackson Hole Conservation Alliance), who wished to become signatories to our comments, so we have added them to this electronic version and are resubmitting. The attachments accompanying the hardcopy pertain to the electronic comments as well. Thank you, Erik Molvar See Attachment.

NOTE: attachments are in the project file on the P:\drive [OSTs 2012\Public Comments\OSTs Comment Attachments on CD\50239]

Dear BLM Officials:

The following are the comments of Biodiversity Conservation Alliance (BCA), Colorado Environmental Coalition, Rocky Mountain Wild, Jackson Hole Conservation Alliance, and Californians for Western Wilderness on the Oil Shale and Tar Sands Draft PEIS. These comments supplement the comments submitted by Western Resource Advocates, to which BCA is a signatory, and focus primarily on potential oil shale lands in Wyoming. Please address these comments in detail as you move this document through the NEPA process. <([#1 [2.3.1] We support Alternative 3, because as dirty and heavy impact a resource as oil shale is, it should be proven through the RD&D process on currently existing RD&D leases before additional public lands are opened up for leasing of any kind.

Our perception is that oil shale is not ready for prime time. The dirtiest of the fossil fuels, it comes with an even bigger carbon footprint than tar sands. Producing it will release toxins into the atmosphere and likely pollute groundwater and/or surface waters with hydrocarbons, salts, and heavy metals that leach out of retorted shales, either in situ and as tailings. It results in 100 percent destruction to the lands that are produced, regardless of whether it is strip-mined or produced in situ, and it will likely take up to a century for these lands to become productive wildlife habitat again. The water demand of oil shale production is itself a major threat, not just to other water users along the Colorado River system but also to the four species of Endangered fishes inhabiting the Colorado River system. And despite years of trying on RD&D leases, no company has shown that oil shale is viable on a commercial scale.

#1])>

A. <([#2 [3.1.1] Wyoming proposed wilderness areas that should be protected from oil shale and tar sands development

The following areas are proposed for wilderness protection in Wyoming. These areas should be protected from oil shale and tar sands development: Adobe Town, Kinney Rim North, Kinney Rim South, Red Creek Badlands, Devils Playground, Buffalo Hump, and Sand Dunes, including citizens' proposed additions to existing WSAs. These lands are identified on GIS datasets included as Attachment 1.

The Adobe Town citizens' proposed wilderness is discussed at great length below under the Adobe Town Very Rare or Uncommon Area, which encompasses the entire citizens' proposed wilderness. It is important to note that lands recognized as possessing wilderness characteristics (the "Adobe Town Fringe") are not shown on Figures 3.1.1-13 and -14; this oversight merits correction. We recommend that the entire Adobe Town citizens' proposed wilderness outside the Wilderness Study Area be shown as "Lands to be Managed to Protect Wilderness Characteristics." For the Rawlins Field Office, all of these areas are mapped as "Lands with Wilderness Characteristics," correcting the oversight, but none (including the designated Wilderness Study Area) are mapped as Lands with Wilderness Characteristics for the Rock Springs Field Office. See Figure 2.3.3-3. This mapping error also is worthy of an update. If the Very Rare or Uncommon Area is withdrawn from oil shale leasing, all of these lands with wilderness character will be protected, however, so these scrivener's errors are of limited import as long as the Very Rare or Uncommon Area is indeed withdrawn from oil shale development as is the apparent intent under the Preferred Alternative. We will discuss other units individually below.

The Kinney Rim is a lofty ridge rising like a wave from a sea of sagebrush. The Kinney Rim North and South citizens' proposed wilderness areas are listed as "Lands to be Managed to Protect Wilderness Characteristics" on Figure 3.1.1-13 and Figure 3.1.1-14, a designation with which we concur. These lands appear to be withdrawn from oil shale leasing under Alternative 2, a withdrawal which we applaud and support.

The Devils Playground – Twin Buttes citizens' proposed wilderness is a land of arid, windswept badlands immediately to the west of Flaming Gorge National Recreation Area, offering outstanding hiking opportunities for visitors to the recreation Area in addition to habitat for the rare midget faded rattlesnake. The Devils Playground/Twin Buttes WSA is listed for the Rock Springs Field Office, but the corresponding citizens' proposed wilderness (or CPW) has apparently been overlooked. DPEIS at Figure 3.1.1-14. We have attached the original citizens' proposed wilderness documentation from 1992. See Attachment 2. In light of the absence of industrial activity within the lands encompassed by the citizens' proposed wilderness, the wilderness characteristics will have improved as human intrusions continue to grow fainter. BLM should evaluate the CPW surrounding the existing Wilderness Study Area and protect all the lands contained therein from oil shale development. Neither the currently designated Wilderness Study Area nor the citizens' proposed wilderness appear to be mapped as "Lands with Wilderness Characteristics" on Figure 2.3.3-3, and portions of this area appear to be made available for oil shale leasing under Alternative 2 in Figure 2.3.3-6. This oversight should be corrected, and these lands should be withdrawn from oil shale leasing in the final decision.

The Red Creek Badlands citizens' proposed wilderness encompasses a maze of shallow canyons through redbeds studded with junipers and pinyon pines. The "Lands with Wilderness

Characteristics” mapped for the Red Creek unit do not appear to correspond with either the Wilderness Study Area or the citizens’ proposed wilderness. See Figure 2.3.3-3. We have attached the citizens’ wilderness overview for this unit for informational purposes. See Attachment 10. However, these lands being outside the “Most Geologically Prospective Area” do not appear to be offered for lease under any alternative, rendering this oversight of limited substantive importance.

#2])>

B. <([#3 [3.1.1] Wyoming ACECs and potential ACECs that should be protected from oil shale development

The following ACECs in Wyoming established under the Green River Resource Management Plan should be protected from oil shale development: Cedar Canyon ACEC (approximately 2,550 acres); Greater Red Creek ACEC (approximately 131,890 acres - originally Red Creek ACEC, expanded from 55,880 acres to include relevant and important values in the Currant Creek and Sage Creek Drainages); Greater Sand Dunes ACEC (approximately 38,650 acres); Natural Corrals ACEC (approximately 1,276 acres); Oregon Buttes ACEC (approximately 3,450 acres); Pine Springs ACEC (approximately 6,030 acres, expanded from 90 acres to include adjacent relevant and important values); White Mountain Petroglyphs ACEC (approximately 20 acres); South Pass ACEC (approximately 53,780 acres); Special Status (Candidate) Plants ACEC (approximately 900 acres); and Steamboat Mountain ACEC (approximately 43,270 acres).

In addition, the following potential ACECs should also be excluded from oil shale leasing: sage-grouse potential ACECs in the South Pass and Salt Wells areas as originally proposed by the Rock Springs BLM identified in the Sage-Grouse Plan Amendment process and others that may be identified in the Pinedale Field Office; the Monument Valley Management Area as identified in the Green River RMP; the Powder Rim proposed ACEC petitioned under the Rawlins RMP EIS, and the migration corridor for the Grand Teton pronghorn herd, extending southward from Trapper’s Point to Seedskaadee National Wildlife Refuge. In addition, Seedskaadee NWR itself should be excluded from oil shale leasing.

#3])>

1. **<([#4 [3.1.1] Adobe Town Very Rare or Uncommon Area – The entire area should be excluded from leasing**

This PEIS presents an important opportunity to protect the Adobe Town Very Rare or Uncommon Area. The State of Wyoming’s 2008 designation of the Adobe Town area as Very Rare or Uncommon under the state Environmental Quality Act should provide the BLM with the legal basis for protecting this entire area. In the original FPEIS, only lands designated as WSA within Adobe Town were protected from commercial development. With Very Rare or Uncommon designation being finalized in 2008, the BLM now has a strong basis for protecting this area’s environmental and cultural resources. Of note this area is erroneously listed on Figure 2.3.3-3 as “Adobe Town Rare and Irreplaceable Land,” a typographical consideration that does not appear to have substantive import as these lands appear to be withdrawn from oil shale leasing under Alternative 2. See Figure 2.3.3-6.

Notably, in the Environmental Quality Council's Very Rare or Uncommon designation, the Council explicitly stated, "The designation would prevent surface mining for oil shale and uranium, as well as gravel pit mining." See Attachment 3 at 18. Since the EQC holds authority over mining permits, and a mining permit would not issue if such mining would impair the Very rare or Uncommon features for which the area was designated (geologic, fossil, wildlife, scenic, and historical) – a virtual certainty – it makes no sense for BLM to issue leases in this area which the lessee would be potentially unable to develop.

Adobe Town has been called the crown jewel of the Red Desert – encompassing irreplaceable ecological, geological, historical and recreation values. At 180,910 acres, Adobe Town is Wyoming's largest and most spectacular desert wilderness. Stretching 26 miles north to south and 19 miles east to west, this area is one of the last places in Wyoming where visitors can take in views of pristine landscape that stretch from horizon to horizon. The landscape ranges from banded badlands to mazes of arches, pinnacles, and spires, offering spectacular scenic vistas and important wildlife habitat.

Adobe Town was designated as s Very Rare or Uncommon due to its geological, fossil, scenic, wildlife, and cultural/historical values. Non-coal surface mining (which would include oil shale) is expressly prohibited in Very Rare or Uncommon areas, except in cases where surface mining would not detract from such qualities. Because scenic qualities are part of the designation, there is no possibility that an exemption for oil shale mining could be issued.

In its formal designation of this area, Wyoming's Environmental Quality Council stated, "The designation protects the area from non surface coal mining only. The designation would prevent surface mining for oil shale and uranium, as well as gravel pit mining." [1] While part of the Very Rare or Uncommon area is a Wilderness Study Area (WSA), which cannot be made available for oil shale leasing under the PEIS, the remainder is outside the WSA. All of Adobe Town as a state of Wyoming Very Rare and Uncommon area, not just the WSA, should be protected from oil shale development. Further, Adobe Town geological formations, abundant fossil resources, historical and prehistoric sites and features, rare and sensitive (including crucial) wildlife habitats, and scenic values are comparable to existing national park units, and thus are of national value. Left unprotected, these treasures are at risk of elimination.

The Adobe Town area should be managed on a landscape level, through a variety of management designations. By managing this area as a whole, the BLM can better protect its important and varied values. This concept is supported by the recently released America's Great Outdoors report, which recommends the agency incorporate landscape-scale conservation and restoration as a priority in BLM resource management plans and programs.[2]

In the original Draft EIS, the BLM recognized Lands with Wilderness Character in the Rawlins Field Office, notably the Adobe Town Fringe, which overlaps with the potential oil shale development area. Original DPEIS at 3-38. However, this section makes no mention of the Adobe Town Very Rare or Uncommon Area, which encompasses the Adobe Town WSA, Adobe Town Fringe area recognized by BLM to contain lands with wilderness character, and also other citizens' proposed wilderness lands not included in the BLM-defined Adobe Town fringe, and which overlap with potential oil shale development.

1. Adobe Town: Historical, prehistorical, and archaeological values

Adobe Town has a number of historical, prehistorical and archaeological values that meet the criteria for Very Rare or Uncommon designation. It is mentioned prominently in the journals of the Geological Exploration of the 40th Parallel (circa 1869), and was used as a hideout for fresh horses by Butch Cassidy and his gang during the Tipton train robbery of 1900. The area has a high density of archaeological sites dating back 12,000 years, and is still used as an important religious site by Native Americans today.

Adobe Town is mentioned prominently in the Report of the Geological Exploration of the 40th Parallel, a federal document authored by eminent geologist Clarence King in 1869. This area was identified by King as the most superlative geological landscape found along the survey route. King described the general landscapes as follows:

From twelve to fourteen miles southwest of the head of Bitter Creek are seen exposures of the soft green clays, marls, and whitish-gray sands of which the upper beds of the Bridger group are made. Passing eastward of Pine Bluffs [known today as Pine Butte], the country is covered with more or less drifting sand, which forms noticeable trains of dunes. The sand suddenly gives way to the soft Bridger beds which are intricately eroded into branching ravines [Adobe Town and Skull Rims]. This bad-land country extends southeastward to the mouth of a dry valley [Sand Creek] north of Cherokee Ridge [Powder Rim/Cherokee Rim], and from that point a chain of bluff escarpments extends northeasterly for twelve or fourteen miles.[3]

In addition to the historical noteworthiness of the Geological Exploration, Adobe Town is also unusually rich in archaeological sites. According to BLM,

Significant archaeological resources are found throughout the [Adobe Town] WSA, representing continuous occupation from Paleo Indian through late Prehistoric periods, that is, for the past 12,000 years. The cultural site density of the WSA is estimated to be 30 surface sites per square mile, which is unusually high.[4]

2. Adobe Town: Geological values

Adobe Town is a geological masterpiece, dominated by outcroppings of the Washakie formation, a deep bed of volcanic ash deposited 50 million years ago during the Yellowstone eruptions as airborne ash and fluvial desposits of ash interbedded with reddish sandstone that forms rimrock. In 1981, BLM described the geology of the rims as follows:

They are composed of green, gray, and red tuffaceous and arkosic sandstone and minor beds of green shale, light-gray and green tuff, gray siltstone and conglomerate. The exposed beds have created the colorful landscape the Adobe Town Area is known for.[5]

These are the epitome of fragile lands, with highly erodible soils (both the tuffaceous sandstone and the stabilized sand dunes mantled with a fragile veneer of vegetation) and the towers, arches, and balanced rocks which would easily be toppled by mechanical disturbance.

Above the rims, unique geological features include desert pavement and stabilized sand dunes. The rims have been whittled by erosion into spires and pinnacles, solifluction caves (known locally as ‘mud caves’) large enough to walk through, natural arches, lone towers, groups of castellated pillars, window rocks, grottoes, buttes, caprocks, mushrooms, hat rocks, and eroded badlands banded with pink, red, and purple tones. According to BLM, “Skull Creek Rim, in the core of the area recommended for wilderness, contains some of the most unique and extensive badlands formations in Wyoming.” [6] BLM described the effect of this surreal landscape as follows:

Many of the spires take on strange life-like forms – stone sentinals (sic) frozen in time standing guard over their silent desert domain. Walking amidst groups of these strange spires gives one the eerie feeling of being watched – by beings who have witnessed the evolution of Adobe Town for millennia.[7]

In addition, the paleontological resources of Adobe Town are among the finest deposits of Eocene mammals and reptiles in the world. According to BLM, “The Adobe Town area is known as one of the three most valuable sites in North America for certain types of mammalian fossils.” [8] This important point appears to have been overlooked in the Paleontological Resources section of the DEIS. BLM further noted,

The WSA is nationally known for the educational and scientific study of paleontological resources. Fossil remains of mammals are numerous and widely distributed throughout the area. Two notable mammalian fossils found in the area are the Uintathere and Titanotheres. The Uintathere was a large mammal about the size and configuration of an African rhinoceros. The species of Titanotheres found in the WSA was a tapir-like mammal, about 40 inches in height. This area has been identified as one of the premiere sites in North America for paleontological resources.[9]

3. Adobe Town: Wildlife values

Adobe Town also has a host of sensitive wildlife habitats that are crucial or vital to meeting the very rare or uncommon designation criteria. These habitats include nest sites, sage-grouse lek sites, prairie dog colonies, and big game crucial winter ranges. The cliffs and pillars found throughout Adobe Town provide ideal nesting habitat for raptors, offering numerous nesting platforms out of the reach of ground-based nest predators. Raptor nest sites, sage-grouse lek sites, and big game crucial winter ranges are exceptionally sensitive to, among other things, development, as temporary disturbances can lead to nest failure or displacement of big game onto marginal ranges where they may not be able to survive.

The white-tailed prairie dog is a BLM Sensitive Species and also is recognized as a Sensitive Species by the Wyoming Game and Fish Department. There is a small white-tailed prairie dog colony observed at T 14N R97W sec. 12, SE ¼, which has been active at least between 2001 and 2006; white-tailed prairie dogs were also observed in Section 13 NW ¼ of the same township in 2006. Active white-tailed prairie dog colonies also occur in Horseshoe Bend south of the Haystacks.[10]

There are a number of known golden eagle nest sites, including two nest sites along the western end of The Haystacks (T16N R97W Sec. 10 NE ¼ and T16N R97W Sec. 15 SW ¼), one along Haystack Wash as it leaves the rimrock area (T16N R96W Sec. 30 NW ¼), and one on the lower rim (T15N R96W Sec. 18 NW ¼). In the Rawlins Field Office, two golden eagle nests occur in the southern end of the WSA, with additional nests known from the Willow Creek Rim in the eastern proposed expansion unit and on outcrops to the west of Sand Creek in the southeastern part of the area.

The greater sage-grouse is a BLM Sensitive Species and also is listed as a Sensitive Species by the Wyoming Game and Fish Department. (Sage-grouse are discussed in further detail below.) There are three known sage-grouse leks – one in the southeastern proposed expansion, another north of the WSA and south of The Haystacks, and a third in the northeastern lobe of the WSA. Sage-grouse leks are the hub of nesting activity, and typically most of the hens bred at a lek nest within 3 miles of the lek site. Thus, the area around each lek also constitutes important nesting habitat.

There is a desert elk herd, known to the Wyoming Game and Fish Department as the Petition Herd, which is one of the few true desert elk herds in North America, spending the entire year in the Red Desert. This elk herd is therefore very rare. Its activities are centered on the Powder Rim.

Known prairie falcon nest sites within the proposed Very Rare or Uncommon area include one at T16N R95W Sec. 19 NW ¼; two near Manuel Gap (T16N R97W Sec. 27 SW ¼ and T16N R97W Sec. 28 SW ¼); and T15N R96W Sec. 19 NE ¼.[11] Prairie falcons with fledgling young were observed roosting on a pinnacle just off the Skull Creek Rim at T13N R97W during the early summer of both 2005 and 2006. Prairie falcons with fledgling young were also sighted at T15N R97W Section 19 SW ¼ on July 9, 2006. A known prairie falcon nest also was recorded by BLM on the bluffs above Willow Creek in the eastern proposed expansion.

Several other raptors are on the BLM and Wyoming Game and Fish Department Sensitive Species Lists. The burrowing owl, which is a prairie dog obligate species that nests in burrows of prairie dog towns, has one known nest location in the southwestern corner of the WSA. The ferruginous hawk, the largest hawk in Wyoming, has nest sites confirmed by BLM two miles south of Manuel Gap and in the southeastern proposed expansion.

Due to the rugged and inaccessible nature of much of Adobe Town, no thorough and systematic inventory of nesting raptors has ever been performed. For instance, there are several known nest sites of ferruginous hawks active in recent years which are not in the BLM's database, even in accessible areas. An occupied and active ferruginous hawk nest was observed by Erik Molvar and Joel Sartore on the eroded walls far below East Fork Point at T14N R96W Section 8 SWSE on May 4, 2004. In addition, an active and occupied ferruginous hawk nest was documented in the Haystacks at T17N R96W Section 33 SWSE by Liz Howell, and separately by Erik Molvar, during summer of 2005. The same nest was found to be active again in 2006 by Erik Molvar.

The mountain plover is recognized as a BLM Sensitive Species and as a Sensitive Species by the

Wyoming Game and Fish Department. Until recently, it was listed as Threatened under the Endangered Species Act (ESA). The Horseshoe Bend area south of The Haystacks contains vital mountain plover nesting habitat with a number of confirmed plover sightings.[12] Mountain plovers have also been sighted atop the Adobe Town Rim at T15N R98W Section 25 NE ¼, and at the southern edge of the Adobe Town Rim.

The Great Basin gopher snake is listed as a BLM Sensitive Species. This species has been photographed along the Adobe Town Rim at T15N R97W Section 19, NW ¼.

The Haystacks is identified by the Wyoming Game and Fish Department as crucial mule deer winter habitat. There is also a substantial amount of pronghorn crucial winter range south of Horseshoe Bend along the branches of Haystack Creek. In addition, portions of the area on the north slope of the Powder Rim are mule deer crucial winter range.[13]

4. Adobe Town: Scenic values

The scenic values of Adobe Town are the most impressive of any desert landscape in Wyoming. It has long attracted the attention of writers and authors. In the 2006-2007 edition of *Wilderness* magazine, writer Allen Best characterizes Adobe Town as “a giant museum of geological curiosities.” In 2004, Kerry Brophy wrote of Adobe Town in *Wyoming Wildlife* magazine as “about as lonesome and lovely a place as you’re likely to find”. Adobe Town is also featured in the guidebook *Wild Wyoming*, which characterized the area as “a landscape worthy of National Park status.” World-renowned author Annie Proulx described Adobe Town as “The maze of badland formations, mesas, and buttes combine with brilliantly colored rock strata to create spectacular canyonland scenery.”

More recently, Adobe Town has become a mecca for photographers, and photographs have been included in calendars, coffee table books such as *Wind River Wilderness and Red Desert: History of a Place*. A scenic photograph of Adobe Town appeared in the July 2005 issue of *National Geographic*. Internationally known nature photographer Tom Mangelson noted, “Adobe Town is truly one of the crown jewels of the West, one of the signature Red Desert landscapes that cannot be allowed to fall under the blade of the bulldozer.”[14] Photographer Ron Marquart described Adobe Town as follows: “Its landscape is comparable to Bryce Canyon, Canyonlands and Badlands National Parks, and represents the most intricate, outstanding badlands topography in the U.S.” Adobe Town was also featured in the new book of photography published by Laguna Wilderness Press, *Wyoming’s Red Desert: A Photographic Journey*.

These scenic values are also important economic values. Both must be protected.

5. Adobe Town: Recreation

Currently, the Adobe Town area is used primarily for recreation. Hikers and photographers concentrate efforts along the Adobe Town Rim, in The Haystacks, and atop the Skull Creek Rim. The unit is an excellent rockhounding area, with moss agates and other semiprecious stones to be found, especially atop the Adobe Town Rim. The flats along the eastern end of the unit are a

well-known trophy antelope hunting area, and The Haystacks, Adobe Town Rim, and Powder Rim are also known mule deer hunting areas. Due to the tangled web of gas field roads to the east of Adobe Town, most visitors approach from the north and west. #4])>

1. <([#5 [3.1.1] **Recreational areas in Wyoming**

As the BLM stated, “Commercial oil shale development activities is incompatible with recreational use (e.g., hiking, biking, fishing, hunting, bird watching, OHV use, and camping).” DEIS at 4-20. We strongly agree with this conclusion. In the PEIS, the BLM must thoroughly assess the impacts on the following areas of high recreational value that fall within potentially leased oil shale areas in Wyoming. We believe oil shale leasing in these areas should be precluded:

1. Little Mountain area, including Greater Red Creek ACEC, Red Creek WSA, and Sugarloaf Basin SMA – These areas were established under the Green River RMP and constitute an outstanding big game hunting resource. According to the Wyoming Game and Fish Department, the elk hunt in this area is the single most sought-after tag in the entire state. Oil shale activities would be certain to drive away elk and destroy the recreational quality of this area.

2. Adobe Town State Very Rare or Uncommon Area – As discussed above, the scenic and wilderness qualities in this area and its viewshed need to be protected from oil shale leasing in order to maintain the scenic and wilderness qualities in this area. Oil shale leasing should be precluded from this area in order to maintain FLPMA-required consistency with the state designation preventing non-coal surface mining. Portions of this area also now fall within the Adobe Town Dispersed Recreation Use Area designated under the Rawlins RMP.

3. Adobe Town Dispersed Recreation Use Area (DRUA) – The Adobe Town DRUA was established under the Rawlins RMP, and includes not only the Very Rare or Uncommon area but also portions of the Kinney Rim North and South citizens’ proposed wilderness areas, the western Powder Rim, and the Prehistoric Rim area to the east of Adobe Town.[15] The DRUA is of high value for dispersed and primitive recreation, including hiking, wildlife viewing, hunting, and camping. It should be excluded from oil shale leasing.

4. Kinney Rim North and Kinney Rim South citizens’ proposed wilderness areas – These lands provide a roadless, primitive/semi-primitive recreation experience, and represent an increasingly rare large tract of public land in the Red Desert that is free of industrial development. Parts of these now fall within the Adobe Town Dispersed Recreation Use Area designated under the Rawlins RMP.

5. The Flaming Gorge National Recreation Area – This area lays entirely within the area proposed for oil shale leasing in Wyoming. In the FPEIS, National Recreation Areas are not specifically listed as units of the National Landscape Conservation System that will be excluded

from oil shale leasing.[16] However, all of this NRA as well as its viewshed should be excluded from oil shale leasing consideration in order to preserve the scenic and recreational qualities found here.

6. Jack Morrow Hills planning area – This is an area highly important for both dispersed recreation and elk hunting. It contains the Boars Tusk and White Mountains Petroglyph Site, both of which are culturally important to Native American tribes. In addition, an archaeological site in the northwest corner of this area is an ACEC and its setting needs to be protected as well. The “most prospective” oil shale area in Wyoming includes portions of the Jack Morrow Hills planning area, a subset of the Rock Springs Field Office set aside from the Green River RMP in the 1990s for special planning due to its outstanding wildlife resources and strong public interest.

#5)>

<([#6 [3.8.2] Because oil shale development includes 100 percent scarification to the land, and represents one of the most major types of visual intrusions possible on BLM lands, leasing should not allow any surface disturbance on lands of Visual Resource Management Class I, II, or III lands. The objectives for Class I and II lands are to “preserve” and “retain” the “existing character of the land, while Class III lands are managed to “partially retain the existing character of the land.”[17] Oil shale development cannot possibly meet these objectives. Based on the definitions for these lands, only the objectives for VRM Class IV, which “provide for management activities which require major modification of the existing character of the landscape” and permit a level of change that is “high,” are compatible with oil shale development. See id. The BLM has recently completed a Visual Resource Inventory for portions of the Rawlins and Rock Springs Field Offices, and we recommend that this VRI be incorporated into the EIS process for oil shale as part of its Affected Environment analysis. Notably, the Visual Resource analysis in the DPEIS for the Washakie Basin notes that this is “an area of active energy development” and that associated visual disturbances are found in the basin. DPEIS at 3-207. This section fails to acknowledge that most of the Washakie Basin is in an undeveloped state, however, and contains some of the most outstanding scenic resources in either the Rawlins or Rock Springs Field Offices, including the Adobe Town Very Rare or Uncommon Area, the Kinney Rim citizens’ proposed wilderness areas, the Powder Rim, and the Adobe Town Dispersed Recreation Use Area. In order to maintain conformity with local Resource Management Plans pursuant to FLPMA, the BLM should therefore allow oil shale leasing and development on VRM Class IV lands only.

#6)>

1. **<([#7 [3.7.5.1] [3.7.5.2] Greater Sage-Grouse**

As oil shale development would be expected to result in a 100% loss in habitat function for sage grouse, important sage grouse habitats (both Priority Habitats and General Habitats) should be excluded from oil shale leasing. See Mitigation Measures, DPEIS at 4-133. The BLM is currently undertaking a Sage Grouse Plan Amendment EIS, and the OSTs EIS should include protections at least as stringent as those to be implemented under the Sage Grouse Plan Amendments. The BLM has convened a National Technical Team to develop science-based recommendations for

the management of sage grouse habitats, and we append the Team's report to these comments as Attachment 4 and incorporate the report by reference into these comments. These recommendations do not appear to have been considered under the mitigation measures to be considered for wildlife. DPEIS at 4-132. BLM should implement the recommendations of the National Technical Team in its final decision on oil shale and tar sands leasing; recommended maximum levels of 3% surface disturbance by land area per square mile are especially relevant to oil shale extraction and processing operations. BLM must also render the oil shale/tar sands leasing decision consistent with the agency's 2004 National Sage-Grouse Habitat Conservation Strategy, which remains BLM policy, particularly requirements to consider the best available science.[18]

Sage grouse have been declining across their range over the past 50 years. Wyoming sage grouse populations are some of the largest left in the nation and have experienced lower levels of population loss (showing a 17% decline from 1985-1994); nonetheless, sage grouse populations have experienced major declines rangewide in recent decades (Connelly and Braun 1997). WGFD (2000) reported that since 1952, there has been a 20% decline in the overall Wyoming sage grouse population, with some fragmented populations declining more than 80%; Christiansen (2000) reported a 40% statewide decline over the last 20 years of the 20th Century. Garton et al. (in press) also reported declining trends for the period of 1965-2007. These declines can be attributed to habitat loss (due to agriculture, mining and energy development, reservoirs, roads, and buildings), habitat fragmentation (due to fences, powerlines, roads, and reservoirs), habitat degradation (due to overgrazing, changes in fire regime, and mechanical and chemical sagebrush control efforts), drought, predation (the importance of which is controlled by the amount and quality of sage grouse habitat), and hunting (Braun 1998). These declines are sufficiently serious that the sage grouse has been listed as a Candidate Species under the Endangered Species Act. It is crucially important that the new plan provide for the maintenance and recovery of sage grouse populations, because this bird is headed for the Endangered Species List if population losses continue.

The sage grouse is a reasonably good 'umbrella species' for many types of sagebrush obligate wildlife from pronghorns to pygmy rabbits and BLM Sensitive songbirds, although protecting sage grouse habitat does relatively little for sensitive reptiles (Rowland et al. 2006). Thus, protecting large swaths of sage grouse habitat provides benefits for other types of sensitive wildlife. Large sage grouse Core Areas like South Pass and the Kinney Rim/Vermillion core have been proposed for protection from future oil and gas leasing under the BLM's Wyoming sage grouse plan amendment process as Sage Grouse ACECs as a means of providing a reservoir of healthy populations of sagebrush obligate wildlife; these lands should also be closed to oil shale leasing for the same reasons..

Sage Grouse Habitats Sagebrush steppe is the dominant plant community type found on lands under consideration for oil shale and tar sands development. In the sagebrush steppe habitat type, which encompasses the area proposed for oil shale leasing, some 41% of the historical sagebrush habitat has been converted to other vegetation types or human land uses (Miller et al. in press). Included within this area is southwestern and south-central Wyoming, one of the last bastions of the sagebrush steppe, and although large expanses have been badly fragmented by oil and gas projects like the Continental Divide – Wamsutter projects, large expanses of essentially untouched sagebrush grassland still remain in the oil shale area. In fact, south-central and southwestern Wyoming have been projected to be the most likely place in the nation to retain the sagebrush ecosystem required by sage grouse (and other sagebrush obligates) in

the face of changing climate, based on the area of agreement between 9 climate change models (Neilson et al. 2005, Attachment 5). Rangeland, climate change is expected to favor the expansion of exotic invasive species at the expense of native vegetation species (Miller et al. in press). The sagebrush steppe ecosystem is home to many rare or declining wildlife species, including the ferruginous hawk, sage grouse, burrowing owl, white-tailed prairie dog, swift fox, pygmy rabbit, Wyoming pocket gopher, black-footed ferret, and mountain plover. The fact that south-central Wyoming is perhaps the last major stronghold of the sagebrush steppe ecosystem and the species that are dependent on it presents a compelling reason that the oil shale/tar sands RMP amendments should regulate development and human use in a way that promotes the persistence of large blocks of intact sagebrush steppe rather than allowing the continued fragmentation of sagebrush habitats until only a few tatters of sagebrush steppe remain.

The Core Area system as currently envisioned by the Wyoming state government is a conceptually useful framework for this, although it incorporates certain political compromises that reduce the Core Area system's effectiveness as a conservation tool, such as excluding some of the highest-value sage grouse habitats from Cores based on the desires of industry to develop them, and the implementation of biologically inadequate protection measures for grouse both inside and outside of Core Areas. BLM has full authority to manage sage grouse habitats on BLM lands; these weaknesses in the state's Core Area strategy can and should be corrected on federal lands through BLM management decisions, including the OSTs plan amendments.

To ensure the viability of sage grouse populations, it is important to consider nesting, brood-rearing, and winter habitats (Call and Maser 1985). Holloran and Anderson (2005) found that 64% of sage grouse females nested within 5 km of a lek. Connelly et al. (2000) proposed comprehensive guidelines regarding the management of sage grouse, focused around the conservation of breeding/nesting habitat, late summer brood-rearing habitat, and wintering habitat. We recommend that these guidelines be implemented in the forthcoming RMP amendments, with the modification of a 3-mile NSO and no surface disturbance/vegetation treatment buffer at minimum (5 miles would be preferable) for sage grouse leks in order to protect the leks themselves as well as adjacent nesting habitat. These alternatives should be fully explored and considered in the forthcoming DEIS.

Breeding and Nesting Habitats Autenreith (1985) considered the lek site "the hub from which nesting occurs" (p. 52). Grouse exhibit strong fidelity to individual lek sites from year to year (Dunn and Braun 1986). During the spring period, male habitat use is concentrated within 2 km of lek sites (Benson et al. 1991). Young males may establish new leks in order to take part in breeding (Gates 1985). Because lek sites are used traditionally year after year and represent selection for optimal breeding and nesting habitat, it is crucially important to protect the area surrounding lek sites from impacts.

The maintenance of high-quality sagebrush steppe habitats, particularly nesting and wintering habitats, is necessary to maintain sage grouse viability on the landscape scale. Regarding energy development, according to Naugle et al. (2010), "Severity of current and projected impacts indicates the need to shift from local to landscape conservation." Sage grouse are dependent on sagebrush steppe habitats, and sage grouse distribution is closely linked with the distribution of big sagebrush (McCall 1974). Numerous studies have shown that female sage grouse show strong fidelity to specific nesting areas from year to year (Berry and Eng 1985, Fischer et al. 1993, Lyon 2000). Fischer et al.

(1993) concluded, "Because Sage Grouse hens appear to seek suitable habitat within a relatively small area, nest-area fidelity may reduce nesting if large areas of nesting habitat are destroyed" (p. 1040). Thus, it is important to foster sagebrush growth at levels useful to sage grouse and to avoid activities that destroy suitable sagebrush habitat.

The optimum height and cover of sagebrush for sage grouse nesting habitats varies from region to region. In their eastern Oregon study, Call and Maser (1985) reported that sagebrush between 30 and 60 cm made the best nesting habitat, while a range of 15-80 cm was suitable for nesting. In the foothills of the Sierra Madres, shrub height at nest sites averaged 22 cm (Klott and Lindzey 1989). In other studies, nesting habitat is typified by greater shrub height and shrub cover (Wallestad and Pyrah 1974, Sveum et al. 1998). Dunn and Braun (1986) found that grouse selected areas with taller shrubs and more homogeneous sagebrush densities, and closer distance to wooded or meadow edges. But in Idaho, Klebenow (1969) found that sage grouse did not nest in areas where sagebrush cover exceeded 35%. Within suitable nesting habitat, nest sites tend to be located under taller-than-average shrubs, particularly sagebrush (Hulet et al. 1986).

Habitat attributes have a direct effect on sage grouse population dynamics. Connelly et al. (1991) found that nest success was higher for birds nesting below sagebrush (53%) versus other shrubs (22%), and hypothesized that avian predation was the key to nest success. In central Washington, Sveum et al. (1998) found that sagebrush cover at successful nest sites averaged 51%, and height averaged 64 cm, while at depredated nests cover and height averaged 70% and 90 cm, respectively. Wallestad and Pyrah (1974) found that sagebrush cover exceeded 15% for all nest sites, and cover of sagebrush was positively correlated with nest success. Several studies have shown that successful nest sites have greater cover of tall grass (Gregg et al. 1994, Sveum et al. 1998). With this in mind, Holloran (1999) recommended leaving residual grass heights greater than 12 cm following removal of livestock in autumn. Thus, not only sagebrush height and density but also understory grass cover are important to maintain in sage grouse nesting areas. BLM should incorporate the sagebrush remote-sensing mapping projects occurring in Wyoming and elsewhere across the sage grouse's range into its OSTs DEIS analysis of baseline information, as a means for evaluating sage grouse habitat attributes beyond the useful index of lek size and location.

Early and Late Brood Rearing Habitats

Sage grouse may move some distance from nesting sites for early and late brood rearing. In western Wyoming, Lyon (2000) found that sage grouse moved an average of 1.1 km from the nest site for early brood-rearing, and late brood-rearing habitats averaged 4.8 km distant from the early brood-rearing areas. In Bates Hole, Holloran (1999) found that early brood rearing habitats are typified by decreased sagebrush cover and height and increased forb abundance, and movement to riparian sites occurred as uplands became dessicated. This pattern of movement and habitat selection is echoed in the findings of Oakleaf (1971). In western Wyoming, wet meadows, springs, seeps, and other green areas within sagebrush steppe were important for early brood-rearing, while late brood rearing focused on irrigated hay meadows, wet meadows, and drainage bottoms which remained green when early brood rearing habitats were withering (Lyon 2000). This researcher found that most recruitment loss occurred during the early brood rearing stage, and that this may be a limiting factor in sage grouse populations (Ibid.). In Nevada, Oakleaf (1971) found that meadows with succulent forbs, while occupying only 2.3% of grouse home ranges during the brood rearing period, were disproportionately important as brood-rearing habitat. In central Washington, Drut et al. (1994b) found that during late brood-

rearing, habitat use shifted from low sagebrush to big sagebrush sites, with heightened use of meadows and lakeshores. Brood-rearing habitats should thus be identified and managed to maximize sage grouse recruitment success.

The availability of forage with a high nutritional content is an important factor determining brood success. Broods require forbs, insects and cover for growth, concealment and shade (Autenreith 1985). The diet of sage grouse chicks is dominated by insects in the first week of life, with forbs becoming more important as time progresses (Call and Maser 1985). Oakleaf (1971) reported that succulent forbs dominated the diets of brood-rearing hens and juveniles until the chicks reached 11-12 weeks of age. Drut et al. (1994a) found that in the area with high sage grouse productivity, insects and forbs made up 80% of chicks' diets, while sagebrush buds made up 65% of diets in the area of low sage grouse productivity. These researchers reached the following conclusions:

“Substantially lower consumption of forbs and invertebrates and increased reliance on sagebrush may affect chick growth and survival, which would be reflected in long-term differences in productivity between areas. Insects are a critical nutrition source for developing chicks” (p. 93).

Dunn and Braun (1986) argued that meadows, as important forb-producing areas, should be preserved. Thus, the BLM should manage sage grouse brood-rearing habitat to maximize high-quality forage for chicks.

Mesic meadows and surface waters are focal points of sage grouse activity during certain times of year. Mesic sites associated with springs, seeps, and streams are critical for sage grouse on a yearlong basis, and assumes even greater importance as brood rearing habitat (Autenreith et al. 1982). Call and Maser (1985) stated, “We believe that free water is an essential component of sage grouse habitat”, but noted that “[s]age grouse may do well in the absence of free water where they have access to succulent vegetation.” (p. 4). Oakleaf (1971) found that the presence of surface water was an important factor that increased the value of meadows as grouse rearing habitat. Thus, BLM should map these key early brood rearing habitats as part of NEPA's baseline information gathering in the OSTs DEIS, and management of oil shale leasing and development should include special emphasis on avoiding and protecting wet meadows, springs, and seeps.

Wintering Habitats

Non-migratory sage grouse winter on their nesting and brood-rearing habitats, while migratory populations may travel some distance to winter on traditional wintering areas. For non-migratory populations, nesting habitat and wintering habitat are one and the same (e.g., Wallestad and Pyrah 1974). In a western Wyoming study, however, sage grouse were migratory and traveled at least 35 km to separate wintering grounds (Berry and Eng 1985). In Colorado's North Park, Beck (1977) found that grouse migrated 5-20 km away from breeding areas during winter. In a southeastern Idaho study, Connelly et al. (1988) found that some adult sage grouse moved more than 60 km to winter range, and some juveniles moved more than 80 km, despite the availability of suitable wintering habitat nearby. In some cases, sage grouse may be widely dispersed during mild winters but concentrate during severe winters (e.g., Autenreith 1985). Sage grouse may be keying in on several habitat variables when selecting appropriate wintering habitat. In the southern Red Desert, Kerley (1994) found that wintering sage grouse moved to tall sagebrush stands on steep south-facing slopes, where the sagebrush were exposed above the snow. Conversely, Beck (1977) found that in North Park, Colorado, 66% of sage grouse wintered on slopes of less than 5%, while only 13% of sage grouse use occurred on slopes

greater than 10%. In Montana, Eng and Schladweiler (1972) found that 82% of winter sage grouse sightings occurred in canopy cover greater than 20%, and a preference was shown for dense stands on lands with little slope. Carpenter et al. (2010) found in Canada, sage grouse selected less rugged topography at lower elevations. Dougherty et al. (2010) found that wintering grouse selected dense sagebrush for both food and cover. The BLM must identify sage grouse wintering habitats within the planning areas and emplace strong measures to protect them from oil shale leasing and development, with an appropriate buffer to ensure that oil shale and tar sands operations immediately adjacent to important wintering habitats do not cause disturbance to birds using those habitats.

Researchers appear to be unanimous in their recommendations that sage grouse winter habitat be protected from disturbance. Kerley (1994) recommended, "Because shrub stands used during winter (category 3 stands) make up a small proportion of available habitats, these patches on south facing slopes, as well as other traditional wintering sites, should not be treated [to remove or reduce shrubs]" (p.113). Since oil shale development would remove all shrubs, it certainly falls into this category of activities that should be proscribed by BLM. Connelly et al. (2000) concurred, recommending against habitat manipulation in sagebrush stands of 10-30% canopy cover heights of at least 25 cm to protect winter habitats. According to Beck and Braun (1980), "Areas of winter concentrations of sage grouse need to be documented and afforded maximum protection" (p. 564). Lyon (2000) recommended that sage grouse wintering habitats be placed off-limits to oil and gas development. Thus, in the OSTs planning area, the BLM needs to rapidly identify sage grouse winter concentration areas and place the areas off-limits to surface disturbance.

Vegetation Treatments

Because the sage grouse is dependent on sagebrush, sagebrush treatments are likely to have major impacts on sage grouse population viability. The OSTs DEIS should consider the cumulative effects that OSTs development would have combined with past and current vegetation treatment programs, and consider the reduction and/or elimination of vegetation treatment projects as part of the overall picture of sage grouse habitat management in the context of OSTs leasing and potential development. Call and Maser (1985) asserted that the spraying of sage grouse nesting habitats is deleterious because it reduces nest cover from avian predators and suppresses forbs that are important in the sage grouse diet. According to Kerley (1994), "shrub stands of 20-40% cover are needed for successful nesting and this shrub coverage should be maintained on identified breeding complexes [within 3.2 km of leks]" (p. 113). Wamboldt et al. (2002) stated:

"Natural or prescribed burning of sagebrush is seldom good for sage-grouse. This assessment recommends that fires within sage-grouse habitat be avoided in most cases, and should be allowed only after careful study of each local situation. The evidence also indicates that habitat loss due to fire may well be the most serious of all the factors contributing to the decline of sage-grouse" (p.24).

Heath et al. (1997) went even farther: "Based on our results, we recommend no reduction or control of sagebrush in areas containing between 18-30% live sagebrush canopy coverage within 4.5 km of leks" (p.50). According to Beck and Braun (1980),

"At present we do not know the relative value of a small versus large strutting ground to the population. Therefore we should afford equal merit to all and strive to maintain the adjacent

habitats, especially areas with sagebrush (*Artemisia*) suitable for nesting and brood rearing” (p. 563).

Call and Maser (1985) stated that spraying should not occur within the breeding complex (which they defined as within 2 miles of a lek), and should also be forbidden in known grouse winter ranges. Taking into account the negative effects of vegetation treatments on sage grouse nesting and lekking areas, and uncertainty in the overall extent of sage grouse nesting habitat surrounding lek sites in the Great Divide region, the BLM should prohibit vegetation treatments within 3 miles of sage grouse lek sites.

Strip Mining

Strip mining for coal has been shown to impact sage grouse populations through major local decreases in recruitment (Braun 1986); local distribution patterns and decreases in lek use are the principal effects, with disturbance, rather than habitat loss, being the primary factor (Remington and Braun 1991). Because oil shale development either involves strip mining directly, or in the case of in situ methods, involves a level of habitat destruction roughly equivalent to strip mining, Klott (1987) recommended that areas near sage grouse leks be avoided for the purposes of strip mining. We concur, and ask the BLM to withdraw lands within 5 miles of a sage grouse lek from lands suitable for surface mining or in situ development under the OSTs plan amendments.

Road Development

Road development can lead to lek abandonment (e.g., Braun 1986). In western Wyoming, Lyon (2000) found that for sage grouse leks within 3 km of oil and gas developments, grouse hens successful at raising their broods selected habitats farther from roads than unsuccessful hens. This finding indicates that habitats near roads experience reduced brood survivorship. Thus, the oil shale RMP amendments should include a moratorium on all road-building within 3 miles of a lek site.

Lessons Learned from Oil and Gas Development

Over the past 10 years, oil and gas development has posed perhaps the greatest threat to sage grouse viability in the region. There has also been much study concerning the impacts of oil and gas development on sage grouse, the findings of which are applicable to oil shale development as well. Over 8% of the total range of sage grouse has already been impacted by oil and gas development; in addition, the Wyoming Basin and Colorado Plateau ecoregions are among those areas that have the greatest proportion of land under lease (and therefore at risk for future industrialization) (Knick et al., in press). Oil shale development, while having a much greater intensity of development (100% landscape destruction rather than the 3-5% of a typical oil and gas field) also involves heavy vehicle traffic, human activity at the site of production, and networks of roads and potentially pipelines to support it. The BLM must consider the current level of energy development impact on sage grouse, which has been sufficient to list the sage grouse as “Warranted but Precluded” under the ESA, cumulatively with the impacts of oil shale development when performing its impact analysis for the OSTs PEIS.

In a study near Pinedale, sage grouse from disturbed leks where gas development occurred

within 3 km of the lek site showed lower nesting rates (and hence lower reproduction), traveled farther to nest, and selected greater shrub cover than grouse from undisturbed leks (Lyon 2000). According to Lyon (2000), impacts of oil and gas development to sage grouse include (1) direct habitat loss from new construction, (2) increased human activity and pumping noise causing displacement, (3) increased legal and illegal harvest, (4) direct mortality associated with reserve pits, and (5) lowered water tables resulting in herbaceous vegetation loss. Pump noise from oil and gas development may reduce the effective range of grouse vocalizations (Klott 1987). Thus, lek buffers are needed to ensure that booming sage grouse are audible to conspecifics during the breeding season. Connelly et al. (2000) recommended, "Energy-related facilities should be located >3.2 km from active leks" (p. 278). But Clait Braun (pers. comm.), the world's most eminent expert on sage grouse, recommended even larger NSO buffers of 3 miles from lek sites, based on the uncertainty of protecting sage grouse nesting habitat with smaller buffers. Thus, areas within 3 miles of a sage grouse lek should be put under year-round "No Surface Occupancy" stipulations.

Oil and gas development poses perhaps the greatest single threat to sage grouse persistence in Wyoming. Walker et al. (2007) found that sage grouse habitat within 4 miles of a lek site was important to the persistence of the lek. Conversely, Walker et al. (2007) concluded that leks heavily impacted by oil and gas development "typically became inactive within 3-4 years." Harju et al. (2008) found a time lag of 2-10 years post-development, at which point negative effects became evident. The BLM should be able to predict, on the basis of the location of oil and gas projects both major and minor that are currently underway or are presently being approved, which sage grouse leks are likely to become inactive over the short term once development begins, and this is a key analysis that needs to be performed in order to properly evaluate the prognosis of sage grouse populations in Wyoming and other states being adversely impacted by energy development. The same is true for winter habitats. Indeed, Naugle et al. (2006) found that a model using habitat variables and coalbed methane development provided a near perfect fit for grouse distribution data. In the Powder River Basin, CBM well density within a 4 km² area provided the best fit for modeling sage grouse habitat use (Doherty et al. 2008).

Walker et al. (2007) found that coalbed methane development within 2 miles of a sage grouse lek had negative effects on lek attendance. Holloran (2005) found that active drilling within 3.1 miles of a lek reduced breeding populations, while wells already constructed and drilled within 1.9 miles of the lek reduced breeding populations. One would expect oil shale development to track within this range; it is important to note that impacts to nesting hens are a second matter, and hens typically nest within 5.3 miles of leks. In Canada, Carpenter et al. (2010) found that sage grouse strongly avoided oil and gas infrastructure to a distance of 1.9 km, and avoided two-track vehicle trails more weakly to a distance of 1.5 km; the closest that a grouse was located to a coalbed methane well was 1,293m. Harju et al. (2008) found that negative impacts of development on lek populations extended 4.8 km (3 miles) from the development. Both Holloran (2005) and Walker et al. (2007) documented the extirpation of breeding populations at active leks as a result of oil and gas development in the Upper Green River Valley and Powder River Basin, respectively. Rowland et al. (2006: A4-3 through A4-7) provide a useful literature review of the distance that impacts spread beyond the edge of disturbed areas into adjacent habitats. Road construction related to energy development is a primary impact on sage grouse habitat from habitat fragmentation and direct disturbance perspectives. Rowland et al. (2006) modeled sage grouse distribution, and reached the following conclusions:

"The secondary road network is a highly significant factor influencing processes in this

landscape and is being developed and expanded rapidly across much of the WBEA (Thomson et al. 2005). Secondary roads are being built as part of the infrastructure to support non-renewable energy extraction (Chapters 2, 4). For example, within the Jonah Field in the Upper Green River Valley, >95% of the area had road densities >2 mi/mi² (Thomson et al. 2005)." p. 5-10. Furthermore,

"The dominant feature affecting output of the sage-grouse disturbance model was secondary roads, which occupy nearly 8% of the study area (Table 5.2) and are presumed to negatively influence an even larger extent."

Pp. 6-15 through 16. Holloran (2005) found significant impacts of road traffic on sage grouse habitat use, concluding that habitat effectiveness declined in areas adjacent to roads with increasing vehicle traffic, documenting the secondary effect referenced by Rowland et al. A number of researchers have noted a time lag between initiation of mineral development and sage grouse population declines. Holloran et al. (2010) noted that yearling males avoided lekking near oil and gas infrastructure, and that yearling females avoided nesting within 950m of oil and gas infrastructure. Thus, the time lag in populations may be driven by the exodus of yearlings from affected areas, while older birds hang on until they die. These researchers stated, "Our results...suggest to land managers that current stipulations on development may not provide management solutions."

Lek Buffers

Current BLM nest buffers for oil and gas of ¼ mile for no surface occupancy and 2 miles for seasonal stipulations traditionally applied, and still applied outside sage grouse Core Areas, are grossly inadequate to maintain sage grouse viability in the planning area. The lek buffer must be based not only on maintaining the lek but also the nesting habitat that surrounds the lek. In addition, seasonal prohibitions that prohibit only construction activities near leks are pointless: If roads or wells are built near leks during the off-season, the resulting regular vehicle traffic will have major negative impacts when the sage grouse are present, effectively circumventing any mitigative value of delaying construction activities.

As a rule, breeding and nesting activity are concentrated in the habitats adjacent to the lek site. In a Montana study, Wallestad and Schladweiler (1974) found that no male sage grouse traveled farther than 1.8 km from a lek during the breeding season. But following breeding, males may make long migrations to distant summer ranges (Connelly et al. 1988). Hulet et al. (1986) found that 10 of 13 hens nested within 1.9 miles of the lek site during the first year of their southern Idaho study, with an average distance of 1.7 miles from the lek site; 100% of hens nested within 2 miles of the lek site during the second year of this study, with an average distance from lek of 0.5 mile. In Montana, Wallestad and Pyrah (1974) found that 73% of nests were built within 2 miles of the lek, but only one nest occurred within 0.5 mile of the lek site.

But in Bates Hole, Wyoming, Holloran (1999) found that average nesting distance from lek site was 3.25 km for adults and 5.27 km for yearlings. Wakkinen et al. (1992) cautioned that leks were poor predictors of sage grouse nest sites; although 92% of sage grouse nested within 3.2 km of a lek in this study, sage grouse did not necessarily nest near the same lek where breeding took place.

Lyon (2000) pointed out that quarter-mile lek buffers were insufficient to maintain the viability of grouse populations. Several years ago, a multi-state group of fish and game biologists evaluated the standard BLM mitigation measures for grouse, and found them wholly inadequate. See

Attachment 6. Naugle et al. (2010) reinforce this assertion with a litany of examples of development compatible with BLM's standard suite of stipulations that exceed sage grouse tolerances. Connelly et al. (2000) recommended that sage grouse habitat should be protected within 3.2 km of lek sites under ideal habitat conditions, within 5 km when habitat conditions are not ideal, and within 18 km where sage grouse populations are migratory. Furthermore, these researchers stated that in areas where 40% or more of the original breeding habitat has been lost, all remaining habitat should be protected. Holloran (2005) provided a critical test of BLM's lek buffers' effectiveness in the Jonah and Pinedale Anticline fields, and found that in the face of full-field gas development, finding that extirpation was expected for sage grouse in both fields within 19 years if conditions remained the same (and, of course, conditions have become much worse for grouse under the continued intensification of drilling and road construction in these two fields).

But Beck (1977) cautioned that protection of lek sites only is insufficient to maintain sage grouse winter habitats. And Connelly et al. (1988) later cautioned, "Protection of sagebrush habitats within a 3.2 km radius of leks may not be sufficient to ensure the protection of year-long habitat requirements" (p. 116). And Braun recommended even larger buffers of 3 miles from lek sites where surface disturbance and vegetation treatments should be prohibited, based on the uncertainty of protecting sage grouse nesting habitat with smaller buffers. See Attachment 7. BLM commits to "Avoid leasing and/or development in sage grouse habitats." DEIS at 4-133. Thus, areas within 5 miles of a sage grouse lek and identified wintering areas should be put under year-round stipulations preventing habitat alterations for the purposes of oil shale leasing and development.

Sage Grouse Predators

A number of raptors and medium-sized mammalian carnivores prey on sage grouse. Sage grouse nest predators include bobcats, golden eagles, red fox, badgers, common ravens, and coyotes (Heath et al. 1997). Coates and Delahanty (2010) found that increases in raven populations were correlated with sage grouse declines in Idaho. Hulet et al. (1986) found that the Uinta ground squirrel was the most important nest predator in their southern Idaho study area. Interestingly, Mezquida et al (2006) postulated that "coyote control is likely detrimental to sage grouse conservation" because coyotes may have a negative influence on foxes, badgers, and ravens, which are the most important nest predators for sage grouse. The maintenance of appropriate habitat and adequate cover, particularly on nesting and brood-rearing habitats, is important to ensure that predation rates do not increase to abnormal levels. In addition to maintaining cover, it is important to avoid the construction of tall structures that serve as raptor perches and concentrate predation pressure, like powerlines and gas condensate tanks, near these habitats. BLM should evaluate in its DEIS the cumulative effects that oil shale will have with predation on sage grouse, and the possible changes to interactions which oil shale development might cause between sage grouse and their predators.

Monitoring

The number of active sage grouse leks can be a useful index of sage grouse population trends (Emmons and Braun 1984). Autenreith et al. (1982) provide a sound monitoring protocol which the BLM should adopt to monitor sage grouse trends. Aerial lek surveys should be undertaken each spring to determine presence/absence of grouse on known lek sites and to locate new lek sites, and a subset of leks should be censused at regular intervals at dawn throughout the

breeding season to gain an index of population trend. It is important to note that the number of grouse at a lek site can vary greatly from day to day (Beck and Braun 1980), so repeat censuses will be needed to establish a mean value. Emmons and Braun (1984) pointed out that timing of lek counts may affect number of grouse observed, as lek attendance is not constant and males commonly move between leks. These researchers recommended that four separate lek counts be taken for each lek, about 10 days apart. Brood counts should be undertaken 11-13 weeks after the peak of hatch using chick distress calls, and average number of chicks per hen should be derived, using both successful and nullparous hens. The OSTs EIS should include a detailed monitoring protocol for recording the response of sage grouse to oil shale development on neighboring lands.

We strongly support the BLM's decision to include a more thorough review of the greater sage-grouse in the PEIS. Notably, while the BLM is taking comments on the scope of this review, the agency is also taking comments on the proposed TransWest Express Line transmission project. That project, like oil shale and tar sands development, will force the agency to ensure its decisions and development activities that follow can protect this important species. Should the BLM not protect this species and its numbers continue to decline, all energy development in the three-state region, including important renewable energy projects, will be seriously compromised.

As the BLM is acutely aware, listing under the ESA is not hypothetical. Since the FPEIS was issued in 2008, the USFWS ruled the sage-grouse is "warranted but precluded" under the ESA. As the agency cautions, "Evidence suggests that habitat fragmentation and destruction across much of the species' range has contributed to significant population declines over the past century. If current trends persist, many local populations may disappear in the next several decades, with the remaining fragmented population vulnerable to extinction." [19] The USFWS determined that southwestern and central Wyoming and northwestern Colorado are strongholds for sage-grouse, with some of the highest estimated densities of males anywhere in the remaining range of the species. The USFWS also identified this high-density sagebrush area as one of the highest priorities for conservation consideration as it comprises one of two remaining areas of contiguous range essential for the long-term persistence of the species." [20]

The BLM recognizes the challenge. As the BLM correctly stated in the FPEIS, "[G]reater sage-grouse have experienced long-term declines because of degradation and loss of important sagebrush steppe and grassland habitat." [21] In addition, as the BLM clearly states, "the decline in greater sage-grouse populations is believed to be the result of a number of factors, including oil and gas wells and their associated infrastructure, traffic, power lines, urbanization, recreation, predators, and a decline in the quality and quantity of sagebrush habitat." [22]

That is why the BLM flagged sage-grouse and oil shale in Instruction Memorandum 2010-071. [23] The precarious nature of the species survival and the nexus to energy development is also why former Wyoming Governor Dave Freudenthal proactively designated core protection areas. It is also why in 2007, the Center for Native Ecosystems petitioned for ACEC designation all known sage-grouse lek sites within the White River Field Office plus four-mile buffers around each site. As provided in the IM, and consistent with Wyoming's strategy and CNE's petition,

one way of to achieve these goals is to establish No Surface Occupancy (NSO).

As noted above, oil and gas development has negatively impacted sage-grouse populations. Because oil shale and tar sands would be concurrent with oil and gas and other uses, the PEIS must consider the cumulative impacts of the proposed action in combination with these uses.

Additional details about the sage-grouse

The sage-grouse is a reasonably good umbrella species for many types of sagebrush obligate wildlife, from pronghorns and pygmy rabbits to BLM Sensitive songbirds.[24] The maintenance of high-quality sagebrush steppe habitats, particularly nesting and wintering habitats, is necessary to maintain viable sage-grouse populations. That's why large sage-grouse Core Areas like South Pass and the Kinney Rim/Vermillion have been proposed for protection from future oil and gas leasing under the BLM's Wyoming sage-grouse plan amendment.

To ensure viable sage-grouse populations, it is important to consider nesting, brood-rearing, and winter habitats. Holloran and Anderson found that 64% of sage-grouse females nested within 5 km of a lek.[25] Connelly proposed comprehensive guidelines regarding the management of sage-grouse, focused around the conservation of breeding/nesting habitat, late summer brood-rearing habitat, and wintering habitat.[26]

In western Wyoming, Lyon found that sage-grouse moved an average of 1.1 km from the nest site for early brood-rearing, and late brood-rearing habitats averaged 4.8 km distant from the early brood-rearing areas.[27] In Bates Hole, Holloran found that early brood rearing habitats are typified by decreased sagebrush cover and height and increased forb abundance, and movement to riparian sites occurred as uplands became desiccated.[28] In addition, the availability of forage with a high nutritional content is an important factor determining brood success. Broods require forbs, insects and cover for growth, concealment and shade (Autenreith 1985). Additionally, mesic meadows and surface waters are focal points of sage-grouse activity during certain times of year. Mesic sites associated with springs, seeps, and streams are critical for sage-grouse on a year-long basis, and assume even greater importance as brood rearing habitat (Autenreith et al. 1982).

As for winter habitats, non-migratory sage-grouse winter on their nesting and brood-rearing habitats, while migratory populations may travel some distance to winter on traditional wintering areas. A western Wyoming study determined sage-grouse traveled at least 35 km to separate wintering grounds.[29] In Colorado's North Park, Beck found that grouse migrated 5-20 km away from breeding areas during winter.[30]

Additionally, researchers appear to be unanimous in their recommendations that sage-grouse winter habitat be protected from disturbance. According to Beck and Braun, "Areas of winter concentrations of sage-grouse need to be documented and afforded maximum protection." [31] Lyon recommended that sage-grouse wintering habitats be placed off-limits to oil and gas development.[32] Thus, in the oil shale and tar sands planning areas, the BLM needs to rapidly identify sage-grouse winter concentration areas and place the areas off-limits to surface

disturbance. Since oil shale development would remove all shrubs, development clearly falls into the category of activities that should be prohibited by the BLM.

Another issue that warrants attention is vegetation treatments. Because the sage-grouse is dependent on sagebrush, sagebrush treatments are likely to have major impacts on sage-grouse population viability. The PEIS should evaluate the cumulative effects that oil shale and tar sands development would have when combined with past and current vegetation treatment programs. The PEIS should also consider the reduction and/or elimination of vegetation treatment projects. Call and Maser asserted that the spraying of sage-grouse nesting habitats is deleterious because it reduces nest cover from avian predators and suppresses forbs that are important in the sage-grouse diet.[33]

In the PEIS the BLM must also evaluate the effects of industrial activities on sage-grouse populations. Strip mining for coal has been shown to impact sage-grouse populations through major local decreases in recruitment.[34] Because oil shale development either involves strip mining directly, or in the case of in situ methods a level of habitat destruction roughly equivalent to strip mining, areas near sage-grouse leks should be avoided. Road development can also lead to lek abandonment.[35] In western Wyoming, Lyon found that for sage-grouse leks within 3 km of oil and gas developments experienced reduced brood survivorship.

When evaluating these and other impacts, oil and gas development provides a good starting point for the BLM's analysis. As Molvar explains, over the past 10 years, oil and gas development has posed perhaps the greatest threat to sage-grouse viability in the region. Over 8% of the total range of sage-grouse has already been impacted by oil and gas development; in addition, the Wyoming Basin and Colorado Plateau ecoregions are among those areas that have the greatest proportion of land under lease (and therefore at risk for future industrialization). In a study near Pinedale, Wyoming sage-grouse from disturbed leks where gas development occurred within 3 km of the lek site showed lower nesting rates (and hence lower reproduction), traveled farther to nest, and selected greater shrub cover than grouse from undisturbed leks.[36] Oil shale development, while having a much greater intensity of development – 100% landscape destruction rather than the 3-5% of a typical oil and gas field – also involves heavy vehicle traffic, human activity at the site of production, and networks of roads and potentially pipelines to support it.

Current BLM nest buffers for oil and gas of ¼ mile for NSO and 2 miles for seasonal stipulations are grossly inadequate to maintain sage-grouse viability in the planning area. The lek buffer must be based not only on maintaining the lek but also the nesting habitat that surrounds the lek. In addition, seasonal prohibitions that prohibit only construction activities near leks are pointless: If roads or wells are built near leks during the off-season, the resulting regular vehicle traffic will have major negative impacts when the sage-grouse are present, effectively circumventing any mitigative value of delaying construction activities.

We therefore recommend that the PEIS and RMP amendments include a 3-mile NSO and no surface disturbance/vegetation treatment buffer at minimum (5 miles would be preferable) for sage-grouse leks, winter habitat, and other vital sage-grouse habitats.

#7])> F. Sensitive fishes and wildlife

<([#8 [3.7.4.1] BLM explains the greater potential for severe impact for Sensitive species due to their smaller population sizes. DEIS at 4-97. But while the Sensitive Species' potential to be impacted is listed in Table 4.8.1-5, nowhere in the EIS are estimates of population size and trend for each species presented, nor does the EIS disclose how many populations of each species are likely to be extirpated under each alternative as a result of the cumulative impacts of oil shale

development along with existing types of development (e.g., oil and gas fields) already impacting these species. This presents a difficulty from the NEPA “hard look” perspective. We are concerned about the impacts of oil shale development on the four species of Endangered fishes that inhabit the Colorado River system: the Colorado pikeminnow, bonytail, humpback chub, and razorback sucker. The negative impacts of oil shale development on these species (see DEIS at 4-122) likely preclude large-scale development except in cases where impacts can be isolated from waterways. The DEIS states that indirect effects from development in Wyoming are unlikely (*id.*), however this is not the case because contamination entering waterways in Wyoming will inexorably make its way downstream to inhabited stream reaches, and water depletions in Wyoming will affect downstream river flows in Colorado and Utah. In addition, Wyoming has four species of BLM Sensitive fishes that are potentially impacted by oil shale development: the Colorado River cutthroat trout, flannelmouth sucker, bluehead sucker, and roundtail chub. Oil shale has many potential impacts on fishes, including increasing stream turbidity, contaminants leaching from tailings or from spills, obstructions to fish movement, and nutrient loading associated with increasing human population, should commercial leasing bear fruit. DEIS at 4-76. The only reproductively isolated population of bluehead sucker in Wyoming is in upper Bitter Creek. DEIS at 3-134. This population deserves special protection.

#8)]> G. <([#9 [3.7.3.9] [3.7.3.12] Key big game habitats deserve protection for oil shale and tar sands development

Big game crucial winter ranges, parturition areas, and migration corridors are critical to the survival and health of big game herds, and deserve protection from oil shale and tar sands development. The DEIS summarizes potential impacts of oil shale development in such areas. DEIS at 4-85, and see 4-87. The “debilitating stress” referenced in the DEIS can lead to population-level impacts, such as the 60% drop in mule deer wintering on and near the Pinedale Mesa as a result of the Pinedale Anticline gas project. The DEIS states that oil shale operations would displace wildlife for “several decades” but that “Reclamation, which would occur in parallel with or after extraction activities are completed, would reduce or eliminate ongoing impacts to the extent practicable by recreating [*sic*] habitats and ecological conditions that would be suitable to wildlife species.” DEIS at 4-82. We view this statement as an unreasonably optimistic one in light of research indicating that Wyoming big sagebrush can take up to a century to recover following oil and gas activities. Oil shale and tar sands leasing should not occur within 0.5 mile of big game crucial winter ranges, parturition areas, or migration corridors.

The Draft PEIS does not include baseline information on population size and trend for any big game species. See DEIS at 3-163 through 165. It also does not include any estimates for changes to population by alternative. This would seem pose a ‘hard look’ issue under NEPA.

#9)]> H. Raptor nest sites should be protected from oil shale development

<([#10 [3.7.3.1] [5] [3.7.3.9] Nesting birds of prey are particularly vulnerable to disturbance by industrial activities of all kinds. Yet the OSTs DEIS has scant analysis on the impacts of oil shale development on raptors in particular, and does not include sufficiently strong mitigation measures. Oil shale development, being particularly noisy and heavy impact by nature, would be expected to be on the more severe end of the spectrum. We recommend attaching mitigation measures requiring not less than a one-mile no surface disturbance buffer for active raptor nests generally and a corresponding two-mile buffer for ferruginous hawks, which are especially sensitive to disturbance. #10)]>

<([#11 [3.7.3.1] [3.7.3.9] [3.7.4.1] Raptor populations nationwide are on the rebound following

declines based largely on insecticide spraying, predator poisoning programs, and shooting in the 1960s and 1970s. Raptors of special concern include the golden eagle, prairie falcon, peregrine falcon, ferruginous hawk, merlin, and burrowing owl. Because they require large natural areas for survival, raptors may be good umbrella species for the protection of entire ecological communities (Burnham and Holroyd 1995).

Importance of Cliff Habitats Cliffs provide important nesting substrates preferred by a broad spectrum of raptors. A study near Medicine Bow, Wyoming found that cliffs provided the single most important nesting habitat for raptor species in the region, and 93% of all prairie falcon nests were found on cliffs, despite the comparative rarity of this landform in the Medicine Bow area (MacLaren et al. 1988). In a Utah study, prairie falcons and golden eagles nested exclusively on cliff sites (Smith and Murphy 1982). Thus, in terms of value to nesting raptors, areas with cliff topography may be of heightened conservation importance.

Importance of Prairie Dogs to Raptor Populations Prairie dogs can be an important mainstay of raptor diets. In a study near Medicine Bow, Wyoming, white-tailed prairie dogs made up 38% of the biomass in the diets of prairie falcons, 18% for golden eagles and red-tailed hawks, and 22% of ferruginous hawk diet biomass (MacLaren et al. 1988). Prairie dog colonies are also important to the survival of raptor populations on their wintering areas. Jones (1989) studied winter raptor aggregations on the High Plains of Colorado “Aggregations of ferruginous hawks, red-tailed hawks, and bald eagles were frequently observed in the vicinity of prairie dog colonies.” p. 256. In this study, golden eagles, ferruginous hawks, and red-tailed hawks were observed taking prairie dogs, while bald eagles and northern harriers competed for the captured prairie dogs. Declines in prairie dog colonies as a result of a plague epidemic resulted in a more than 60% decline in wintering bald eagles, ferruginous hawks, and red-tailed hawks (Ibid.). Numbers of wintering ferruginous hawks also declined dramatically following a crash in prairie dog populations in New Mexico (Cully 1991). Thus, full recovery of prairie dog populations would be the optimal outcome for maintaining and recovering raptor populations.

Effects of Management Activities and Development on Raptors The primary impact to raptor populations is direct disturbance of raptors on the nest, leading to reductions or loss of viability for eggs or nestlings. Disturbance of nesting raptors may cause nest abandonment, damage to the eggs, subject eggs or nestlings to cooling, overheating, or dehydration leading to mortality, prevent young nestlings from receiving sufficient feedings to remain viable, and cause premature fledging (Parrish et al. 1994). Thus, the BLM should establish adequate nest buffers (on the order of 2 miles in diameter for ferruginous hawks and one mile for other species) around nest sites, preventing all construction of developments (such as facilities and roads) that would lead to future disturbance of nesting raptors through focusing human activities in these areas. Seasonal restrictions are insufficient; a well or road constructed outside the nesting season is still likely to lead to nest abandonment or reductions in recruitment due to disturbance from vehicle traffic that does occur during the nesting period.

The overall landscape-scale effects of widespread industrialization threaten the viability of raptor populations through habitat loss and fragmentation. Nest buffers currently in force as standard oil and gas stipulations are unlikely to safeguard the viability of native raptors; a more conservative approach is needed in order to safeguard raptor viability in this region. White and Thurow (1985) stated: “We would prefer to see ecosystems kept intact (cf. Wagner 1977) rather than divided into isolated islands set aside for nesting raptors, because aspects of general land use other than restricted areas also affect the health of raptor populations” (p. 21). Thus, not only should nest buffers be implemented, but the overall integrity of the landscape should be

maintained (or improved in areas where it is currently degraded) in order to better provide for raptor viability.

Powerline Corridors *Powerline towers are likely to concentrate raptor nesting and perching activities, to the potential detriment of prey species. Transmission towers may be particularly attractive as nest sites for ravens, and Steenhof et al. (1993) reported that 133 pairs of ravens had colonized transmission towers on a single stretch of powerline in Idaho during its first 10 years of existence. Gilmer and Wiehe (1977) found that nest success for ferruginous hawks was slightly lower for transmission towers than other nest sites, and noted that high winds sometimes blew tower nests away. Steenhof et al. (1993) also found that transmission tower nests tended to be blown down, but found that nest success was not lower on towers for ferruginous hawks and was significantly higher on towers for golden eagles. In North Dakota, Gilmer and Stewart (1983) found that ferruginous hawk nest success was highest for powerline towers and lowest for nests in hardwood trees. Thus, although powerlines can be designed to reduce impacts to raptors, these corridors should be sited more than 2 miles away from prairie dog colonies and sage grouse leks to prevent major impacts to these sensitive prey species.*

Golden Eagles

Golden eagles, their nests and young are strictly protected under the Bald and Golden Eagle Protection Act (16 USC 668a-d). This species is very popular with the wildlife viewing public, and conversely has historically suffered from shooting as well as poisoning directed at terrestrial predators. The maintenance of viable golden eagle populations should be an important consideration in the new RMP(s).

Conservation efforts should focus on protecting nest sites and important foraging areas, such as prairie dog colonies. Golden eagles are highly territorial. Even when surface-disturbing activities such as strip mining are located away from golden eagle nest sites, the destruction of important foraging habitats, such as prairie dog colonies, within the territory of nesting pairs can be a major problem for the viability of nesting golden eagles (Tyus and Lockhart 1979). In New Mexico, plague-related declines in prairie dog abundance from 30 per hectare to less than 1 per hectare triggered a decline in the nesting population of golden eagles (Cully 1991). Thus, golden eagle protection is linked with the maintenance and recovery of prairie dog colonies.

Ferruginous Hawks

The ferruginous hawk has been experiencing declines across the continent for the past 30 years, although Wyoming is often viewed as a stronghold for the species. The ferruginous hawk has been petitioned for listing under the Endangered Species Act in the past, and has also been identified by the Wyoming Game and Fish Department as a Species of Special Concern (Oakleaf et al. 1996).

Prey Base *The ferruginous hawk has been identified as a species dependent on prairie dogs, and ferruginous hawk populations have shown declines in response to prairie dog population declines (Kotliar et al. 1999, and see Jones 1989). Olendorff (1993) pointed out that prairie dogs and ground squirrels were the most important prey in some areas, while hares and rabbits predominated in the ferruginous hawk diet in others. In several studies from central Utah, ferruginous hawks were found to be highly dependent on jackrabbits as prey, and hawk population fluctuations were closely tied to the rise and fall of jackrabbit populations (Woffinden*

and Murphy 1977, Smith and Murphy 1978). The proximate cause of this hawk population decline was linked to a decrease in nesting effort and an increase in nomadism in ferruginous hawks following the jackrabbit decline (Woffinden and Murphy 1989). In southeastern Idaho, a jackrabbit population crash was also implicated in a decline of the ferruginous hawk population (Powers 1976).

In contrast, a study on the Canadian high plains found that ferruginous hawk population density and fledging success were consistently correlated with the abundance of Richardson's ground squirrels, and negatively correlated with poisoning efforts (Schmutz and Hungle 1989). On the plains of South Dakota, thirteen-lined ground squirrels dominated the ferruginous hawk diet, while meadowlarks, pocket gophers, and jackrabbits also played important roles (Blair and Schitoskey 1982). In southwestern Idaho, Steenhof and Kochert (1985) found that ferruginous hawks were heavily dependent on Townsend's ground squirrels, and that squirrel declines linked to drought resulted in depressed nest success for the local ferruginous hawk population. In southern Wyoming, ferruginous hawks have a fairly diverse diet. In a study near Medicine Bow, MacLaren et al. (1988) found that jackrabbits contributed 48% to the ferruginous hawk diet biomass, white-tailed prairie dogs 22%, and Wyoming ground squirrels 16%.

Secondary prey may attain paramount importance during prey declines, droughts, and other stochastic events. Secondary prey species become critical to maintaining hawk population numbers when primary prey species crash (Olendorff 1993). Smith and Murphy (1978) found that ferruginous hawk diets shifted increasingly to rodents as jackrabbits became scarce. Thus, it is important to maintain both primary and secondary prey bases to guarantee ferruginous hawk viability over the long term.

Nesting Habits Ferruginous hawks use the same nest from year to year and also build alternate nests within the same territory (Smith and Murphy 1978). In the Centennial Valley of Montana, where cliffs and suitable ground nesting sites are unavailable, ferruginous hawks commonly nest in aspens and willows (Restani 1991). In eastern Washington, ferruginous hawks nested primarily on basalt outcrops and in junipers (Bechard et al. 1990). In central Utah, Smith and Murphy (1978) noted cliff, rock outcrop, and tree nest sites (particularly juniper). Also in Utah, Smith and Murphy (1982) found that ferruginous hawks nested most often in junipers (53% of nest sites) but also used rock outcrops (24%) and ground nests (14%). A subsequent study in the same region found 66% of nests in juniper trees, 32% on rock outcrops, and 2% on the ground (Woffinden and Murphy 1983). In North Dakota, small clumps or rows of hardwood trees were the most common ferruginous hawk nest sites, while ground nests atop rugged moraines made up 22% of the nest sites and powerline towers accounted for 18% of ferruginous hawk nests (Gilmer and Stewart 1983). On the plains of South Dakota, Blair and Schitoskey (1982) found that all ferruginous hawks built ground nests, most of them in rough terrain. Similarly, in southeastern Idaho, all ferruginous hawk nests were ground nests built atop bluffs with the exception of a single juniper nest (Powers 1976).

Ferruginous hawks will also nest on man-made structures. Niemuth (1992) documented ferruginous hawks nesting on the roof of an abandoned shed as well as on an idle center-pivot irrigation apparatus in Wyoming.

Ground-nesting ferruginous hawks can be quite susceptible to predation. Foxes and coyotes have been documented as important predators of ferruginous hawk ground nests (Blair and Schitoskey 1982). The availability of elevated topographical features may be important to nest success for this species.

Effects of Development Ferruginous hawks are among the most sensitive of all raptor species,

and are prone to nest abandonment if disturbed (Parrish et al. 1994). Nest abandonment, egg mortality, parental neglect, and premature fledging are common results of disturbing ferruginous hawk nests (White and Thurow 1985). Smith and Murphy (1978) noted that increased human access is a primary threat to the viability of ferruginous hawk nest success. For their central Utah study, these researchers found that “in all instances of nesting failure where the cause could definitely be determined, humans were at fault” (p. 87). White and Thurow (1985) found that walking disturbance and vehicle use had the greatest effect on ferruginous hawk nest success, while vehicle use had the greatest flushing distance. Instead of becoming habituated, most hawks in this study increased their flushing distances with repeated disturbance (ibid.). In addition, disturbed nests averaged one less offspring fledged per nest when compared to undisturbed control nests. Oakleaf et al. (1996) pointed out that the cumulative effects of oil and gas development may impact large areas of ferruginous hawk habitat. White and Thurow (1985) recommended quarter-mile nest buffers during years of prey abundance, but noted that sensitivity to disturbance increased when prey were scarce, and recommended that nest buffers be “considerably larger” during years of prey scarcity. Although Olendorff (1993) recommended buffer zones of only ½ mile for ferruginous hawk nests, he recommended much larger buffers during periods of prey scarcity. Because it is impractical to move roads away from nest sites when prey bases decline, the appropriate way to ensure the persistence of ferruginous hawks at traditional nesting sites is to use large buffers within which ground-disturbing activities are prohibited. Cerovski et al. (2001) reviewed the issue of appropriate nest buffers and recommended a 1-mile buffer, kept free from human disturbance. Thus, under this Alternative, 1-mile buffers prohibiting surface disturbance should apply to ferruginous hawk nest sites as well as all other raptor nest sites.

Burrowing Owl

Nationwide, the burrowing owl is a species on the decline. As of 1997, over half of the agencies across North America tracking burrowing owl population trends reported declining populations, while none reported increasing populations (James and Espie 1997). Burrowing owl populations are highly susceptible to stochastic disturbances such as drought, and thus may decline more rapidly than would be predicted on the basis of demographic factors alone (Johnson 1997). In Wyoming, data suggest an overall population decline, with 17.5% reoccupancy of historic sites, but the spotty quality of historical data makes comparisons difficult (Korfanta et al. 2001). The burrowing owl has been identified as a species of concern by both the BLM and the Wyoming Game and Fish Department.

Dependence on Prairie Dog Colonies Burrowing owls are in a select group of wildlife most closely tied to prairie dog colonies, and prairie dog burrows are preferred nest sites for burrowing owls. Thompson (1984) reported that owls preferred abandoned prairie dog burrows in the early stages of succession. Green and Anthony (1989) found that nest burrows lined with dung were less susceptible to predation, perhaps explaining this unusual behavioral attribute. On the Great Plains, Sidle et al. (n.d.) found that burrowing owls actively selected for active prairie dog towns, and showed much lower usage of towns that had been decimated by plague, shooting, or poisoning. Desmond and Savidge (1999) found that burrowing owl nest success was positively correlated with density of active prairie dog burrows, and recommended preserving prairie dog colonies to maintain the viability of burrowing owl populations. And in the Columbia

Basin, where prairie dogs are absent, burrowing owls nested in badger burrows, but as a result were subjected to badger predation (Green and Anthony 1989). Thus, the ongoing loss of prairie dog colonies has undoubtedly been a prime factor in the decline of the burrowing owl.

In the prospective oil shale area, burrowing owls are closely tied to white-tailed prairie dogs. Thompson (1984) found that burrowing owls near Casper were associated with white-tailed prairie dogs, while near Torrington they were associated with black-tailed prairie dogs. But in eastern Wyoming, fewer than half of the nesting burrowing owls were associated with active prairie dog towns (Korfanta et al. 2001).

Hunting Habits

Burrowing owls hunt most actively during the twilight hours (Thompson 1984). In the Columbia Basin, pocket mice are the primary mammalian prey (Green and Anthony 1989). In Wyoming, insects are the most frequent prey item, but small mammals dominate the dietary biomass (Thompson 1984). Due to the importance of insects (particularly grasshoppers) in the diets of burrowing owls, the widespread use of pesticides would most likely result in impacts to burrowing owl viability #11)> .

I. <([#12 [3.9.4] Historic Sites and Trails must be protected from oil shale development

Under the national Historic Preservation Act, BLM must protect not only properties eligible for listing on the National Register of Historic Places (NRHP), but also their historic settings. Because oil shale development, either in the strip mine and retort form, or the in situ form with pads covered densely in wells and pipes, are inconsistent with the historic settings of eligible properties, they will have major impacts on the settings of such properties and must be excluded from areas within view of eligible properties. Oil shale operations would often “dominate the view” from a visual resources perspective. DEIS at 4-138. At minimum, oil shale leasing should not be allowed within 5 miles of NRHP-eligible properties. This is the “foreground-middleground” area where project impacts can be seen in detail. DEIS at 4-137. Both the visual impact and noise associated with oil shale operations has the potential to result in major impacts to the settings of historic properties. We would feel more comfortable with BLM’s commitment to treat lands within 15 miles of historic trails as VRM Class II for the purposes of oil shale development (DEIS at 4-158) if this included assurances that oil shale activities would be allowed in this area only if they were invisible from the trail in question, given the large size and heavy visual impact of oil shale operations.

In the Rawlins Field Office, the Cherokee Historic Trail is one such eligible property which occurs within the Geologically Prospective Area for Oil Shale. DEIS at 3-34, and see Figure 3.1.1-13. Another property in the Rawlins Field Office which we believe to be eligible is the abandoned Cow Creek Ranch (also known as the Jolley Ranch), located at T14N R98W Sec. 27, within the Adobe Town Dispersed Recreation Use Area. Finally, there is a historic structure in the vicinity of Kinney Spring (T15N R98W Sec. 8) which may also be eligible for the National Register. In the Rock Springs Field Office, historic trails passing through the oil shale Prospective Area are noted under Visual Resources in the EIS. DEIS at 3-207. In addition, there are many archaeological sites that are NRHP-eligible, and their settings warrant protection as well. See DEIS at 3-224. BLM must consult with applicable tribes to ensure that Traditional Cultural Properties get similar protections for their settings #12])> .

J. <([#13 [3.8.2] Visual Resources

The area proposed for oil shale leasing encompasses some of the most scenic landscapes in Wyoming's fabled Red Desert. Included within this area are the spectacular badlands of Adobe Town and The Haystacks, the breathtaking swell of the Kinney Rim, the juniper-clad hills of the Powder Rim, the varied badlands and dunes of the Jack Morrow Hills area, and the buttes and canyons of the Flaming Gorge area. These areas are described in detail elsewhere in these comments. The Rawlins Field Office is currently undergoing a Visual Resources Management plan amendment to address the deficiency in its 2009 Resource Management Plan and failure of the associated EIS to adequately address visual resources. The Rock Springs Field Office is currently undergoing an RMP revision which will address visual resources. For both field offices, a Visual Resource Inventory was completed in 2011. In the interim, lands with Scenic Quality Ratings of A or B should be granted protection from oil shale leasing.

Given the commitment in the DEIS to site oil shale activities outside the viewsheds of Key Observation Points (KOPs) and sensitive areas, where possible (DEIS at 4-156), these features should be defined and listed in the decision document. KOPs should include points atop the following promontories: Skull Creek Rim, Adobe Town Rim, the Haystacks, Kinney Rim, Powder Rim, Steamboat Mountain, Joe Hay Rim, Oregon Buttes, Little Mountain, and Devils Playground. Sensitive areas should be defined to include the Killpecker Dune Field, Boar's Tusk, Honeycomb Buttes, Whitehorse Creek badlands, and Red Creek Badlands. #13])>

K. Groundwater

<([#14 [5] In situ oil shale operations can result in groundwater impacts when groundwater comes into contact with retorted zones. DEIS at 4-195. What types of mitigation measures will be required to prevent the excursion of contaminated groundwater from in situ sites after production has ceased? For example, in Shell's Mahogany Ridge project, the retorted area is (theoretically, at least) isolated by a "freeze wall." However, this freeze wall requires active maintenance. What will happen when companies like Shell walk away from projects like these? Will isolation barriers be required to be maintained permanently? The Mitigation Measures (DEIS at 4-196) are silent on this point, indicating that additional safeguards need to be put in place.

#14])>

L. <([#15 [6.1.1] Wyoming lands should meet the same 25-foot-thickness/25 gallon per ton criteria for leasing as in Colorado and Utah

In the original Oil Shale/Tar Sand PEIS, the BLM approved minimum criteria for leasing oil shale in Colorado and Utah at 25 feet in thickness and 25 gallons per ton (GPT), in order to ensure economic feasibility. However, the agency approved a different standard for Wyoming, 15 feet of thickness and 15 gallons per ton. DPEIS at 2-13. In its original Final EIS on oil shale, BLM stated, "Of course, the most geologically prospective deposits in Wyoming are those exceeding 25 gallons per ton and 25 feet in thickness." Original FPEIS at 4-281. These are by definition more geologically prospective than deposits averaging 15 feet thick and 15 gallons per ton. It is illogical for the BLM to assign a different standard for Wyoming oil shales as the geologic properties do not change when one crosses the state line. Wyoming shows a much greater "geologically prospective" oil shale area by square miles than either Utah or Colorado precisely because the standards have been lowered for Wyoming. Wyoming has the lowest-quality oil shale deposits of all three states. BLM was right in making deposits unavailable for

leasing in Colorado in Utah that were less than the 25 ft./25 GPT threshold, but wrong to lower the standard in Wyoming to 15 ft./15 GPT. By avoiding this mistake in the new OSTIS leasing decision, the BLM can at the same time provide collateral protections from ill-considered oil shale projects for lands with wilderness characteristics, key sage grouse habitats, and big game crucial ranges and migration corridors in Wyoming which are underlain by uneconomic oil shale deposits.

In the PEIS, the BLM must provide a rational explanation for why the 15 gpt/15-ft threshold was used in Wyoming while a different standard was applied in Colorado and Utah. BLM's response to this issue from the original FEIS is as follows:

"In Section 369 of the Energy Policy Act of 2005, Congress directed the Secretary of the Interior to complete a PEIS for commercial leasing on public lands with an emphasis on the most geologically prospective lands in the States of Colorado, Utah, and Wyoming. There are differences in the quality of the oil shale resource between the three States, so to meet Congress' direction to look at all three States, a different standard was used for Wyoming." Original FPEIS at 4-480.

BLM's response implies that the different standard for Wyoming was necessary to permit oil shale leasing in Wyoming due to the absence of oil shale deposits of 25 feet in thickness averaging 25 gallons per ton. This, however, is not the case, as evidenced by a Wyoming State Geological Survey Analysis while delineates oil shale deposits in Wyoming which exceed 25 feet in thickness and 25 gallons per ton. See Attachment 8.

The arbitrary and capricious nature of a lower leasing standard for Wyoming was also raised in the comments of Glen Miller, a proponent of oil shale development. This commentor states,

"The different grade-thickness criteria established for 'ore' in Utah, Wyoming and Colorado is unusual, and is not logical, unless some undescribed State-specific regulatory or incentive features apply. The 'economics' of determining 'ore' are fairly rigorous; if 15 feet of 15gpt rock is not 'ore' in Colorado, how can it be 'ore' in other states?"

Original FPEIS at 4-711.

In response to this comment, BLM stated:

"00139-009: The standards developed by the USGS Conservation Division, and subsequently adopted by the BLM, use 15 gallons per ton and 15 ft thick as the prospectively valuable classification standard for oil shale resources. The USGS further defined oil shale leasing area criteria on a regional basis as 25 gallons per ton and 25 feet thick." Original FEIS at 4-720. This response does not explain why a 15-foot thickness/15 gallons per ton threshold was selected for leasing in Wyoming rather than the 25-foot thickness/25 gallons per ton applied for Colorado and Utah.

BLM's analysis was based on Fischer assays of well logs and cuttings performed in the 1970s and 1980s. According to the agency, "In Wyoming, the most geologically prospective oil shale

resources were defined on the basis of detailed analyses of available oil shale assay data (Wiig 2006a,b).” DPEIS at 1-2, Footnote 2. Wiig (2006a and b) are listed respectively as personal communications from S. Wiig of the Rock Springs BLM Field Office to P. Perlowitz of the Wyoming State Office on June 13, 2006; and to K.P. Smith of the Argonne National Laboratory on June 27, 2006. We append the email to P. Perlowitz to these comments as Attachment 9.

In a telephone conversation between Steve Wiig of the Rock Springs Field Office and Erik Molvar of Biodiversity Conservation Alliance on January 26, 2009 at 4:40 pm, Mr. Wiig stated that he used the same Fischer analyses as were used in the 2008 USGS Open File Report for his analysis of oil shale prospectivity in Wyoming, which he then shared with Argonne National Laboratory. According to Wiig, “I had every assay that was available for that area.” Wiig reported having no record of an email between himself and Kathy Smith of Argonne National Lab for June 27th (he stated that “quite a bit of correspondence was going on at that particular time” between Wiig and Smith), but was able to locate the referenced email to Phil Perlowitz. “We basically used the USGS standard” in recommending oil shale areas, he stated. The memo of July 26, 2006 between Wiig and Smith confirms this interpretation.

Wiig (2006a) states in relevant part,

“According to my conversation with Charlie Beecham and the information that was included in the Oil Shale Development RFD writeup, oil shale zones with an average quality less than 20 gal/ton are not considered likely to be developed. Under this scenario, you can eliminate virtually 90% of the known oil shale deposits in Wyoming from further consideration. So the question becomes: just how large an area do you want to analyze in the PEIS and under what criteria?”

Emphasis added.

Three observations can be made from this statement: (1) the 15-foot thickness/15 gallon per ton threshold for oil shale leasing in Wyoming is insufficiently high to support commercial oil shale development, (2) there are in fact oil shale deposits in Wyoming that are above the 20 gpt/20 ft threshold that might be commercially viable, and (3) BLM has inflated the acreage available for oil shale leasing in Wyoming in the face of commercial infeasibility of developing oil shale deposits at the lower end of the spectrum, and instead based the offering on “how much of an area [they] want[ed] to analyze.”

In October of 2008, Scott Quillinan of the Wyoming State Geological Survey prepared a spatial analysis of oil shale deposits 25 feet thick averaging 25 gallons per ton or more in Wyoming. See Attachment 9. This analysis was based on data contained in the USGS Open-File Report 2008-1152, titled “Fischer assays of oil-shale drill cores and rotary cuttings from the greater Green River Basin, Southwestern Wyoming.” FEIS at 7-181 also indicates that BLM used Fischer assay data from wellbores in the Green River Basin, indicating that this identical dataset was available to them at the time of the FPEIS. The WSGS analysis shows a substantial acreage of Wyoming lands which meet the threshold of 25 gallons per ton over 25 feet of thickness, the threshold set for oil shale leasing in Utah and Colorado under the OSTIS PEIS. Thus, it is completely unnecessary to lower the threshold for oil shale leasing in Wyoming below 25 gallons

per ton over a 25-foot stratigraphic interval. Thus, the BLM needs to apply the same standard for Wyoming as in Utah and Colorado and still meet the directives of the Energy Policy Act.

According to Section 369(d)(1) of the Energy Policy Act,

“...the Secretary shall complete a programmatic environmental impact statement for a commercial leasing program for oil shale and tar sands resources on public lands, with an emphasis on the most geologically prospective lands within each of the States of Colorado, Utah, and Wyoming.”

Emphasis added. It is abundantly clear that oil shale deposits of less than 25 feet in thickness and 25 gallons per ton are not geologically prospective, regardless of which state they are found in.

*Having a different set of standards for leasing oil shale deposits across state lines would violate the intent of the Energy Policy Act in a manner that is arbitrary and capricious and an abuse of discretion. In the review of Federal agency action, courts apply the standard of review set forth in the Administrative Procedures Act (“APA”): “The reviewing court shall – (1) compel agency action unlawfully withheld or unreasonably delayed; and (2) hold unlawful and set aside agency action, findings, or conclusions found to be – (A) arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law...[or] (D) without observance of procedure required by law.” 5 U.S.C. § 706. See also *Friends of the Bow v. Thompson*, 124 F.3d 1210, 1215 (10th Cir. 1997) (Court reiterated that under the APA, it must set aside agency action that is “arbitrary, capricious, an abuse of discretion, or not otherwise in accordance with the law”). In *Friends of the Bow*, the Tenth Circuit explained what constitutes arbitrary and capricious agency action:*

Generally, an agency decision will be considered arbitrary and capricious if “the agency had relied on factors which Congress had not intended it to consider, entirely failed to consider an important aspect of the problem, offered an explanation for its decision that runs counter to the evidence before the agency, or is so implausible that it could not be ascribed to a difference in view or the product of agency expertise.”

Friends of the Bow, 124 F.3d at 1215 (internal citations omitted). The NEPA analysis affords BLM an informed basis to ensure a rational connection between the facts found and the decisions made; a basis that also allows BLM to prevent permanent impairment, prevent unnecessary or undue degradation, minimize adverse environmental impacts, and comply with the Public Trust Duty. 43 U.S.C. §§ 1702I, 1732(b)), 1732(d)(2)(A).

*An agency action is arbitrary and capricious if the agency has “entirely failed to consider an important aspect of the problem, offered an explanation for its decision that runs counter to the evidence before the agency, or is so implausible that it could not be ascribed to a difference in view or the product of agency expertise.” *Motor Vehicle Mfrs Ass’n of U.S. v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 42-43 (1983); *The Lands Council v. Powell*, 395 F.3d 1019, 1026*

(9th Cir. 2005); *DIRECTV, Inc. v. FCC*, 110 F.3d 816, 826 (D.C. Cir. 1997) (quoting *State Farm*, 463 U.S. at 43). Although a Court's review under this standard is deferential, the agency must nonetheless "articulate a rational connection between the facts found and the conclusions made." *Or. Natural Res. Council v. Lowe*, 109 F.3d 521, 526 (9th Cir. 1992). Even when heightened deference may be warranted to an agency's "scientific" or "technical" conclusions, the "presumption of agency expertise may be rebutted if the decisions, even though based on scientific expertise, are not reasoned." *Oregon Natural Desert Ass'n v. Shuford*, 2007 WL1695162, *3 (D. Or. June 8, 2007) citing *Greenpeace v. Nat'l Marine Fisheries Serv.*, 80 F.Supp. 2d 1137, 1147 (W.D. Wash. 2000). We urge BLM to avoid an arbitrary and capricious, and logically unsupportable, outcome by mandating the 25 GPT/ 25 ft. threshold for all three states in the PEIS.

In light of the fact that oil shale deposits exceeding 25 gpt/25 ft exist in Wyoming in appreciable areal extent, the 25 gallons per ton/25-foot thickness threshold for oil shale leasing could have been applied in Wyoming as it was in Utah and Colorado, and the fact that the BLM has been unable to provide scientific or legal justification for the differing thresholds, the BLM must raise the standard for lands available for oil shale leasing in Wyoming to 25 feet in thickness and 25 gallons per ton. We fully expect this outcome to be analyzed in detail in at least one action alternative per NEPA's requirements to analyze a full range of reasonable alternatives, and urge the BLM to adopt this approach in its final decision on oil shale leasing. In addition to oil shale development, there are important wildlife and recreational resources at stake, and this leveling of the playing field among states will also provide a better balance of multiple uses and resource values in Wyoming, while at the same time prevent industry from wasting capital and impacts to the land on futile prospecting in areas with low-quality oil shale deposits. #15)>

Conclusions

<([#16 [2.3.1] Given the potential for massive impacts on land, wildlife, water, and air resources inherent to oil shale development, we recommend the implementation of Alternative 3 as the final decision in the OSTIS EIS process. We appreciate the opportunity to comment. Please keep us informed of all future opportunities to have input into this process. #16])>

Comments on BLM's 2012 OSTs-PEIS and BLM's Preferred Alternative 2b

<([#1 [2.2] BLM's preferred alternative 2b offers little or no viable commercial opportunity due to severe restrictions of productive areas available, now allowing only 10% of Colorado lands opened in 2008. Further, those lands that would be opened by Alternative 2b are non-contiguous and widely separated, inhibiting collection and distribution by pipeline.

BLM's Preferred Alternative 2b precludes the richest oil-shale areas from development.

#1)> <([#2 [1.3] Industry faces an uphill battle contesting BLM's Preferred Option, since the BLM has already ignored the preferences of 14 other agencies cooperating in this OSTs-PEIS review. Many of those agencies cooperating in the review selected Alternative 1-- allowing development on all lands proposed in the 2008 OSTs-PEIS.

#2)> <([#3 [3.1.5] The BLM has chosen to include as criteria for reducing available acreage all "Areas of Critical Environmental Concern" (ACECs) defined in the 2008 OSTs-PEIS as well as acreage which had been under consideration for ACECs but which have not heretofore been designated as such. This criteria raises concerns that the BLM is choosing to exclude areas from commercial development without adequate and fair consideration to new methods, including in-situ development, that have minimal impact to important environmental elements. #3])>

<([#4 [6.3.3] Some groups likely to submit public comment are encouraging constituents with comments like "Don't let Big Oil melt public land for private profit" and "When we say they

want to melt the Rockies, we mean it.” Such comments are obviously extreme and unscientific. The BLM should give due consideration to the more advanced and in-situ technologies now proposed. #4)>

<([#5 [3.10.3] Some in the local communities raise concerns about another boom-and-bust cycle if the BLM were to allow access to the larger areas opened by the 2008 OSTs-PEIS. Those concerns should be allayed by the fact that new development is driven predominately by private investment, will be restricted by BLM’s permitting process, and must prove economically viable on a trial-basis prior to scale-up. This process can only be step-wise and slow to progress, providing for measured and sustainable growth. #5])>

<([#6 [2.1.1] We support and encourage the BLM to adopt the 2012 OSTs-PEIS review Alternative 1--that no existing land use plans be amended and all acreage opened by the 2008 OSTs-PEIS remain open. Through its RD&D program and permitting processes, the BLM has ample control over progression of development to ensure demonstrable capabilities and sustainable long-term development that is in the best interest of good environmental stewardship in balance with the production of this potentially important domestic energy source. #6])>
On behalf of Natural Soda, Inc, of Rifle CO, we do appreciate the opportunity to comment on the BLMs 2012 OSTs-PEIS.

Submission Text

Dear Director Abbey:

Oil shale and tar sands are vital to the future economic and energy balance for the State of Utah and the nation as a whole. Governor Herbert's Ten Year Energy Plan outlines strategies and objectives to facilitate balanced, responsible development of Utah's energy resources, (including oil shale and tar sands) [http://www.utah.gov/governor/docs/J_Oyear-strategic-energy.pdf] .The United States Geological Survey estimates that oil shale lands in Utah contain 1.32 trillion barrels of recoverable oil equivalent [Assessment of In-Place Oil Shale Resources of the Green River Formation, WY, CO and UT, USGS June 2011]. A viable, commercial

scale and privately funded oil shale and tar sands industry is underway in Utah today, so it is with extreme disappointment and displeasure that the state sees the BLM in full retreat regarding the establishment of a complete commercial leasing program for oil shale and tar sands. This retreat is represented by the Preferred Alternative proposed for adoption in the Draft Programmatic Environmental Impact Statement. The Preferred Alternative proposes to reduce the lands available for leasing and to pull back to a Research Development and Demonstration (RD&D) program that does not meet the ultimate requirements of the law. In addition, the issuance in May of proposed rules to eliminate the existing royalty rate for the commercial leasing of oil shale will further erode implementation of a full leasing program as required under the Energy Policy Act of 2005 .. These proposed changes to the 2008 allocation decision for the availability of land and the commercial leasing program are in direct opposition to the laws, plans and policies of state and local governments. The state will vigorously oppose these proposed changes to the current oil shale and tar sands program.

The state participated fully in BLM's 2008 NEPA analysis regarding the availability of lands for the leasing of oil shale and tar sands and the structure of a potential leasing program, as required by the Energy Policy Act of 2005. This process concluded with a Record of Decision in 2008 allocating certain lands through the BLM's Resource Management Plans as available for leasing. The BLM also established the basic framework for a leasing program through adoption of leasing regulations, now found at 43 C.F.R. Pr 13900. (See 73 FR 69414, November 18, 2008) The state concluded its review of this earlier effort with the conclusion that the proposed RMP amendments were consistent with state law, policy and programs, as required under provisions of the Federal Land Policy and Management Act, and expressed full support for the establishment of a commercial leasing program.

Despite the adequacy and sufficiency of the previous Record of Decision and supporting documentation prepared under the provisions of the National Environmental Policy Act, the BLM has reversed the sound decisions it made in the 2008 ROD. The decision to significantly reduce lands available for leasing appears to be predicated on the terms of a Settlement Agreement ("Agreement") drafted in response to litigation [*Colorado Environmental Coalition,*

et. al. v. Salazar, Civil Action No. 09-cv-0009 I -JLK, Colorado.]. brought by parties antagonistic to the development of adequate and sufficient domestic sources of energy. The BLM declares that this

revisit of its previous decision is based on the need to take a “fresh look” at the land allocations made in the 2008 NEPA analysis in light of “new information which has emerged since the 2008 OSTs PEIS was prepared” [See Executive Summary page 1-1, 1-4].

The Settlement Agreement states that BLM must publish a Notice of Intent to consider amending each of the land use planning decisions made by the 2008 OSTs ROD, including alternatives that met the plaintiffs goals. These goals, in general, require that BLM have the option to reject a commercial lease based upon “environmental or other resource considerations,” and have the option to decline to offer a commercial lease unless it can be shown that “operations can occur without unacceptable environmental risk” [Defendants’ and Plaintiffs’ Joint Motion to Administratively Close the Case, *Colo Env. Coalition v. Salazar*, page 3].

Nowhere in the terms of the Settlement Agreement is there a requirement that the BLM select an alternative that furthers the goals of the plaintiffs. The BLM has misconstrued the intent of the Agreement and abrogated its decision- making responsibilities in favor of an alternative that it was only required to consider, not select.

<([#1 [1.1.1] In furtherance of the Settlement Agreement, the BLM proposes to eliminate the current

provisions of the commercial leasing program in favor of a Research and Development program, reduce the amount of acreage available for leasing, and, shortly after the current period to comment on the DPEIS is closed, offer another rulemaking which will propose to “remove the royalty rate for oil shale production” [*Id*]. The eleven day period between the closing of the comment period for the DPEIS and the potential publication of royalty rate provisions affecting oil shale and tar sands does not allow cooperating agencies the chance to include royalty rate and commercial leasing aspects into their comments, thereby impermissibly segmenting the proposed rulemaking as envisioned by Congress. For this reason, the state requested an extension of the comment period, and advises the BLM that it expects the comments upon any proposed royalty rate adjustment be incorporated into the analysis of the issues within the DPEIS.

#1])> Summary of the DPEIS Review

<([#2 [1.5] The state has reviewed the Draft Programmatic Environmental Impact Statement accompanying BLM’s current proposal. The state finds that the information contained within the DPEIS is procedurally deficient and cannot support the proposed Resource Plan Amendments. Specifically, the state finds that the BLM has not been diligent in locating and considering information generated since the 2008 Record of Decision. This is unacceptable, particularly given the ease with which this information may be obtained. The State of Utah finds that the DPEIS is incomplete, biased and does not meet the required “hard look” purpose of the National Environmental Policy Act. Any final EIS based upon the provisions contained in this Draft cannot support a decision by the BLM which would alter the provisions in the 2008 ROD concerning the availability of lands for oil shale and tar sands leasing. Decisions based on analyses in the DPEIS will be arbitrary and capricious as a matter of law, and will not be consistent with state law, policy or procedures if the Preferred Alternative, as identified in the DPEIS, is chosen as the final decision.

#2])> As a general point of discussion, documents currently prepared under the provisions of the National Environmental Policy Act have evolved in recent years into a format which is

staggering in its ability to obfuscate information. These documents are so convoluted that the reader is unable to discern the validity and adequacy of the NEPA analysis on which the agency bases its conclusions, especially in the short time frame provided. Nonetheless, the state has been able to discern the following salient facts and identify a singular bias by BLM against information supporting the viability of the oil shale and tar sands industries, and local and state economies, instead favoring a particularly antagonistic position towards oil shale and tar sands development.

<([#3 [9.8] [9.2.4] Focus of the Current Proposal

The Executive Summary for the DPEIS states BLM has decided to take a “fresh look” at the land allocations made in the 2008 review based upon the Settlement Agreement and upon “new information which has emerged since the 2008 OSTs PEIS was prepared.” (ES-1) BLM further refines this fresh look to include a reconsideration of the 2008 allocations and determine whether it is “appropriate for approximately 2,000,000 acres to remain available for potential development of oil shale,” with an equivalent decision for tar sands [Executive Summary, p. ES-1].

The BLM states that the reason for this reconsideration is specifically 1) the need to review new inventories for lands having wilderness characteristics, 2) the March 2010 decision of the Fish and Wildlife Service concerning sage grouse, and 3) the completion of studies related to Areas of Critical Environmental Concern (ACECs).

In a related action required under the Settlement Agreement, the BLM will propose amendments to the oil shale final rule to remove the royalty rate codified in BLM regulation (43 CFR 3903.52) and perhaps propose alternative adjustments to the royalty rate. These proposed royalty rate adjustments are not scheduled to be made public until mid-May 2012, after the comment period for the DPEIS has concluded.

As discussed further below, the state finds that there is no new information concerning lands with wilderness characteristics in Utah beyond that considered for the 2008 Oil Shale EIS or the 2008 Resource Management Plans. Management for Sage grouse and its habitat is being addressed through a massive effort by the affected states, the BLM, the Forest Service, and the U.S. Fish and Wildlife Service, with these efforts determining the needs of the species and the means to balance species protections with provisions for human needs. Any proposed discussion of sage grouse needs in the current DPEIS is not ripe for analysis, and any proposed restrictions due to sage grouse are premature. Any decision to amend currently operative RMPs, based on an issue currently undergoing such a massive review, would constitute an arbitrary and capricious decision.

The state finds that the BLM has not only based its decision on new information where none exists, but also has, to compound this egregious error, inexplicably ignored new information which supported the conclusions of the 2008 decision, and failed to analyze significant new information that would satisfy NEPA’s required hard look.

#3]> <([#4 [9.2.2] Congressional Mandate

The Energy Policy Act of 2005 (EPACT 2005), Section 369, is the driving force behind the BLM’s original Oil Shale and Tar Sands (OSTs) Programmatic Environmental Impact Statement and the resource allocation decisions it supported. Section 369 of EPACT 2005 specifically states “not later than 18 months after the date of enactment of this Act. . . the Secretary (of Interior) shall complete a programmatic environmental impact statement for a commercial leasing program for oil shale and tar sands resources on public lands, with emphasis

on the most geologically prospective lands within each of the States of Colorado, Utah, and Wyoming.’’

BLM advanced the purposes of EPACT 2005 through its conclusions in the 2008 OSTIS Record of Decision and the accompanying decisions within 2008 Records of Decision for the Vernal, Price and Richfield Field Offices, along with adoption of the oil shale leasing regulations codified at 43 CFR Part 3900. These decisions successfully laid out the availability of land containing the resources and the framework of the regulatory structure for acquiring leases on BLM land for the development of these resources. The state believes that BLM did an adequate and thorough job in reaching the decision contained in the 2008 ROD. The state also applauds the agency’s efforts in 2008 to conform with state and local laws as well as engage in significant cooperative exchanges with countless agencies and stakeholders.

The current proposal, and the supporting documentation found in the DPEIS, takes a huge step in the wrong direction. Congress did not ask BLM to determine if commercial leasing was appropriate or not, or to wait on a commercial leasing process in favor of some other proposal. As noted on page 1-3, EPACT 2005 requires the BLM to complete a programmatic EIS, establish a leasing program, consult with the Governors, conduct lease sales and consider land exchanges. The current proposal does not meet those requirements and directly ignores both the mandate and timeline given to it by Congress under Section 369 of EPACT 2005. In addition, the Preferred Alternative will push commercial leasing farther into the future by requiring more unnecessary planning and research and development before commercial leasing can be established. Therefore, the Preferred Alternative is at direct odds with and contravenes the directions given by Congress in the EPACT 2005 to establish an oil shale and tar sands commercial leasing program.

#4) > < (#5 [1.5] Precedential Value of the Settlement Agreement

BLM has clearly stated that this entire effort is the result of the settlement of litigation brought by various environmental groups. Litigation, by its very nature, excludes many stakeholders interested in the issue litigated. Because full public involvement is required by NEPA and other laws, the Settlement Agreement requires only that the BLM propose various adjustments to the existing regulatory and planning provisions. The provisions of NEPA require that other alternatives be considered as well, including the option of doing nothing, which in this case would keep the 2008 land allocation decision intact.

The Settlement Agreement itself is not determinative of the final decisions made in response to the current DPEIS. This means that the No Action Alternative is as viable as the alternatives identified in the Agreement. Yet the Agreement, which was made without the involvement of many of the relevant stakeholders, including the state, is apparently being used to drive a hasty decision. The BLM informed the state and other stakeholders that the calendar is tight, and there is no room for additional analysis and review. This rush to complete the DPEIS by an artificial deadline is arbitrary in light of the vast amount of information the BLM must analyze to adequately meet the requirements of NEPA.

Request of the State

As shown below, this rush to complete has produced numerous major and minor errors which combine to produce a flawed product. The state urgently requests the BLM:

- slow down the analysis;
- carefully analyze the information offered below concerning the maturity of the oil shale and oil sands industry in Utah;
- recognize the clear delineation of jurisdiction between the states and the BLM;

- review the impacts to the social and economic structure of the state and local governments;
- examine the needs of the industry within larger venture capital markets; and produce a complete analysis of impacts.

If necessary, the state requests the BLM and its attorneys petition the court for additional time, based upon the reality of completing the tasks and further analysis outlined below. #5)>

<(#6 [1.3] Consultation with the Governors

The provisions of EPACT 2005 require that the BLM consult with the Governors of the states involved in the creation of commercial leasing program. Specifically, Section 369 requires the BLM to

Consult with the Governors of States with significant oil shale and tar sands resources on public lands, representatives of local governments in such states ... to determine the level of support and interest in the States in the development of tar sands and oil shale resources.

During the preparation of the 2008 Record of Decision, the BLM met on several occasions with the representatives of the Governors of the three states involved, and as a result were advised of the necessary "level of interest." Utah advised the BLM that the level of interest in Utah was high, and that if necessary, the BLM should proceed with a commercial leasing program in Utah even if the other states were not interested. In stark contrast, no such meetings have taken place with the Governor of Utah or his representatives during the current PEIS effort.

Request of the State:

The State of Utah urgently requests meetings with the BLM which meet the letter and the spirit of the requirement of EPACT 2005 to consult with the Governors, and local government, to determine the level of support for a commercial program for the leasing of oil shale and tar sands. Only then will the BLM be able to fully analyze the social and economic impacts to the state as well as work with the state on decisions affecting a critical component of the state's economy. These meetings must include thorough discussion of all information and issues pertaining to a commercial leasing program, including royalty rates, the structure of the leasing program, and the availability of lands for leasing. #6)>

<(#7 [1.3] [6.3] State Authority

The DPEIS reflects a lack of respect for state authority and capabilities. The BLM repeatedly asserts that it wishes to hold off on implementing a commercial leasing program until more information is available on the impacts of oil shale and tar sands operations." BLM explicitly asserts on many occasions in the DPEIS that oil shale extraction processes are unknown and that it must delay allocations of lands for leasing pending further study. In contrast, the state asserts that oil shale processes are fundamentally composed of discrete extractive operations that have existed for decades, all of which are covered by state authority and regulatory programs. For example, the BLM states that it requires more information on the impacts on water quantity and quality [ES.7, found on ES-9] from oil shale and tar sands operations. Yet information concerning a permitted commercial operation pertaining to water quantity and quality are readily available on the Division of Oil, Gas and Mining's website. The BLM, in cooperation with its state and local regulatory partners, can readily engage in the discussion of impacts to the natural, social and economic environments from these well-understood processes.

The extraction of kerogen from oil shale, as proposed in Utah, is nothing more than a mining operation followed by a retort operation. Mining operations have existed in Utah for

over a hundred years and the state has implemented the necessary regulatory controls to mine in an environmentally sensitive manner, using the latest in technology and management practices. Retorts have been used since ancient days to reduce ore and produce useful products. Oil shale and tar sand operations involve well-defined; basic extraction~ processing, and upgrading techniques that have been in use in Australia, Brazil, Canada, China, Estonia, Ireland (commercially in Canada and Estonia), and tested for over 50 years in the U.S. Oil shale and tar sand development activities have existed on Utah State lands for many years with adequate protection of the environment under state regulatory programs sanctioned by the Office of Surface Mining and the Environmental Protection Agency.

Water is owned by the state in trust for its citizens and is subject to the state water appropriation system managed by the Utah State Water Engineer. The federal government must participate in the state's allocation system should it desire to quantify any water rights it may claim [43 U.S.C .Section 666.].

Water rights appropriations are for specific diversion or use proposals. A general water right for general use by the public lands is not allowable under state law. As discussed further below, the state believes and asserts that water is available for oil shale and oil sands development, both through existing water rights and through the general market system. The state's allocation system examines issues related to availability, prioritization, interference with other rights, and related factors. BLM's decision to defer analysis until it obtains further information on water availability imposes BLM vague desires onto the decision-making process of the state. The state will make decisions regarding the availability of water, not the BLM. The state will, consistent with the authority of the state water engineer, process applications to approve or transfer water rights for oil shale or any other use.

The same is true for air quality and water quality. The state has primacy for enforcement of the Clean Air and Clean Water Acts within the state and works closely with the EPA to insure the protection of these resources. The Utah Department of Environmental Quality, along with federal, state, and industry partners is currently studying issues related to air quality in areas containing the most geologically prospective oil shale resources, and will work to jointly find solutions to air quality issues in these regions .. An inventory of emission sources is underway in conjunction with studies of the factors surrounding the formation of ozone during the winter months in the Uintah Basin. Protection of water quality from underground or surface mining operations is well within the regulatory authority and expertise of the state. Although issues related to the particular soil chemistry and topography must be addressed, the state is perfectly capable of the project specific analysis and decision making necessary to address any environmental concerns. See the Addendum below for further information concerning the permitting process.

Request of the State for Further Analysis:

Surface and underground mining as well as retorting generates no major unknowns for BLM beyond those presented by other mining and refining operations. The State of Utah strongly requests that the BLM make use of the information readily available to it from its regulatory partners and conduct the required environmental analysis of the impacts of wellknown processes rather than continue to insist that the production of a refinable liquid product from oil shale is shrouded in mystery. The BLM must defer to the expertise and authority of the state in these matters, use available information about standard mining and retort processes for its environmental analyses, and stop insisting that it cannot make resource allocations at this time based on upon vague, ill-defined assertions that more information is necessary. #71)>

<([#8 [9.2.1] [3.1.3] **Lands with Wilderness Characteristics**

BLM conducted inventories of lands for the presence of wilderness characteristics prior to the Record of Decisions made for the 2008 oil shale allocation decisions and all other management issues covered in the final 2008 RMPs. No inventories for wilderness characteristics have been conducted since that time. As part of the 2008 RMP decision process, the state commented on management prescriptions for the lands identified, in whatever manner, as possessing the characteristics of wilderness. At the time, the state informed BLM as follows: The State of Utah has reviewed BLM's inventory of and proposed management for lands identified as possessing wilderness characteristics. The state does not believe that BLM has the authority to create a category of management based solely on the characteristics of wilderness. The characteristics of wilderness, or their constituent elements, were first recognized by the Wilderness Act of 1964 and passed to the BLM within the provisions of Section 603 of the Federal Land Policy and Management Act of 1976. The authority within Section 603 has now expired by its own terms. The state recognizes that recent court decisions have affirmed BLM's authority to inventory for wilderness characteristics, and have required the BLM to consider new information about these characteristics in its documents prepared under the National Environmental Policy Act. These decisions do not, however, consider or affect the BLM's statutory authority for management policies on the BLM lands. The state cautions BLM against an overly broad reading of these decisions. Management authority must be derived solely from the specific provisions of the Federal Land Policy and Management Act, (e.g. Areas of Critical Environmental Concern) or other specific federal legislation, and it is incumbent upon the BLM to carefully define its detailed legal rationale and reasoning for its proposed management policies, provisions and categories.

The DPEIS does not contain any such analysis of its authority to manage for wilderness characteristics. In addition, the DPEIS does not contain any new information on inventories for lands contained within inventories for wilderness characteristics. All inventories in the areas of concern in the DPEIS were completed prior to 2008. Because the BLM presents no new information regarding new inventories that would indicate the reasons for an increase, decrease or adjustment, related to the management of lands with wilderness characteristics, the BLM must carry forward the decisions made in the 2008 oil shale EIS and the 2008 RMPs for lands managed for wilderness characteristics. A decision containing new management prescriptions for lands with wilderness characteristics would be contrary to the decisions in the 2008 Records of Decision and would therefore be arbitrary and capricious, as it would not be supported by any significant new information. #8])>

<([#9 [9.5] Since 2008, the State of Utah has passed several laws which have bearing on this decision

regarding the protection of lands with wilderness characteristics. First, Utah Code Section 63J-8-1 03(4) provides that the public lands should not be "segregated into separate geographical areas for management that resembles the management of wilderness, wilderness study areas, wildlands" and the like. Instead, state law indicates the need for BLM to simply adhere to the normal standard of preventing unnecessary and undue degradation to the land.

In addition, Senate Bill 83, passed in the 2012 General Session of the Utah Legislature, provides that certain areas of Uintah, Duchesne and Daggett Counties are designated as an Energy Zone, and managed for the primary purpose of the production of energy. Senate Bill 83 provides in part, as follows:

The landfJ comprising the Uintah Basin Energy Zone contain abundant, world-class

deposits of energy and mineral resources, including oil, natural gas, oil shale, oil sands, gilsonite, coal, phosphate, gold, uranium, and copper, as well as areas with high wind and solar energy potential; and the highest management priority for all lands within the Uintah Basin Energy Zone is responsible management and development of existing energy and mineral resources in order to provide long-term domestic energy and supplies for Utah and the United States.

The state supports a cooperative management approach among federal agencies, state, and local governments to achieve broadly supported management plans for the full development of all energy and mineral resources within the Uintah Basin Energy Zone. The state calls upon the federal agencies who administer lands within the Uintah Basin Energy Zone to fully cooperate and coordinate with the state and with Daggett, Uintah, and Duchesne Counties to develop, amend, and implement land and resource management plans and to implement management decisions that are consistent with the purposes, goals, and policies described in this section to the maximum extent allowed under federal law, ... [and to] refrain from any planning decisions and management actions that will undermine, restrict, or diminish the goals, purposes, and policies for the Uintah Basin Energy Zone ... and refrain from implementing a policy that is contrary to the goals and purposes [of the Energy Zone].

BLM must give the provisions of this law full consideration based upon respect for the authority of the state to provide for the general welfare of the citizens of the state and must review and analyze the purpose and effect of the law in the DPEIS. Additionally the law is an expression of state planning for the resources of the area, and is entitled to consideration as part of the consistency review discussed below. **#9)**>

<(#10 [9.2.1] [3.1.3] Because the BLM does not possess any new information about lands with wilderness

characteristics from that available in 2008, a change in any type of management for the lands, from that finalized in the 2008 RMPs and the 2008 Oil Shale EIS, as is proposed by various alternatives within the DPEIS, would constitute an improper use of Secretarial Order 3310, issued December 23, 2010. Secretarial Order 3310 was defunded by Congressional action, which required that no funds may be used to implement or enforce the Order. In this case, the BLM is proposing to restrict the availability of these lands for the commercial leasing of oil shale and tar sands based solely upon the existing, older inventory for the presence of wilderness characteristics. This clear expression of intent to manage for wilderness is the functional equivalent of the creation of wild lands as proposed within the Secretarial Order. Because the Congressional action clearly stated that the BLM may not implement or enforce Secretarial Order 3310, the DPEIS must be rewritten to reflect this fact. **#10)**>

Request of the State for Further Analysis:

<(#11 [9.8] The State of Utah requests the BLM revisit its analysis of the proposed management prescriptions concerning the existing inventories of lands with wilderness characteristics, and

- Recognize that no new information is available since the 2008 Records of Decision;
- Recognize the soundness of the decisions made in the 2008 for the Resource Management Plans Records of Decision and the Oil Shale Record of Decision;

#11)> **<(#12 [9.5]** The State of Utah requests the BLM revisit its analysis of the proposed management

prescriptions concerning the existing inventories of lands with wilderness characteristics, and

- Adopt the intent of state law and policy upon the subject of wilderness and wildernesslike

management;

~~#12]~~ <(~~#13~~ [9.5] The State of Utah requests the BLM revisit its analysis of the proposed management

prescriptions concerning the existing inventories of lands with wilderness characteristics, and

- Adopt the intent of state law and policy concerning the Energy Zone; and

~~#13]~~ <(~~#14~~ [9.2.1] The State of Utah requests the BLM revisit its analysis of the proposed management

prescriptions concerning the existing inventories of lands with wilderness characteristics, and

- Adhere to the Congressional moratorium requiring BLM not enforce in any manner

Secretarial Order 3310. ~~#14]~~>

<(~~#15~~ [2.1.1] The state specifically requests that the BLM adhere to the decisions made in the 2008

Records of Decision concerning lands with wilderness characteristics, and support BLM's previous sound decisions by adopting the currently proposed No-action alternative.

~~#15]~~ <(~~#16~~ [3.7.5.1] [9.2.4] Sage Grouse

Eleven of the western states, including Utah, are engaged in a cooperative effort to review the status of the Greater Sage grouse within its existing range, and to determine the elements of plans, conditions or stipulations, along with other mechanisms, to preserve the sage grouse while allowing economic development and growth to occur. The state of Utah has been sponsoring programs to protect the sage grouse for years, but the latest coordinated effort is occasioned by the March 2010 decision of the U.S. Fish and Wildlife Service concerning the potential listing of the sage grouse under the provisions of the Endangered Species Act. The Fish and Wildlife Service determined that a listing was warranted but precluded by higher priorities. This decision is now set for review by the end of 2015.

As a result of the listing decision, BLM and the Forest Service have initiated, through a Notice of Intent to Prepare an Environmental Impact Statement, a massive effort to determine if amendments to various Resource Management Plans (BLM) and Land Use Plans (Forest Service) are required in order to address the issues raised in the FWS decision. This effort is scheduled to be completed in 2014.

The State of Utah provided comments to the BLM planning process, and stated as follows:

The Notice of Intent states very specifically that the reason for the entire effort is to respond to the decision by the U.S. Fish and Wildlife Service that the listing of the Greater Sage Grouse is "warranted, but precluded" by higher listing priorities, and that the FWS asserts that BLM and Forest Service lands are the key to sage grouse survival. To the contrary, the state firmly believes that sage-grouse populations in Utah are in good condition, are receiving significant management attention and, therefore, do not warrant listing under the Endangered Species Act. The state will challenge a proposed listing whenever and wherever necessary. The state requests that the BLM and Forest Service receive, review and fully analyze all evidence offered by the state and others in support of its position that a listing is not warranted as part of the analysis of the impacts of the EIS provisions and alternatives. The state specifically requests that the BLM fitly analyze and explain the ability of the BLM and Forest Service to protect the species without the cooperation of other landowners, as discussed further below.

In fact, the state strongly asserts that a decision to list sage-grouse range-wide, but especially in Utah, would be a major setback to current conservation management

activities. Sage grouse in Utah, while challenged, are biologically stable. Utah conservation efforts are being conducted at a scale that will likely be hard to match anywhere else across the species' range. Finally, organizational and funding mechanisms unique to Utah have fostered cooperation and focus for continued and long-term conservation into the future. The state is concerned that unnecessary restrictions imposed by the BLM and Forest Service will upset the successful efforts underway in Utah, to the detriment of the species.

To further the state's commitment to conservation of the sage grouse and economic health of the state, the Governor recently convened a Sage Grouse Working Group. This Working Group is comprised of representatives of the Governor's Office, BLM, Forest Service, Fish and Wildlife Service, National Resource Conservation Service, Utah's Office of Energy Development, School and Institutional Trust Lands Administration, Department of Agriculture and Food, Division of Wildlife Resources, and representatives of the oil and gas industry, transmission line industry, oil shale industry, ranching community, county commissioners, The Nature Conservancy, and Utah State University. The Governor's charge directed the group to provide recommendations for the protection of sage grouse, while continuing to provide for a healthy economy and protecting private property rights. The Working Group was recently briefed on issues related to the life cycle of the sage grouse and previous and ongoing efforts to protect the species, and expects to provide recommendations within a few months. These recommendations are expected to lead to a state sage grouse plan soon thereafter. The state will expect the BLM and Forest Service to adhere to the provisions of this plan, both as a matter of respect for state authority, and in compliance with ELM's Instructional Memorandum 2012-039, which requires the BLM to make use of state data related to wildlife.

The State of Utah, in response to these factors, is currently, through the Working Group, engaged in an effort to review habitat needs of the sage grouse and make determinations about the relative importance of the habitat against the presence of other human and wildlife needs. The state is doing this in addition to weighing other options concerning the need to list the species. This process is expected to result in the designation of areas of greater and lesser importance. A similar process in the state of Wyoming resulted in the designation of areas as "core" and "non-core," which is a possible outcome of the Utah process as well. The state assumes the Wyoming results, approved by the FWS, are the origin of the term core within the DPEIS. The BLM also recently issued an Instructional Memorandum concerning management of the sage grouse, covering the interim period until the massive planning effort concludes. In it, the term priority habitat is employed, along with general habitat, which is presumably the source of those terms within the DPEIS.

The state is very disappointed, therefore, to see "core" or "priority" discussed within the DPEIS for the State of Utah, and maps prepared with "core" or "priority" habitat displayed. The state, which is the entity with management authority over the sage grouse, has not yet reached a conclusion about any habitat designations, and does not expect to do so until the Working Group process is completed. The legend for Figure 2.3.3-2 [See page 2-38, DPETS.], entitled "Lands Excluded from Application for Oil Shale Leasing Under Alternative 2 in Utah," clearly shows lands defined as

Core or Priority. The state has not yet made any such determination, and strongly objects to BLM making such a determination. The information contained in the DPEIS about core or priority sage grouse habitat in Utah, as evidenced by this map, and any analysis based upon the

information, is wholly inaccurate, and must be altered to reflect the true situation.

Request of the State for Further Analysis:

Because the data concerning sage grouse habitat is inaccurate, BLM must remove all reference to it in the DPEIS, and replace it with the habitat types which result from the efforts of the state's decision after the Working Group's work is completed. The BLM and the FWS are both represented on the Working Group, and will have every opportunity to influence the final product. Proceeding with the current data does not advance a completely and correctly informed analysis, but only perpetuates the continued use of erroneous data and misinformed opinion.

#16)> <(#17 [3.10.3] NEP A Requirements- Social and Economic Studies

BLM has not presented a serious study of the social and economic impacts of the proposal as required by the provisions of the National Environmental Policy Act. The DPEIS contains discussion about the generic social effects of a boom and bust economic cycle, but does not contain a countervailing discussion of the social effects of limited and reasonable economic growth. The DPEIS discusses the history of oil shale development twenty years ago, but includes no discussion concerning current energy needs, the current pricing structure for oil and gas, and the corresponding ability of oil shale and tar sand operations to continue to contribute a larger share of a healthy economy in the eastern part of Utah, and for the state as a whole. The discussions in the DPEIS generically concerning boom and *bust* economic cycles, without any discussion of reasonable economic growth alternatives demonstrates the agency's bias against development of oil shale and tar sands.

The DPEIS must to include a discussion of the entire market process for creation of a viable oil shale and tar sands industry, including its role in the regulatory certainty needed to attract venture capital. The State of Utah expects the BLM to be an active partner in the marketing of opportunities to diversify the domestic production of the nation's energy needs, not hang its institutional head claiming ignorance of real world market realities.

BLM needs to revisit the analysis of socioeconomic impacts in the DPEIS and present additional analysis of the opportunities to encourage a viable oil shale and tar sands market. BLM has the resources and the expertise to evaluate the reasonable effects of simple mining and retort operations. BLM should immediately communicate with industry to determine the needs for certainty and about reasonable development opportunities. The state knows that if BLM delineates reasonable requirements for resource development, industry will participate. There is clear evidence that industry is engaging in oil shale and tar sands development in Utah. Based on past experience with oil shale and tar sands development on state and private lands in Utah, growth will be measured and moderate, which is a viable alternative to the boom and bust scenarios presented in the DPEIS.

The State of Utah understands the value of a balanced economy, and values the contributions of tourism to the state's economy. However, BLM must not assume that tourism is the only possible contributor to a stable economy in the Uintah Basin and elsewhere in Utah.

BLM must recognize and analyze studies which demonstrate the value of oil and gas to the Uintah Basin, and examine the benefits the oil shale and tar sands industry could bring to providing a stable and robust economy in the area. BLM must examine the contributions of tourism, oil and gas, government and other existing industries in the area, then analyze the value that a moderate growth oil shale and tar sands industry might add to that by bringing additional diversity to the area's economy.

BLM must also not falsely assume that a viable tourism industry is put at risk by oil shale production in the Uintah Basin. This is not to say that BLM should not discuss tourism

and outdoor recreation as part of a significant economic evaluation - it should. But BLM must also evaluate wages from the tourism industry against those of the energy industry and evaluate the prospects for employment, revenue and community stability based on those figures.

Other Economic Studies - Examples:

The state contracted with Utah State University and the University of Utah to complete a number of economic and social-attitude studies regarding the use of and values attributed to public land resources by Utah residents. These studies assess: general attitudes of the citizens toward the public lands, off-highway vehicle use on public lands, grazing on public lands, and economic impacts of oil and gas exploration and production. Below are short summaries of a number of these studies, which are available on the state's website.

A statewide survey of the residents of Utah, the *Utah Public Lands Study*, was conducted in the summer of 2007 by Utah State University. One focus of the survey involved assessing various ways in which residents engage in economic activities that are linked to public lands and resources. Other major purposes involved assessing attitudes toward public lands as part of the residents' quality of life and sense of community, and assessing attitudes and preferences regarding public land management.

Preliminary results from the *Utah Recreational Off-Highway Vehicle Use Study* conducted by Utah State University show OHV use becoming increasingly popular, but the number of trips taken per year declining. Recreational activities that OHV users participate in are diverse, including both passive (sightseeing and photography) and active (camping and hiking). Rider motivation includes stress relief and nature appreciation, along with achievement, stimulation, independence and socialization with others. The study also shows economic impacts broken out by direct and total impact to Duchesne, Uintah and Daggett counties as well as by regional gross output, employment, household income, and value-added income. A "Random Utility Model" will be used to measure change in the allocation of trips across counties, measure change in the total number of trips taken by Utah OHV users, measure change in economic value accruing to OHV users and generate trip-distribution information for use in economic impact modeling. Full results will be made available upon completion of the study.

The Utah State University study, *Trend information for the Vernal RMP: Livestock Industry Issues* indicates that the trend in livestock grazing preference and authorized use in the Vernal Field Office Planning Area is downward. The permitted AUM level proposed in the Draft RMP Preferred Alternative is a reduction of 8,323 AUMs, a 5.7 percent reduction in preference from the current level. This reflects a reduction of 15,376 AUMs, (10 percent) from the level 16 years ago.

The Bureau of Economic and Business Research at the University of Utah has completed an economic impact study of the oil and gas exploration and production industry in the Uinta Basin titled *The Structure and Economic Impact of Utah's Oil and Gas Exploration and Production Industry: Phase I- the Uinta Basin*. The Phase I study shows that rapidly rising energy prices and the corresponding rise in oil and gas activity are causing an economic boom in the Uinta Basin. During 2006, the oil and gas exploration and production industry was directly responsible for 19.9 percent of employment and 34.8 percent of total wages in the Uinta Basin, while those figures rose to 49.1 percent of the employment and 60 percent of the wages in the Basin when the indirect (multiplier) effects were considered. The industry also has a sizeable fiscal impact on local governments in the Uinta Basin. Property taxes paid on producing oil and gas wells were \$18.2 million in 2006 and accounted for 38.7 percent of all property taxes paid in the two counties.

Required Further Analysis Requested by the State:

These studies, and other similar work, should be discussed as part of the examination of the social and economic structure of the area influenced by the upcoming oil shale and tar sands mining activities. Only after such consideration can the BLM make reasoned analysis of the economic impacts of the required leasing program. BLM must not make decisions which may influence the structure and robust nature of local and state economies without an examination of the ability and desire of the local economy to face the challenges raised by the proposal. The DPEIS focuses almost entirely on the perceived perils of a boom and bust cycle. This is pejorative and misleading, and does not reflect a serious attempt to analyze the potential contributions, both positive and negative, from the proposed leasing program. BLM must step back, and redo the social and economic analysis with these factors in mind. Failure to do so violates the provisions of NEPA requiring analysis of the social and economic impacts of a proposal to the same degree as the environmental analysis.

#17])> <([#18 [3.1.3] Support for the Mission of SITLA

Utah's School and Institutional Trust Lands Administration (SITLA) is an independent state agency responsible by law for management of lands granted to the State of Utah pursuant to the Utah Enabling Act, (Act of July 17, 1894, 28 Stat. 1 09), for the financial support of Utah's public schools and other state institutions. The United States Supreme Court has referred to this Enabling Act land grant as a "solemn compact" between the United States and the State of Utah that obligates the United States to take into consideration the purposes of the grant when managing federal lands.

The State of Utah is obligated by both the Utah Enabling Act and the Utah Constitution to act as a trustee in managing school trust lands. Among the fiduciary duties imposed by this trust on SITLA is the duty to manage trust lands in the most prudent and profitable manner possible, and not for any purpose inconsistent with the best interest of the trust beneficiaries. Revenues from school trust lands are deposited in the Permanent School Fund, a permanent endowment for public education. Interest and dividends from the Permanent School Fund are distributed to individual public schools statewide annually to supplement critical academic needs.

SITLA manages lands within the boundaries of the BLM Field Offices under discussion in the DPEIS. Most of these state trust lands are comprised of numbered sections 2, 16, 32 and 36 in each township, representing the grant of in-place school sections made by the Utah Enabling Act; however it also includes lands acquired from the federal government in a land exchanges. The significance of the checkerboard pattern of land ownership is that because most trust lands are surrounded by BLM lands, planning decisions made by BLM with respect to rights-of-way, withdrawals from mineral leasing, special designations (e.g. ACECs, management for wilderness characteristics, etc.) and other determinations inherently impact the state trust lands, making them an island within the surrounding BLM lands. BLM's decisions on how to manage its lands directly affect the ability of the State of Utah to manage state trust lands for the purposes for which they were granted by Congress, which was to provide revenue for public schools and other beneficiary institutions. BLM management is an issue of significant impact to Utah's school trust. For example, lands within the Vernal Field Office make up approximately 13 percent of Utah's total surface trust land portfolio.

Conversely, management by SITLA of state trust lands within BLM areas of special designations can directly affect the ability of BLM to achieve management objectives. SITLA is not obligated by law, for example, to manage its lands within BLM areas managed for

wilderness characteristics or ACECs for environmental protection. SITLA development of inholdings consistent with SITLA's governing mandate may substantially defeat the purpose of the special designation.

Request of the State for Further Study

BLM has an obligation to include in its planning an effective and timely means of addressing the impact of federal land actions on in-held state trust lands. BLM must engage in a serious study of its need to support the purposes of the grant of lands to the state for the support of the common schools. Specifically, the BLM needs to rework the DPEIS to include effects of the lack of a leasing program upon the ability of the state, through SITLA, to expect a robust leasing program for oil shale and tar sands and the related expectation of revenue.

In addition, the DPEIS addresses the requirements of Section 369(n) of the Energy Policy Act of 2005 (EPACT), Public Law 109-58, only in a cursory manner. Section 369(n) provides in relevant part:

(n) LAND EXCHANGES.

(1) IN GENERAL. To facilitate the recovery of oil shale and tar sands, especially in areas where Federal, State, and private lands are intermingled, the Secretary shall consider the use of land exchanges where appropriate and feasible to consolidate land ownership and mineral interests into manageable areas.

(2) IDENTIFICATION AND PRIORITY OF PUBLIC LANDS. The Secretary shall identify public lands containing deposits of oil shale or tar sands within the ... Uintah ... basin ... , and shall give priority to implementing land exchanges within those basins

At page 1-6, lines 32-34, the PEIS states that the decision in the 2008 ROD that "the specific decision that the BLM will consider and give priority to the use of land exchanges to facilitate commercial oil shale development pursuant to Section 369(n) of the Energy Policy Act of 2005" will be carried forward through this planning process. This statement should be clarified to confirm that, pursuant to the EPACT 369(n) directive, BLM lands that are not made available for commercial leasing will nonetheless be available for state exchange, subject to other applicable laws applicable to federal-state land exchanges. #18]>

<([#19 [9.5] Consistency with State Law, Plans and Policies

The State of Utah is extremely supportive of the consistency review requirement, as provided in federal law (43 U.S.C. § 171 2(c)(9)) and regulation (43 C.F.R. § 1610.3-2).

Pursuant to this regulation, RMPs shall be

consistent with officially approved or adopted resource-related plans, and the policies and procedures contained therein, of ... State and local governments, ... so long as the ... [RMPs] are also consistent with the purposes, policies and programs of Federal laws and regulations applicable to public lands.

BLM correctly notes this requirement, but then qualifies the requirement to be that of consistency with state and local plans, where possible [Section 1.4.5, Page I -21.].

The DPEIS also discusses the plans of

the City of Rifle for economic development, and mentions that the final Record of Decision should consider consistency with the City's plans [i.e.].

The state certainly believes that BLM

should consider the views of the City of Rifle, but more accurately consider consistency with state and local plans, policies and programs as demonstrated to BLM through the Governor's consistency review.

As an explanation for the idea that BLM need only be consistent with state and local laws, plans, policies and programs, the BLM previously provided an interpretation of the consistency requirement [See generally the 2008 RMP efforts.]. BLM stated that the “RMP ... [must] be ... consistent ... to the maximum extent possible by law and [that] inconsistencies between Federal and non-Federal Government plans be resolved to the extent practical” [Vernal RMP EIS, p. 5- 17]. The BLM thereafter defined an inconsistency as anything that “cannot be resolved or reconciled where state and local plans conflict with federal law.” The state strongly asserts that this interpretation does not fully recognize nuances of the consistency requirement, especially involving discretionary planning decisions of the BLM.

The state recognizes that federal law requires certain decisions and establishes parameters within which those decisions can be made. However, the BLM retains considerable discretion within these legal sideboards. State and local governments cannot demand that BLM act outside these sideboards, but when state and local governments’ policies pertain to areas within BLM’s lawful discretionary decision space, BLM is obligated to make its plans consistent with state and local policies to the maximum extent possible. Thus, it is inappropriate to dismiss state recommendations that fall within BLM’s legally prescribed discretion simply because BLM disagrees with the balance struck by the state. To assume that BLM’s discretionary choices constitute federal law has the immediate effect of determining that state plans, programs and policies which strike a different balance yet accomplish the same purpose as the BLM’s choice are, a priori, in conflict with federal law. Instead, the state asserts that if its recommendations strike a slightly different balance between competing resource demands and this balance is within BLM’s lawful discretionary decision space, the BLM must endeavor to make its final decision consistent with state and local government policies.

Request of the State:

The State of Utah provided a consistency review just prior to the 2008 oil shale and tar sands Record of Decision. The state indicated the decision was generally consistent with state law, policy, plans and procedures. Within the decision space laid out by the alternatives within the DPEIS, the no-action alternative, i.e. the status quo, would remain consistent with state and local plans. Other alternatives may not be. Fundamentally, the decision space allowed BLM in this matter is limited. EPACT 2005 requires the creation of a commercial leasing program for oil shale and tar sands within 18 months of enactment. The State of Utah supports this, and found the efforts of BLM in 2008 to be consistent with its laws, plans, policies and procedures. The state is not asking the BLM to step outside the law in retaining the status quo, and BLM has not demonstrated any information which would require a decision different from that made by BLM in 2008. Therefore, the BLM can easily accommodate the state’s request that the Record of Decision in the current analysis reflect consistency with the state’s position. BLM should simply adopt the no action alternative at this time. #19]>

<([#20 [6.5] **The BLM Relies on Outdated Information on Oil Shale and Tar Sands Resources in Utah**

Although the BLM cites the U.S. Geological Survey reassessment of oil shale resources in Colorado, Utah, and Wyoming as one important reason for reevaluating the allocation decisions in the 2008 PEIS, the BLM did not use this new information in its analysis of the most geologically prospective resources. The DPEIS simply carries forward the data used for the 2008 PEIS. The 2012 PEIS would greatly benefit from the incorporation of new USGS resource

assessments and new oil shale data resource data published by the Utah Geological Survey in 2008.

This omission of new data is extremely troubling and calls into question both the validity of BLM's allocation decisions and whether the BLM took the requisite hard look for purposes of NEPA. Despite its insistence that updated geological assessments were important for improved allocation decisions in the 2012 PEIS, the BLM instead demonstrates an almost total disregard for this new information. For example, the BLM relied on digital data provided by the BLM Utah State Office rather than data from USGS or UGS [Draft PEIS, Chapter 1, 1.2, pg. 1-10, footnote 4].

Oil shale data for the 25 foot thick, 25

gallon per ton resource standard used in the 2008 PEIS came primarily from older reports focusing on the southeastern part of the Uinta Basin. Newer USGS and UGS studies include complete data sets spanning the entire Uinta Basin [Vanden Berg, 2008; UGS Special Study 128; USGS 2010b, *Oil Shale Resources of the Uinta Basin, Utah and Colorado*, National Oil and Gas Assessment Project, Digital Data Series DDS-69-BB].

The DPEIS states that "(t)he BLM considered this new (USGS) information and has determined that while the new data should inform and update the 2012 PEIS effort, particularly with respect to information pertaining to the 2008 study area, the boundaries defining the in-place assessment do not represent the most geologically prospective areas of the Green River Formation located in the ... Uinta ... Basin ... (T)he PEIS will not employ the USGS boundary to define the study area" [Draft PEIS, Chapter 2, 2.5.1, pg. 2-77].

The BLM discusses at some length why it did not consider the increases found for estimated total in-place oil in the Piceance Basin USGS Oil Shale assessment [The BLM quoted the assessment as saying "much of this previously unassessed resource is of low grade and unlikely to be developed." *Id.*], but fails to justify why similar assessments for the Uinta and Green River Basins were not incorporated.

The BLM does not include reference citations in the text, map, or table identifying the geologically most prospective areas in Utah for oil shale [Draft PEIS, Chapter 2, 2.3, pp. 2-13 to 2-16];

however, UGS is certain the data

described comes from preliminary information provided by the agency for the 2008 PEIS and does not reflect updated information developed by either UGS or the USGS. The DPEIS references Tabet (2007) as the source of oil shale and tar sand resource data for oil shale lands in Utah [*Id.*, 2.3.1, pg. 2-20, footnote 4; Appendix A references].

These references to information provided by a UGS senior geologist in 2007 confirms that the resource data used for the 2012 DPEIS came from information provided by the agency for the 2008 PEIS. This information, as even the BLM acknowledges, is out-of-date and been replaced by information from more recent UGS and USGS resource assessments.

It is disturbing that the BLM employed few people with geological and mining engineering backgrounds in the analysis of the most geologically prospective areas for the 2012 DPEIS? 21 Draft PEIS, Chapter 8.

It appears that the BLM chose to update the resource picture without the assistance of suitably trained personnel. The only geologist employed in the current effort evaluated paleontological resources, not OSTs resources. This demonstrates a biased reevaluation by BLM of the issues and impacts from OSTs leasing. It also violates the NEPA requirement that insures "environmental information is available to public officials and citizens before decisions

are made and before actions are taken. The information must be of high quality. Accurate scientific analysis, expert agency comments, and public scrutiny are essential to implementing NEP A” (emphasis added) [40 CFR 1500.1]. #20)>

<(#21 [1.5] **The Draft PEIS Fails to Adequately Analyze Oil Shale Technologies**

The DPEIS relies heavily on outdated information regarding oil shale and tar sands development technologies and in doing so, fails to provide the kind of comprehensive information required by NEP A for proper decision making.

CEQ regulations are quite clear about the standards required under NEP A for EISs.

According to Sec.1500.1 (b)

“ .. information must be of high quality. Accurate scientific analysis, expert agency comments, and public scrutiny are essential to implementing NEP A.”

Because an EIS is used to plan actions and make decisions and must be supported by evidence that the agency has made the necessary environmental analyses [40 CFR § 1502. 1], it must contain the

most accurate, up-to-date information available. Based on our extensive discussions with oil shale and tar sands industries, the DPEIS is clearly deficient and shows little to no coordination with industry. This may be a product of the backgrounds of the DPEIS contributors, where there is no evidence of industry or development background.

The BLM admits that “some of the information on the environmental consequences of oil shale development. .. is based on past oil shale developments. For purpose of this analysis, in the absence of more specific information of the oil shale technologies to be implemented in the future and the environmental consequences of implementing those technologies, information derived from other types of development. .. was used “ (emphasis added) [Draft PEIS, Chapter 4, pg. 4-1].

Consultation and coordination with industry by the BLM is critical to the effective and unbiased analysis of the environmental consequences as well the economic benefits of oil shale and tar sands development. Based upon the previous decisions of the BLM, companies have invested hundreds of millions of private capital in technology, permitting, construction, and processing of oil shale and tar sands. The willingness of the state and private landowners to encourage this development in Utah has produced a highly sophisticated, successful, privately funded and well-capitalized oil shale and tar-sands industry in the state.

The BLM qualifies its analysis of oil shale and tar sands technologies by stating that the information on these technologies is presented for the purposes of general understanding and doesn't define the range of possible technologies that might emerge in the coming years [*ibid*].

This reflects a lack of due diligence on the part of the BLM. There is information available on newer,

cutting-edge technologies that have moved from the RD&D phase into commercial scale development. BLM's reliance on outdated or general descriptions of the technology and its environmental impacts when there is ample information available on the newest developments in the industry contravenes NEPA's implementation requirements for EISs [40 CFR § 1502.2 (g)

“*Environmental Impact Statements shall serve as the means of assessing the environmental impact of proposed agency actions, rather than justifying decisions already made*”]. Appendix A references six oil shale projects in Utah from the late 1960s-the mid 1980s and cites these projects as a “wealth of resource, engineering, and baseline environmental data that will be useful in future efforts to develop oil shale resources” [DPEIS Appendix A, pg. A-21].

While past experience may be useful for

the analysis of the impacts of oil shale technologies, it is also important to include analysis of the innovative technologies currently in use that seek to resolve some of the environmental concerns raised by these earlier projects. Relying on technological examples in any industry (e.g. computing for example) from years back simply does not meet the requirement of NEPA to consider the best information available .. This is true especially in the oil shale and tar sands industries present in Utah.

An examination of Chapters 4 and 5 of the PEIS, along with the accompanying references, shows that the BLM did little research on newer technologies and did not make personal contact or mention any coordination with a single representative from industry. This is troubling to the state, since the Preferred Alternative relies on proven success through RD&D projects before allocating additional lease lands. A willingness to communicate and work effectively with industry will be critical under any of the alternatives, but especially under an RD&D driven alternative.

For example, BLM's analysis of the EcoShale™ In-Capsule Technology developed by Red Leaf Resources was based solely on information derived from Red Leaf's website [*Ibid.*, A.5.3.7, pg. A-87].

Employing a team of researchers devoted to addressing reasons to exclude lands from commercial development while limiting technology and industry research to an effective 'google search' demonstrates BLM's fundamental incapability to work with industry.

A second example is the information regarding the development of Enefit's RD&D lease at the White River Mine. This DPEIS relies heavily on findings from a 2007 EA for OSEC's proposed development activities at the same site. The only update BLM provides for the purpose of its analysis is that Enefit will employ its own version of the proposed underground mining and aboveground retort technologies based on its Enefit280 plant under construction in Estonia [*Ibid.*, A.5.3.34, pg. A-75].

BLM provided no comparative analysis between the Enefit280 process and the ATP retort process the agency evaluated for the purposes of the 2007 EA. It also fails to mention that the Enefit280 plant is possible only due to the commercial success of Enefit's parent company producing energy from oil shale since before 1950. Framing Enefit's successes and technology as "Enefit280 plant under construction" further shows BLM's bias and active efforts to portray the industry as nascent while in fact it has been functioning successfully and economically outside of the country. This demonstrates that the leading reason that oil shale and tar sands have not been proven commercially is due to the efforts and bias of BLM; not the lack of technology as BLM asserts.

The Utah Division of Oil, Gas and Mining (DOG M) recently granted Red Leaf a permit to begin commercial scale oil shale production in the Uintah Basin. Following a successful pilot test of its EcoShale technology, the company will commence oil shale operations on 1,500 acres in the Uintah Basin on state owned school trust lands. Enefit American Oil, a subsidiary of an Estonian energy company with 50 years of experience commercially producing energy from oil shale, acquired the Utah-based Oil Shale Exploration Company (OSEC) in March of 2011. Eesti Energia, the parent company of Enefit, recently announced it will conduct a commercial study of the application of its Enefit retort process to operations at the White River Mine.

These companies report that their new technology uses less water and result in fewer environmental impacts than the process technologies of the 1980s. For example, the EcoShale technology utilizes low temperatures for heating and does not require process water. The Enefit140 retort process, currently in use in its Estonian facilities and the predecessor to the

Enefit280, uses no water, runs on organic waste, and emits significantly lower CO2 emissions [<https://www.energia.ee/en/oi/1/oilandgas/enefit/140>]

While the BLM acknowledges that these two companies are planning commercial production in the Uintah Basin in the near future, BLM fails to examine these technologies in any detail or evaluate their assertions of reduced environmental impacts. The agency instead relies on assumptions based on old data [*Ibid*, Chapter 4, 4.1, pg. 4-2.].

This omission is serious. According to regulations for the implementation of NEP A: “If a draft statement is so inadequate as to preclude meaningful analysis, the agency shall prepare and circulate a revised draft of the appropriate portion.” [40 CFR 1502.9(a)]. BLM’s failure to include any kind of meaningful consideration of current oil shale and tar sand technologies and their environmental impacts is a serious breach of its responsibility to provide thorough, unbiased analyses in its EISs. CEQ regulations are very clear that EISs shall serve as the means for assessing the environmental impact of proposed agency actions, rather than justifying decisions already made.

#21) > <(**#22** [1]) The state strongly supports the development of oil shale and tar sands resources and

recognizes the significant contribution this development will provide Utah’s economy. Utah contains some of the richest oil shale reserves in the world. Unconventional fuels such as oil shale and tar sands are an important component of Governor Gary Herbert’s 10-year Strategic Energy Plan for the state [Energy Initiatives and Imperatives: *Utah’s 10-Year Strategic Energy Plan*, pg. 14.].

Energy development attracts new jobs, capital investment, and economic development opportunities for the state.

Information gathered by the Utah Office of Energy Development (OED) bears this out.

Enefit has invested over \$100 million dollars to bring its commercially proven technology to Utah [[https://www.energia.ee/-/doc/10187/pdf/concern/Interim report 20 II 03 eng. Pdf](https://www.energia.ee/-/doc/10187/pdf/concern/Interim%20report%20II%2003%20eng.Pdf)] and has indicated it will invest more if given the opportunity to develop resources on public lands. Questerre Energy Corporation recently signed a letter of intent to invest \$40 million in Red Leaf and their EcoShale In-Capsule technology, citing the success of the Utah pilot project [“Red Leaf Resources Get Green Light for Oil Shale Project in Utah”, April 5, 2012, <http://www.centerwest.org/publications/oilshale/7new/?p=450>].

As recent as April 2012, the major French Oil Company Total entered into a \$200 million Joint Venture with RedLeaf to further commercial scale operations [<http://www.marketwatch.com/story/red-leaf-resources-inc-total-ep-usa-oil-shale-llc-announce-a-joint-venture-for-oil-shale-production-project-2012-04-18>, *Red Leaf Resources, Inc & Total E&P USA Oil Shale, LLC announce a joint venture for oil shale production project*, Marketwatch website accessed 5/1/2012.].

In March of 2012,

the Uintah Transportation Special Service District awarded a \$9 million asphalt paving contract to surface the first 17 miles of a road to the Uintah-Grand County line with Plant Mixed Oil Sand Asphalt (PMOSA), a heated blend of Uintah county aggregate and tar sands. Additional paving contracts using PMOSA demonstrate a growing commercial demand for tar sands.

OED also performed an informal survey of companies who had either previously invested in oil shale and tar sands development or had indicated a strong interest in doing so in the future. Survey results showed that 99.7% of the investment dollars represented in the survey believed

that the primary impediment to developing oil shale and tar sands was uncertainty surrounding access to BLM lands, ranking overwhelmingly higher than lack of technology, capital, or access to state or private lands. With over \$190 million of recent (< 5 year) investment and over \$930,000,000 of planned (5< year) investment represented in the survey, OED calculates that implementing the Preferred Alternative, with its RD&D emphasis and limited acreage available for leasing, would prevent approximately \$3.26 billion dollars in investment in the state for oil shale and tar sands development. #22])>

<([#23 [3.4.4] Availability of Water

Supposition vs. Fact

The characterization of water resource use in the DPEIS study area lacks the clarity necessary to satisfy the requirements of NEPA, which stipulates that “statements shall be concise, clear, and to the point” [40 CFR § 1502.1]. Broad statements and the confusing application of water use terms cloud and complicate the analysis. The state asserts BLM’s data Jacks the necessary

confidence to properly evaluate the impact of oil shale and tar sands on water allocations under the Upper Colorado River Basin Compact, given the lack of clarity contained in the agency’s descriptions of water availability and usage.

The BLM describes water use in the Colorado River Basin as “highly developed, allocated, and regulated” [Draft PEIS Chapter 3, 3.4, pg. 3-61.].

This sentence is misleading. Although the statement is true for the lower-basin states, it misrepresents conditions along the main stem of the Green and Colorado Rivers in Utah. None of the Upper Basin States have developed all of their Colorado River Compact water, with the possible exception of New Mexico. Utah has yet to deplete or consume roughly 300,000 acre-feet of its approximately 1.3 7 million acre-feet of water under the Colorado River Compact, as evidenced by BLM’s own table included in the DPEIS [*ibid.* Table 3.4.1-3, pg. 3-67.].

The BLM should make it clear in its discussion of water allocation under the Compact that the 6 million acre feet of water available both physically and under the provisions of the Compact is the quantity of water the Upper Basin States may deplete or consume [*ibid.* 3.4.1.1, pg. 3-61].

While the BLM defines the terms “diversion” and “consumptive use” in the DPEIS, it does not define the term “demand.” It appears the BLM uses the term synonymously with diversion, which is not correct. Since the BLM does not provide a definition of “demand,” the use projections on two of the tables are misleading [*ibid.*, Tables 3.4-1-2 and 3.4.1-3, pp. 3-67-3.72].

and conclusions regarding supply and demand are faulty [*Ibid.* pp. 3-73, 3-74, 3-75].

The Utah Water Demand Table (3.4.1-3) shows the projected 2020 and 2050 demand will be greater than the 23% allocation of 6 million acre-feet available for the Upper Colorado River Basin under the compact [*Footnote j: ibid.*, pg. 3-70.].

Without a definition of supply or demand, this comparison is meaningless. The 6 million acre feet of water available for the upper basin states is not a limitation on diversion or demand, but rather a limitation on the allowable depletion or consumption. Statements regarding water use [*Ibid.* pg. 3-73.] make it appear that there is no water available to develop in the Upper Basin states. Utah has not fully used its allocation of the Colorado River Compact and, as the BLM indicates in its 2030 projections, even if consumptive uses are on the high end, Utah will still have a 268,425 acre-foot surplus for consumptive use

[*Ibid.*, Table 3.4.1-2, pg. 3-67]. #23)>

<([#24 [6.3.2] [3.4.3] The BLM Uses Outdated Assumptions Regarding Water Usage for Oil Shale and Tar

Sands Development

The BLM states that ‘although a certain amount of water is calculated to be available in . . . Utah . . . , this does not imply that the water is readily or physically available for development’ [*Ibid.* , pp. 3-74 and 3-75].

Supporting statements include:

- Oil shale basins and STSAs are situated in areas much smaller than the Upper Colorado
- Hydrologic basin on which water availability was calculated
- Storage and capture infrastructure may not be available in oil shale basins and STSAs
- Developers would have to acquire water rights either through transfer or purchase, since most of the water has been claimed
- Water use would be regulated under a number of state and federal regulations, as well as instream flow requirements to protect endangered fish [*Ibid.*,pg. 3-75]

These broad statements would apply to most water use in the Upper Colorado Basin and should not be used as justification for wholesale dismissal of water availability for oil shale and tar sands development.

In its discussion of water use for oil shale development, the BLM bases its assumptions on outdated information [Draft PETS, Chapter 4, 4.5.1 .2, pg. 4-33].

Its assessment assumes 2.6 to 4.0 bbl of water per barrel of oil for surface mining with a surface retort and underground mines with surface retorts and 1 to 3 bbl of water for in situ projects. Current technology utilizes 1 to 1.5 barrels of water per barrel of oil. New technologies do not use water for the actual extraction of the oil from the shale but primarily for dust control.

Recently permitted oil shale operations in Utah use considerably less water than the BLM assumes for purposes of the PEIS. According to Red Leafs permit “most water will be consumed for construction of the process capsules and for dust control. The EcoShale In Capsule process itself is a net producer of water” [Utah Division of Oil, Gas, and Mining. Red Leaf Large Mining Operation Application, Appendix K. Approved March 14, 2012.].

Red Leafs petroleum removal process extracts water

from the oil shale. Removed as water vapor, condensed, recovered and then put to use in mining operations, this process water will supply approximately one third of the total project water demand. All water captured, recovered, or withdrawn for use on the project is to be used on site [*Ibid.*]. The DPEIS assumption of 1-3bbl water/bbl oil produced for a 30,000-50,000bbVday in

situ plant does not take into account the different water requirements for Red Leafs mining technology [Draft DPEIS, Chapter 4, Table 4.5.2-1, pg. 4-43.].

Enefit's retorting process itself does not require water, although water is needed for cooling, upgrading, power production, and dust control [<https://www.enefit.com/en/oil/projects/usa>].

In considering the impacts to water

resources from Enefit's White River Mine, the BLM references its 2007 EA for OSEC's proposed mining operations at the mine site [Draft PEIS, Appendix A, A.5 .3.4.3, pg. A-79].

Water requirements for the OSEC operations,

based on the use of an A TP retort, are likely not comparable to those proposed by Enefit and

again shows that BLM has failed to cooperate and discuss these vital issues with industry. The state strongly suggests that BLM cooperates with industry and again asserts that the DPEIS is deficient without these efforts.

The anticipated decline in available Colorado River water is based in part on the development of water for oil shale and tar sands development [Draft PEIS, Chapter 4, 4.5.2.2, pg. 4-48].

This decline appears to be based

on the water requirements of older technologies and should be revised accordingly.

The BLM appears to believe that water is only available through retiring agriculture water rights [Draft PEIS, Chapter 4, pg 4-34-4.35; Chapter 5, 5.5. 1.2, pg 5-27]. In Utah currently, there are approved water right applications totaling well in excess of 10,000 acre-feet of water for the express purpose of developing oil shale and tar sands. The assumptions regarding likely water sources for tar sands development on Asphalt Ridge are flawed [Draft PEIS, Chapter 5, 5.5.2.2.1, pg 5-37]. Water in the Green River, which flows past the southern tip of Asphalt Ridge, is available for use. Until recently, there was an approved application to divert water from the Green River for tars sands development at Asphalt Ridge. The application is held by the Uintah Water Conservancy District, which plans tar sands development as a future use for the application. **#24])>**

<([#25 [9.2.2] The DPEIS Does Not Fulfill the Requirements of a Commercial Leasing Program as

Required by the Energy Policy Act of 2005

Section 369 of the Energy Policy Act of 2005 (EPACT) states “not later than 18 months after the date of enactment of this Act ... the Secretary (of Interior) shall complete a programmatic environmental impact statement for a commercial leasing program for oil shale and tar sands resources on public lands, with emphasis on the most geologically prospective lands within each of the States of Colorado, Utah, and Wyoming” [Public Law 109-58, “Oil Shale, Tar Sands, and Other Strategic and Unconventional Fuels Act of 2005,” Section 369 (d)].

Like the 2008 PEIS before

it, the 2012 Oil Shale Tar Sands PEIS seeks to simply identify lands “available for application for leasing” rather than completing an analysis that would make lands available for commercial leasing. The DPEIS, contrary to the intent of Congress in EP ACT, does not actually designate lands available for commercial leasing or establish the necessary guidelines or regulations for a commercial oil shale and tar sands leasing program by the BLM. The Preferred Alternative, in fact, takes a step backwards, constraining commercial leasing by:

- excluding large swaths of geologically prospective lands from application for leasing;
- demanding unnecessary, burdensome NEPA analyses that go beyond those required for conventional oil and gas and surface mining leasing programs; and
- predicating commercial leasing on the successful application of oil shale technology through an RD&D leasing program. **#25])>**

<([#26 [9.2] [2.2] Geologically Prospective Lands Excluded From Application For Leasing

The Preferred Alternative removes geologically prospective lands due to perceived conflicts with sage grouse core or priority habitat and lands with wilderness characteristics (LWCs). While the Settlement Agreement (“Agreement”) [Civil Action No. 09-cv-00085-JLK, February 15, 2011.] between the BLM and environmental plaintiffs that resulted in the revision of the 2008 PEIS ROD required the BLM to

analyze the environmental effects of an alternative that excluded these lands from oil shale and tar sands leasing, the Agreement did NOT require the BLM to select this alternative. As discussed above, BLM's analysis of these two factors is replete with errors in fact and policy. In fact, in light of the requirements of EPACT, the Preferred Alternative nullifies the intent of Congress to establish a commercial leasing program. #26)>

<([#27 [9.6.1] Unnecessary, Burdensome NEPA Analyses That Go Beyond Those Required For Conventional Oil And Gas And Surface Mining Leasing Programs

The BLM treats oil shale and tar sands leasing differently than oil and gas leasing and coal leasing by requiring additional levels of analysis before commencing commercial leasing.

The agency states "it anticipates, to the best of its knowledge, that the surface disturbing activities involved with other types of mineral development are comparable to those that may result from oil shale and tar sands development" [Draft PETS, Chapter 4, pg. 4-1].

It also says that it anticipates that oil shale

development will proceed in a three-step decision-making process similar to that used for federal on shore oil and gas [Draft PETS, Executive Summary, pg. ES-5]. Then it turns around and says that due to the experimental nature of oil

shale and tar sands technologies, the BLM believes the stages of NEPA compliance will be different from oil and gas. It goes on to explain that "(i)f and when applications to lease are received and accepted, the BLM will conduct additional required analyses, including consideration of direct, indirect, and cumulative effects, reasonable alternatives, and possible mitigation measures, as well as assessment of level of development that may be anticipated.

(Based on this analysis of future lease applications), the BLM will establish general lease stipulations and best management practices" for oil shale and tar sands leasing and development [Jd.]

These extra levels of environmental analyses are unnecessary and place an undue burden on companies wishing to develop oil shale and tar sands resources. The proposed process is so cumbersome and fraught with uncertainty that few companies could afford to secure investment and dedicate capital resources to development efforts, especially given the added possibility of additional delays due to protests or legal challenges. This lengthy process defeats the intent of EPACT to construct a commercial leasing program, a program originally scheduled to be in place by 2011.

There are adequate federal and state regulations to deal with the impacts of oil shale and tar sands operation that protect water quality, air quality, and other resource values. Oil shale and tar sand developments involve well-defined, basic extraction, processing, and upgrading techniques that have been in use in Australia, Brazil, Canada, China, Estonia, and Ireland. Oil shale and tar sands enjoy commercial success in Canada and Estonia and have been produced there successfully for many years. Similar extraction and production technologies have undergone RD&D testing in the United States since the 1960s. The impacts from developing these resources should not require further BLM analysis or research to understand the environmental impacts of oil shale and tar sands before leasing can take place.

Oil shale and tar sand leasing and associated development activities have occurred on Utah state lands for many years. These operations have proceeded in a manner that provides adequate protection of the environment under state regulatory programs sanctioned by the Office of Surface Mining (OSM) and the Environmental Protection Agency (EPA). The BLM gives no reason why similar activities, safeguarded by the same level of environmental protection, could not be carried out on federal lands absent further NEP A or BLM analysis. The BLM correctly

states that it would have ample opportunities to assess the impacts of OSTs development plans with further “NEPA analysis and other appropriate review” “before approval of a lease and subsequent plan of development on a lease” [Draft PEIS, Chapter I, pg. 1-1].

More RD&D and NEPA analysis is not needed now or before BLM proceeds to a commercial OSTs leasing program. **#27]>**

<([#28 [9.7] Commercial Leasing Predicated On the Successful Application Of Oil Shale Technology

Through An RD&D Leasing Program

The BLM declares in the Preferred Alternative that the agency “would like to maintain focus on RD&D projects” [Draft PEIS, Executive Summary, pg. ES-9].

This is not the mandate of EP ACT, which was to proceed to

commercial leasing. Congress did not ask the BLM to determine whether it wished to have commercial leasing or not. As was stated before, a number of companies have initiated pilot projects on state and private lands in Utah for years. One company, Red Leaf, is confident that its technology will lead to oil shale production on a commercial scale. It requested and received a permit from the Utah Division of Oil, Gas, and Mining (UDOGM) to proceed with commercial operations. The justification for seeking more RD&D data is not valid in the case of oil shale companies who might seek federal leases in Utah. **#28]>**

<([#29 [9.6] BLM’s RD&D Leasing Program

The BLM declares in the Preferred Alternative that the agency “would like to maintain focus on RD&D projects” [Draft PEIS, Executive Summary, pg. ES-9].

The state finds this unacceptable, as the previous RD&D Leasing

Program was not only excessively burdensome, but not economically attractive and, as a result, effectively killed interest in development of oil shale and oil sands on BLM land. As an example, the first round of RD&D leases offered more than 5,000 acres for commercial development if a technology was deemed ‘worthy’ by BLM. The second round decreased the amount ‘awarded’ to RD&D lease applicants to less than 700 acres, as well as increased the administrative oversight and bureaucratic burden. Quite simply, 700 acres is not enough area for a successful commercial project, as evidenced by the examples throughout these comments. In addition, BLM placed approximately 50% of Enert’s preferential lease area as ‘off-limits’ to development despite having identified this as an area which should be awarded to the RD&D lease holder.

This is a clear example of the disregard for the realities faced by industry and shows that BLM is not truly interested in understanding the requirements of a successful oil shale industry. A simple coordination with industry during the DPEIS process would have borne this out, but BLM showed no effort in this regard. The result is massive regulatory uncertainty that shadows the industry and prevents successful economic development. It is further evidence that the reason that there is less commercial success in the United States is not due to lack of technology, as asserted in the DPEIS; instead it is due to the regulatory uncertainty created by efforts like this DPEIS. **#29]>**

<([#30 [9.2.3] BLM’s Deal With Plaintiffs In The Settlement Agreement Is At Variance With The

Requirements Of EPACT

The BLM in many ways abrogated its responsibilities under EPACT when it signed the Settlement Agreement. The Agreement prohibited the BLM from issuing a call for expression of leasing interest for oil shale or offer lands for competitive tar sands leasing or expressions of interest in tar sands leasing prior to January 15, 2013 [Civil Action No. 09-cv-00085-JLK, 12,

February 15, 2012], well after the December 2012 deadline for issuance of an ROD. This defeated the stated purpose behind the original 2008 PEIS for establishing a commercial leasing program. The Agreement effectively precluded consideration of areas of interest to industry for the purposes of the 2012 PEIS while at the same time giving disproportionate weight to “nominations” of areas precluded from oil shale and tar sands leasing by environmental interests. This turns the intent of EPACT on its head.

The labyrinthine process created in this DPEIS makes it nearly impossible for companies to develop oil shale resources on public lands. How can interested parties make applications for commercial leasing of oil shale in the absence of a commercial leasing program? If BLM delays further oil shale leasing analyses until companies nominate lands for leasing and BLM has no mechanism to allow companies to nominate lands for leasing, it is difficult to see how there can be commercial level oil shale leasing.

This is troubling for a number of reasons. NEP A requires agencies to assess the direct and indirect effects of a proposed action [40 CFR 1508.8.]. It also requires analysis of the cumulative impacts of a proposed action [40 CFR 1508.7]. The BLM proposes to complete the analyses for areas nominated for commercial OSTIS leasing after the ROD. Since this information is critical to an informed decision on the allocation of lands available for leasing and should be considered in the DPEIS, the BLM effectively signed away its statutory responsibility to properly analyze a major federal action that required an EIS under NEP A when it entered into the Settlement Agreement [See 40 CFR 1508.18 (b) (3) as it applies to adoption of a program to implement a specific statutory program, specifically EPACT].

In contrast, the BLM incorporates information related to lands with wilderness characteristics inventoried over five years ago. It proposes to include priority areas for sage grouse in its lands for exclusion from leasing with no supporting evidence for the selection of these core areas. Yet it fails to consider current evidence of interest in lease areas; in fact, it prevents the consideration of this interest. The level of interest in oil shale and tar sands lease areas has a direct and indirect effect on oil shale development. Denial of consideration of industry interest has cumulative impacts both on the development oil shale and tar sands technologies as well as the implementation of a commercial oil shale tar sands leasing program. The Agreement did not require the BLM to predicate its leasing program on nominations of lands for leasing, nor did it prevent the BLM from establishing a commercial leasing program subsequent to the January 2013 date. Its selection of the Preferred Alternative indicates that the BLM did not seriously consider other options.

By entering into an Agreement that effectively foreclosed the opportunity for industry to express an interest in prospective areas or nominate appropriate areas for leasing prior to a ROD on the FPEIS and creating a situation in which the agency claimed it could not even consider such areas for the purposes of analysis in the DPEIS, the BLM :

- Violates the express provisions of EPACT to establish a commercial leasing program for oil shale and tar sands; and
- Violates NEP A by segmenting issues to a degree that it is impossible for the agency to take the requisite hard look at the environmental impacts of a commercial leasing program. #30)>

<([#31 [9.2.3] [10.5] [1.5] Segmentation of Issues Violates NEP A and Contravenes Intent of EP ACT

The BLM cannot properly analyze the impacts from oil shale and tar sands leasing

because the agency has failed to:

- consider expressions of interest in oil shale and tar sands areas
- establish royalties, fees, rentals, bonus, and other payments for leases
- consider the support and interest in Utah for the development of oil shale and tar sands resources
- establish a program to facilitate land exchanges to consolidate land ownership and mineral interests into manageable areas [Public Law 109-58, “Oil Shale, Tar Sands, and Other Strategic and Unconventional Fuels Act of 2005,” Section 369 (e), (n), (o).].

These actions are not only required by EPACT, they are necessary elements of a commercial leasing program. The 2008 PEIS provided the environmental analysis required by EPACT for a commercial leasing program, with the assumption that within a carefully prescribed

time period the other critical components of the program would be in place. Four years later, these critical pieces remain in a state of flux.

Consider expressions of interest in oil shale and tar sands areas

This was discussed at length earlier.

Establish royalties, fees, rentals, bonus, and other payments for leases

A recent oil shale rulemaking agreement [Civil Action No.-09-cv-00091-JLK] allows the BLM to change royalty rates for oil

shale and tar sands leases, with the notice of proposed rulemaking (NPR) due out after the DPEIS comment period closes. The BLM states that “determining commercial royalty rates” [Draft PETS, Chapter I, pg. 1-13.] is

outside the scope of the congressional requirements of EPACT for the BLM’s programmatic analysis for a commercial OSTs leasing program. By removing and replacing the current royalty rate and creating even greater uncertainty for industry, the BLM, as it did with the Settlement Agreement, chose to further erode the formation of a commercial oil shale and gas leasing program,

Consider the support and interest in Utah for the development of oil shale and tar sands resources

The BLM acknowledges that state interest in leasing is relevant, stating “it has been suggested by one of the cooperating agencies, and seconded by others, that BLM develop an alternative that would allow for larger scale leasing and development in Utah and Wyoming where the majority of the cooperators support a program that makes more federal oil shale and tar sands resources available for application for future leasing, while limiting development in Colorado, where the majority of cooperators favor a more cautious approach to leasing and development” [Draft PETS, 2.4.4, pg. 2-76].

Governor Herbert has made it quite clear that Utah favors this approach [Utah Energy Initiative: A 10 Year Strategic Energy Plan, Pg. 7].

However, The BLM dramatically reduced the acreage of lands allocated as available for leasing in Utah in the Preferred Alternative in apparent conflict with the high interest demonstrated by the state for increasing oil shale and tar sands development.

Establish a program to facilitate land exchanges to consolidate land ownership and mineral interests into manageable areas

The BLM admits it has no plans in place for land exchanges. The DPEIS contains no discussion of the ways BLM might facilitate such exchanges, either through requests for nominations for lands to exchange, determination of which federal lands are available for

exchange, extra staff and budgets to identify and expedite proposed exchange opportunities, or streamlined NEP A and land resource appraisals to foster quicker exchanges. The DPEIS simply avoids the subject by claiming that “the possible locations for such future exchanges are unknown at this time” [Draft PEIS, Chapter I, pg. 1-12].

Deferring or avoiding the identification of lands available for future exchange does nothing to move the BLM forward in facilitating or giving priority to land exchanges as required by EPACT.

The 2012 DPEIS was an ideal opportunity to remedy the lack of coordinated consideration of the cumulative impacts of these components on a commercial leasing program. Instead, the DPEIS segments these elements, removing them from even initial consideration, and cites the agency’s self-imposed inability to weigh these essential factors as justification for scaling back the lands available for leasing even further than it did in the 2008 PEIS. By excluding these significant aspects of a commercial leasing program from analysis in the DPEIS, the BLM fails to properly examine the full range of impacts from oil shale and tar sands leasing as required by NEPA, and has improperly segmented the analysis of the proposal. **#31)>**

<([#32 [8.3] [6.1.1] BLM Overstates the Amount of Land Truly Available for Leasing

BLM overstates the availability of oil shale lands by failing to discuss the potential for conflicting known uses. Much of the land proposed for availability for oil shale leasing is already leased for oil and gas, and projects are planned to develop those resources. It is nearly impossible for both developments to occur on the same piece of land. The discussion in the DPEIS does not adequately reflect the true status of lands available for oil shale development because of existing proposals. The BLM uses out-of-date (pre-2005) information and grossly underestimates levels of oil and gas drilling in the Book Cliffs area [footnote: Utah Division of Oil, Gas, and Mining drilling statistics by county for Duchesne and Uintah Counties for the years 2008 through 2011 give an average annual rate of 264 oil wells in Duchesne County (Diamond Mountain area) and

88 oil wells and 410 gas wells in Uintah County (Book Cliffs area). Using these updated average annual drilling rate

figures for 20 years, rather than the incorrect 15 year planning level presented in Table 6.1.6-5, provides estimates of

5280 oil wells in Duchesne County (versus BLM’s 76 oil wells) and 760 oil and 8200 gas wells in Uintah County

(versus BLM’s 62 oil and 143 gas wells) as the expected amount over a 20-year planning horizon. Attachment A I,

Section 6, Current Crude Source, pg A-1 09, needs to be revised to reflect current information on oil production

levels, which have increased significantly in the last few years. For example, Utah is currently producing at least 57

to 58,000 barrels per day compared to the 43,000 barrels per day depicted in Figure 8. The discussion of PADD 4

does not reflect the new pipeline connecting Salt Lake City, Utah to the Las Vegas, Nevada market]. The DPEIS must be rewritten to discuss the conflict with oil and gas operations, discuss the minimal amount of lands

available as a result of oil shale leasing in Utah in the next 20 years.

The DPEIS also needs to discuss making a suitable amount of lands available for oil shale and tar sands leasing in the face of the oil and gas development. As discussed above, the

oil shale industry is ready to proceed, and the BLM must provide enough resource to allow this industry to flourish. Allowing this will reduce our reliance on foreign oil, create jobs and bring significant economic development to every state involved. The state suggests modifying the definition of the most geologically prospective oil shale lands in Utah to include resources to a depth of 3000 feet. **#32]>**

Conclusion

The State of Utah appreciates the opportunity to work with the BLM on the development of active oil shale and tar sands industries in Utah, and stands ready to rework the DPEIS in order to do so. Specifically, we request that the BLM prepare the analyses requested by the state and local governments in Utah, and issue a Supplemental Environmental Impact Statement which discloses these new analyses to public scrutiny under the provisions of NEPA. The state also urgently requests the BLM to immediately request further time to complete these analyses from the Court, for the reason that the tight time frame originally set out has proven too narrow to meet the provision of substantive federal law. The state offers to support the BLM in this request.

<([#33 [9.2.3] [1.1.1] The State of Utah also respectfully formally informs BLM, pursuant to the terms of

EPACT 2005, that it will not be bound by the artificial timeline set out in the Settlement Agreement providing that the amendments to the existing oil shale regulations will be offered for public comment on or about May 15, 2012, after the comment period on the DPEIS has closed. The BLM is required by EP ACT 2005 to consider the views of the Governors of the states involved, and is required to consider the effects of the land allocation decisions and the regulatory structure simultaneously as part of those consultations. The land allocation decisions and the leasing and royalty structure are part and parcel of the total leasing program envisioned by EPACT 2005. The state will not allow the law which created these consultation requirements to be artificially segmented by actions of the BLM and non-governmental parties, no matter the forum employed by BLM to create this improper segmentation. The state will be offering the BLM substantive comment about the connection between the land allocation information in the DPEIS and the soon-to-be-announced new regulatory structure. The state will require the BLM to consider any such comments as part of the record in the final decision concerning the Record of Decision based upon the current DPEIS. **#33]>**

<([#34 [2.1.1] The State of Utah strongly supports the work done by the BLM which culminated in the

2008 Records of Decision, and will actively and vigorously oppose any amendments or other changes to those decisions. The state specifically requests the BLM to consider the other alternatives within the DPEIS in light of the rush to poor analysis occasioned by the illconceived timeline set out in the Settlement Agreement, and determine that more time is necessary for BLM to obtain sufficient information to make a reasoned decision. In light of the need for further information and analysis, and the need for a Supplemental EIS to provide this information to the public for review. Fundamentally, the state requests that BLM simply choose the No-action alternative, and affirm the earlier work.

#34]> Thank you for the opportunity to work with you to improve the land in Utah, and to provide for a healthy economy. Additional comment is attached as an Addendum and Technical Comments. Please feel free to contact myself for any further information that you may need.

Addendum To State of Utah Comments

Environmental Permit Requirements

<([#35 [3.5.2] [3.5.5] [3.5.6] [9.3] **Air Quality**

The state is heavily engaged in studies designed to identify potential adverse impacts on regional haze and winter ozone levels in the Uintah Basin. The state objects to the conclusory statements drawn from generalized information. The DPEIS indicates that PM_{2.5} and ozone could rise above acceptable levels in the Uintah Basin if oil shale and tar sands development begins on a commercial scale.

The DPEIS, however, contains some pro forma references to state and federal regulatory means for addressing air quality issues, particularly in the Uintah Basin, that lack the specificity required for informed decision-making. Annual emission inventory for criteria pollutants and VOCs for counties is ten years old [Draft PEIS, Chapter 3, 3.52, pp. 3-105-107].

UDAQ recommends updating the emissions to most current available inventory.

Utah Division of Air Quality urges the BLM to identify best management practices (BMPs) for the reduction of PM, NO_x, and VOC emissions from oil shale and tar sands operations. The Division also requests that BLM consider the cooperative efforts currently underway statewide and regionally to tackle the challenges presented by wintertime ozone. The results of these studies and cooperative partnerships are important for BLM's decision-making process on the allocation of areas available for oil shale tar sands leasing and should be part of the DPEIS analysis.

Regulatory Mechanisms

A Memorandum of Understanding (MOU) signed by the Department of Agriculture, Department of the Interior, and the Environmental Protection Agency on June 23, 2011, committed the signatory agencies to a clearly defined, efficient approach to compliance with NEPA regarding air quality and air quality values (AQRVs) in connection with oil and gas development on federal lands [*Memorandum Of Understanding Among The U.S. Department Of Agriculture, U.S. Department Of The Interior, And U.S. Environmental Protection Agency, Regarding Air Quality Analyses And Mitigation For Federal Oil And Gas Decisions Through The National Environmental Policy Act Process.*].

The MOU established procedures for assessing impacts related to NAAQs and AQRVs. The DPEIS referenced the MOU for GHG emissions [Draft PETS, Chapter 4, 4-6.1.1.1, pg. 4-57]. but failed to do the same for other criteria pollutants.

According to Section V.D. of the MOU [*Memorandum of Understanding, pg. 9.*], “ ... the Lead Agency (BLM) will complete and document supporting air quality and AQRVs analyses prior to (f)ederal oil and gas planning, leasing, or field development decisions. “ (*emphasis added*)

These air quality and AQRVs analyses should incorporate the most current data. The county annual emissions inventory data cited in the DPEIS is ten years old. The Utah 2008 Statewide Emission Inventory contains the latest data and is available on the UDAQ web site at: [http://www.airquality.utah.gov/Planning/Emission-Inventory/2008 State/08 State List.htm](http://www.airquality.utah.gov/Planning/Emission-Inventory/2008%20State/08%20State%20List.htm).

The state summary, last updated in November 2010, categorizes emissions for the six criteria pollutants by area source, non-road mobile, on-road mobile, point source, biogenics and wildfires:

([http://www.deq.utah.gov/search results.htm?cx=0032154170477771 85873%3Asg4mqvgk&q=2008+emissions+inventory+county&cof=FOR1D%3A9](http://www.deq.utah.gov/search%20results.htm?cx=0032154170477771%2085873%3Asg4mqvgk&q=2008+emissions+inventory+county&cof=FOR1D%3A9)).

The inventory includes detailed annual emissions from point sources in each county (<http://www.airquality.utah.gov/Planning/Emission->

Inventory/2008 State/2008 FormB CountyDetails112210.pdf) as well as from area sources (<http://www.airquality.utah.gov/Planning/Emission-Inventory/2008 State/2008 Area revised 11301 O.pdD>).

UDAQ has pointed out this omission in previous comments. According to the MOU [*Ibid.*], early in the NEPA process the lead agency will discuss with the agencies:

- information about the affected environment to include in the baseline assessment;
- methodology, assumptions, and scale of the analyses; and
- monitoring protocols and mitigation

The BLM has yet to include this important information in its air quality impact analysis.

UDAQ requests the BLM update its data and utilize the 2008 emission inventory in its analysis for the DPEIS.

Monitored concentrations representative of the study area [Draft PEIS, Chapter 3, Table 3.5.3-2, pp. 3- 11 2-113] reference concentration

levels for PM₁₀, PM_{2.5}, and SO₂ from monitors in surrounding states, specifically the Grand Junction CO Powell Station and Rock Springs, WY station. Data from these monitors, located at some distance from oil shale/tar sands resources in Utah, do not provide the necessary specificity for an accurate accounting of emission levels in the Uintah Basin. UDAQ, through its 2012 Winter Ozone Study, is collecting air quality data from 20 fixed, distributed monitoring stations in the Basin and two air quality “super sites” in Roosevelt and Horsepool. Three permanent monitors in Fruitland, Roosevelt, and Vernal supply regional air quality information. Data from these sites should be considered in any analysis of air quality in the study area.

About 75% of all PM_{2.5} found on UDAQ’s monitoring filters is created by secondary particulate formation, which occurs when precursor emissions, usually NO_x, SO_x, and VOC, react in the atmosphere to form PM_{2.5}. Oil and gas operations emit precursor gases that contribute to the formation of PM_{2.5} and oil shale development would likely do the same.

UDAQ recommends the BLM utilize the data from the aforementioned monitoring stations located in the Basin, incorporate this data into the FPEIS, and consider it in its Record of Decision. Any impact assessment for air quality from oil shale and tar sands development should contain the available emissions data from the Uintah Basin 2012 Ozone Study (see below). The preliminary results from this study, scheduled for release in July, will provide a more comprehensive picture of air quality conditions in the Basin. Given the challenges facing the Basin with ozone and PM_{2.5}, the BLM should utilize the most up-to-date air quality information to make informed decisions on oil shale lease allocation decisions.

In addition, UDAQ requests the BLM reference the MOU Appendix “Modeling Approaches to Evaluate Air Quality for NEPA Decisions Regarding Federal Oil and Gas” in support of the requirements of Section V.D. The Reusable Modeling Framework (RMF) contained in the Appendix recommends that

“(/)or future emissions, projections should be made ft-om the base year to 10-15 years forward to examine the potential for maximum growth in the planning area. “

Emissions projections will apprise the DLM of potential air quality issues associated with commercial scale oil shale development and should be part of the air quality analyses for lease allocation decision-making.

Best Management Practices

Normally, the state uses the New Source Review (NSR) program to regulate oil and gas emissions, with sources subject to Best Available Control Technology (BACT) review, modeling, and public comment before receiving a permit. To qualify for NSR, sources must meet

a minimum threshold of emissions- 5 tons per year of any criteria pollutant, less than 500 pounds per year of any single hazardous air pollutant, or less than 2,000 pounds per year of combined hazardous air pollutants. If the source emits less than the threshold they fall outside of NSR regulations (de minimis emissions).

In the Basin, many of the oil and gas emission sources, including wellheads and tanks, do not meet the NSR threshold and are not regulated [UAC R307-413-2.]. RD&D oil shale projects will probably also

not meet this NSR threshold. UDAQ and its partners in the Basin are working with stakeholders to determine the feasibility of other regulatory measures for sources that fall outside of NSR to establish better pollution controls for smaller sources.

Emissions that fall within this de minimis exemption could include fugitive dust from mine operations, products of combustion including SO_x, NO_x, CO, CO₂, and VOC from oil processing and handling equipment.

Proposed National Environmental Standards for Hazardous Air Pollutants or NESHAPS regulations on oil and gas sources [76 FR 52738, Tuesday August 23, 2011.] could significantly lower emissions, particularly from VOC

sources. These VOC reduction methods include the use of low bleed pneumatic controllers, wet seals on centrifugal compressors, rod packing replacement for reciprocating compressors, and the use of vapor recovery units on storage tanks. Use of these controls could prove crucial to protecting Basin air quality while allowing for resource development.

We have included suggested oil shale development BMPs for fugitive dust, VOCs, and combustion engines. These BMPs include management practices for emissions from current oil shale development projects. The BMPs cited do not represent the full complement available for emissions reduction.

Fugitive Dust

Blasting

- Stabilize surface soils where drills, support equipment, and vehicles will operate
- Pre-water and maintain surface soils in a stabilized condition
- Apply and maintain a chemical stabilizer on surface soils
- Stabilize soil during blast preparation activities
- Limit the blast footprint to no larger than what can be practically stabilized immediately following the blast
- Maintain surface rock and vegetation where possible to reduce exposure of disturbed soil to wind
- Stabilize soil after blasting
- Water disturbed soils to form crust immediately following blast and safety clearance

Clearing

- Stabilize surface soils where support equipment and vehicles will operate
- Pre-water and maintain surface soils in a stabilized condition or,
- Apply and maintain a chemical stabilizer on surface soils
- Stabilize disturbed soil immediately after clearing and grubbing activities
- Water disturbed soils to form crust, or
- Apply and maintain a chemical stabilizer on disturbed soils to form crust.
- Stabilize slopes at completion of activity
- Stabilize sloping surfaces using soil binders until vegetation or groundcover can effectively stabilize the slope

- Apply water and maintain sloping surfaces/wind breaks in crusted conditions

Additional Ongoing Measures

- Water unpaved roads periodically or apply chemical stabilizers
- Remove dust-forming debris from roads promptly and scrape and compact unpaved roads frequently to stabilize the road surface
- Restrict the speed of vehicles in and around the mining operation
- Revegetate, mulch, or otherwise stabilize the surface of all areas adjoining roads that are a source of fugitive dust
- Restrict the travel of vehicles on other than established roads
- Enclose, cover, water, or otherwise treat loaded haul trucks to minimize loss of material to wind and spillage
- Substitute conveyor systems for haul trucks and cover conveyor systems when conveyed loads are subject to wind erosion
- Minimize the area of disturbed land
- Revegetate lands promptly
- Plant special windbreak vegetation at critical points in the permit area
- Control dust using water sprays, hoods, dust collectors or other controls
- Reduce the period of time between initially disturbing the soil and revegetating or other surface stabilization
- Restrict fugitive dust at spoil transfer and loading points
- Control dust from shale storage piles through use of enclosures, covers, or stabilization

Combustion Engines

Require the following emission standards for stationary internal combustion engines:

- 2 g/bhp-hr of NO_x for engines less than 300 horsepower
- 1 g/bhp-hr of NO_x for engines over 300 horsepower.

Control emissions from engines utilizing Best Available Control Technology (BACT) such as lean-burn technology, catalysts, air/fuel ratio controllers or other technologies. Schedule proper maintenance and upkeep of vehicles to ensure optimal functioning of engines.

Volatile Organic Compounds

- Use vapor control systems on tank breathing vents, with vapors routed to condensers and/or combustion for tanks larger than a certain capacity [40 CFR 60 Subpart Kb] is if the material has a true vapor pressure greater than 5.2 kPa. This is equal to 5.2 bar, 0.05 atmospheres, or 0.76 psig.
- Conduct regular leak detection using a VOC detection device and repair all process connections in VOC service
- Ensure regular maintenance of tanks, roof seals, hatch seals, and tank loading process connections
- Replace safety relief valves less than 48 hours after use
- Operate thief hatches in the locked position at all times when the tank itself is not being actively maintained
- Discourage the use of surface evaporation impoundments to receive produced wastewater
- Use pneumatic controllers with a no bleed or low bleed design

Studies and Partnerships

UDAQ is currently involved in several studies to address the problem of wintertime ozone in the Uintah Basin. Stakeholders from the oil and gas industry, federal land management agencies (including the BLM), several western states, and the EPA have joined forces to identify the causes of winter ozone and formulate mitigation strategies.

In 2009 and 2010, monitors showed that concentrations of both PM_{2.5} and ozone were at or near the current state and national standards. The EPA and the Ute Indian Tribe have four monitoring stations in the Uintah Basin: Myton, White Rocks, Ouray, and Red Wash. In the winter of 2010, ozone levels reached a high 8-hour value of 139 ppm during inversion conditions, nearly twice the national health standard. UDAQ wintering monitoring studies for 2007, 2008, and 2009 have shown that, under inversion conditions, PM_{2.5} concentrations are at or above the standard and can be as high as those seen along the Wasatch Front. Due to low snow cover this winter, in 2012 ozone levels did not exceed these standards. However, UDAQ anticipates that under normal snow cover conditions in the Basin, ozone levels will rise above this standard during wintertime inversions.

The Uintah Basin 2012 Winter Ozone Study was a comprehensive study of the atmospheric chemistry and precursor gases that form wintertime ozone in the Basin. The study was by far the largest and most complex air quality study ever conducted in Utah. The nearly \$3 million effort was funded by a number of agencies, including the Uintah Basin Impact Mitigation Special Service District, Western Energy Alliance, BLM's Utah Office, and EPA Region 8. Cooperative research work was undertaken by atmospheric research partners from USU, NOAA's Chemical Sciences and Global Monitoring Divisions, University of Colorado's Institute

of Arctic and Alpine Research, DAQ, EPA, BLM, and local oil and gas producing members of the Western Energy Alliance.

Study components included:

- Basin-wide ozone and precursor measurements to determine spatial extent of the problem.
- Long-term monitoring of ozone and key precursors at two "super sites"- Roosevelt and Horse Pool-to provide baseline trend information against which energy production increases and mitigation work can be evaluated.
- Intensive atmospheric chemistry studies to understand the chemical pathways and determine limiting formation precursors.
- Development of a complete, detailed inventory of emissions sources in the Basin, including information on location, operation, and pollutants emitted.

Preliminary results and conclusions are scheduled for release in July 2012. The goal of the study is to develop a conceptual model of wintertime ozone formation in the basin and identify appropriate and effective air pollution mitigation strategies. While the lack of snow this winter hindered efforts to analyze the photochemical reaction of sunlight on snow that seems to lead to ozone production, the emissions inventory component of the study was still important. The emissions inventory identified source emitters, emission rates, and emissions characteristics. Source specific measurements located areas of high concentrations for precursor gases. This data will not only aid in identifying the location, level, and spatial representation of ozone and its precursors in the Basin, but will also assist in the development of mitigation measures and strategies for emissions reductions in areas where high levels of ozone have been detected. Utah, Colorado, and Wyoming, the EPA, the BLM, and the U.S. Forest Service are participants in a pilot project called the Three-State Study. The project will provide a regional

assessment of air quality conditions by focusing on the impacts from oil and gas development. Leasing allocation decisions in the DPEIS for oil shale and tar sands will be located in these three states and the findings from this project on air quality issues in the Uintah Basin will have bearing on oil shale development in the area.

Specifically, the pilot project focuses on the following activities:

- Expanding air quality monitoring to establish baseline conditions, track trends, and evaluate model performance;
 - Creating a data warehouse to store, manage, and share data among state and federal agencies, industry, and their contractors to support modeling of air pollutants; and
 - Performing regional scale air quality modeling of current and projected conditions.
- UDAQ has also established an Oil and Gas Air Quality Partnership to evaluate the impacts of oil and gas development on air quality and determine the best approaches for managing the Uintah Basin air shed. UDAQ will include oil shale development in this effort. Representatives from the following agencies are involved in the partnership:

Anadarko Petroleum
 Bill Barrett Corporation
 Bureau of Land Management
 Duchesne County Commission
 ECO Resources
 Energy Dynamics Lab
 Environmental Protection Agency
 GASCO
 McVehil Associates
 Newfield Exploration
 QEP
 Questar
 Red Leaf Resources
 Rocky Mountain Power
 SITLA
 Tri-County Health Department
 Uintah County Commission
 Uintah Impact Mitigation SSD
 Utah Cooperatives
 Utah Department of Environmental Quality
 Utah Division of Air Quality
 Utah Governor's Office
 Utah Petroleum Association
 Ute Energy
 Western Energy Alliance

These collaborative efforts demonstrate the willingness of parties involved in resource development in the Basin to work cooperatively in search of solutions. These partnerships and the resulting development of air quality mitigation strategies will have a direct bearing on the resource use decisions contained in the DPEIS and should be given thorough consideration.

#35])>

**<([#36 [3.4.2] Water Quality
 Surface Water Quality**

In Utah, oil shale reserves are located primarily in the Green River Formation within the Colorado River drainage. Surface waters in the Uintah Basin are known for high salinity. Several rivers located in the area are listed on Utah's 303(d) list of impaired water bodies for high salinity (total dissolved solids, or TDS) at levels that do not protect for agricultural uses. When pollutants impair the use of water a study is required to determine how to reduce them and restore water quality. This study is known as a Total Maximum Daily Load (TMDL). A TMDL establishes the maximum amount of a pollutant allowed in the water while maintaining all of its designated beneficial uses. Several water quality studies have been conducted in the Colorado drainage that address the reduction of pollutants like salinity and the restoration of water quality. A full list of approved TMDL's for this area of Utah is located online at or by request from the Division of Water Quality.

The development of oil shale and tar sands as described in the DPEIS will have impacts on the Bitter Creek and Willow Creek watersheds, which will have to be addressed. Willow Creek is on the 2010 Utah 303(d) list of Impaired Waters for biological degradation based upon macro invertebrate data. Bitter Creek frequently exceeds numeric water quality standards for both TDS (> 1,200 mg/l) and boron (> 750 ug/l). Currently, the main source of TDS and boron in the Uintah Basin is from the erosion of weathered rock. The BLM should consider and, wherever possible, control for actions that could potentially increase either TDS or boron concentrations in the surrounding surface waters.

Oil shale development can potentially cause impacts to surface water quality through:

- Erosion;
- Withdrawal of water for operations; and
- Discharge of water used in operations

Ground disturbance activities (erosion) can degrade surface water through drainage from prepared sites, which can contribute sediment, salts, and possibly chemicals and oil shale products into receiving streams. Typically, DWQ minimizes the degradation to surface water from ground disturbance activities through stormwater permits. However, mining activities are exempt from this requirement unless the water comes into direct contact with tailings. The BLM should evaluate the potential for water-tailings contact. In the event a permit is not required for oil shale projects, DWQ recommends the development of a detailed plan that minimizes stormwater influence on surface waters and a monitoring program that measures the effectiveness of mitigation measures. A voluntary mitigation plan would demonstrate a commitment by project developers to sustainable development and would provide necessary data for future expansions.

Withdrawal of groundwater during mining operations can potentially affect surface water quality. Significant decreases in groundwater aquifers can result in a corresponding decrease in inputs to streams or lakes. Such decreases would likely increase stream temperature and Dissolved Oxygen (DO), which could have damaging effects on fish and other wildlife. It is frequently difficult or impossible to contain all of the groundwater withdrawn for mining operations, which necessitates a Utah Point Source Discharge Elimination System (UPDES) permit. #36]>

<([#51 [3.4.2] Groundwater Permits

Groundwater conditions in the southern Uintah Basin are poorly known because the area has not been exploited for groundwater historically and the predominance of fine-grained sedimentary rocks in the area is not favorable to containing groundwater in aquifers. Aquifers

controlled by the stratigraphy are present, mainly in the subsurface. The Douglas Creek and Bird's Nest aquifers are good examples of these types of aquifers.

These aquifers will become increasingly important as the area is developed for oil shale and tar sands operations. Isolated aquifers and zones of saturation such as PR Spring may be locally important sources of water. Oil shale and tar sands operators should, as part of their mine development activities, prepare an inventory of springs and seeps near their proposed operation and note occurrences of groundwater in exploratory drill holes and water wells. Operators should take samples from these sources to determine background groundwater quality and class.

When ongoing monitoring or other reporting is necessary to ensure groundwater protection, the permittee and DWQ will develop and mutually agree upon permit conditions. A draft version of the permit will be made available to the public for a 30-day comment period, and after resolution of concerns raised during this comment period, a final permit will be issued.

#51])>

<([#52 [3.4.2] Groundwater Discharge Permits

The Utah Ground Water Quality Protection Rules (UAC R317-6) allow DWQ to protect Utah's groundwater resources by issuing ground water discharge permits. The rules require facilities that have the potential to cause a discharge of pollutants to groundwater to apply for a ground water discharge permit. These facilities include mining and milling operations with waste management units such as tailings impoundments and waste storage piles. This requirement ensures that oil shale and tar sands facilities that have the potential to impact groundwater resources are regulated by the state to minimize or prevent degradation of groundwater quality. Groundwater discharge permits require site-specific characterization of the proposed facility including depth to ground water, hydraulic gradient, ground water flow direction, and pre-operational background ground water quality.

The two primary components of a groundwater discharge permit are best available technology and groundwater monitoring. Best available technology minimizes the discharge of contaminants from the waste source by applying control and containment technologies such as liners, leak detection systems, leak collection systems, and pump-back systems. Groundwater quality monitoring in compliance wells measures the actual effect of the facility operations on groundwater quality. The rules utilize federal drinking water maximum contaminant levels as groundwater quality standards. Permit-specific protection levels are percentages of the standards based on the site- or well-specific Groundwater Class (i.e., the better the ground water quality, the more stringent the protection level). If practical, based on depth to groundwater, compliance monitoring wells are used to provide an early warning of contamination. This allows time to implement corrective actions well before beneficial uses are adversely affected. Permit conditions can also address the discharge of subsurface water affected by a permitted facility that may become a nonpoint source of pollutants to surface water.

In some cases, after review of the material submitted in a groundwater discharge permit application, DWQ may conclude that the project qualifies for permit-by-rule status, if it has *de minimus* effect on water quality or if other regulatory programs insure protection of water resources.

#52])> Technical Comments

<([#37 [13] Preamble, Page xxiii, line 15:

Insert "SITLA" as an acronym for "School and Institutional Trust Lands Administration (Utah)"

#37])> <([#38 [2.2] ES. 6.3, page ES-6, lines 28-29:

Core or priority sage grouse habitat, as defined by such guidance as the BLM or DOI may issue” has not been determined. DOI and BLM have committed to defer to state-level determinations of what constitutes such habitat. These processes are ongoing. As more fully set forth in the body of these comments: (1) the State and its constituent agencies cannot adequately comment on the proposed alternatives until the extent of such habitat is determined; and (2) the PEIS appears to be based on maps of such habitat that have not been themselves released for public comment or reviewed under NEP A. #38])>

<([#39 [10.6] Chapter 1, Page 1-13, lines 32-37:

It is erroneous to exclude oil shale regulations and national policy from the scope of the PEIS. BLM is obligated to follow the law in its analysis. EPACT 2005 explicitly makes development of oil shale resources a national policy priority. The PEIS needs to include a detailed analysis of the relationship between each alternative and national policy as expressed in EP ACT. Similarly, determination of commercial royalty rates should not be excluded from the scope of the PEIS. Depending on the level at which such rates are set, the range of foreseeable development of oil shale resources will vary greatly. The analysis of each alternative should include analysis of development scenarios under various royalty rates, or else be delayed until royalty rates are determined, and then analyzed. #39])>

<([#40 [1.5] Chapter 1, page 1-20, II. 20-23:

The PEIS states that BLM has not received any new information since the 2008 OST PEIS and ROD concerning the environmental consequences of commercial oil shale development. There is a wealth of public information that is available and should be considered. These include multiple reports prepared on behalf of the U.S. Department of Energy by the University of Utah’s Institute for Clean and Secure Energy on environmental, resource and socioeconomic consequences of unconventional fuel development in the subject area, prepared in response to Section 369 of EPACT. Significant information is also available with respect to development of oil shale and tar sands on state trust lands in Utah, notably in the form of public files for mine permitting on file with the Utah Division of Oil, Gas and Mining and the Utah Division of Water Quality. The DPEIS must be revised to take into account each of these sources of information. #40])>

<([#41 [9.2.2] Chapter 2, Page 2-13, II. 10-24.:

As noted in the body of the state’s letter, the PEIS should confirm that just because BLM lands are withheld from competitive leasing does not disqualify the lands from conveyance to the State by land exchange in accordance with Section 369(n) of EPACT, other exchange authority, or state indemnity selection.

This section of the PEIS should also be reworded to discuss how BLM will follow Congress’ mandatory directive in Section 369(n) of EPACT that it will give priority to land exchanges. As currently draft, the PEIS notes the directive, and then devotes most discussion to why BLM will have problems with doing so. The PEIS should reflect that by law such exchanges are to be a priority. The PEIS should also note the environmental benefits of land exchanges, including protection of natural values and other resources on state trust lands through conveyance to the United States.

This section of the PEIS also needs to be supplemented to reflect legal alternatives to an appraisal process in concluding land exchanges. Existing BLM land exchange regulations state: *In the absence of current market information reliably supporting value, the authorized officer may use other acceptable and commonly recognized methods to determine market value: 43 C.F.R. 2201.3-2(c).*

This language has been used as the basis for multiple oil shale land exchanges between BLM and Utah on the basis of ton-for-ton conveyance of oil shale, adjusted for energy content, without necessity of appraisal. Similarly, the Utah Recreation Land Exchange Act of 2009, Pub. L. 111-53, contains language for transfer of federal oil shale land to the State without appraisal, based on BLM reserving an interest in future oil shale production from the lands equal to 50% of bonuses and rentals, and BLM's royalty share, less preexisting mineral revenue sharing obligations to the State. See H. Rep. 111-79 at 6-7 (analysis of section 3(f)). Proposed legislation now pending in Congress as H.R. 4027 contains similar language with respect to mineral valuation. The PEIS should recognize these authorities. #41)>

<([#42 [6.5] Chapter 4: Effects of Oil Shale Technologies

Table 4.1.1-1 Assumptions Associated with a Surface Mine with Surface Retort, page 4-3.

This table needs further explanation of the data presented to improve clarity. For example, the "(f)ootprint of development area (acres)" for Wyoming and Utah should give a number based on a time frame (per/yr) as is done with "water use," rather than the vague footnote explanation that it is the disturbance at any given time. The factor listed for "surface disturbance" is a larger number of acres than one could assume is the cumulative life of mine disturbance and it would be helpful to have the number in the table labeled as cumulative rather than having the reader refer to the footnote for extra clarification. The "wastewater" factor is provided on a gal/ton basis, but the table does not contain any data on the annual or cumulative number of tons produced. Such data would make this number meaningful in relation to the other factors provided. The wastewater factor should be in gallons per year, or ac-ft /yr, or gallons per barrel of oil produced in order to be meaningful. The "total employment" factor is not the sum of the direct and indirect employment factors and there is no explanation of how the BLM derived total employment from direct and indirect sources. #42)>

<([#43 [6.5] Table 4.1.2-1 Assumptions Associated with an Underground Mine with Surface Retort, page 4-8.

This table suffers from the same lack of clarity in data presented as mentioned for Table 4.1.1-1. #43)>

<([#44 [6.5] Table 4.1.3-1 Assumptions Associated with an In Situ Retort Project, page 4-11

This table suffers from the same lack of clarity in the data presented as mention for Table 4.1.1-1.

#44)> <([#45 [6.5] 4.1.6 Expansion of Electricity-Generating Capacity, page 4-13

This section mainly refers to the high electricity need for in situ projects proposed for Colorado, and does not differentiate that from the lower power need for the mine and retort technologies proposed in Utah. Specifically, this section does not reflect that ENEFIT and Red Leaf assertion that their operation will supply nearly all their own project energy needs from the retorting process. In addition, the first paragraph incorrectly states that definitive information about the power requirements of commercial oil shale development is not available. This is not the case with the ENEFIT technology. BLM's analysis is faulty because it does not include specific information about ENEFIT and Red Leaf technologies, which are both poised for commercial development in Utah. #45)>

<([#46 [3.4.5] 4.2.1.2 Acquisition, Conversion, or Transfer of Water Rights, page 4-19

This section only discusses water rights in Colorado, not in Utah or Wyoming. The ENEFIT project acquisition included water rights. The DPEIS needs a more complete and balanced discussion about water rights for all three states. #46)>

<([#47 [3.4.5] [6.3.2] 4.5 Water Resources, starting page 4-31

The discussion in this section and various subsections tends to use relative terms like “large” and “small” without defining what is meant quantitatively by such terms. For example, on page 4-33 under Water Use, on line 41, the PEIS states that “A large amount of water is required during the operations phase.” Subsequent sentences give actual numerical ranges of water use, but nowhere is the term “large” actually defined. Likewise, on page 4-39, the last sentence EIS states that “(a) relatively large water-quality impact is expected in areas where population growth is large and the receiving water is small.” The PEIS should define such relative terms in quantitative terms. #47]>

<([#48 [6.2.1] 4.9.1.4.2 Power Generation Facilities, page 4-152

This section relies on outdated information that anticipates new power generation coming from coal-fired power plants. Pending carbon management legislation and a surge of new domestic natural gas supplies means new power plants in Utah would likely be gas-fired. This assumption of coal-fired power generation and any associated analysis incorporating this assumption is out-of-date for the present market situations. BLM needs to revise the DPEIS to reflect the current market situation for new power generation plants. #48]>

<([#49 [3.14] 4.15 Health and Safety, page 4-199, Table 4.15.2

At the beginning of Chapter 4, the BLM revised the size of mining and surface retort and in situ oil shale projects downward, but this table utilizes the 2008 scenario of a 1,000,000 bbl/day oil shale industry. This table needs to have the size of the industry’s health effects reduced to match the reduced size of the oil shale operations as provided earlier in Chapter 4. This would probably drop the overall industry to 14 facilities, with a production level below 500,000 bbl/day. The accompanying text and footnote also appear to be inconsistent and provide an overestimation of the number of oil shale workers compared to the total employee numbers given in Table 4. 1.1-1, 4.1.2-1, and 4.1.3-1 #49]>

<([#50 [4.3] Table 6.1.6-5, Projected Levels of Major Activities for Seven Planning Areas

This table presents faulty analysis of the level of OSTs developments on nonfederal lands in Utah by simply using the phrase “potential unknown” to gloss over known development activities, particularly those in the Book Cliffs area that are mentioned in Appendix B of the PEIS.

Submission Text

Dear Ms. Thompson and Mr. Nedd, <([#1 [2.3.1] After reviewing the alternatives, I believe that

ES. 6.5 Alternative 3 Oil Shale Research Lands Focus and ES.6.6 Alternative 3 Pending Commercial Lease Tar Sands provides for multiple use, and habitat protection and is the most alternative at this time. Alternative 3 would allow the continued development of 32,640 acres under lease, allowing for the extraction technology and reclamation technology to be refined prior to leasing of additional acreage. Alternative 3 would not preclude future generations from making the choice to lease additional acres, but it would allow the technology to develop. This strikes the right balance for this point in time. Thank you for the opportunity to comment.

BLM Oil Shale and Tar Sands Resources

Draft Programmatic EIS

Argonne National Laboratory

9700 South Cass Avenue - EVS/240

Argonne, IL 60439

John Corra, Director

RE: Comments on the "Draft Programmatic Environmental Impact Statement and Possible Land Use Plan Amendments for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah, and Wyoming" dated January 2012

Dear Sir/Madam:

Thank you for the opportunity to comment on the January 2012, Draft Programmatic Environmental Impact Statement and Possible Land Use Plan Amendments for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah, and Wyoming. The following is a compilation

of comments from the Wyoming Department of Environmental Quality organized by our agency's divisions.

Land Quality Division

Given the voluminous and detailed nature of this document, much of this review was broadly focused on the key "big picture" elements of the draft PEIS. Areas of general concern to the LQD include, but are not necessarily limited to, groundwater contamination, water consumption for retort processes, wastewater generation and reuse, land disturbance rate and acreage, placement of spent shale, and surface leaching of spent shale. In addition to general comments, this review contains comments that are specific to several sections relative to surface and underground oil shale mining and surface and in situ oil shale retort projects.

<([#1 [6.4] 1. Section 4.1.1 Surface Mine and Surface Retort Projects states "Regardless of the retort, spent shale volume would increase by 30% over the volume of raw shale introduced into the retort." Does this 30% increase in volume occur as a 'bulking factor' when the shale is removed from the ground, or does this 30% increase in volume occur between introduction to the retort and when the shale is spent, as the statement suggests? #1])>

<([#2 [6.4] 2. Section 4.1.2 Underground Mine and Surface Retort Projects states "It is assumed that up to 30% of the processed spent shale could be returned to the mine for disposal. If 30% of spent shale is returned to the mine, surface disposal is estimated to require approximately 60 acres/yr. with disposal heights and depths of 250 ft. " Later in this section, "No more than 30% of the spent shale would be disposed of within the mine; the remainder would be disposed of on the surface. This assumption is based on a best estimate of what may be feasible at any given site; specific mine development procedures may accommodate disposal of a greater percentage of the spent shale inside the mine." Comment: Identifying the underground mining technique which allows a greater percentage of spent shale to be disposed of inside the mine, is optimal. These various underground mining alternatives should be thoroughly examined, relative to the site specific geologic constraints. #2])>

<([#3 [6.3] 3. Section 4.1.3 In Situ Retort Projects states that "Groundwater and process water would be of variable quality, with the higher-quality water being used for industrial processes, dust control, revegetation, and so forth. Water of lower quality would be reinjected or otherwise disposed of pursuant to state requirements." Comment: Given the water consumption rates of retort operations, it seems that proposing higher quality water be used for dust control may be better reused in the retort process, and other non-water consumptive uses for dust control be investigated. #3])>

<([#4 [2.2] 4. The draft PEIS does not describe the methodology used to select the preferred alternative by the Bureau of Land Management (BLM).

- Section 2.4.4 discusses the preferred alternatives and there are comparison tables (Example - Table 2.6-1 and Table 2.6-2). However, it is not clear how the preferred alternatives are selected by BLM.
- It is understood that "under all alternatives there is a lack of information on the magnitude of future actions on public land, the number of projects that might be undertaken, and the likely locations for future development,

the magnitude of the differences among the cumulative effects of the alternatives cannot be evaluated (page 6-243)". However, given these uncertainties, it is very useful for decision makers and readers to understand the methodology and metrics used by BLM to select the preferred alternative.

#4] **<([#5 [1.5]** 5. The draft PEIS lacks adequate details and is limited in applicability to serve the

purpose of the PEIS. **#5]**

<([#6 [9.1] 6. The purpose of the PEIS as understood are listed as below:

- Page 1-4, lines 16 to 20 "The BLM proposes to amend 10 land use plans in Colorado, Utah, and Wyoming to describe those areas that will be open and those that will be closed to application for commercial leasing, exploration, and development of oil shale and tar sands resources. The analyses in this PEIS have been developed to evaluate the effects of this proposed action and its alternatives."

Page 1-5, lines 23 to 27 "The analysis of potential impacts associated with oil shale and tar sands development in Chapters 4, 5, and 6 is programmatic in character and designed to disclose the potential impacts from future leasing and development, in order to provide the decision maker the available, essential information for making the allocation decision."

#6] **<([#7 [9.3]** 7. It is acknowledged that "subsequent NEPA and other analyses at the leasing stage

(whether oil shale, tar sands, or RD&D) will be required to determine the extent of the effect of oil shale and tar sands development when more specific information is known about the specific technologies being proposed and associated environmental consequences in the locations being proposed."

However, it is unclear how this draft PEIS would support the allocation decision making. It would be beneficial to include a section or a description how the draft PEIS is intended to be used by the decision makers for the allocation decision. It is our expectation that project specific NEPA analyses will provide further specificity in the available extraction technologies to be applied and magnitude of impacts on the site specific environment.

#7] **<([#8 [6]** 8. The Rock Springs oil shale retort site in Wyoming is not discussed in adequate

details in the PEIS. It would be very useful for the PEIS to describe these site operations, environmental impacts and the remediation strategies applied at this site. It would also be crucial to draw distinctions to the advances in technologies made in the extraction of oil shale in recent years over the technologies applied at Rock Springs.

- In appendix A.2 History of Oil Shale Development there are only 2 sections - A.2.1 Colorado Activities and A.2.2 Utah Activities. The activities in Wyoming are not included in this appendix or not discussed elsewhere in the draft PEIS
- The Rock Springs oil shale retort site was an experimental facility operated by the U.S. DOE, Laramie Energy Technology Center (LETC)

and its predecessor, Laramie Energy Research Center (LERC) between 1965 and 1979. The available documents on this site are maintained with the Wyoming Department of Environmental Quality, Land Quality Division. #8]>

<([#9 [9.7] 9. There is a lack of quantitative data from the existing oil and shale RD&D projects and the usage of this data and analysis for the PEIS.

- The RD&D projects are intended by the BLM to provide more information on the technological requirements and the environmental implications. However, for example in section 6.1.3 .4 (compilation of impacts on water resources from existing RD&D projects) there is no discussion or figures showing the impacts of the existing RD&D projects on groundwater. Plots and discussions on contaminants of concern from these existing RD&D projects would give the reader critical information about the magnitude of impacts on groundwater.

- It is understood that more details on the RD&D projects are in the EAs. But, the application of existing data from RD&D projects to support the qualitative statements in the PEIS would improve the quantitative reliability of the PEIS for the decision makers. #9]>

<([#10 [3.4.2] 10. Chapter 6 (Impact assessment for oil shale and tar sands) discusses the impacts

from different alternatives. There is a very limited discussion on the impacts of groundwater resources in this chapter and this discussion is also very broad and lacks any specifics or presentation of data from existing RD&D projects.

- For example, in section 6.1.2.4 discussing the impacts on water resources caused by Alternative 2 it refers that the impacts are same as Alternative 1. When referring section 6.1.1.4 (for alternative 1) there is just a list of possible impacts in very generic terms. #10]>

<([#11 [5] 11. The PEIS lacks any significant discussion on the available technologies and their effectiveness to remediate and restore the environment from the potential impacts caused by the development of oil shale and tar sands. #11]>

<([#12 [3.1.7] 12. The cover letter (4th paragraph, page 1) says “The oil shale planning area consists

of 3,538,038 acres, which includes 2,138,361 acres of public lands and 158,566 acres of split estate lands”. It is unclear what the other categories of lands are that constitute the difference between the total of (2,138,361+158,566) and the planning area acreage of 3,538,038. #12]>

<([#13 [9.2] 13. There does not appear to be reference to the requirement for a mine permit in Wyoming. Table D-15, Federal and State Leasing and Permitting Requirements, lists “NA” for Wyoming. Kerogen is a solid mineral and a mine permit is required for its extraction, though either conventional or in-situ mining technology. #13]>

Solid and Hazardous Waste Division

After reviewing Section 4.14 (Hazardous Materials and Waste Management) of the draft PEIS, the SHWD has the following general and specific comments.

General Comments

<([#14 [3.13] 1. The PEIS notes that wastes may be generated under different circumstances

dependent on technologies and locations (e.g., tar sand and oil shale facilities; support facilities), and describes general expectations for generic and specific waste types. Regardless of the particular circumstances, it is the responsibility of the waste generator to be aware and understand the requirements for identifying, classifying and managing wastes including, but not limited to whether a waste is a solid or hazardous waste, the management requirements once generated (e.g., short-term storage) and the permitting requirements. This is particularly true of the ‘specialty’ wastes discussed in the PEIS, including asbestos, refrigerants, lubricants, process wastes, solvents, protective coatings, etc. **#14])>**

<([#15 [3.13] 2. The waste generator must verify that wastes managed off-site are managed at permitted facilities. The PEIS discusses this, but isn’t consistent in all parts.

Further, the PEIS should note, in certain circumstances, it may be necessary to obtain landfill operator approval before disposing of certain wastes at a permitted landfill. **#15])>**

<([#16 [3.13] 3. The PEIS notes the potential for releases to the environment, but generally minimizes this by assuming wastes will be ‘stored, used, and disposed of according to all applicable regulations.’ While it is true appropriate management can reduce the potential for releases, the PEIS should acknowledge that when spills and releases occur there are requirements for reporting and for conducting clean-up through approved state programs. **#16])>**

<([#17 [3.13] 4. In Section 4.14.2 (Mitigation Measures) of the PEIS discusses measures and plans

to mitigate potential impacts from waste management. This is a fairly comprehensive list. However, while the list has a pollution prevention bullet related to substituting less hazardous alternatives, this section should also emphasize the full range of pollution prevention activities, including reducing the amount of waste generated, reusing wastes appropriately and recycling waste components. **#17])>**

Specific Comments

<([#18 [3.13] 1. Page 4-188, line 32 of the PEIS specifies that solid wastes are expected to be containerized and hauled to a permitted sanitary landfill or ‘other appropriate waste disposal facilities.’ It should be noted in certain cases this may be a solid waste transfer facility and not a disposal facility; regardless, the ‘appropriate’ facility must be permitted or approved by state or local government. **#18])>**

<([#19 [3.13] 2. At page 4-189, line 13, the PEIS refers to ‘established’ off-site sanitary landfills. This should be ‘permitted’ sanitary landfills. **#19])>**

<([#20 [3.13] 3. At a number of locations in the PEIS (e.g., page 4-189, line 18; page 4-190, line 18; page 4-196, line 17), it is noted that temporary on-site storage may occur.

Waste storage, particularly hazardous waste storage, is subject to specific requirements and time frames.

#20])> <([#21 [3.13] 4. At page 4-190, line 4, the PEIS states sludge accumulating in vessels and tanks

should be removed periodically according to cleaning and maintenance schedules.

At the time those tanks or vessels are cleaned, it will be the responsibility of the waste generator to manage the sludges in accordance with applicable federal, state and local requirements. **#21])>**

<([#22 [3.13] 5. At page 4-190, line 28, the PEIS states landscape wastes may be composted onsite.

If wastes other than landscape wastes (for example, other construction wastes) are proposed for composting, a permit or authorization may be needed for an on-site composting facility. #22]>

<([#23 [3.13] 6. At page 4-191, line 46, the PEIS indicates wastes from upgrading activities may need to be characterized as hazardous wastes. It is possible cellain wastes may meet a hazardous waste ‘ listing’, and it is the generator’s responsibility to be aware of applicable hazardous waste listings and manage wastes accordingly.

#23]> <([#24 [3.13] 7. Page 4-192, line 19, isn’t clear with respect to the types of wastes and types of

landfill cells (off-site permitted disposal facilities, on-site facilities?) specifically created to dispose of cellain wastes. This should be clarified with more detail. #24]>

<([#25 [3.13] 8. On page 4-196, line 15, it states owners/operators may elect to treat and dispose

of hazardous waste at the oil shale facility. While the PEIS acknowledges the need to obtain state permits for hazardous waste management, it is important to note hazardous waste treatment, storage and disposal (particularly) permit applications are subject to specific review and public comment and it may take some time to obtain a permit. #25]>

<([#26 [3.13] 9. Page 4-197, line 30. The bullet should also note the reporting requirements for releases and spills of hazardous materials and substances.

#26]> <([#27 [3.4.5] Water Quality Division

The following should be added to the bullet list of common impacts under Section 4.5.1: “Cross flows between aquifers of varying water quality resulting from mining activities;” Also the bullet on Page 4-32 stating on line 6 should include agriculture wells since most wells on BLM have agricultural (livestock) rather than domestic uses. #27]>

<([#28 [6.3] Section 4.1.4 discusses rights of way for Transmission Lines and Crude Oil Pipelines, but

should be expanded to include pipelines to the mine/processing sites for natural gas or other fuels which might be necessary for providing heat for retorting. #28]>

<([#29 [3.5.7] Air Quality Division

The Wyoming Department of Environmental Quality Air Quality Division (WDEQAQD) recognizes that the draft Programmatic Environmental Impact Statement (PEIS) for possible Land Use Plan/Resource Management Plan amendments for allocation of Oil Shale and Tar Sands (OSTS) shows that the proposed OSTs study area in the Green River Basin includes lands/areas that are located within the currently proposed Ozone Non-Attainment Area boundary for the Upper Green River Basin under all four current alternatives. Any development that may occur in the Green River Basin portion of the planned development area in Wyoming may be located within the proposed ozone nonattainment area, and may be subject to more restrictive nonattainment rules and regulations. #29]>

<([#30 [3.5.4] [3.5.6] The WDEQ-AQD finds that the PEIS air quality analysis is not specific enough in the

absence of project specific quantitative air quality impact analyses to adequately address air quality impacts from oil shale development. Therefore, when specific oil shale

development is identified within Wyoming at the implementation stage, the WDEQ-AQD expects the BLM to conduct quantitative air quality impact (i. e., dispersion modeling) analyses that are proportional to the type and intensity of the project based on the locations and emission levels of proposed project sources, which must incorporate geographical and topographical characteristics, and site-specific meteorology. The quantitative air quality impact analyses should be conducted to estimate impacts to air quality (e.g., ambient air quality standards) and air quality related values (e.g., visibility, atmospheric deposition). If the quantitative air quality impact analyses show that significant impacts are predicted, air quality mitigation measures must be considered. If such a need becomes evident during the life of the PEIS, the WDEQ-AQD expects the BLM to consult with WDEQ-AQD on the development of emission inventories, the necessary air quality impact analyses, and mitigation measures.

#30J)> Thank you again for the opportunity to provide comments on the draft PEIS. Please feel free to contact me at 307-777-7555 with any questions.

Submission Text

To the Bureau of Land Management:

On behalf of the Roaring Fork Sierra Club Group I welcome the opportunity to submit comments of the Bureau of Land Management's Oil Shale and Tar Sands Draft Programmatic Environmental Impact Statement. We are pleased that the BLM is taking clear and measured steps to establish a rational and balanced approach to the federal oil shale and tar sands program.

<([#1 [2.2] While the agency's preferred alternative (2(b)) represents a step in the right direction, we feel that a stronger approach is needed to adequately protect our public lands while still supporting Research, Development and Demonstration (RD&D) of the oil shale industry. We do not understand why it is necessary to open up over 450,000 acres for additional oil shale RD&D leasing while 6 RD&D leases are still being explored and 3 additional applications for the second round of RD&D leasing are currently being evaluated. As yet, no viable process for extracting oil from oil shale has come out of these research and development leases. However, the lease held by Shell Oil seems to be the one most actively developed with efforts focused on their In-situ Conversion Process. But, even Shell speculates that it will be another decade before a viable oil shale process materializes.

#1]>

<([#2 [2.3] We would prefer to see an alternative closer to Alternative 3 that would maintain a more limited acreage for RD&D and not allow for commercial development of oil shale extraction until it is clearly demonstrated that a viable process is available. Moreover, we need a better understanding of the impacts that further oil shale development will have on our public lands, fish and wildlife.

#2]>

<([#3 [3.4.1] Before moving ahead with the leasing of greater acreage for oil shale and tar sands (the proposed Alternative 2 would allow up to 1 million acres for these purposes), we need to seriously consider the effects of a large scale oil shale development on **i) our water resources, ii) energy requirements and greenhouse gas emissions, and iii) our outdoor recreation and tourism industry.**

Demands on water resources: Current estimates for water requirements for the new oil shale retorting methods are 1 to 3 barrels of water per barrel of oil. Thus, for an oil shale industry projected to produce 2.5 million barrels per day, 105 to 315 million gallons of water per day will be required and an additional 58 million gallons per day will be needed for projected population growth. Where will this water come from? For the Piceance Basin, the major water source will be the Colorado River Basin. However, this basin is already in a water crisis due to global-warming induce drought and increasing population growth. These factors plus the amount allocated to Colorado and Utah under the interstate compact, and maintaining minimum flows, will place severe restrictions on water available for the oil shale industry.

#3]>

<([#4 [3.5.1.1] [12] **Before moving ahead with the leasing of greater acreage for oil shale and tar sands (the proposed Alternative 2 would allow up to 1 million acres for these purposes), we need to seriously consider the effects of a large scale oil shale development on i) our water resources, ii) energy requirements and greenhouse gas emissions, and iii) our outdoor recreation and tourism industry.**

Energy requirements and greenhouse gas emissions: The energy needs for oil shale development are immense. According to the RAND Corporation, production of 100,000 barrels of oil per day using Shell's in-situ heating method would require 1,200 megawatts (MW) of electricity. This is the capacity of the largest power plant currently operating in Colorado (the Craig Generating Station). A projected large-scale commercial oil shale industry producing 1 million barrels of shale oil per day would thus require 10 power plants the size of the Craig plant.

This seems to us like a huge waste of energy resources. If these new power plants are powered by fossil fuels, they will be producing millions of tons of greenhouse gases and other pollutants per year. Until more energy efficient and less polluting oil shale methods are developed, we are totally against further expansion of the oil shale leases.

#4)>

<([#5 [3.1.2] [3.10.4] **Before moving ahead with the leasing of greater acreage for oil shale and tar sands (the proposed Alternative 2 would allow up to 1 million acres for these purposes), we need to seriously consider the effects of a large scale oil shale development on i) our water resources, ii) energy requirements and greenhouse gas emissions, and iii) our outdoor recreation and tourism industry.**

Effects on Colorado's outdoor recreation and tourism industry: The land overlying oil shale resources in Colorado, Wyoming and Utah contains some of the best wildlife habitat in the West where outdoor recreation and tourism are huge economic drivers of the economy. In Colorado alone, hunting, angling, and other wildlife-related activities generate \$3 billion annually. The projected reductions in river flows as the result of large scale oil shale development will likely concentrate dissolved solids, increase salinity, and devastate fisheries. In a 1996 study, the BLM found that a large scale oil shale industry "would result in the permanent loss or severe degradation of nearly 50% of BLM stream fisheries" and that surface disturbance, base flow reductions, and long-term aquifer disruption would result in the loss of 35% of the Colorado River cutthroat trout fisheries. This is unacceptable.

#5)>

<([#6 [2.3.1] Because of these considerations, we recommend that you adopt Alternative 3, or something close to it. Moreover, we urge you to restrict future oil shale leasing and development to a continued, rational research and development program until a viable, economically and environmentally feasible process for extracting oil from oil shale is proven and developed.

#6)>

To Whom It May Concern:

Re: Comments on Draft Programmatic Environmental Impact Statement and Possible Land Use Plan Amendments for Allocation of Oil Shale and Tar Sands Resources on Lands Administered by the Bureau of Land Management in Colorado, Utah and Wyoming (DPEIS)

This comment letter is submitted on behalf of the Front Range Water Council (Council), which consists of Denver Water, Northern Colorado Conservancy District, Colorado Springs Utilities, Aurora Water, Board of Works of Pueblo, Southeastern Colorado Water Conservancy District, and Twin Lakes Reservoir and Canal Company. The Council members are the largest water suppliers of municipal, commercial, industrial, and agricultural water needs in the state of Colorado. Collectively, the Council meets the water demands of approximately 80% of Colorado's population. The Council submitted comments to the Bureau of Land Management's (BLM) 2008 Draft Oil Shale and Tar Sands Programmatic Environmental Impact Statement (Draft

PEIS) expressing concern about impacts to the state's water supplies. <([#1 [9.8] The Council appreciates the

BLM's approach to take a "fresh look" at new alternatives and the associated impacts of oil shale and tar sand development on public lands in Colorado. #1])> The Council resubmits its comments from

the 2008 Draft PEIS (letter attached) for consideration under the BLM's 2012 DPEIS, in addition

to the following related comments:

<([#2 [3.7.4.1] Impacts to Upper Colorado River Threatened and Endangered Species

The Council commented on the 2008 Draft PEIS that oil shale impacts to the Colorado River's threatened and endangered fish species were not analyzed. The BLM's response to this comment was that such effects would be analyzed in NEPA documents for individual leasing authorizations, and until specific development plans are submitted to the BLM, the details regarding impacts would be unclear. This approach is inadequate to address the programmatic effects on the Colorado River Endangered Fish Species Recovery program. The Council believes this DPEIS must consider the potential effects to the recovery program and the species.

Northern Colorado Water Conservancy District; Northern Colorado Water Conservancy District; Pueblo Board of

Water Works; Southeast Colorado Water Conservancy District; Twin Lakes Reservoir & Canal Company

BLM Oil Shale and Tar Sands PEIS

May 4, 2012

Page 2

<([#3 [3.4.5] Impacts to Colorado’s Future Water Development

Similar to its comment on the 2008 Draft PEIS, the Council believes the BLM must consider the most recent data available from the state of Colorado regarding the amount of water available for use in Colorado under the Colorado River Compact as well as policy statements from

the State of Colorado regarding future water development.

#3])> <([#4 [3.4.1] [6.3] Impacts on Population and Increased Energy Demands

Impacts to Colorado from oil shale development include population growth and increased energy use. These impacts directly affect water resources, future water development and water supply. The Council continues to be concerned that the DPEIS’ analysis of impacts to water supply, water quality, and water development is inadequate, in part because it does not analyze the

range of impacts associated with various technologies used by oil shale developers. The analysis only generally describes impacts to water resources, and there is no quantification of the impacts, making it difficult to assess the potential severity of impacts.

#4])> <([#5 [3.4.1] Water Quality Impacts

The Council remains concerned about impacts to water quality from oil shale development.

The DPEIS needs to include technology specific data to adequately analyze potential impacts to water quality.

The DPEIS raises the same concerns about oil shale development that the Council expressed in its 2008 comments on the draft PEIS. This DPEIS lacks sufficient data and does not analyze the ranges of impacts from the various technologies to determine what the impacts will be

to water resources. The Council would like to see the broad scale impacts of oil shale development thoroughly analyzed before the BLM begins to look at individual, project-specific approvals. #5])>

Sincerely,

Ji ater Council

BLM Oil Shale &

Tar Sands Draft Programmatic EIS

Argonne National Laboratory

9700 South Cass Avenue

Argonne, Illinois 60439

To Whom It May Concern:

Re: Comments on Draft Oil Shale & Tar Sands Programmatic Environmental Impact Statement

The Front Range Water Users Council (Council), consisting of Denver Water, Northern Colorado Water Conservancy District, Colorado Springs Utilities, Aurora Water, Board of

Water

Works of Pueblo, Southeastern Colorado Water Conservancy District, and Twin Lakes Reservoir and Cannl Company, submit these comments on the December 2007 Draft Oil Shale and Tar Sands Programmatic Environmental Impact Statement (Draft PETS). The Council members are the largest water suppliers of municipal, commercial, industrial, and agricultural water needs in the state of Colorado. About half of the State's population receives its water supply from Council members. The Council became aware of the Bureau of Land Mnnagement's (BLM) Draft PEIS and the schedule for comments in late Pebruary 2008. Therefore, a letter was submitted to the BLM on behalf of the Council requesting a 60-day extension to the comment period allowing for a more thorough review of the document. 'f'o date no response to the request has been received.

<([#6 [3.7.4.1] Negative Impact of Large Uses on Endangered Fish Species

Oil shale development impacts to the Colorado River could negatively impact Threatened and Endangered Species. According to a preliminary review, the water requirements for commercial leasing could be substantial, especially when considered in the context of other cmrent and anticipated projects/activities in the Upper Colorado River Basin. The Council is concerned that the substantial water usc could hold negative consequences for the Colorado River Endangered Fish Species Recovery Program. In nddi tion, the project ns proposed raises several policy questions smrouncing the amount of available water from the Upper Colorado River for existing and futmc development.

The State of Colorado is currently engaged in an effort to recover four fede rally listed fish species (Colorado pikeminnow, Humpback chub, Razorback sucker, and Bonytail) along a ISMile

reach of the Colorado River approximately 50 river miles below the area of development of oil shale. The Programmatic Biological Opinion (PBO) for the Upper Colorado River Endangered Fish Recovery Program is a multi-agency effort, which requires upstream water users to release 10,825 acre-feet of water to the mainstem of the Colorado River on a demand schedule. Future depletions associated from oil shale development need to be analyzed concurrent with the releases required to determine if there arc impacts to the cooperative efforts on the Upper Colorado River between Front Range Water Users and West Slope water users to benefit the Endangered Species. Currently there is a 120,000 acre-feet pool of developable Colorado River water under the PJ30. What will be the impact of oil shale development on the PBO? Will its uses be beyond the 120,000 acre-feet and will that jeopardize the endangered fish? Will its uses place at risk both existing and future East and West Slope diversions? What arc the impacts on the 120,000 acre-feet of developable Colorado River water? Is the use of the limited water resource for oil shale development in the best economic, social, and environmental interest of the region and Colorado? #6)>

<([#7 [3.4.1] Negative Impact on Puture Water Development in Colorado

Oil shale development impacts to the Colorado River could have negative impacts on reasonably foreseeable and future water development needs and projects. According to Table 4.5.2-1 (Water Budget Data for Oil Shale Development Projects) of the Draft PEIS, the remaining available surface water in the year 2000 was 340,000 acre-feet/year and the projected amount for 2030 ranges between 268,000- 412,000 acre-feet/year. Is this data presented accurate? Does this data take into consideration reasonably foreseeable water development projects? The State of Colorado is only now attempting a comprehensive analysis of the amount of Colorado River

water remaining under the Colorado River Compact. As a minimum, the Draft PEIS must list the “ranges” of water available for use in Colorado under the Compact. What are the social, economic, and environmental impacts to communities in the Front Range of Colorado if they are

unable to develop Colorado River water or they are required to remain dependent on nontributary groundwater? What are the Threatened and Endangered Species issues associated with this shift in water supply use? How does the shift from use of Colorado River water to South Platte River water affect the Platte River Recovery Program and the four species being protected by that program? Considering that there is only a limited amount of water that can be developed in the Platte River without impacting the Threatened and Endangered Species in Nebraska, how will development of Colorado River water by oil shale impact the social, economic, and environmental resources on the Front Range of Colorado? #7)>

<([#8 [6.3] [3.4.1] Additional Analysis of Population and Technology Impacts Needed

Oil shale development impacts to the Colorado River will have impacts on population growth and energy use. The Draft PEIS should provide a more detailed analysis and additional discussion of the population influx associated with oil shale development, the proposed retorting technologies, and the subsequent energy demands. These variables could potentially have a greater impact on water resources in the region and is inadequately addressed. The Draft PEIS mentions proposed in-situ retorting technology and underground mining techniques with surface retorting that are to be implemented as part of the oil shale development and does not specify duration or the technology most feasible for the oil shale areas located in Colorado. However, variability in amount of water needed and the potential environmental impacts associated with these technologies make it difficult to determine the effects on resources on such a large scale, especially since the incorrect assumption is made that resources will be available for oil shale development under all conditions. Impacts associated with dewatering activities involved with the in-situ retorting process could be significant. These impacts could include degrading/depleting groundwater resources, critical habitat areas, aquatic resources, and surface water quality. #8)>

<([#9 [3.4.6] Water Quality Impacts

Oil shale development impacts to the Colorado River could have negative impacts to water quality, water treatment facilities, and raw water users. There is also an increased risk of significantly reduced quality water resulting from the oil shale sites. Another potential environmental concern is the increase in salinity and other toxic compounds stemming from oil shale development that could adversely affect the Colorado River Basin ecosystem, endangered fish species, and municipal, industrial, agricultural, and recreational users. The Draft PEIS provides no discussion about baseline or comprehensive water quality monitoring of the water resources in this region. A water quality monitoring program would provide important background data on water quality in the developable oil shale areas, especially since it is indicated that water generated from oil shale development would be of lower quality than the receiving waters. Therefore, the Draft PEIS should provide more technology specific data to further define the impacts of oil shale development on water resources. Oil shale development has not historically been successful in Colorado so the Draft PEIS should also consider the corresponding “bust” cycle if oil shale development is not economically feasible and how the water resources could be reallocated to beneficial uses that will support population growth in other areas of the state. #9)>

<([#10 [6.2.3] Increased Energy Demands

Oil shale development impacts to the Colorado River could have negative impacts by increasing energy demands in the region. Along with increased oil shale development and production over the BLM's suggested 20 year period of time, there would be an increase in energy needs. These increased energy needs could elevate levels of greenhouse gases, which could have potential impacts on climate and regional water supplies. The Draft PEIS identifies the need for a 2,400-MW coal fired power plant to service the needs of the oil shale industry and the population growth (double the size of the Craig power plant, the largest power plant in Colorado). The Draft PEIS shows inconsistencies between Table 4.1.6-J (Assumptions Associated with a 1,500-MW and a 2,400-MW Conventional Coal-fired Electric Power Plant) and the text on Page 4-32. The table indicates water use of 13,000 acre-feet/year, yet in the text water use of approximately 13,800 acre-feet/year is suggested. This 800 acre-feet/year difference corresponds to approximately 6%, which represents a significant amount of water in this tri-state area. The Draft PEIS should also consider the impacts associated with the amount of water consumed, water quality impacts, and increased emissions, such as greenhouse gases from additional coal-fired

power plants to meet energy needs for development. If it takes a 2,400-MW coal-fired power plant to serve oil shale development, is there a reasonable expectation that there will be sufficient oil developed to justify the cost including other resources consumed, i.e. coal and water. #10)>

<(#11 [1.5] The Draft PEIS has raised substantial concerns that development of oil shale in Colorado could

significantly affect the Council's ability to serve its existing customers and the future growth projected for the Front Range of Colorado. The Draft PEIS provides insufficient data and analysis and does not properly identify or address the direct or cumulative impacts caused by oil shale development. #11)> <(#12 [1.1.1] Furthermore, the BLM's present deadline for comments does not provide

the Council with adequate time to prepare specific comments on this potentially enormous new water use of an already strained water supply. In short, it is critical that the Council have adequate time to develop a comprehensive set of comments on the Draft PEIS. The fact that oil shale development in Colorado has been discussed for decades, and with the potential impacts that oil shale development could have on the state's existing and future citizens, the Council believes it should have a meaningful role in the comment process. #12)>

Submission Text

<([#1 [2.2] We are in support of the BLM preferred option. Where we live in Garfield County for over 100 years industry and politicians have promised a technological breakthrough that would produce oil from rock. Garfield County went through two booms on this promise and were left in the devastating wake of two busts, the last one ending May 2nd 1982. It's time we learn from this. The emphasis that the 2012 OSTs PEIS promotes of making industry establish proven technology prior to leasing of public lands under a more reasoned energy policy only makes sense. #1])> Sincerely, Bill and Susan Harding Silt Colorado Cc: Senator Mark Udall
Senator Michael Bennett

Submission Text

The following is the first of four batches of comments submitted on behalf of supporters of the Center for Biological Diversity one Friday, May 4, 2012. See Attachment.

This letter pertains to the BLM's "draft programmatic environmental impact statement" for oil-shale and tar-sand development in Colorado, Utah and Wyoming.

<([#1 [3] I am deeply concerned about the potential environmental effects if the BLM initiates a commercial leasing program for oil-shale and tar-sands development. It would pollute our land, air and water and exacerbate climate change. Endemic, threatened and endangered species would be lost.

Between global warming, rampant extinction and a quickly drying Colorado River -- problems that oil-shale and tar-sand development would only worsen -- it's hard to imagine a less prudent use of our public lands.

#1])>

<([#2 [12.3] I therefore oppose any action by the BLM to continue or to authorize any new oil-shale or tar-sand development on public land, or create or continue land-use allocations that would allow for such uses in the future. #2])> <([#3 [2.5] The draft programmatic environmental impact statement should have included an alternative that does not in any way endorse additional publicland use for this unproven industry.

#3])>

<([#4 [3.10.4] Oil shale is currently producing no jobs and no revenue -- the Congressional Budget Office confirmed that it is not expected to produce significant revenues through 2022.

The land overlying oil-shale resources in Utah, Colorado and Wyoming is some of the best wildlife habitat in the West, and outdoor recreation and tourism are huge economic drivers for the region. We must protect this sustainable economy by making smart decisions based on sound information.

#4])>

<([#5 [3] I ask that you evaluate carefully and disclose fully the serious impacts of all new energy required for oil-shale and tar-sand production and its potentially devastating impacts to our climate, as well as the threat it poses to wildlife, special-status, threatened and endangered species, and to our water, air and communities.

#5])>

Submission Text

To Whom It May Concern:

As the voice for beneficial, efficient, responsible and environmentally sound development, production and use of Western Colorado oil and natural gas, West Slope Colorado Oil & Gas Association (WSCOGA) is pleased to provide comments on the revised 2012 Oil Shale and Tar Sands Draft Programmatic Environmental Impact Statement (PEIS) for oil shale and tar sand development. WSCOGA appreciates the Bureau of Land Management's (BLM) focus on this important resource. Oil shale has the potential to diversify our energy portfolio and provide a resounding economic boost to Colorado, Utah and Wyoming.

The BLM mission states that the agency should manage "BLM-administered lands and resources in a manner that best serves the needs of the American people" with decisions being made based

on the “principles of multiple use and sustained yield.” <([#1 [2.2] Unfortunately, the revised PEIS restricts the available amount of land so severely as to make commercial activity or viability a near impossibility. The revised preferred alternative in the draft PEIS limits the amount of available land in Colorado. Indeed, it limits oil shale leasing opportunities most drastically in the areas where the majority of oil shale resources are located. So much so that oil shale development, under the preferred alternative, could not be maximized or sustained in the Centennial state.

#1)> <([#2 [9.8] WSCOGA firmly believes that if a “fresh look” is to be taken, it must be done in the best interest of the United States and not merely a convenient excuse to change the PEIS for political purposes unrelated to any technical basis. WSCOGA is also concerned that the new information referenced in pages 1-4 of the document does not actually constitute a viable foundation for overhauling the entire PEIS. It would be unfortunate for the American public, in terms of the cost of revisiting the document and the potential loss of return to the American tax payer, if the revised PEIS is to be finalized in its current form.

#2)> <([#3 [9.8] WSCOGA strongly urges the BLM to take into consideration the fact that no directive from Congress has been issued requesting the change of time period for leasing development nor has there been any request of a reexamination of the PEIS via Congress. Indeed, quite the opposite: many Western congressional officials have not only supported the 2008 PEIS but have encouraged its timely implementation.

#3)> We support sustainable, timely, environmentally-responsible development to help boost America’s energy portfolio and energy security. Oil shale is an important resource, and development and commercial leasing is critical. At no time should political biases take precedence over up-to-date science and thoughtful economic analysis.

WSCOGA has technical concerns related to the factual accuracy of the document that need to be addressed prior to moving forward with a final document and record of decision. The following narrative includes many specific areas in which WSCOGA sees as troubling, outdated or incorrect information. WSCOGA also requests, in certain areas within the document, specific justification and rationale for decisions.

1. <([#4 [3.4.1] [9.3] On page ES-9, the statement is made that the BLM looks forward to gaining a clearer understanding of the implications of develop of oil shale for water quality and quantity, for example. Industry has provided much information on water needs for oil shale, and that information is used in Section 4. A number of laws at the Federal, State and local levels are already in place that protect, regulate and monitor water quality and quantity. Any lessee for oil shale – as with any energy lessee – would be required to go through a site-specific NEPA process and demonstrate that their proposed activities will not violate existing laws and regulations. Further, if there is a compelling public need to limit water consumption by an oil shale company or industry to less than the industry currently estimates, no further information is needed from the industry—it would simply be required to stay within the aforementioned bounds. Industry analyses indicate that enough water rights are in place to support oil shale production in excess of 1 million barrels per day. It must be also stated that it is not the responsibility of the BLM to interfere or subjugate water rights legally purchased by operators.

#4)> 2. <([#5 [5] As alluded to previously, it is not within the jurisdiction of the BLM to generate regulations or requirements not authorized by Congress. On pages 1-13 and 2-78, the BLM is exceeding its bounds within the PEIS by enacting CO2 emission requirements. Further, CO2 mitigation is primarily a financial issue, not a technological issue.

#5)> 3. <([#6 [2.2] The amount of land available for RD&D leases under the preferred

alternative 2b in Colorado, which has the best resource, is so restrictive that it will be virtually impossible to obtain actual operating data on multiple processes to achieve the stated purpose. WSCOGA is concerned that alternative 2b could be construed as a thinly veiled excuse to stop oil shale development independent of its potential value to the United States. WSCOGA requests that the BLM analyze the potential loss of investment from companies due to such severe limitations on land use.

#6)> 4. <(**#7** [1.3] On page 1-15, the PEIS lists governmental agencies that cooperated in the PEIS. One of the cooperating agencies, Garfield County, Colorado has approved a resolution adamantly opposed to the current PEIS. Further, surrounding counties in Colorado that would also be affected by the outcome of this PEIS, including Rio Blanco and Mesa counties, have signed similar resolutions opposing oil shale development. Since the majority of the oil shale resource is located in NW Colorado, the insights and opinions of those counties should be heavily weighted.

#7)> 5. <(**#8** [13] On page 1-17, the footnotes say that EGL have been renamed “since the preparation of this PEIS”. To what PEIS does “this” refer? EGL was renamed AMSO in early 2008, and OSEC was renamed Enefit in early 2011, which are well before the issuance of the current draft PEIS.

#8)> 6. <(**#9** [6.1.1] [9.6] On page 2-13, on what basis did the BLM decide that commercial viability requires 25 ft of oil shale >25 gal/ton in Utah and Colorado but only 15 ft of 15 gal/ton in Wyoming? Economic recoverability is a complex matter that depends on both depth and technology. It cannot be overstated -- simply opening an area for commercial lease application does not mean that any company will actually try to lease it if it does not see commercial viability. Concerns about land speculation are more appropriately addressed by performance clauses in the lease rather than taking them off the potentially leasable area.

#9)> 7. <(**#10** [6.1] There are technically incorrect statements about oil shale on page 2-15. Not all oil shale in the Green River formation is a marlstone. The Garden Gulch member is clay rich and does not fall within the marlstone field. The temperature required to generate shale oil varies with time. For timescales of human activity, temperature for significant shale oil generation is as low as 500 oF, as that temperature for a few years will convert a substantial amount of kerogen. The processes being pursued by Shell and by AMSO will generate shale oil at temperatures primarily between 600 and 700 oF. While some recent people are misusing the term “shale oil” to denote shale-hosted natural crude oil, the term “shale oil” has meant the product formed from destructive distillation of oil shale for hundreds of years.

#10)> 8. <(**#11** [9.6] On page 2-30, the statement is made that six existing RD&D leases have terms that could allow commercial development up to 5,120 acres each. The most obvious interpretation of this statement is that even though the option 2 acreage largely excludes the preference right lease area from commercial leasing (see, for example, Table 2.3.2-2), it would be

allowed for commercial leasing to the RD&D lease holder by virtue of an existing contract, and this interpretation is supported by words on page 2-54. However, if it is suitable for commercial leasing, why is it not included in the area available for commercial leasing independent of the RD&D lease fate? Does its exclusion mean that the Department of the Interior has determined that the PRLA’s are not actually suitable for commercial leasing and just isn’t going to tell the RD&D lease holders that they cannot actually lease the PRLA until they consider the commercial lease conversion application? **#11)**>

9. <(**#12** [9.6] On page 2-26, the statement is made that if an RD&D lease holder relinquishes

its lease, the area may be leased to another operator with the decisions in the RMP at the time of application. To which application is the BLM referring? The original RD&D lease application or a subsequent application after the original lease is terminated? Does that mean that if Alternative 2 is adopted, essentially all of that acreage would be removed from commercial leasing? What would occur if the lease is transferred to another entity rather than terminated? Would the new entity be required to pursue the same process originally proposed, or could the entity modify the process consistent with either the old, or a new, environmental assessment?

#12)> 10. <(**#13** [6.3] The statement is made that MMTA would be excluded from oil shale leasing until technology or other factors exist to develop oil shale without jeopardizing trona mines. Does that mean that if a company demonstrates that it is possible, the land would be available for leasing? If so, why is a lease stipulation a more appropriate way to enforce that requirement? Multi-mineral extraction requirements are already in force for nahcolite and oil shale.

#13)> 11. <(**#14** [2.2] It is stated on page 2-35, in effect, that Alternative 2b was not conceived until the PEIS was in draft form and is not even properly discussed in the rest of the document. An obvious question, therefore, is what specific technical discoveries of the PEIS process motivated the creation of this alternative and its eventual adoption? If no technical discoveries were the cause, what specific meetings or actions precipitated the idea after the analysis of alternatives had been completed? As such, on what basis does the Department of the Interior claim that this alternative and decision are consistent with the spirit of the 2005 Energy Act?

#14)> 12. <(**#15** [2.2] Figure 2.3.3-1 on page 2-37 demonstrates how much of a farce the preferred alternative is. Almost the entire Piceance Basin is excluded from commercial leasing applications even though it has not been identified as either Sage-Grouse Core or Priority Habitat or Lands with Wilderness Characteristics. Part of the land proposed for commercial leasing applications is identified as Sage-Grouse critical. Further, most of the land made available is in such small isolated parcels that it would not support significant commercial development. It is clear from this map that the explicit purpose of Alternative 2b for Colorado is to prevent commercial development of oil shale, in direct violation of the 2005 Energy Act.

#15)> 13. <(**#16** [2.4] As much Figure 2.3.3-1 is a farce, Alternative 4 shows a lack of thought concerning the definition of “moderate” in moderate development. Land proposed for commercial leasing includes Sage-Grouse critical habitat. Even though it is arguable that oil shale development could occur without adversely affecting the Sage Grouse and there is a paragraph outlining the responsibility of the field office in that regard, the amount of acreage so designated is so small that it could easily be eliminated without significant impact on the oil shale industry this century. Similarly, there is a portion of the Cathedral Bluffs designated as Lands With Wilderness Characteristics that could easily be eliminated from leases without adversely affecting the oil shale industry.

#16)> 14. <(**#17** [2.2] In discussing a comment about limiting leases to those in process, the PEIS states that it is not consistent with the Secretary’s and Director’s emphasis on develop and maintaining a robust RD&D process. The preferred alternative has so little land available in such isolated parcels that it is not conducive to either RD&D or commercial activity. The clearest evidence for this is that the number of proposals dropped from 20 to 3 when the preference right lease area was dropped from 5,120 to 640 acres. While it may be profitable to perform multi-mineral extraction on a 640 lease tract, it is doubtful for strictly oil production given the 500-ft restriction of activity from the border of the lease, which potentially reduces the available resource by one third. Further it is clear that a significant portion of the land made available will

not even support a 640-acre lease. WSCOGA requests that the Department of Interior provide specific rationale for peppering the available acreage in smaller, incongruous blocks. It is also the opinion of WSCOGA that the BLM and DOI must include figures that discuss the loss to the American taxpayer by overly restricting development in Colorado.

#17)> 15. **<([#18 [3.10.3]** The discussion on pages 3-241 through 244 is incongruous.

Statements are made about rapid growth and employment due to the oil and gas industry, about having to import skilled labor from afar, and about how wages are increasing due to the oil and gas industry, as if all these are detrimental. Currently, the unemployment rates are about 10% in the regions that would be affected by oil shale development, and foreclosures are at least as common as in other parts of the country.

#18)> 16. **<([#19 [3.10.1] [3.10.3]** On pages 3.11.2.2.4, the statement is made that rental housing in the Rifle area is all taken and there are no hotels available. That may have been true 3 years ago, but it is not true now. Rental housing is easy to find, and rents are dropping. Hotel rooms are plentiful, and construction of one hotel was stopped a few years ago because of the drop in demand. In addition, recent analysis from the Colorado River Valley Field Office Resource Management Plan states that housing in surrounding counties, like Pitkin County, Colorado, will continue to be plentiful. If the PEIS is supposed to give a basis for economic status on which to make decisions about oil shale, it must be up to date. Otherwise, it is giving a completely mistaken view of why economic development, including oil shale, is needed to maintain a healthy economy in the Rifle area in the long run. In other words, if it was worth redoing the PEIS, it is worth doing it right and not using data that is 3 years old as if it were current. Again, the way to avoid booms and busts is to have steady growth, and waiting to develop oil shale during a national crisis is exactly opposite to what the country should do. It should have leasing policy that enables enough high-quality resource to be available for leasing so that the industry can learn, mature, and grow gradually over the next 20 years. Alternative 2b will almost kill oil shale development, except possibly for a few small operations.

#19)> 17. **<([#20 [6.2.1]** On page 4-13, the BLM has projected that the new electricity capacity needed for in-situ oil shale would be generated by coal. That may be true if the electricity is generated in Utah and transmitted to Colorado, and of course, that changes the Colorado impact. If the electricity is generated nearer, it will probably be from a combination of co-produced gases and natural gas. This is an active choice that could be made to minimize impacts, and the PEIS seems to ignore that possibility.

#20)> 18. **<([#21 [6.3.2]** Section 4.5.1.2 on water use does not mention the possibility of using reverse osmosis or distillation of deep brackish water to supply the water needs for oil shale production. The economics appear tolerable, particularly if waste heat is used for a distillation method, but this has not been actively studied because of the availability of plentiful water at low cost—ironic due to the near hysteria about water availability. The point here is that shale oil production is such a high-value operation and its water needs sufficiently modest that it could likely get along with no significant draw on fresh-water supplies, if the government insists upon confiscating current water rights.

#21)> 19. **<([#22 [6.3.2.1]** It is likely that a 100,000 bbl/day oil shale industry would use less than 1% of the upper Colorado Basin remaining available surface water. Tables 4.5.2-1 and 3.4.1-2 indicate a water surplus of about 300,000 ac-ft/yr, and a generous estimate of water consumption by an in-situ industry would be only 10,000 ac-ft/yr according to Table 4.5.2-1 if it did not use electrical heating.

#22)> 20. **<([#23 [6.3]** On page 4-54, the phrases “at best, professional judgment” and “at worst

would be speculation” are used. The PEIS should not be using speculative numbers from non-experts in its consideration. There are several accurate, professionally derived numbers in the literature that agree reasonably well enough that one does not have to use the derogatory qualifier “at best”. The point here is that there will be a range of emission estimates for various candidate technologies, and establishment of regulations on CO2 emissions would affect the ultimate outcome.

#23])> 21. **<([#24** [3.8.3] Figures 4.9.1-1 and 4.9.1-2 show pictures of a UMATAC industrial process. No one in the United States is considering using this ill-fated technology and as such pictures of the UMATAC process should be removed.

#24])> 22. **<([#25** [5] Page 4-154 has a discussion on oil shale activities in the 1980s related to surface disturbance. Nowhere on this page is it noted that those activities generated substantial experience on how to reclaim surface disturbance. It would be prudent for the BLM to include a discussion on current Best Management Practices developed for oil shale over the last three decades.

#25])> 23. **<([#26** [6.3.2] In the introductory sentence of 4.12.1.4, it is stated that “it is likely that oil shale technologies will require large amounts of water.” What is the BLM using as a comparison? In the arid west, typically 85-90% of the water is used for agriculture, and an oil shale industry will have only a minor effect on that number. So from that perspective, nothing except agriculture uses large quantities of water. Now if one uses a metric of economic value generated per unit of water consumption, how does oil shale compare to other industries? The Department of Interior should not repeat common misstatements about water crippling agriculture—it should analyze the true impacts of the oil shale industry, which are that a major commercial-scale industry would divert only a small percentage of agricultural water, and that could easily be made up by more efficient use of water by agriculture.

#26])> 24. **<([#27** [3.12.3] The implicit attitude of section 4.13.1.3 is misstated and inappropriate: Grand Junction and Carbondale are so far away from the oil shale development that any direct impact is clearly a stretch. The oil shale industry will provide jobs and economic growth for those who want to lift themselves out of poverty. The biggest threat to the health and well-being of poor people is an economy that cannot provide decent employment opportunities for all, and an oil shale industry can help provide a robust economy for western Colorado. It also appears that the author of this section is unaware of the discussion regarding oil shale and retorting in the preceding hundreds of pages. WSCOGA requests that the first two sentences be stricken as redundant and useless.

#27])> 25. **<([#28** [9.6] The bottom paragraph on page 6-1 states that making land available for lease applications has no impact on the environmental or socioeconomic setting. It is the subsequent development work on the land that would have an impact, and it must be analyzed by the NEPA process. Under this heading, what is the BLM’s justification for removing essentially all the land in Colorado from the lease application process?

#28])> 26. **<([#29** [9.8] The information about AMSO LLC in section A.5.3.2 is extremely outdated. An Addendum to the original Plan of Operations was submitted in July 2008 and approved by the BLM in October 2008, and a Plan of Operations was submitted in May 2009 and approved by the BLM in September 2009. The stated reason for the update of the PEIS is to incorporate more recent information, and here is a case where the BLM has failed to incorporate relevant information contained within its own regulatory approval process.

#29])> We thank you for the opportunity to add our comments to the public record and look forward to continuing a dialog on this important resource.

Submission Text

<([#1 [2.1] The 'no action' Alternative #1 is the only Alternative justified under Section 369 of the Energy Policy Act of 2005, and subsequent Record of Decision of the original PEIS in 2008. #1])>

Since the publishing of the 2008 PEIS and RMP guidelines, there has been nothing new that would warrant a revising of these regulations. The 'fresh' and 'hard' looks stated as the objective of this latest PEIS action are policy-motivated objectives not based on any change in underlying facts as found in the original PEIS.

Adoption of any of the other alternatives would eliminate the most prospective of the geologically prospective resources, contrary to the mandates of EPAct 2005 and the findings of the 2008 PEIS. The most prospective resources include those rich resources near the surface that are eliminated in Alternatives other than Alternative 1.

The argument is made that somehow the original PEIS erred in allowing leasing when technologies are not proven. The only way for a resource to be proven is for the availability of a lease to justify the investment in technology development. Any thought that technology will be developed without a lease is unrealistic. But if it is the policy purpose to impede development, that is the argument one would make.

<([#3 [9.2.2] For more than 80 years, oil shale has not had a federal leasing program. It still does not have a federal leasing program. And there will be no development of federal resources until there is a leasing program. Lack of leasing is what has led to lack of technology. And lack of leasing of the most economical resource locations has deterred investment.

Section 369 of EPACT 05 was designed to solve these issues and the current effort to roll back progress made toward implementing Section 369 is contrary to the intents of the law. Given the lead times required for development of technology and projects, once a lease has been secured, the effect of any alternative, other than the no-action Alternative 1, will be to delay oil shale development until a crisis atmosphere causes a change in policy. #3])>

<([#4 [9.7] The R, D and D efforts under way will not solve the technology issue. These efforts are not designed to answer the questions (water, emissions, etc.) that some are saying is required before leasing is made available. These efforts are aimed at a limited sample of technologies situated in limited geologic settings. Further, the uncertainty in lease conversion terms is delaying activity in these projects. Putting the R, D, and D leases on a critical path for

commercial leasing of oil shale effectively defers development.

#4) **<([#5 [2.1]** When EFACT 2005 was passed the Nation had the time to avoid a crisis in oil supply. At that time oil shale and tar sands could have been the difference between crisis and hardship. It is not certain that we have enough time now to avoid a crisis. Adding additional impediments, by removing the most geologically prospective resources from available leasing, adding excessive layers of environmental review, and withholding leasing regulations all serve to delay what could be an orderly, well-managed development of these vast, rich resources. Impeding development, which Alternatives 2-4 will do, runs the danger of repeating the energy crisis atmosphere that existed in the 70s. Unlike the 70s however, the next crisis will not be solved with more petroleum, renewable alternatives, or gas. Liquids from unconventional sources; oil shale, tar sands, and synthetic liquids will be needed to keep our economy healthy. The no-action Alternative 1 gives us the best chance to avoid the negative impacts of fuel shortages. The no-action alternative is warranted in that no new, substantive facts have come to light, or intervening changes have occurred to justify the other alternatives.

#5)

<([#1 [12] Please allow us to register our discomfort with the very best of the Oil Shale/Tar Sands Programmatic EIS, and our outright objection to all other than the best. At the very time when we should be sinking our intelligence, entrepreneurship, capital and resources into the demonstrably clean alternatives, in order to make them even cleaner and more feasible, instead we continue to exhaust these marginal collective fiscal resources on massive scale greenhouse gases, pollution-producing substances, and pollutants outright. It makes no sense at all.

I regret that I've not had time to review the details of any of the specific proposals, other than that of Red

Leaf Resources. This is possibly the most nearly sane of the lot --- but only 'most nearly sane'

for its restraint of scale of impacts. At face value, Red Leaf has invented a brilliant mechanism for building insulated cells on a massive scale, heating them to kerogen's melting point, and siphoning off the decant 'wax.' On the bottom line, however, Red Leaf's proposal is outlandishly crazy, destined to irretrievably contaminate all the lands it contacts. It is possible that more kerogen will be recovered than by other methods --- but then what do you have? A massively greenhouse-gas producing substance. True, there is the possibility of reclamation of the burned-out and exhausted oil shale cells. Energetically, however, we have no sense at all that we are not disproportionately allowing the conversion of one form of energy to another, and in the process one form of wealth to another. Natural gas happens to be inexpensive, at present, therefore we are swapping 'fracked' natural gas for kerogen from these cells, with the casualty occurring in devastated landscapes and a globally altered climate. #1)>

<([#2 [3.4.1] Water resources are the inevitable compound casualty, impacted essentially forever. As water becomes more valuable than kerogen or its refined products, largely due to the impacts of refined oil on global climate stability, then our approach to the technology-specific tipping point will be rapid, indeed: So rapid that we will realize almost immediately that we should not have done it, at all. This genie has been kept in the bottle for many years out of a skeptical wisdom. This is where it needs to remain. The difference may be that we should pay the Tribes and the Native American owners of these lands NOT to develop their energy resources. #2)>

<([#3 [3.4.1] As for the remainder of the oil shale/tar sands technologies, the same is true as is the case for the rest of the oil infrastructure, as well as the "messier" natural gas world: Stop, now, for the following reasons:
 * The impacts of gross devastation will rival that of mountaintop removal has done for coal removal. The quantity of underground and surface waters destroyed by mountaintop removal will forever distinguish this generation of engineers and coal workers as the most knowingly savage of all. The OS/TS concern for environment is at least this bad.
 #3)> <([#4 [5] As for the remainder of the oil shale/tar sands technologies, the same is true as is

the case for the rest of

the oil infrastructure, as well as the “messier” natural gas world: Stop, now, for the following reasons:* Reclamation even of the superficially impacted lands will be nearly impossible to execute well,

particularly in these zones of low- and diminishing-precipitation. When there are not nutrients or water, there is no way to apply enough energy to the land to generate adequate plant growth to secure the surface.

#4)]> <([#5 [3.7.3.II] As for the remainder of the oil shale/tar sands technologies, the same is true as is the case for the rest of

the oil infrastructure, as well as the “messier” natural gas world: Stop, now, for the following reasons:* Where chemical analysis of Cretaceous and Jurassic soils find that selenium is high --- or arsenic or

any number of trace elements, but particularly selenium --- the damage assumes legendary proportions in the high Colorado Plateau/West Slope rangelands. Give it enough time, which this surely will have over 20 to 100 years or more, and the results will be inevitable. This is not true just

for cattle and livestock, but also for native rangeland animals, such as deer, elk, antelope and smaller mammals, and most emphatically for fish (the highest level of tissue selenium ever found was in catfish at Stewart Lake, in the late 1980s). They simply will cease to proliferate, will exhibit

symptoms of reproductive distress, and (in short) will die out. This isn't a problem for the people developing oil or gas resources, but it's a gigantic problem for those who want to continue to live off of the land: hunters, fishermen, and Native Americans.

#5)]>

We have no desire to belabor this set of points. Either you get it, or you don't. It's a monstrous, outrageous problem, with readily addressable ramifications. Agencies in general, and BLM in particular,

must cease to give in to these kinds of proposals that are driven by Congressional and State Legislative pressures.

Submission Text

I am writing on behalf of Glen Canyon Institute (GCI), to submit comments on the draft Oil Shale and Tar Sands Draft Programmatic Environmental Impact Statement (OSTS PEIS) being

prepared by the Bureau of Land Management (BLM). GCI is a nonprofit organization founded in 1996 and based in Salt Lake City, Utah, with 1,500 members and supporters from the seven Colorado Basin states and across the United States. These members and supporters have a significant interest in the management, protection, and restoration of Glen Canyon, the Grand Canyon ecosystem, the Colorado River, and the entire Colorado Plateau region. <([#1 [2.3.1] We support Alternative 3, Oil Shale Research Lands Focus (RDandD with PRLA only), and urge the BLM to select this as the preferred alternative and proposed management decision in the Oil Shale and Tar Sands Proposed Management Plan and Environmental Impact Statement. Selecting Alternative 3 would help ensure that we have the best possible information before considering opening our natural open spaces and ecosystems to the development of oil shale and tar sand resources. GCI is particularly concerned about the potential impacts of such development on Glen Canyon, Grand Canyon, the Colorado River, and surrounding lands. This development could have serious and irreversible impacts, including on water supplies and quality, air quality, native ecosystems and wildlife, and recreational uses. #1])> The following are some of our specific concerns regarding the draft OSTs PEIS: <([#2 [3.4.1] * The OSTs PEIS needs to ensure water quality will not be adversely affected by development of oil shale and tar sand resources. The water usage for oil shale production far outstrips the amount of oil produced, even prior to the refinement process. Water resources in the West are already overused and the effects of climate change and increased population will only add further strain to an already depleted system. #2])> <([#3 [3.4.1] * The OSTs PEIS should be conducted in such a way to address issues of dust, noise, and pollution in the affected areas. Heating oil shale in the ground can contaminate vital groundwater supplies. High salt concentrations in groundwater limit water available to native plants and are harmful to agricultural production. The Colorado River Basin already spends millions of dollars annually on damages caused from high salinity. #3])> <([#4 [3.1.1] * The OSTs PEIS should address the potential encroachment on protected National Park System units, such as Glen Canyon Recreation Area and Canyonlands National Park, designated wilderness areas, and inventoried roadless areas. This includes a thorough analysis of the possible damage to these priceless protected areas by oil shale and tar sands development. #4])> <([#5 [2.3.1] This OSTs PEIS should ensure that all alternatives seriously assess the issues outlined above. Considering the present lack of adequate information and the tremendous risks of misguided development, we want to reiterate that the only reasonable alternative at this point is Alternative 3, Oil Shale Research Lands Focus (RDandD with PRLA only), as described in the OSTs PEIS. Thank you for the opportunity to comment on the draft Oil Shale and Tar Sands Draft Programmatic Environmental Impact Statement. #5])>

Submission Text

<([#1 [12] Most of my 67 years have been spent enjoying the outdoor wonders of Utah enjoying the scenery, the habitat and the wildlife. This is a precious resource to be conserved. However, our most precious resources for sustaining life are water and air. Water is a scarce resource in our desert environment, and water quality is critical to the survival of all species. There should be no greater obligation for the BLM than protecting our water resources. Tar sands and oil shale mining threaten those resources in a multitude of ways, not the least of which is the release of toxic waste/solvents into the environment. Safeguarding the environment and our precious life sustaining resources against these hazards should be the first priority in protecting the public interest.

Submission Text

My great-grandparents homesteaded in northwestern Colorado in the 1890's. I graduated from Glenwood Springs HS in 1975 and currently live in Glenwood. I have worked as an engineer and analyst in the energy and water resources arenas for 30 years, working for or consulting for state, federal, local government, utilities, and private clients. This has included long-range planning for electric and gas utilities, water rights administration for the entire Colorado River basin, and renewable energy project development support, for which I currently work for the National Renewable Energy Laboratory. <([#1 [2.2.1] I support the Preferred Alternative, because I believe that a limited amount of acreage is all that should be set aside for oil shale RandD. The technology should have to demonstrate that it is cost-effective and environmentally sound before additional leasing should be allowed. Current proposed technologies do not meet these criteria. In particular, studies on water demands for oil shale extraction clearly indicate that the industry will require more water than is available in this over-appropriated section of the Colorado/Green River basins. We will never choose to give up our river ecosystems, our agriculture, our non-industrial economy, and our lifestyles to support this industry. In addition, the electricity needed for extraction technologies such as freeze-wall concepts will be enormous and require new power plants to be constructed. Fuel resource, air quality, and global warming limitations will limit additions to our power grid in the future and, once again, we will not choose to dedicate this limited electricity resource to oil shale development at the expense of our way of life. Finally, I am very concerned about the direct environmental degradation that will occur, both on-site and off, if this business is subsidized into a large industry, and the affects this degradation will have

on our economy, lifestyle, and air and water quality. Thank you for consideration of my comments.

Earthjustice collected 33,698 comments regarding the Oil Shale and Tar Sands Programmatic EIS. Attached are comments 1-5,000. Here is the sample comment that people could edit:

<([#1 [3] I am deeply concerned about the potential effects to our water, wildlife, communities and public lands if the BLM initiates a commercial oil shale leasing program. The two million acres in UT, WY and CO previously allocated for commercial leasing is a massive amount of public, taxpayer land that would be sacrificed for a singular use of the landscape.

#1])>

<([#2 [2.2] [12.3] While the preferred alternative (Alternative 2) is a step in the right direction, BLM should consider an alternative that does not endorse giveaways of public lands to this unproven industry.

#2])>

<([#3 [3] Oil shale is currently producing no jobs and no revenue. The Congressional Budget Office confirmed that it is not expected to produce significant revenues through 2022. This means we have time to thoroughly assess the impacts of development to our water, wildlife and communities, and should not rush now to give away public lands.

#3])>

<([#4 [3.10.4] The land overlying oil shale resources in Utah, Colorado and Wyoming is some of the best wildlife habitat in the West. Outdoor recreation and tourism are huge economic drivers that depend on this habitat. The farming and ranching sectors require reliable access to water resources, which may be depleted by extensive commercial oil shale development. We must protect these jobs by making smart decisions about how we allow oil companies to move forward with oil shale speculation. #4])>

<([#5 [3] I recommend that you carefully consider the serious impacts of oil shale production to our wildlife, water, air, and communities as you take another look at oil shale development.

#5])>

May 4, 2012 BLM Oil Shale and Tar Sands Draft Programmatic EIS Argonne National Laboratory 9700 S. Cass Ave. Argonne IL 60439 Ladies and Gentlemen: Thank you for the opportunity to provide comments to the Oil Shale/Oil Sand Programmatic Environmental Impact Statement (PEIS). With the passage of the Energy Policy Act of 2005 (EPA), Congress recognized the fact that development of these resources is crucial to the future of the United States and I whole-heartedly agree. We can develop these resources and achieve environmentally sound practices while we grow the economies of rural areas such as Vernal and Uintah County, UT and ease our Country's dependence on foreign oil from unstable and sometimes hostile countries and governments. <([#1 [9.3] The PEIS attempts to identify lands that should be open to development of unconventional resources based on a generalized environmental assessment of those lands. Obviously, when considering lands as massive as those containing these oil shale and oil sand resources, it is impossible to generalize environmental conditions in a single document. That is why specific environmental review is suggested for each project. However, I do take exception to the PEIS's function to exclude lands from potential development. As noted, a specific environmental review will be required for each potential project and that is the proper forum to assess impacts on the environment, sensitive and endangered species, and socio economic concerns, among others. To exclude large swaths of land based on a programmatic document is unjust. #1])> <([#2 [3.10.3] I acknowledge that this document is an environmental assessment of impacts of development on the lands in Utah, Colorado, and Wyoming and with

development there are always trade-offs between preservation of the natural environment and development of the American economy. I found that the PEIS dealt only with negative consequences of development and there was no balance to reflect the positive aspects of unconventional resource development. As an example, Appendix G, the socioeconomic and environmental justice impacts of oil shale and oil sand development were considered. The entire appendix dealt with negative consequences of development. It is unfathomable that no benefits of increased employment opportunities in high paying jobs were mentioned, especially as the United States works to recover from one of the most serious economic upheavals in its history. #2)> <([#3 [6.1] In the case of oil sands development, the PEIS takes the approach that it will use similar industries to assess potential impacts, since the resource is different from that present in northern Alberta. However, I believe that oil sand operations in Alberta will more closely represent operations than assessments of proposed projects that never commenced operation. However, when evaluating impacts of proposed development, the PEIS considers “mega projects” similar to those in operation in Athabasca, Alberta. Utah’s oil sand resources amount to approximately 2% of those found in northern Alberta and these resources simply will not support the scale of development that has occurred around Fort McMurray. The productive capacity from oil sands development in Utah is likely on the order of 25,000 – 50,000 barrels per day and to present individual projects sized at 100,000 barrels of bitumen per day is misleading. In fact, the PEIS includes several photos from Athabasca operations, even though these projects are of a scale beyond that which Utah’s resources could support and though these types of projects were excluded from analysis by the report’s authors. #3)> <([#4 [6.3.5] On page 5.45 the PEIS states that there are, “no commercially proven technologies for extracting liquids from oil shale or tar sands.” The Canadian oil sands are the United States’ largest single source of oil imports, while commercial oil shale extraction and processing facilities exist in Brazil and Estonia, so this statement is obviously misleading and may have imparted bias in the team that prepared the PEIS document. Further, when considering bitumen extraction projects, the report’s authors seem to have assumed that integrated projects are required; that is, any extraction operations would have to be paired with on-site upgrading of the bitumen. Again, this is not consistent with the development in Alberta’s oil sands. While the major mining projects have associated upgraders, the majority of the in situ producers (principally steam assisted gravity drainage, or SAGD) do not upgrade the bitumen and instead dilute the produced bitumen with lighter fractions and ship this mixture to the United States for refining. There is no underlying necessity for any of the projects to incorporate an upgrader, especially given the level of deep conversion capacity at American refineries. #4)> <([#5 [9.3] My overarching conclusion from review of the PEIS is that the lands containing unconventional resources of kerogen and bitumen should be available for leasing. Each specific project should undergo a thorough review of the merits and impacts of the project and should be approved or denied based on that assessment. A programmatic document that excludes huge areas of land from development based on generalized assessments and theoretical projects does not serve America’s interests. #5)>

<([#1 [2.2.1] We are writing to share our concerns about the impact of oil shale development in Utah, and to weigh in on the current Draft Environmental Impact Statement (DEIS). In short, we have serious concerns about the impacts of commercial-scale development on our water and way of life in eastern Utah, and support the balanced approach represented by Preferred Alternative, 2(b) as the best option. #1])> <([#2 [3.4.1] As you are well-aware, Utah is second-driest state in the country and meeting our water needs is not something we take for granted. Ranchers, farmers and rural communities in eastern Utah are sometimes challenged meeting their water demands even during a good year. Therefore, putting dramatically increased stresses on our water supply will only make things worse. Since commercial-scale oil shale development would require anywhere from one to four or more barrels of water for every barrel of oil produced, commercial-scale development is guaranteed to have major consequences for our way of life here. In a 2010 report by the Government Accountability Office for instance, the agency stated that “oil shale development could have “significant impacts on water quantity and quality in eastern Utah, with the exact magnitude of those impacts unknown. #2])> <([#3 [2.2.1] We are also concerned about the impacts to our public lands that the oil shale industry would have. Our public lands are what make Utah such a special place to live, and we count on these places for hunting, fishing, recreating and grazing our cattle. For the above reasons and more, we support the Preferred Alternative 2(b) in the pending DEIS. This plan would lease more than 500,000 acres of public lands to energy companies to do their research and development, while allowing for the opportunity to further study the impacts of oil shale development to our water and way of life. In closing, we thank you for the opportunity to weigh in on this issue, and for the balanced approach being taken by the Department of Interior with respect to its oil shale development program. Since you come from a ranching and farming family too, we know you understand the importance water and shared natural resources to our way of life in the West. #3])>

<([#1 [2.2.1] I have reviewed the BLM's alternative to the original 2 million acres allocated for tar sands and shale oil R and D. Reducing the area to 325,000 total acres is a more reasonable approach for R and D. It preserves lands from being unnecessarily compromised for development that may prove to be impractical, too costly, and too resource intensive to ever be implemented. #1])>

<([#1 [10.6.1] [12] Why is this country so hellbent in wringing every drop of oil out of every rock at the expense of the air, water, and wildlife that inhabit the areas where there may be such? How much greed, arrogance, and stupidity do we have to endure before we say, "Enough is enough"? What good will these drops of oil do in the larger scheme of things other than to pollute, devastate, and kill what is right and beautiful in this country?! Stop this insanity and obsession with a finite resource and turn your attention and efforts to renewable and sustainable resources of sun, wind, geothermal, biofuels, etc. It's way passed time that fossil fuels be left where they need to stay and let the earth renew itself and come back from the brink of global warming and the resulting disasters and catastrophes that are beginning to take their toll on us all. #1])>

<([#1 [9] What happened with the fracking decision? Why is the industry allowed to not divulge what chemicals are being used until AFTER they begin digging? What is the problem with "overlapping" state regulations? How do their lobbyists get to influence our federal government and we don't? I've sent e-mail after e-mail and I know others who have done the same. Why do I have to comply with state regulations and divulge any possible "toxic" intent and they don't? It has to be money to spend in Washington. Much, of which, I don't have. I'm more than disappointed. I'm damn mad. #1])>

<([#1 [12] I strongly oppose the extraction of oil from oil shale and tar sands for a number of reasons. Foremost is the environmental damage it causes, which is permanent and irreversible, and whose long-term effects cannot be safely predicted. Next to that is the lack of proof that it would help the economy or lower the price of gasoline domestically. In fact, reliable studies indicate that it will negative affect the economy, as well as increase domestic gas prices. These are more important concerns than the price of stock or the increased profits of drilling companies, refineries, or fuel corporations. Please do not allow it!!! #1])>
